Laura Turrini, PhD Student, Kühne Logistics University, Grofler Grasbrook 17, Hamburg, Germany, Laura.Turrini@the-klu.org, Maria Besiou, Joern Meissner

Donations are generally the main income of humanitarian organizations and are central to their successful operations. Due to their voluntary nature, they are difficult to predict, but they can be stimulated, when needed, by the means of fundraising appeals and advertising. But how much should an organization spend in fundraising? And is it always worth it? We model the fundraising activity using data from humanitarian organizations in order to help answering these fundamental questions.

2 - Mitigating the Unintended Impacts of Generosity: The Case of Unsolicited Donations after Disasters

Miguel Jaller, Research Associate, Rensselaer Polytechnic Institute, 306 Gold St. Apt 3B, Brooklyn, NY, 11201, United States of America, jallem@rpi.edu, Johanna Amaya, Jose Holguin-Veras, Luk Van Wassenhove

This presentation introduces a donations management system designed to reduce the impacts of unsolicited donations after disasters. The authors take advantage of empirical work to estimate the flow of donations to be sent after large disasters and strategically manage the flow of information to be sent to the possible donors.

3 - ICT and Humanitarian Supply Chains

Ioanna Falagara Sigala, Vienna University of Economics and Business, Welthandelsplatz 1, Vienna, 1020, Austria, ioanna.falagara.sigala@wu.ac.at, Tina Wakolbinger, William Kettinger

This paper aims to explore the role of information systems in supporting humanitarian organizations in efficiently and effectively delivering humanitarian aid and essential medicines to the people in need. First, we look at the current implementation of an ERP system at different humanitarian organizations.Second, we use agent-based modeling and simulation to highlight how the technology adoption will spread throughout the organization, where points of resistance might exist.

4 - Horizontal Coordination in Humanitarian Operations
Mahyar Eftekhar, Assistant Professor, W.P. Carey School of Business, ASU, BA 440, 300 E Lemon Street, Main Campus, Tempe, AZ, 85287, United States of America, eftekhar@asu.edu, Hongmin Li

Despite their resource and financial limitations and despite the considerable level of demand uncertainty they face, Humanitarian Organizations (HOs) do not typically share resources. In this paper, using both empirical and analytical methods, we consider the potential barriers to resource pooling, as well as its costs and benefits for individual agencies. We find out the circumstances in which resource pooling could yield higher benefits for individual HOs.

Cloud Computing

Cluster: Tutorials

Invited Session

Chair: Stefan Voss, University of Hamburg, IWI - Von-Melle-Park 5, Hamburg, 20146, Germany, stefan.voss@uni-hamburg.de

1 - Cloud Computing and Decision Analytics
Stefan Voss, University of Hamburg, IWI - Von-Melle-Park 5, Hamburg, 20146, Germany, stefan.voss@uni-hamburg.de, Leonard Heilig

Cloud computing offers a variety of flexible, on-demand and highly-scalable computing services. The associated flexibility and cost-effectiveness make it a valuable option. We present a classification of decision analytics in the area of cloud computing (e.g., to choose best options and to make predictive statements under uncertainty and information asymmetry). We review related problems, models and techniques applied to support cloud computing oriented decision making. Case studies are given.

Hilton- Continental 5

Joint Session Social Media/MAS: Social Media in Disaster Response

Cluster: Social Media Analytics & Military Applications Society

Invited Session

Chair: Christopher Smith, Director, TRAC-MTRY, U.S. Army, 700 Dyer Road, Monterey, CA, 93943, United States of America, cmsmith1@nps.edu

1 - Using Social and Semantic Network to Analyze a Disaster Response Online Forum
Gail Thomas, Associate Professor, Graduate School of Business & Public Policy, NPS, 555 Dyer Road, Monterey, CA, 93943, gthomas@nps.edu, Jessica Neff, Kimberlie Stephens

Large-scale disaster response often requires the synchronization of military heavy lift and humanitarian assistance. Our study analyzes the actual messages from an online social media forum to determine the dynamic interactions and properties of a knowledge system. We use social network analysis to examine how the search for expertise evolves during the early weeks of the response. Semantic network analysis maps the emergent nature of the communication discourse.

2 - Overview of ISIL's Twitter Communication Network
Gregory Freeman, Naval Postgraduate School, CORE Lab, 589 Dyer Rd. RO-107, Monetery, CA, 93943, United States of America, gsfreema@nps.edu, Rob Schroeder

Twitter accounts associated with the Islamic State of Iraq and the Levant (ISIL) have been prolific propagandists. This presentation overviews how ISIL spreads its messages online and how it is resilient against disruption.

3 - Tweeters of the Storm: Local government use of Social Media during Hurricane Sandy
Rob Schroeder, Naval Postgraduate School, CORE Lab, 589 Dyer Rd. RO-107, Monterey, CA, 93943, rcschroe@nps.edu, Gregory Freeman

While individuals and companies have learned how to effectively use Twitter, how can local governments best leverage the new capability? During Hurricane Sandy many local government groups informally communicated with the public using Twitter, we analyze these local government accounts during the storm in order to compare government use and measure effectiveness.

4 - Looking for Flu Patterns in Twitter Data
Samuel Buttrey, Associate Professor, Department of Operations Research, Code OR/Sb, Naval Postgraduate School, Monterey, CA, 93943, United States of America, buttrey@nps.edu

We examine about 18 months' worth of a 1% sample of Twitter messages for incidence of the words "flu" or "influenza" in English-language tweets originating in the United States. This incidence rate is compared to the actual prevalence of flu as reported by the Centers for Disease Control. Our sample occupies thousands of files and perhaps 5TB of disk space. Some of the practical difficulties associated with handling and analyzing data of this magnitude are addressed.

Crowdsourcing and the Cloud

Cluster: Special Sessions

Invited Session

Chair: Charles Weber, Associate Professor, Portland State University, PO Box 751 ETM, Engineering and Technology Management, Portland, OR, 97207, United States of America, webercm@gmail.com

1 - The Role of ICT-based Informal Communication in International R&D Networks
Vesna Babaja, Doctoral Student, Wirtschaftsuniversitaet Wien, Welthandelsplatz 2, Vienna, A-1020, Austria, Vesna.Babaja@wu.ac.at

Informal communication has been shown to help with building trust, reducing uncertainty and transferring tacit knowledge. However, in geographically dispersed R&D collaborations providing space for the development of informal communication may be cost-prohibitive. This study looks at the effectiveness of ICT in this setting by exploring advanced research collaborations between CERN and its academic and industrial partners from all over the world.

2 - Which Incentives Increase the Motivation to Participate in Technology Transfer Projects?
Manuel Burger, Doctoral Student, Wirtschaftsuniversitaet Wien, Welthandelsplatz 2, Vienna, A-1020, Austria, m.burger@wu.ac.at

The explorative study focuses on the researcher as an individual actor in the technology transfer process. The research project deals with motivational structures behind scientists¥ engagement in technology transfer. In particular a case study will be conducted at CERN to explore technology transfer from fundamental research to industry.

3 - Determining the Locus of Influence Online: A Case from High Tech
Charles Weber, Associate Professor, Portland State University, PO Box 751 ETM, Engineering and Technology Management, Portland, OR, 97207, United States of America, webercm@gmail.com, Nitin Mayande

What determines the locus of influence online? A case from a high tech industry identifies structural factors and factors pertaining to information flow

Hilton- Continental 7

Economics of Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Kenan Arifoglu, Assistant Professor, University College London, Gower Street, London, WC1E 6BT, United Kingdom, k.arifoglu@ucl.ac.uk

1 - Remanufacturing Strategies for OEMs without Remanufacturing Capabilities
Anton Ovchinnikov, Assistant Professor, University of Virginia, 100 Darden Blvd, Charlottesville, VA, United States of America, AOvchinnikov@darden.virginia.edu, Yu Xiong, Yu Zhou

We discuss two strategies for how an OEM without remanufacturing capabilities could interact with independent remanufacturers: outsourcing and relicensing. Factoring in the possibility of unauthorized remanufacturing and the resultant incentive compatibility concern, we discuss which strategy should be used and when. We present analytical results and numerical illustrations with behaviorally-estimated parameters. We then quantify the benefits of bringing remanufacturing in-house.

2 - Licensing Contracts in Conspicuous Markets
Prateek Raj, PhD Student, University College London, Gower Street, London, WC1E 6BT, United Kingdom, p.raj.12@ucl.ac.uk, Kenan Arifoglu

We study licensing in conspicuous markets where, in addition to product's functionality, customers also value brand exclusivity. We consider a brand-owning firm that sells its primary product to conspicuous customers, and also licenses its brand name to a licensing firm selling in a noncompeting market. Contrary to previous literature, we find that royalty contract may perform better than fixed-fee contract. We also develop a mixed contract that improves total profit and coordinates the system.

3 - On Contests with Heterogenous Agents
Ersin Korpeoglu, Tepper School of Business at Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, ekorpeog@andrew.cmu.edu, Soo-Haeng Cho

In a contest in which heterogeneous agents make efforts to develop solutions, existing theory predicts that agents will reduce their efforts as more participants compete for a prize. However, a recent empirical study found that high-ability agents raise their efforts with more participants. This paper offers new explanation for the empirical finding by proposing and analyzing a novel model of a contest. We also characterize when a free-entry contest (open innovation or crowdsourcing) is optimal.

4 - Hedge against Shortages: Supply and Demand Uncertainty Reduction and Comparison Analysis
Mehmet Begen, Ivey Business School - Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, mbegen@ivey.uwo.ca, Xinghao Yan, Hubert Pun

Shortages are widely observed and their consequences are costly in many industries. A main driver of shortages is the uncertain nature of supply and demand. To hedge against shortages and to reduce uncertainties, more information about supply and demand can be obtained by exerting some effort. We perform analysis of the (supply and demand) uncertainty reduction and comparison with and without efforts.

■ TB11

Hilton- Continental 8

Procurement

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Zhixi Wan, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 S Six Street, Champaign, IL, 61820, United States of America, wanzhixi@illinois.edu

1 - Knowledge-Based View on the Use of an Agent in Manufacturing Outsourcing: A Game Theoretic Model
Qiong Chen, Clemson University, 100 Sirrine Hall, Clemson, SC, 29631, United States of America, qiongc@g.clemson.edu, Gulru Ozkan, Aleda Roth, Shouqiang Wang

We evaluate the buyer's dynamic choice of outsourcing channels: directly through in-house procurement department or indirectly through an intermediary agent. Using a two-period game-theoretical model, we demonstrate the critical yet interesting role of outsourcing knowledge therein. In particular, we highlight the effects of direct and indirect learning on the change of buyer's strategies over time.

2 - Optimal Procurement Auction under Multi-Stage Supplier Qualification
Wei Chen, The University of Texas at Dallas, 800 West Campbell Rd, Richardson, TX, 75080, United States of America, wxc103020@utdallas.edu, Milind Dawande, Ganesh Janakiraman

A firm is soliciting price bids from N symmetric suppliers for a sourcing contract. The contract can only be awarded to a supplier who passes multiple stages of qualification test, which must be performed simultaneously in each stage. We obtain the optimal mechanism for the buyer and show that the optimal admission policy in each stage is based on non-uniform reserve prices. We extend our results to a special case of asymmetric suppliers. A descending-meter implementation is also presented.

3 - Favoritism and the Right-of-First-Refusal in Procurement Auctions
Manu Goyal, Assistant Professor, University of Utah, College Of Business, Salt Lake City, UT, United States of America, Manu.Goyal@business.utah.edu, Ali Pilehvar, Wedad Elmaghraby

Long-term relationships with suppliers have several benefits, but these can create inefficiencies and lock-ins which raise procurement costs. Classical procurement auctions lower costs, but result in unsteady short-term relationships with suppliers. The Right-of-First-Refusal can harmoniously resolve this tension: A buyer can lower procurement costs and yet strike steady relationships with preferred suppliers through auctions with the Right-of-First-Refusal granted to the preferred supplier.

4 - Contracting for Capacity under Renegotiation
Eda Kemahlioglu-Ziya, Assistant Professor, Poole College of Management at the University of North Carolina, Raleigh, NC United States of America, ekemahl@ncsu.edu

Two original equipment manufacturers (OEMs) sign fixed-quantity contracts with a contract manufacturer (CM) prior to demand realization. The contracts are renegotiated after demand realization. We aim to understand how an OEM's expected post-renegotiation profit is affected by her ability to negotiate a low wholesale price in the initial contract as well as the ability of the other OEM to do the same. Finally, we identify when the OEMs prefer to leave the CM out of the renegotiation.

Regulation Issues in Sustainable Operations

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Gal Raz, Associate Professor, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, razg@darden.virginia.edu

1 - Valuable E-Waste: Implications for Extended Producer Responsibility
Gokce Esenduran, Ohio State University, OH, United States of America, esenduran.1@osu.edu, Atalay Atasu, Luk Van Wassenhove

In a market regulated with take-back legislation, if recycling is profitable then producers have to compete with third-parties in collecting and recycling end-of-life (EoL) products. We answer the question of whether increased collection or recycling targets lead to better environmental or economic outcomes in a competitive market for EoL products.

2 - Firm and Nonprofit Levers to Improve Supplier Environmental Performance
John Khawam, Operations Strategy Lead, Google Inc., 1600 Amphitheatre Parkway, Mountain View, CA, 94043, United States of America, johnkhawam@google.com, Ozgen Karaer, Tim Kraft

We examine how a firm can induce higher environmental quality from a supplier under varying cost and market sensitivity conditions. We consider two methods: supplier competition and cost sharing. Our research is based on our work with an nonprofit as it markets to industries a tool to safely share chemical information.

3 - Competitive Response to Environmental Tax Incentives for Green Technology Adoption
Dmitry Krass, Professor, Rotman School of Management, Univ. of Toronto, 105 St. George st., Toronto, ON, M5S 3E6, Canada, krass@rotman.utoronto.ca, Anton Ovchinnikov

We consider operational aspects of how an industry composed of heterogeneous firms responds to an environmental tax by choosing production quantities and emissions-reducing technologies. We show the existence and uniqueness of the "market-only equilibrium" (with fixed technology choices) and demonstrate its many interesting properties. We then discuss the technology-and-market equilibria under different structural assumptions.

4 - The Environmental Impact of Product Design Choices in Primary and Secondary Markets under Regulation
Vered Blass, Tel Aviv University, Tel Aviv, Tel Aviv, Israel, vblass@post.tau.ac.il, Gal Raz, Cheryl Druehl

This paper examines the impact of DfE innovations of a firm selling new products in a primary market and refurbished products in a geographically distinct secondary market. The firm determines use stage innovation and design-for-refurbishing, its primary and secondary market prices, and its product collection decision. The paper shows the consequences of Extended Producer Responsibility (EPR) and Use stage regulations on the firm's profits and its environmental impact in both markets.

Panel Discussion: Philosophy of Hiring and Advising Graduate Students

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: Erick Moreno-Centeno, Assistant Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77845, United States of America, e.moreno@tamu.edu

1 - Philosophy of Hiring and Advising Graduate Students

Moderator: Erick Moreno-Centeno, Assistant Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77845, United States of America, e.moreno@tamu.edu, Panelists: Panos Pardalos, Sheldon Jacobson, Mark Lawley, Suvrajeet Sen

Critical to the success of junior faculty is the success of his/her PhD Students. Here, the panelists will share their proven hiring and advising philosophies. All panelists have a track record of training successful PhDs who now hold academic positions at prestigious institutions. This panel was inspired by the Graduate Students & Faculty Relationship Workshop organized by the INFORMS student chapter at Texas A&M. Panelists: Sheldon Jacobson, Mark Lawley, Panos Pardalos, and Suvrajeet Sen.

Data Envelopment Analysis 1

Contributed Session

Chair: Ya Chen, University of Science and Technology of China, No. 96, JinZhai Road, Hefei, China, ychen10@mail.ustc.edu.cn

1 - Considering Favourability Indices as Part of the Malmquist Index

Kwaku Ohene-Asare, Lecturer, University of Ghana Business School, RT16 LG78, Legon Ghana, Legon, Ghana, kohene-asare@ug.edu.gh

Recently, Asmild and Tam (2007) defined a Global Malmquist Index. The present paper contributes to the extant productivity literature by defining a further decomposition of the global frontier shift, into favourability index and favourability change indices. This is interesting when analysing if technology changes over time affects some observations more than others. The indices have potentially interesting policy implications which we show using empirical data set on Ghanaian banks.

2 - The Performance Measurement of Municipal Governments in Mexico using the Data Envelopment Analysis

Mariana Flores-Serralde, Universidad Nacional Autonoma de Mexico, Av. Universidad No. 3000, Col. UNAM, Del. Coyoacan, Mexico, D.F., 04510, Mexico, mathiana_9@hotmail.com, Oscar Olvera-Neria

The quantification of the public administration performance constitutes a new scenario for the control of the government efficiency. In this study, the Data Envelopment Analysis is used to measure the efficiency of municipal governments in Mexico. The municipalities were stratified by population density. The most efficient municipalities (~0.8 efficiency) are in the north and center of Mexico, which corresponds with regions with major cultural, economic and social development.

3 - Network Data Envelopment Analysis for Sustainable Performance in Brazilian Gas Station

Claudia Francisco, Professor, Federal University of Rio Grande do Norte, Rua Senador Salgado Filho, 3000, Campus Universiterio, Natal, 59000000, Brazil, claudiacacf@hotmail.com, Mariana Almeida, Djalma Silva

In this study, we present a quantitative model Network Data Envelopment Analysis associated with Sustainable Balanced Scorecard for mensure the sustainable performance of fuel stations in Brazil. This results indicate an average performance of 69.42%. With a efficiency decomposition, it can provide a set of recommendations to support the decision making of firms and regulators.

4 - DEA Efficiency Research of High Technology Industries

Liang Gao, University of Science and Technology of China, The School of Public Affairs, Hefei, China, gaol3016@mail.ustc.edu.cn

By construction of two stages network DEA, to evaluate high-tech industrial technology introduction of digestion, absorption and innovation efficiency in China, and put forward the development strategy of the various provinces and cities.

5 - An Extension on Super-efficiency Approach for Slacks-based Measure

Ya Chen, University of Science and Technology of China, No. 96, JinZhai Road, Hefei, China, ychen10@mail.ustc.edu.cn, Yongjun Li

Fang et al. [Fang, H.H., Lee, H.S., Hwang, S.N., & Chung, C.C., 2013. A slacks-based measure of super-efficiency in data envelopment analysis: An alternative approach. Omega, 41, 731-734] develop a slacks-based version of the super slacks-based measure (SBM) and propose a two-stage approach to calculate both super-efficiency score by the super SBM model and efficiency score by the SBM model. In this paper, we extend their approach to consider continuity of efficiency scores.

Revenue Management and Pricing of Multiple Products and Assortments

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Ozge Sahin, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21231, United States of America, ozge.sahin@jhu.edu

1 - Repricing Algorithms in E-Commerce

Dana Popescu, Assistant Professor, INSEAD, 1 Ayer Rajah Ave, Singapore, 138676, Singapore, dana.popescu@insead.edu

We analyze a duopoly where sellers compete using repricing algorithms, which have a built in demand function and use specific pricing rules. We compare the revenues obtained when both sellers use the same software provider with the revenues obtained when the sellers use different providers, for various pricing rules, demand forecast accuracies and frequency of updating.

2 - Strategic Pricing of Ancillary Services: To Bundle or to Unbundle?

Yao Cui, PhD Candidate, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, 48109, United States of America, cuiyao@umich.edu, Izak Duenyas, Ozge Sahin

We consider a firm that sells a main service (e.g., air travel) and an ancillary service (e.g., baggage delivery) to multiple consumer segments (e.g., business travelers and leisure travelers). We study the firm's strategic decision of whether to bundle the ancillary service into the main service or to unbundle. We investigate several factors that affect this decision, including forward-looking vs. myopic consumers, firm's main service price discrimination, and selling through intermediaries.

3 - Real-time Optimization of Personalized Assortments

Hamid Nazerzadeh, Marshall School of Business, University of Southern California, Los Angeles, CA, United States of America, nazerzad@marshall.usc.edu, Negin Golrezaei, Paat Rusmevichientong

Motivated by the availability of real-time data on customer characteristics, we study personalization of the assortment of products for each arriving customer. Using actual sales data from an online retailer, we demonstrate that personalization based on each customer's location can lead to over 10% improvements in revenue. We propose a family of index-based policies that coordinate the assortment decisions with the backend inventory constraints and achieve an optimal competitive ratio.

4 - Pricing Assortments for Online Travel Agents

Ozge Sahin, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21231, United States of America, ozge.sahin@jhu.edu, Ruxian Wang

In this paper we study the assortment selection and pricing problem of online travel agents. We first show that the assortment selection problem is NP complete. Next, we study the pricing problem under both monopoly and competitive scenarios.

Hilton- Franciscan B

Contact Centers

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Noah Gans, OPIM Department, Wharton - University of Pennsylvania, Philadelphia, PA, United States of America, gans@wharton.upenn.edu

1 - Service Times in Call Centers: A Data-Based Perspective

Rouba Ibrahim, University College London, London, United Kingdom, rouba.ibrahim@ucl.ac.uk, Haipeng Shen, Pierre L'Ecuyer

We carry out a large-scale data-based study of service times in a call center with heterogeneous agents and multiple call types. We find that the service-time distribution depends strongly on the agent and on time, and that service times are correlated. We develop models that account for these facts. We compare our models to ones commonly used in practice. We find that the goodness-of-fit is much better for our models than for the simplified ones, both in-sample and out-of-sample.

2 - Fluid Models for Customer Service Chat Systems with General Service and Patience Times

Tolga Tezcan, Professor of Operations Management, Simon School of Business, University of Rochester, 3-345 Simon Hall. Simon Business School, Rochester, NY, 14627, United States of America, tolga.tezcan@simon.rochester.edu, Jiheng Zhang

We study customer service chat systems where service and patience times are generally distributed. We propose a framework involving measure-valued processes to model the system dynamics. Deterministic fluid models are developed to provide first-order approximations for system performance. The invariant state of the fluid models provides simple approximations for various performance measures in steady state. Numerical experiments show that these approximations are fairly accurate.

3 - Telephone Call Centers: Asymptotic Optimality of Myopic Forecasting-scheduling Scheme

Han Ye, University of Illinois at Urbana-Champaign, College of Business, Champaign, IL, United States of America, hanye113@gmail.com, Noah Gans, Yong-Pin Zhou, Haipeng Shen

We determine workforce schedules for call center arrivals that are doubly stochastic. Period-by-period arrival rates follow a hidden AR(1) process, and only arrival counts are observed. We formulate stochastic programs to minimize long-run average staffing costs, subject to a long-run average constraint on abandonment. We show that, in steady state, repeated, myopic solution of the single-period problem is stable, has low cost, and meets the abandonment constraint.

4 - Dynamic Scheduling in a Many-Server Two Class System with Service Guarantees and Abandonments

Amy Ward, Professor, USC, Marshall School of Business, BRI401H, Los Angeles, CA, 90089-0809, United States of America, amyward@marshall.usc.edu, Ramandeep Randhawa, Jeunghyun Kim

We study how different models for customer impatience affect scheduling decisions. We do this in the context of a many-server queue with two classes of customers that are distinguished by their patience distribution. Our objective is to minimize the abandonment percentage for one class subject to a promised service level for the other class. For large systems, we characterize the optimal policy structure as a function of the patience distribution.

Revenue Management in Retail

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Kris Johnson, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, krisdj@mit.edu

1 - Incorporating Buyer's Paralysis into the MNL Choice Model

Rene Caldentey, Professor, New York University, 44 West Fourth Street, 8-77, New York, NY, 10012, United States of America, rcaldent@stern.nyu.edu, Anisha Patel, Srikanth Jagabathula

We empirically investigate the notion of choice paralysis (i.e., the idea that too many options can paralyze a consumer and make them more prone to not purchasing) and its implications on assortment and inventory decisions. We also propose a modification to the existing MNL model that aims to capture this choice paralysis.

2 - Estimating Willingness to Pay and Willingness to Sell from Negotiations Data

Garrett van Ryzin, Columbia University, 412 Uris Hall, Columbia University, New York, NY, 10027, gjv1@columbia.edu, Robert Phillips, A. Serdar Simsek

In many businesses, the final sales price is the result of a negotiation between buyer and seller - e.g. real estate, autos, consumer finance and B2B commerce. We discuss results on a novel method for estimating willingness-to-pay and willingness-to-sell distributions from negotiations transactions data.

3 - Analytics for an Online Retailer: Demand Forecasting and Price Optimization

Kris Johnson, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, krisdj@mit.edu, David Simchi-Levi, Bin Hong Alex Lee

We present our work with Rue La La, an online retailer who offers limited-time discounts on designer apparel. One of their main challenges is revenue management for new products. We use machine learning techniques to build a demand prediction model, the structure of which poses challenges on creating a pricing policy. We develop new theory around multi-product price optimization and use this to create and implement a pricing decision support tool. Results show significant increases in revenue.

Choice and Pricing Models in Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Sumit Kunnumkal, Indian School of Business, AC4 Level 1 4116, Hyderabad, India, Sumit_Kunnumkal@isb.edu

1 - Modeling Dynamic Choice Behavior of Customers

Srikanth Jagabathula, New York University, 44 West Fourth St, New York, NY, 10012, United States of America, sjagabat@stern.nyu.edu, Gustavo Vulcano

The effectiveness of pricing/product assortment decisions in retail operations relies heavily on accurate demand predictions. Motivated by this, we consider the setting in which retailer has access to panel data — sales transactions tagged by customer id. Given this rich data, we present techniques to (a) predict the purchase likelihood for each customer as a function of offer set and promotions and (b) develop a prescription for personalizing promotions.

2 - The Cross Moment Choice Model

Karthik Natarajan, Associate Professor, Singapore University of Technology and Design, 20 Dover Drive, Singapore, 138682, Singapore, natarajan_karthik@sutd.edu.sg

In this talk, I will discuss a new class of discrete choice models that assumes mean and covariance information on the utilities. We show that the choice probabilities for the distribution that maximises expected user utility is efficiently computable with convex optimization. We will provide evidence that the model is a practical alternative to Multinomial Probit in a few applications. The talk is based on joint work with Li Xiaobo, Selin Damla Ahipasaoglu, Rudabeh Meskarian and Tom Magnanti.

3 - Upper Bounds for Choice Network RM

Sumit Kunnumkal, Indian School of Business, AC4 Level 1 4116, Hyderabad, India, Sumit_Kunnumkal@isb.edu, Kalyan Talluri

The deterministic LP is a simple heuristic that obtains an upper bound on the choice network RM value function. The affine and the piecewise linear approximations are more sophisticated methods that obtain tighter bounds than the deterministic LP. We establish analytical limits on how much these methods can further tighten the deterministic LP bound.

4 - Dynamic Pricing versus Fixed Prices in Revenue Management

Alper Sen, Bilkent University, Department of Industrial Engineering, Bilkent, Ankara, 06800, Turkey, alpersen@bilkent.edu.tr

We consider the problem of selling a fixed stock of items over a finite horizon. Arrivals follow a Poisson process. We obtain a general lower bound on the performance of using a fixed price which is 63.2% for one unit of inventory and improves as the inventory increases. For one unit, we obtain tight bounds: 89.8% for constant elasticity and 96.9% for linear price response functions. We also suggest a new dynamic pricing heuristic which performs better than 99.8% in a large number of problems.

Facility Logistics II

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Soondo Hong, Assistant Professor, Pusan National University, 2, Busandaehak-ro 63beon-gil, Geumjeong-gu, Pusan, 609-735, Korea, Republic of, soondo.hong@pusan.ac.kr

1 - Setting Cutoff Times for Order Fulfillment Systems with Capacity Degradation

Kevin R. Gue, Professor, Auburn University, Shelby Center, Auburn, AL, 36849, United States of America, guekevi@auburn.edu

In many order fulfillment settings, orders received before a cutoff time are guaranteed to be shipped that evening to meet next-day or two-day service promises. In a system that batches orders for more efficient picking tours, the control system must determine how large a batch pickers can handle as the deadline approaches. The nearer the deadline, the smaller the batch size and the lower the effective capacity. We show how to set the latest possible cutoff time in such a setting.

2 - Technology Infrastructure in Third Party Logistics (3PL) Warehouses: Status, Barriers, and Future

Michael Ogle, Assistant Professor and Undergraduate Director, UNC Charlotte, 9201 University City Blvd., CARC 220, Charlotte, NC, 28223, United States of America, Mike.Ogle@uncc.edu

The rate of technology infrastructure adoption within Third Party Logistics (3PL) warehouses lags behind that of private dedicated facilities owned and operated by manufacturers, retailers and distributors. Despite the lack of scale-enabling automation solutions, third-party logistics continues to grow faster than the U.S. GDP. What are the challenges associated with automating 3PLs and how might they be overcome as projected growth continues for 3PLs? This session addresses those questions.

3 - Bulk Tank Allocation for Industrial Gas Distribution: Heuristic Approach for a Multi-Period Model

Leily Farrokhvar, PhD Candidate, Virginia Tech, Industrial & Systems Engineering (0118), Blacksburg, VA, 24061, United States of America, leily@vt.edu, Kimberly Ellis

We study the bulk tank allocation (BTA) problem for industrial gas distribution. The BTA problem determines the preferred size of bulk tanks to assign to customer sites to minimize total cost, including the initial tank installation costs and the net present value of distribution costs occurring in multiple periods. The problem is modeled as a mixed-integer program and then solved using a heuristic approach which incorporates a two-phase decomposition approach.

4 - Order Batching with Time Constraints in a Parallel-aisle Warehouse: A Multiple-policy Approach

Soondo Hong, Assistant Professor, Pusan National University, 2, Busandaehak-ro 63beon-gil, Geumjeong-gu, Pusan, 609-735, Korea, Republic of, soondo.hong@pusan.ac.kr, Brett Peters, Andrew Johnson

This study analyzes an order batch operation with limited vehicle capacity and specified deadlines to complete orders. We develop a model which partitions orders to batches to minimize the total travel time such that each trip meets the time constraint and capacity limit and determine a suitable operational policy. Each policy is characterized by routing method and associated speed, capacity, and pick time. The proposed model groups orders and selects a best policy among possible policy choices.

Innovative Solutions for Congestion Mitigation II

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Yafeng Yin, University of Florida, Gainesville, FL, United States of America, yafeng@ce.ufl.edu

Co-Chair: Siriphong (Toi) Lawphongpanich, University of Florida, Industrial and Systems Engineering, Gainesville, FL, 32611, United States of America, Lawphong@ise.ufl.edu

1 - Dedicated Bus Service in London, Towards Better Transit and Traffic

Guangzhi Zhang, Tsinghua University, Room 615, Shunde Building, Beijing, 100084, China, zgz11@mails.tsinghua.edu.cn, Lefei LI

Dedicated Bus Service (DBS) is a new urban transit service that bridges bus/metro and private vehicles. By directly connecting high-demand OD pairs, the DBS is expected to alleviate traffic congestion and provide better commuting experiences. We build a simulation model for London traffic network based on TRANSIMS. Experiment result shows that a properly designed DBS can lead to better traffic and transit services. We also investigate the contract design problem for a better performance of DBS.

2 - Optimization-based Methods for Hybrid Transit System

Yihuan (Ethan) Shao, University of Southern California, Industrial and Systems Engineering, 3715 McClintock Avenue, Los Angeles, CA, 90089, United States of America, yihuansh@usc.edu, Fernando Ordonez, Xiaoqing Wang

Considering the traffic congestion in megacity, we propose a new hybrid transit system, which combines a ridesharing system with a fixed-route public transit system. The main idea behind this new system is to take advantage of the flexibility of ridesharing and the low cost of public transit. We developed optimization-based methods to solve the routing problem for the shared vehicles under this system. Computational experiments for these methods expose some interesting results.

3 - Pricing of Parking Games with Atomic Players

Yafeng Yin, University of Florida, Gainesville, FL, United States of America, yafeng@ce.ufl.edu, Fang He, Zhibin Chen

This paper considers a parking competition game where a finite number of vehicles from different origins compete for the same number of parking spaces in a downtown area to minimize their own parking costs. We first define and formulate equilibrium and system optimum assignments of spaces to vehicles, and then discuss various parking pricing schemes to reduce total cost of the parking competition game.

Designing, Modeling and Managing Disrupted Transportation Networks

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Kash Barker, Assistant Professor, University of Oklahoma, 202 W Boyd St, Rm. 124, Norman, OK, 73019, United States of America, kashbarker@ou.edu

1 - Large-scale Evacuation Routing and Scheduling Optimization with Uninterrupted Traffic Flow

Xuechi Zhang, University of Maryland, 0147C Engineering Lab Building, University of Maryland, College Park, MD, 20742, United States of America, zhangxc90@gmail.com, Ali Haghani

This paper develops a two-stage optimization framework for large-scale vehicular evacuation. In the first phase, a mixed integer programming model, with the objectives of minimizing the network clearance time and total in-network time is developed to determine an optimal routing plan. In the second phase, a simulation-based Heuristic is proposed to dynamically generate the time-dependent departure rates. Case study of Maryland Eastern Shore is conducted by using the proposed model.

2 - Fortification of a Transportation Network against Disruptions

Mustafa Y. Sir, Antalya International University, Üniversite Cad. No:2 07190, Dö emealtı, Antalya, Turkey, mustafa.sir@antalya.edu.tr, Gokhan Karakose

Usage of critical structures (e.g., bridges) in a transportation network might get disrupted due to natural disasters such as earthquakes. Previous work defines component-specific vulnerability indices, which do not capture the change in network performance due to multiple simultaneous disruptions. A scenario-based method is proposed to fortify a transportation network against simultaneous disruptions by allocating maintenance resources over critical structures to minimize the economic impact.

3 - Multi-objective Optimization for Scheduling of Contraflow Evacuation

Yingyan Lou, Assistant Professor, Arizona State University, P.O. Box 873005, Tempe, AZ, 85287-3005, United States of America, yingyan.lou@asu.edu, Peiheng Li

Contraflow evacuation scheduling problem is formulated as a multi-objective optimization in this research, with total system travel time and operation cost as two individual objectives. The problem is solved with an enhanced nondominated sorting genetic algorithm that also incorporates adaptive random search based on response surface methodology. Multiple scenarios are investigated using a simulation-based contraflow planning tool. Optimal Pareto sets of scheduling solutions are provided.

4 - Multi-regional Vulnerability Analysis of Freight Transportation Network

Mohamad Darayi, PhD Student, University of Oklahoma, 202 W Boyd St, Rm. 124, Norman, OK, 73019, United States of America, mdarayi@ou.edu, Kash Barker

Oklahoma's central location and economic anchors within the state enforce a special attention given to the multimodal freight transportation network as a connector between business and markets in Oklahoma and the United States. This network is prone to natural/man-made disruptive events which might disable any of the network components. Vulnerability analysis of freight transportation network in a multi-regional, multi-industry interdependent economic context is pursued in this research.

Sponsored Session

Chair: Kevin Furman, ExxonMobil, 1545 US 22 E, Annandale, NJ, United States of America, kevin.c.furman@exxonmobil.com

1 - An Inventory Routing Problem for Liquefied Natural Gas Distribution Model with Net Present Value Approach

Yousef Ghiami, Technische Universiteit Eindhoven, Eindhoven, 5600 MB, Netherlands, y.ghiami@tue.nl, Tom Van Woensel

Due to its environmental characteristics, Liquefied Natural Gas (LNG) is becoming a more attractive fuel in the energy market. We develop an inventory routing model incorporating the deterioration property of LNG with a net present value approach, followed by numerical analysis.

2 - A Matheuristic for the Multi-vehicle Inventory Routing Problem

M.Grazia Speranza, Professor, University of Brescia, C.da S.Chiara 50, Brescia, Italy, grazia.speranza@unibs.it, Natashia Boland, Claudia Archetti

The Multi-vehicle Inventory Routing Problem (MIRP) is the problem of determining for each time of a discrete horizon the quantities to deliver to customers and the routes at minimum total cost. No stock-out is allowed and the vehicle capacity must be satisfied. We present a matheuristic where mathematical programming models are embedded in a heuristic scheme. Computational results are presented for a large set of benchmark instances that prove the effectiveness of the algorithm.

3 - Inventory Routing and Freight Consolidation of Perishable Goods

Weihong Hu, Georgia Tech, Department of ISyE, Atlanta, GA, United States of America, weihongh@gatech.edu, Alejandro Toriello, Maged Dessouky

We investigate a model of combined inventory routing and freight consolidation with perishability constraints. We design efficient solution methods that utilize the problem structure, including transportation-inventory decomposition, perishability parameter based heuristics, etc. The algorithms are tested with real data from the cut flower supply chain practice in California.

4 - On-Board Blending in Multiproduct Maritime Inventory Routing

Kevin Furman, ExxonMobil, 1545 US 22 E, Annandale, United States of America, kevin.c.furman@exxonmobil.com, Jin-Hwa Song, Myun-Seok Cheon

We introduce a practical problem for simultaneous optimization of ship routing, inventory management and on-board blending of multiple bulk products. In addition to traditional ship routing characteristics, this problem involves variable product value based on blend specifications, time dependent costs, cargo draft limits at ports and allowing routes with multiple pick-ups and drop-offs. We develop a discrete time optimization model and practical solution approaches which address these various real-world issues.

1 - Modeling the Spatiotemporal Propagation of Information in Vehicle-to-Vehicle Communications

Yong Hoon Kim, West Lafayette, IN, 47907, United States of America, kim523@purdue.edu, Srinivas Peeta, Xiaozheng He

This study proposes an analytical model for the spatiotemporal propagation of information in large-scale vehicle-to-vehicle (V2V) communications. The information propagation is described by embedding a propagation model with an analytical traffic flow model. Insights are illustrated using numerical experiments.

2 - Entropy Weighted Average Method for the Determination of Unique Path-Flow Solution for Static Deterministic User Equilibrium Traffic Assignment Problem

Amit Kumar, Purdue University, West Lafayette, IN, United States of America, kumar44@purdue.edu, Srinivas Peeta

This study formulates entropy weighted user equilibrium (EWUE) to determine a unique path-flow solution to the static deterministic user equilibrium traffic assignment problem. The implementation simplicity of the EWUE represents an important benefit over the maximum entropy user equilibrium (MEUE) models proposed in the past. Computational experiments illustrate the characteristics of the EWUE solution.

3 - A Simulation Based Approach for Optimal Road Network Demand Modification

Evan Fields, Massachusetts Institute of Technology, 77 Massachusetts Ave., Boston, MA, United States of America efields@mit.edu, Carolina Osorio

A road network operator may have some capacity to modify demand. We present two contributions to the problem of finding optimal magnitude and location of reduction. First, we use an analytic queueing model to demonstrate several important features of the problem. Second, we present a case study of using simulation based optimization to solve the optimal demand modification problem on a subnetwork of Lausanne.

4 - Fine-grained Modeling of Arterial Traffic: A Data Fusion and Information Integration Approach

Zhanbo Sun, RPI, Troy, NY, 12180, United States of America sunz3@rpi.edu, Peng Hao, Xuegang (Jeff) Ban

In this research, a data fusion and information integration approach is proposed to model and interpret the straffic along urban arterial corridors based on heterogeneous data sources. The method captures variables such as data accuracy, travel time, lane choice and traffic merging at a corridor-level. Results from the method can be directly applied to estimate individual corridor travel times and vehicle trajectories.

Chair: Rebecca Scott, University of North Texas, 1155 Union Circle #311396, Denton, TX, 76203, United States of America, rebecca.scott@unt.edu

1 - Modeling the Residual Useful Life of Railroad Bearing Grease

Douglas Timmer, Professor, University of Texas - Pan American, Manufacturing Engineering Department, 1201 West University Dr, Edinburg, TX, 78539, United States of America, timmer@utpa.edu

This research will develop an analytical model or models to predict the residual useful life of railway bearing grease. Modeling techniques to be employed include mechanistic or first principles models based upon process kinetics and empirical models including physics-based reliability models, non-linear regression and neural networks. The analytical model will provide users the ability to predict residual life based upon operational characteristics.

2 - Rescheduling Railway Timetables in Presence of Passenger Transfers Between Lines Within a Transportation Network

Miguel Angel Pozo, Universidad de Sevilla, Facultad de Matematicas, Calle Tarfia s/, Sevilla, 41012, Spain, miguelpozo@us.es, Juan Antonio Mesa, Francisco A. Riejos, Justo Puerto

The problem of coordinating transfers consists of determining timetables which ensure the transfer of passengers between trains from different lines. This paper considers a transit line where a train fleet circulates according to a predetermined timetable. Passengers arrive at according to an assumed deterministic model of arrivals. In this scenario, a service rescheduling forced by an incidence is determined in order to minimize the loss of passengers who require transfers between lines.

3 - Planning for Protection in Rail-Truck Intermodal Transportation
Hassan Sarhadi, PhD Student, Memorial University of Newfoundland, 57 Allandale Road, PO BOX 534, St.John's, NL, A1B 3S7, Canada, hassan.sarhadi@mun.ca, Manish Verma, David Tulett

Railway intermodal transportation is one of the main sources of revenue for major U. S. railways. Due to such an importance, railway companies should make sure that their intermodal chain is working properly. In this presentation, a mathematical model for protection planning of rail-truck intermodal transportation infrastructure facing intentional disruptions will be presented. Then, the model will be applied to an intermodal chain in U. S. to find the best way of protecting its infrastructure.

4 - Causal Loop Simulation Model of Public Transportation Decision Making Factors
Rebecca Scott, University of North Texas, 1155 Union Circle #311396, Denton, TX, 76203, United States of America, rebecca.scott@unt.edu

A causal loop simulation examines the decision making factors that influence the use of public transportation. Factors are visually represented in the developed model that allows evaluating the importance of the optimal decision making factors. Implications are reported in an effort to provide insight for increasing public transportation use.

5 - Combining Cost-benefit Analysis and Transport Optimization
Arnt-Gunnar Lium, Senior Research Scientist, SINTEF, SINTEF Technology and Society Applied Ec, SP. Andersensvei 5, Trondheim, NO-7465, Norway, arnt-gunnar.lium@sintef.no, Marte Fodstad, Truls Flatberg, Michal Kaut

We present a model for long term strategic investments in railroad infrastructure were the traditional cost-benefit analysis is integrated in an optimization setting. We also discuss challenges related to the handling of uncertainty and transportation choice modelling for a real life problem for the Norwegian railroad infrastructure manager (Jernbaneverket).

Facility Planning and Design

Contributed Session

Chair: Yue Zhang, University of Toledo, 2801 West Bancroft St., Toledo, OH, 43615, United States of America, yue.zhang@utoledo.edu

1 - A Metaheuristic for the Layout and Scheduling Problem in a Job Shop Environment
Eva Selene Hernandez-Gress, Researcher, Autonomous University of Hidalgo, Pachuca-Tulancingo Road km. 4.5, Pachuca, Mexico, evah@uaeh.edu.mx, Mary Carmen Reyna Amador, Juan Carlos Seck Tuoh Mora, Hector Rivera Gömez, Oscar Montaño Arango

We propose in this paper a new approach that jointly addresses the layout of a facility and the scheduling of a sequence of jobs. In real production, these two problems are interrelated. However, they are treated separately in the literature. Our approach is an extension of the job shop problem with transportation delay, where the location of the machines is selected among possible sites. The model minimizes the makespan, combining the travel salesman problem with genetic algorithms.

2 - Block Layout Design on the Foundations of a Circular Flow Pattern under Flexible Bay Structures
Hossein Jahandideh, PhD Student, UCLA, 110 Westwood Plaza, Los Angeles, CA, 90024, United States of America, hossein.jahandideh.1@anderson.ucla.edu, Ardavan Asef-Vaziri

In this paper we develop a procedure for the concurrent design of block layout, material handling network, and pick-up and drop-off stations. We first develop a set of heuristics and a genetic algorithm based on efficient approximations to configure block layouts based on loop flow patterns. The unidirectional loop and station locations are then designed on the chosen layout. A set of improvement algorithms finally integrates the best loop and layout.

3 - Optimal Capacity Investment with Time-Sensitive Demand
Yue Zhang, University of Toledo, 2801 West Bancroft St., Toledo, OH, 43615, United States of America, yue.zhang@utoledo.edu

The research concerns optimizing capacity investment for a single firm or two competing firms facing time-sensitive demand. After studying two basic models for a single firm, we focus on two competitive models, where two competing firms operating a single server are to enter a market sequentially or simultaneously. We obtain the conditions under which the two firms would enter the market and the optimal capacity investment for each firm to maximize its profit if entering.

4 - Locating Charging Facilities for Electric Vehicles
Kiana Roshan Zamir, Graduate Research Assistant, University of Maryland, Dept .of Civil and Environmental Eng., 1173 Glenn Martin Hall, College Park, MD, 20742, United States of America, Kianarz@umd.edu, Ali Haghani

Using new alternative fuels than fossil fuels for motorized transportation vehicles has become more and more popular with the growing concerns on the limitation of fossil fuels and environmental degradation. One of the major challenges for the owners of electric vehicles is lack of charging infrastructures and limited range of these vehicles. In this paper, a model is developed for optimal placement of these facilities along the network.

5 - 1-Refueling Location Problem on a Continuous Tree Network
Sang Jin Kweon, PhD Student, Pennsylvania State University, 232 Leonhard Building, University Park, PA, 16802, United States of America, svk5333@psu.edu, Seong Wook Hwang, Jose A. Ventura

In this talk, we consider a location problem for 1-refueling station on a tree network. We aim to locate the station anywhere on the network, including along the edge. Our objective is to locate a 1-refueling station to maximize the total traffic flow covered in round trips. For this, we derive reduction properties regarding the problem size and optimality conditions. Then, we develop an exact algorithm to determine the set of optimal locations for the refueling station.

Rail System Performance

Sponsor: Railway Applications

Sponsored Session

Chair: Bo Zou, University of Illinois at Chicago, 2073 Engineering Research Facility, 842 West Taylor Street, Chicago, IL, 60607, United States of America, bzou@uic.edu

1 - A Column Generation Approach for Designing Dynamic Train Service Network
Xuesong Zhou, Associate Professor, Arizona State University, School of Sustainable Engineering, Tempe, AZ, United States of America, xzhou74@asu.edu, Lingyun Meng

This talk presents a holistic modeling approach for integrating transportation demand, train service and infrastructure networks. We develop integer programming models for a train dispatching problem on an N-track network by means of simultaneously rerouting and rescheduling trains. A space-time path reformulation can provide an efficient decomposition mechanism through modelling track capacities and trip demand as side constraints in a Lagrangian relaxation solution framework.

2 - Capacity of Single-Track Railway Lines with Short Sidings to Support Operation of Long Trains
Ivan Atanassov, University of Illinois at Urbana-Champaign, 205 N. Mathews Ave., Urbana, IL, 61801, United States of America, atanass1@illinois.edu, Christopher PL Barkan, Tyler Dick

The use of distributed power locomotives has allowed for greater efficiencies through longer trains, but is complicated by the inadequate length of many existing passing sidings. This research seeks to characterize and analyze the interaction between siding lengths and the length of trains, and its effect on track utilization and train-delay. The analysis includes a discussion of the existing problem, as well as practical implications of the results on planning siding extension programs.

3 - Analysis of Rail Line Capacity on Shared Corridors with Multiple Freight Train Types
Mei-Cheng Shih, Graduate Research Assistant, University of Illinois, Urbana-Champaign, 205 North Mathews Ave. B118, Urbana, IL, 61801, United States of America, mshih2@illinois.edu, Tyler Dick

Expanding rail network line capacity through efficient planning requires an understanding of how traffic mixture affects line capacity and the delay incurred by various classes of trains. This study analyzed the interaction of three different types of trains using simulation. A general transformation between delay and throughput was also developed.

4 - Integrated Network Performance in Denmark
Steven Harrod, Associate Professor, Technical University of Denmark, Room 109A, Building 116, Kgs. Lyngby, 2800, Denmark, stehar@transport.dtu.dk

DTU Transport is investigating how to measure and direct railway services for the benefit of the larger, multimodal transport network. This presentation will present the recommendations of the Danish Congestion Commission and discuss their implications for management of the Danish railway services. Further, the common data foundation managed by the DTU Transport Model Center and its application to analysis of railway performance will be explained.

Airline Choice-based Pricing and Revenue Management

Sponsor: Aviation Applications

Sponsored Session

Chair: Emmanuel Carrier, Delta Airlines, 30 Delta Boulevard, Atlanta, GA, 30354, Georgia, Emmanuel.Carrier@delta.com

1 - The Impact of Advance Purchase Deadlines on Airline Customers' Search and Purchase Behaviors

Laurie Garrow, Georgia Institute of Technology, School of Civil Engineering, Atlanta, GA, 30332, United States of America, laurie.garrow@ce.gatech.edu, Susan Hotle, Matthew Higgins

Few studies have investigated how individuals respond to advance purchase deadlines and price uncertainties induced by these deadlines. We model individuals' search and purchase behaviors using an instrumental variable approach that corrects for price endogeneity. We find search increases just prior to an advance purchase deadline and that some consumers who want to travel just after an advance purchase deadline are willing to travel a day or two later in order to avoid paying a higher fare.

2 - Willingness to Pay Forecaster for Airline Demand Forecasting

Abinav Rameesh, Associate Scientist, PROS, 8333 Braesmain Drive, Apartment 1416, Houston, TX, 77025, United States of America, arameesh@pros.com, Wei Wang

Forecasting models are evolving to incorporate a market of price sensitive customers, looking for the cheapest available fare. As customers "buy down" to the lowest available class they reveal their true "Willingness to Pay". The Willingness to Pay model holds that a customer's true willingness is greater than the paid fare and is derived from the distribution of paid fares. At PROS, we have conducted simulations to explore the behavior of this model and its impact on demand forecasting.

3 - Implementation of MNL Choice Models in PODS Network D6: First Steps

Emmanuel Carrier, Delta Airlines, 30 Delta Boulevard, Atlanta, 30354, Georgia, Emmanuel.Carrier@delta.com, Larry Weatherford

This presentation summarizes results of Passenger Origin Destination Simulator (PODS) research on how to implement our MNL choice model in a large "domestic" network with two airlines competing in 482 O&D markets. Based on the choice model parameter estimates, a new MNL path forecast is created. Revenue results are presented when comparing this new MNL forecaster vs. classic methods like leg standard, path standard and hybrid forecasting, under both leg and network optimization.

4 - Discrete Choice and Semi-supervised Learning for Air Travel Shopping Data

Jie Yang, Graduate Student, Northwestern University, 2145 Sheridan Road, Evanston, IL 60208, Evanston, Il, 60208, United States of America, jieyang2011@u.northwestern.edu, Diego Klabjan, Sergey Shebalov

Travel agents get itineraries from global distribution systems. The resulting air travel shopping data consists of requests and return itineraries but not bookings. We combined discrete choice modeling and semi-supervised learning to estimate bookings. We report findings based on real world data from a major global distribution system provider.

Contributed Session

Chair: Vishwanath Hegde, Professor, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, vish.hegde@csueastbay.edu

1 - A Two-Phase Algorithm of DCF Maximisation for the Milestone-Settled Project

Piotr Lebkowski, Professor, AGH Univ. of Science and Technology, al. Mickiewicza 30, Krakow, PL 31-059, Poland, plebkows@zarz.agh.edu.pl, Marcin Klimek

The paper presents a RCPSP settled by contractual milestones. The criterion analysed here is the maximisation of aggregate discounted cash flows from the contractor's perspective, known as an RCPSP problem with Discounted Cash Flows. The cash flows analysed here cover the contractor's cash outflows, related to the commencement of individual activities, and cash inflows after the fulfilment of individual milestones. The authors propose a two-phase algorithm for solving the problem defined.

2 - Bi-objective Resource-constrained Project Scheduling with Net Present Value and Robustness

Yangyang Liang, HuaZhong University of Science and Technology, HUST University of Wuhan,China, Wuhan, China, yangliang0419@sina.com, Nanfang Cui

This paper involves the RCPSP problem with discounted cash flows, the objective is to build a robust schedule that maximize the project net present value and minimize the stability cost, simultaneously. The tabu search algorithm is used to obtain a satisfying solution based on STC scattered buffer method. Finally a comprehensive computational experiment is performed to confirm the availability and feasibility of the algorithm.

3 - Determining Project Duration in Project Portfolio Environments

Vishwanath Hegde, Professor, California State University East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, vish.hegde@csueastbay.edu, Zinovy Radovilsky

In this paper, we examined resource allocation patterns across projects and the project duration in a portfolio of projects over eleven years. We identified the variables that impact project duration in multiple project settings. The resource allocation and duration estimation approaches were contrasted between multiple project and the single project management environments.

4 - Robust Optimization of the Resource Allocations in Projects Networks

Nasim Nezamoddini, State University of New York at Binghamton, 13 Goethe St., Binghamton, NY, United States of America, nnezamo1@binghamton.e, Sarah Lam

In this research, project resource planning has been addressed when some activities may fail due to the unexpected events. Failures are expressed in terms of delays that system will face and it is assumed that failure probability of each activity will be decreased with allocating more resource. To identify the most critical activities that need to be protected, two stage stochastic model with objective of minimizing resource allocation cost and expected delay penalties has been presented.

Supply Chain Scheduling and Optimization

Cluster: Scheduling and Project Management

Invited Session

Chair: Shengbin Wang, Assistant Professor, North Carolina A&T State University, 1601 East Market Street, Merrick 116, Greensboro, NC, 27411, United States of America, swang@ncat.edu

1 - Remanufacturing Scheduling Systems: A Comparison of Academic Progress with Industry Practice

Roger Gagnon, Director-Master of Science in Management, North Carolina A& T State University, 1601 E. Market Street, 312 Craig Hall, Greensboro, NC, 27411, United States of America, gagnonr@ncat.edu, Shona Morgan

We review the academic progress made in remanufacturing scheduling systems and compare this to the practices in industry. We report on academic advancements made in scheduling system methodologies, objective functions, and complexities. We survey members of ARPA to learn the techniques used to schedule remanufacturing operations and the difficulties encountered. Survey results are compared with academic progress in remanufacturing scheduling and the results of previous industry surveys.

2 - A Continuous-time Model and Meta-heuristic Algorithm for the Aluminum Scheduling Problem

Qingxin Guo, The Logistics Institute, Northeastern University, NO. 3-11, Wenhua Road, Heping District, Shenyang, China, guoqingxin@ise.neu.edu.cn, Lixin Tang

We consider a short-term scheduling problem of aluminum industry. The characterization of aluminum production process are a bit different from the steel or chemical engineering industries. The proposed problem is formulated by a continuous-time model. We develop a meta-heuristic algorithm to solve this model. The proposed approach is compared with a well-known optimization software. The computational results show the efficiency and effectiveness of the proposed formulation and approach.

3 - An Adaptive Partitioning Algorithm for Solving Supply Chain Optimization Problems

Weiwei Chen, Assistant Professor, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, wchen@business.rutgers.edu

Many supply chain optimization problems, such as inventory control problem, can be expressed as sequential decision making problems. When the problem size becomes large, derivative-free random search algorithms have been popularly used to solve the problem. In this talk, an adaptive partitioning algorithm is developed to exploit derivative information to speed up the search for optimal policy. Numerical tests on an inventory control problem show the effectiveness of the proposed algorithm.

4 - Disaster Relief Operations Scheduling with Multiple Resources

Yuan Hong, Assistant Professor, University at Albany, SUNY, 1400 Washington Ave., Albany, NY, 12222, United States of America, hong@albany.edu, Shengbin Wang

We study an operations scheduling problem commonly encountered in the process of providing relief, support and assistance in affected areas after a disaster or a humanitarian catastrophe occurs. Each operation requires multiple resources from a set of distribution centers with an independent fleet. We consider the operations/transportation costs as well as a penalty cost if missing the pre-specified deadline. An approximation solution to minimize the total cost is proposed and analyzed.

5 - A Two-stage Stochastic Integer Linear Programming (SILP) Model for Phlebotomist Scheduling

Laquanda Leaven, Assistant Professor of Supply Chain Management, North Carolina Agricultural and Technical State University, 1601 East Market Street, 337 Merrick Hall, Greensboro, NC, 27411, United States of America, ltleaven@ncat.edu

A Two-Stage Stochastic Integer Linear Programming (SILP) Model was formulated to determine better phlebotomist schedules for the preanalytical stage in hospital laboratories. The objective is to balance phlebotomist workload between and within shifts. By implementing the recommendations of this study, hospital laboratories should see significant improvements in patient satisfaction, workload balance, and resource utilization, which are all considered cost savings strategies.

Overcoming Business Impact Uncertainty

Sponsor: Service Science

Sponsored Session

Chair: Genady Grabarnik, St Johns University, 8000 Utopia Parkway, Queens, Ne, 11439, United States of America, grabarng@stjohns.edu

1 - On Exact Estimate in the Palm Khinchin Theorem

Genady Grabarnik, St Johns University, 8000 Utopia Parkway, Queens, NY, 11439, United States of America, grabarng@stjohns.edu, Larisa Shwartz, Haim Michlin

In the services science requests are described by discrete distribution, and in many cases we may consider that a number of requests' streams are merged to create load on service provider. The Palm-Khinchin theorem states that merging a large number of independent identical discrete distributions will generate distribution with exponential time between event (requests) arrivals. We provide estimates for merge of finite number of distributions to be close exponential distribution.

2 - Hierarchical Multi-Label Classification over Ticket Data using Contextual Loss

Larisa Shwartz, IBM TJ Watson Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, lshwart@us.ibm.com, Genady Grabarnik

This paper models a determination of a ticket type as a hierarchical multi-label classification problem. A loss function is proposed by considering the contextual miss-classification information to the hierarchy of labels to support different scenarios in IT environments. An optimal prediction rule is developed. We introduced a greedy algorithm to predict the multiple labels of a ticket, without violating the hierarchy consistence. Extensive empirical studies over the ticket data are conducted.

3 - Performance Measurements of IT Service Associates under Random Load

Haim Michlin, Technion, Technion City, Haifa, Israel, yefim@technion.ac.il, Genady Grabarnik, Larisa Shwartz

We used sequential test (SPRT) to assess effects of innovation for a case when load of the service teams being constant over time. The method works with random arrival of service requests. We design performance test based on concepts of Repeated Significance Test (RST), which allowed us to take into account variable number of SAs. We show superiority of the test in comparison to fixed sample size test (FSST) in ASN. We also compare RST with SPRT when size of service team is constant.

4 - Non-statistical Representation of Uncertainty: A Topological Approach

Victor Tang, Research Scientist, MIT, 55 Deerfield Lane South, Pleasantville, NY, 10570, United States of America, victor.w.tang@gmail.com

Risk and Uncertainty are conflated by even academic researchers. Risk can be characterized statistically; uncertainty cannot. Risk has drawn the lion's share of research attention. We concentrate on what lions have neglected. We characterize uncertainty using set theory and topology. We discuss the social-technical systems design and management implications of this approach. We focus specifically on the uncertainty of unknown-unknown's. We present a prescriptive framework for decision analysis.

5 - Business Driven Optimization of Cloud-based IT Services

Mauro Tortonesi, Assistant Professor, University of Ferrara, Via Saragat 1, Ferrara, FE, 44122, Italy, mauro.tortonesi@unife.it, Genady Grabarnik

Through virtualized resources, dynamic pricing schemes, and federated environments, Cloud Computing allows seamlessly reconfigurable IT architectures. This enables service providers to dynamically optimize their infrastructure to match customer request load while minimizing operational costs. Our work focuses on business driven optimization of Cloud-based IT services, proposing a resource allocation model, ILP and computational intelligence based optimization, and a decision support tool.

Workforce Planning II

Cluster: Workforce Management and Engineering

Invited Session

Chair: Michael Hewitt, Loyola University Chicago, 820 N. Michigan Ave, Chicago, IL, 60611, United States of America, mhewitt3@luc.edu

1 - Allocating Inflexible Labor Costs in Dynamic Markets

Aaron Chonko, Captain, Naval Postgraduate School, Monterey, CA, United States of America, awchonko@nps.edu, Kenneth Doerr, Robert Eger, Travis Rudge

We explore the way demand forecasts impact cost competitiveness by driving labor costs. At the distribution center we study, markets are dynamic, but labor costs are relatively static. Forecasts of demand and workload are used to determine capacity (number of workers). Either an inaccurate forecast, or an inaccurate method of predicting workload from a forecast, can leave a distribution center with a mismatch between their costs and market prices. This mismatch is problematic in environments such as the one in our field study, where labor cost has little flexibility relative to the competition.

2 - Stochastic Assignment with Individual Learning

Silviya Valeva, University of Iowa, Iowa City, IA, United States of America, silviya-valeva@uiowa.edu, Barrett Thomas, Michael Hewitt

We consider the problem of assigning workers to a series of tasks, the completion of which yields a finished product. We seek to maximize the expected revenue generated from sales of the finished product while facing uncertain future demand and taking into account the workers' learning abilities. We formulate the problem as a two-stage stochastic integer program. Results demonstrate the value of modeling learning as well as the trade-off between cross-training and inventory.

3 - Workforce Staffing and Planning Models that Recognize Human Learning

Michael Hewitt, Loyola University Chicago, 820 N. Michigan Ave, Chicago, IL, 60611, United States of America, mhewitt3@luc.edu, Barrett Thomas

When hiring for a team or project, organizations must balance the experience and aptitude of their hires against a budget. In this research, we extend previous work that enabled us to solve large-scale scheduling problems that include non-linearities associated with quantitative models of human learning to include workforce selection. With a computational study, we derive insights into how to compose a workforce for various budget levels.

4 - The Flexible Break Assignment Problem for Hierarchical Tour Scheduling Problems

Ferdinand Kiermaier, Technical University of Munich, Arcisstrafle 21, Munich, Germany, ferdinand.kiermaier@tum.de, Markus Frey, Jonathan Bard

Many personnel scheduling problems require the explicit assignment of shifts and days-off to individual employees taking into account information such as skills and overtime balances while incorporating break regulations. We present a decomposition that includes hierarchical skills and the possibility to use different break regulations. Moreover, we provide a classification scheme for breaks regulations discussed in literature and show the merits of using flexible break regulations.

Operations/Finance Interface 1

Contributed Session

Chair: Yunpeng Pan, Assistant Professor, South Dakota State University, Mathematics&Statistics, Box 2220, Brookings, SD, 57007, United States of America, yunpeng.pan@sdstate.edu

1 - A Valuation Framework Using Real Options and Big Data for Selecting Cloud Data Center Sites

Yunpeng Pan, Assistant Professor, South Dakota State University, Mathematics&Statistics, Box 2220, Brookings, SD, 57007, United States of America, yunpeng.pan@sdstate.edu, Zhiguang Wang, Carrie Steinlicht

We develop a valuation framework based on real options and Big Data for selecting cloud computing data center sites. The model takes into account costs and customer proximity as well as industry factors such as fiber paths and population reach. Optimization of data center operations is embedded in the model. Both service providers and local/regional governments with the intent to recruit data centers can use our valuation framework to assess the impact of their strategic policy decisions.

2 - The Midas Touch: The Effect of Gold Hedging on Inventory and Profit Variance

Panayotis Markou, IE Business School, Calle Maria de Molina 11, Madrid, Spain, pmarkou.phd2016@Student.ie.edu, Daniel Corsten

We empirically investigate the effects of risk management practices on firm operational variables. Specifically, we test the impact of financial hedging on inventory and profit variance by leveraging a unique and novel database highlighting the amount of gold hedged by mining companies. Our results show that hedging has a significant influence on firm inventory levels and profit variance, and also provide initial support for analytical models in the Operations field.

3 - Aggregate Production Planning under Financial Constraints

Maxim Bushuev, Assistant Professor, Kent State University, 1835 Beacon Hill Cir #21, Cuyahoga Falls, OH, 44221, United States of America, mbushuev@kent.edu

The research focuses on Aggregate Production Planning (APP) problem with financial elements which is modeled as convex stochastic dynamic programming model. The APP problem is concerned with determining the production rate and work force level over a given horizon in order to meet the demand and minimize the expected cost. Financial elements include bankruptcy cost and capital structure which is an additional decision variable. Three demand forms are used: constant, trend, and seasonality.

4 - Access to Pre-shipment Finance: Does Buyer's Guaranty Help?

Boray Huang, National University of Singapore, 1 Engineering Drive 2, E1A-06-25, Singapore, SG, 117576, Singapore, borayhuang@nus.edu.sg, Andy Wu, David Chiang

This paper studies a Buyer-Backed Purchase Order Financing (BPOF) scheme in a simplified supply chain with one main manufacturer buying from two sources: A low-cost but unreliable SME supplier, and the high-cost but reliable spot market. We identify the properties of the buyer's optimal joint sourcing and credit-guarantee decisions under different risk-free interests in the capital market. Through numerical experiments, BPOF is shown to significantly improve the manufacturer's profitability.

Models for Emergency Medical Services

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Laura McLay, Associate Professor, University of Wisconsin-Madison, 1513 University Ave, Madison, WI, 53706, United States of America, lmclay@wisc.edu

1 - Optimizing Compliance Tables for Ambulance Repositioning

Armann Ingolfsson, University of Alberta, School of Business, Edmonton, AB, T6G2R6, Canada, aingolfs@ualberta.ca, Ramon Alanis, Fernanda Campello, Bora Kolfal

Compliance tables are commonly used to specify ambulance repositioning policies. We study multiple methods for performance evaluation and optimization of compliance tables, ranging from a greedy heuristic combined with a realistic Markov chain model, to an integer program combined with much simpler performance evaluation. We use stochastic ordering to show that the integer program can be used to obtain bounds on performance. We study how "nesting" and "doubling up" impact performance.

2 - A Stochastic Programming Approach for Real-time Ambulance Redeployment with Restricted Workload

Shakiba Enayati, North Carolina State University, 111 Lampe Dr., Raleigh, NC, 27695, United States of America, senayat@ncsu.edu, Maria Mayorga, Osman Ozaltin

Ambulance redeployment is a strategy to potentially help to increase coverage when some ambulances become unavailable. However, redeployment may not always be possible or practical due to EMS providers' workload restrictions. Moreover, excessive ambulance relocation can cause emergency service providers to have undesirable fatigue and back pain. This paper presents a stochastic programming approach, implemented in real time to maximize expected coverage subject to provider workload restrictions.

3 - The Vehicle Mix Decision in Emergency Medical Service Systems

Kenneth Chong, Cornell University, 257 Rhodes Hall, Ithaca, NY, 14853, United States of America, kcc66@cornell.edu, Shane Henderson, Mark Lewis

We consider the problem of selecting the number of Advanced Life Support (ALS) and Basic Life Support (BLS) unitsó the vehicle mixó to deploy in an ambulance fleet. To this end, construct an optimization-based framework under which quantitative comparisons can be made, that takes into account the effects of the vehicle mix decision on how ambulances are assigned to bases and dispatched in real time. We test our models via numerical experiments on a large-scale emergency medical service system.

4 - Spatial Queueing Models of Wildfire Evolution

James MacGregor Smith, Professor, University of Massachusetts, 874 North Pleasant Street, Amherst, MA, 01002, United States of America, jmsmith@ecs.umass.edu, Alexander Stepanov

We develop a stochastic wildfire model based upon a discretized random flow process with state dependent queueing models. Utilizing a tesselated landscape data base of Voronoi polygons for thirteen different fuel types, we develop a state dependent queueing model algorithm for predicting the expected flow time of the wildfire. The advantage of the state dependent model is that general rates of spread can be utilized to model the path of the fire through the network of Voronoi polygons.

Joint Session SPPSN/Minority Issues: Panel Discussion- Publishing Community and Humanitarian Operations Research in High-Impact Journals

Sponsor: Public Programs, Service and Needs & Minority Issues Forum

Sponsored Session

Chair: Michael Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu

Co-Chair: Emmett Lodree, University of Alabama, 361 Stadium Drive, Tuscaloosa, AL, United States of America, ejlodree@cba.ua.edu

1 - Panel Discussion: Publishing Community and Humanitarian Operations Research in High-Impact Journals

Michael Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu, Panelists: Vedat Verter, Stefanos Zenios, Emmett Lodree, Roman Slowinski

Journal quality rankings are often used by academic units to make important assessments regarding faculty performance including tenure and promotion decisions. This criterion can be problematic for researchers in the community and humanitarian operations areas because "top-tier" journals are often not the most appropriate outlets for this type of research. This panel will attempt to articulate the characteristics papers that are likely to be successful in top-tier titles, and discuss other strategies for justifying research quality in these areas. Confirmed participants (so far): - Vedat Verter (Socio-Economic Planning Sciences) - Stefanos Zenios (Operations Research) (we're likely to get either Stephen Graves or Pinar Keskinocak of Manufacturing and Services Operations Management) Sponsoring subdivisions: Minority Issues Forum; Section on Public Programs, Services and Needs

Optimization Techniques for Reliable Operation of Mobile Communication Systems

Sponsor: Telecommunications

Sponsored Session

Chair: Albena Mihovska, Associate Professor, Center for TeleInfrastruktur-Aalborg University, Fredrik Bajers Vej 7C1, Aalborg, 9000, Denmark, albena@es.aau.dk

1 - Mathematical Model for Optimized Node Selection in Resource-Constrained Environments

Albena Mihovska, Associate Professor, Center for TeleInfrastruktur-Aalborg University, Fredrik Bajers Vej 7C1, Aalborg, 9000, Denmark, albena@es.aau.dk

A main concern related to Internet of Things (IoT) research efforts is the realization of autonomous decision-making and communications between the resource-constrained nodes, part of a dynamic topology. This contribution proposes a novel mathematical model to define the node interactions in a resource-constrained environment and optimize the selection of a partner for the most reliable communication depending on the needs of the service required.

2 - The Next Billion of Devices and Beyond: Getting Ready for Machine-to-Machine (M2M)

Rasmus Nielsen, Cisco Systems, 855 Tasman Dr, San Jose, United States of America, rhnielsen@ieee.org, Mahbubul Alam

The next wave of connectivity will consist of Machine-to-Machine (M2M) devices with usage patterns much different from what is currently seen from the human-driven network traffic. This paper investigates the challenges of connecting this large number of devices and supporting their specific requirement while proposing ways and methods to addresses these challenges in the form of optimizing networks specific to such devices in terms of scalability, performance, security and reliability.

3 - Topological Optimization of Reliable Networks under Dependent Failures

Javiera Barrera, Universidad Adolfo Ibañez, Faculty of Engineering, Santiago, Chile, javiera.barrera@uai.cl, H Cancela, Eduardo Moreno

We address the design problem of a reliable network. Previous work assumes that link failures are independent. We discuss the impact of dropping this assumption. We show that under a common-cause failure model, dependencies between failures can affect the optimal design. We also provide an integer-programming formulation to solve this problem. Furthermore, we discuss how the dependence between the links that participate in the solution and those that do not can be handled. Other dependency models are discussed as well.

Data Mining and Machine Learning

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Dave Choi, Carnegie Mellon University, Hamburg Hall 2101C, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, davidch@andrew.cmu.edu

1 - Data-driven Individual and Joint Chance-Constrained Optimization via Kernel Density Estimation

Bruno A. Calfa, Graduate Student, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, bacalfa@gmail.com, Ignacio E. Grossmann, Scott J. Bury, John M. Wassick, Anshul Agarwal

We propose a data-driven, nonparametric approach to reformulate (conditional) individual and joint chance constraints with right-hand side uncertainty into algebraic constraints. The approach consists of using Kernel Density Estimation (KDE) to approximate unknown "true" continuous probability density/distribution functions. We propose a new way of specifying the phi-divergence tolerance based on point-wise standard errors of the smoothing estimates with respect to the asymptotic distribution.

2 - Approximate Formulations for Chance Constrained Problems

Gabriela Martinez, Postdoctoral Associate, Cornell University, 319 Riley-Robb Hall, Ithaca, NY, United States of America, mgm256@cornell.edu, C. Lindsay Anderson

We propose an approximate formulation for chance constrained optimization models with ambiguous probability distribution of the random parameters of the optimization model. In this work, the uncertainty of the distribution is described by confidence regions constructed from order statistics of historic data of the uncertain parameters.

3 - Ensemble Recommendation and Segmentation for Large Datasets

Jorge Silva, SAS, 100 SAS Campus Dr, Cary, NC, United States of America, jorge.silva@sas.com, Jared Dean, Susan Haller, Patrick Hall, Ilknur Kabul

Recommender systems are a growing application of data mining and machine learning. We describe a recommendation and segmentation framework based on an ensemble of models, leveraging parallel computation. We employ a flexible factorization machine model, using not only recorded user-item access but also side information. Using a parallel Monte-Carlo procedure, the learned factors are clustered under multiple hypotheses, producing robust and interpretable ensemble estimates for large datasets.

Health Care Modeling Optimization II

Contributed Session

Chair: Srinivasa Puranam, La Salle University, 1900 W Olney Ave, Philadelphia, PA, 19102, United States of America, kartys.here@gmail.com

1 - Appointment Scheduling of Outpatient Surgical Services in a Multistage Operating Room Department

Payman Jula, Associate Professor, Simon Fraser University, 8888 University Drive, Burnaby, BC, V5A 1S6, Canada, pjula@sfu.ca

We address the appointment scheduling of multistage operating room departments with stochastic service times serving multiple patient types. We discuss many challenges, such as the limited availability of multiple resources (e.g., staff, operating rooms, surgeons, and recovery beds), and the compatibility of patient and surgeon types. Simulation-based optimization methods have been proposed to minimize the patients' wait time, patients' completion time, and number of surgery cancellations.

2 - Coordinating Contracts in Value-Based Healthcare Delivery

Tannaz Mahootchi, PhD Candidate, Wilfrid Laurier University, 75 University Ave. West, Waterloo, ON, N2L 3C5, Canada, tmahootchi@wlu.ca, Ignacio Castillo, Logan McLeod

Value-based healthcare delivery requires reforms to different components of the healthcare system including organizational structure, outcome/cost measurement, and reimbursement. This study looks at coordinating contracts between healthcare purchasers and healthcare providers in this context. A dynamic principal-agent model is used to model the interactions between treatment strategy and health outcomes where there is a single responsible entity for both the health outcomes and costs of care.

3 - Robust Post-donation Blood Screening Strategies under Prevalence Rate Uncertainty

Hadi El Amine, PhD Candidate, Virginia Tech, 1228 University City Blvd., Apt F67, Blacksburg, VA, 24060, United States of America, hadi@vt.edu, Ebru Bish, Douglas Bish

Blood product safety, in terms of being free of transfusion-transmittable infections, is crucial. Under prevalence rate uncertainty, various objective functions, including minimization of a mean-variance objective and minimization of the maximum regret, were considered in order to determine a "robust" post-donation blood screening strategy that minimizes the risk of releasing an infected unit of blood into the blood supply. Efficient and exact algorithms are provided.

4 - On the Determination of Optimal Ordering Policies for Blood Products with Blood Transfers

Srinivasa Puranam, La Salle University, 1900 W Olney Ave, Philadelphia, PA, 19102, United States of America, kartys.here@gmail.com, David Novak, Marilyn Lucas

We investigate the determination of optimal order policies for blood products when blood transfers exist from other hospitals. We develop an analytical model to propose simple decision rules and compare these rules to existing policies - relying on real-world data from the Blood Bank of a local hospital.

5 - The Mahalanobis Distance Approach to Minimization of Kidney Discard Rate

Philip Appiah Kubi, PhD Candidate, Ohio University, 14 Pine St., Apt # 1B, The Plains, OH, 45780, United States of America, pa809911@ohio.edu, Park Namkyu

In 2011 over 5,000 people died on the kidney waitlist while the discard rate also increased from 12.7% in 2002 to 17.9% in 2011. This paper discusses the prospects of minimizing the kidney discard rate by applying the Mahalanobis distance (MD) model to kidney allocation. This approach will offer candidates with kidneys of virtually the same quality over time, hence are presented with minimal incentive to reject a kidney offer.

Managing Capacity and Demand in Healthcare Services

Sponsor: Health Applications

Sponsored Session

Chair: Craig Froehle, University of Cincinnati, 2925 Campus Green Dr, Lindner College of Business, Cincinnati, OH, 45221-0130, United States of America, craig.froehle@uc.edu

1 - A Queuing Evaluation of Partial Flexibility in Healthcare Systems with Multi-priority Patients

Elham Torabi, University of Cincinnati, 2925 Campus Green Dr, Lindner College of Business, Cincinnati, OH, 45221-0130, United States of America, torabiem@mail.uc.edu, Yann Ferrand, Michael Magazine, Uday Rao, Craig Froehle

Resource flexibility can improve responsiveness to customers/jobs in different priority groups. Using the context of an emergency department, we develop queueing models to determine the ideal degree of flexibility based on number of resources and uncertainty in various system parameters, such as arrival and service rates for each priority group.

2 - The Impact on LOS of a Reduction in ED Ultrasound Order Processing Time

Anita Tucker, Harvard Business School, Morgan Hall, Soldiers Field, Boston, MA, 02163, United States of America, atucker@brandeis.edu, Jillian Berry Jaeker, Michael Lee

We use a process change at two EDs to test whether increasing capacity increases wait times due to additional services being provided. We find that an increase in capacity for ultrasounds (U/S) resulted in an 11.5% increase in the probability of an U/S being ordered, and the increased demand for U/S resulted in longer times to return other tests. Consequently, the average length of stay for increased by nearly 30 minutes, and the waiting time to enter the ED increased by 26 minutes.

3 - Quality & Efficiency Implications of Interruptions & Information Overload on Decision-Making

Lauren Laker, University of Cincinnati, 2925 Campus Green Dr, Lindner College of Business, Cincinnati, OH, 45221-0130, United States of America, lakerln@mail.uc.edu, Craig Froehle

Research suggests that the timing of interruptions during a cognitive task can affect the quality and timeliness of decision-making in knowledge-intensive work environments. We hypothesize that providing framing, or directed learning, beforehand can improve decision-making by reducing information overload, partly mitigating the effects of interruptions. We evaluate these effects through controlled experiments. Initial findings are presented.

4 - Improving Service Levels in Hospital Porter Services

Ken Klassen, Professor, Brock University, Goodman School of Busin, 500 Glenridge Ave, St. Catharines, ON, L2S 3A1, Canada, kklassen@brocku.ca, Sean Brown

Causes of poor porter services can be difficult to identify. The hospital under study was experiencing such long wait times that all calls were reported as urgent ("STAT") and patients were often not ready when the porter arrived because arrival times were uncertain. The hospital had different systems for segregated sets of porters, and workloads were unequal. This study uses multiple quantitative and qualitative techniques to understand and analyze the system and to provide recommendations.

Chair: Pengyi Shi, Assistant Professor of Operations Management, Purdue University, Krannert School of Management, West Lafayette, IN, United States of America, shi178@purdue.edu

1 - A Simulation Algorithm to Staff for Time-varying Arrivals and Multiple Customer Classes

Leon Cui, University of Rochester, 620 University Park, Rochester, NY, United States of America, leon.cui@Simon.Rochester.edu, Tolga Tezcan, Ozlem Yildiz

We propose a data-driven heuristic algorithm to find the minimum staffing level required in a queueing system with time-varying arrivals and multiple customer classes, given a service level criterion for each customer class. Our algorithm has been implemented by the transportation department of a local research hospital. Its validity is supported by results from the hospital, and by numerical experiments.

2 - OptiCare: An Outpatient Capacity Planning Tool for Integrated Care Access

Jivan Deglise-Hawkinson, University of Michigan, 820 S First Street Apt 2, Ann Arbor, MI, 48103, United States of America, jivan@umich.edu, Jonathan Helm, Thomas Rohleder, Mark Van Oyen, Todd Huschka, David Kaufman

Our capacity planning model seeks to meet targets on the access to an initial/root appointment by patient type and plan for a patient mix. A root visit usually generates a series of other appointments in both the initial department and in other medical areas. Our approach uses integer programs to optimize a booking plan that is also sensitive to utilization and incorporates stochastic models of future return visits and downstream appointments generated to follow up on the initial visit.

3 - Overflow Policies for Emergency Department Patients Awaiting Inpatient Beds

Pengyi Shi, Assistant Professor of Operations Management, Purdue University, Krannert School of Management, West Lafayette, IN, United States of America, shi178@purdue.edu, Jim Dai

Emergency department patients who wait to be admitted to inpatient wards sometimes have to be overflowed to a non-primary ward when they wait too long. Overflowing patients may alleviate the system congestion temporarily, but could reduce the quality of care delivered. We study a queueing system to gain insights into the impact of overflow policies on various performance measures. We also evaluate how different factors such as the bed capacity and discharge timing affect the overflow rate.

1 - Optimized Dual Shewhart-EWMA Statistical Control Charts for Hospital-acquired Infection Surveillance

Salah Haridy, Northeastern University, 360 Huntington Avenue, Boston, MA, United States of America, s.haridy@neu.edu, Dayna Martinez, James Benneyan, Arthur Baker, Deverick Anderson

Early detection of hospital-acquired infection (HAI) outbreaks remains an important problem across the U.S. We develop an optimized dual Shewhart-EWMA approach that minimizes the expected number of additional HAIs by allocating detection power between two sets of control limits under random outbreak sizes. Numerical testing and application to 10 years of infection surveillance data across 40 community hospitals outperformed traditional methods by 20-to-360% reductions in additional HAIs.

2 - Informing Resuscitation Decisions in Acute Care by Capturing Provider-specific Model Uncertainty

Muge Capan, North Carolina State University, 400 Daniels Hall, College of Engineering, Raleigh, NC, United States of America, mcapan@ncsu.edu, Jeanne Huddleston, Julie Ivy

Modeling physiological deterioration to inform resuscitation decisions involves the challenge of specification of the input parameters. Specifically, cost parameters require translation of provider preferences. We develop analytical models for determining optimal patient-specific resuscitation policies. We consider care providers' risk-sensitive behavior to capture model uncertainty due to subjective cost parameters, and variability in the value of providers with different expertise.

3 - Impact of the Disease Surveillance System in Epidemiologic Characterization of Pandemic Outbreaks

Eric Meisheri, Western Michigan University, 4601 Campus Drive, Kalamazoo, MI, 49008, United States of America, eric.r.meisheri@wmich.edu, Diana Prieto, Peter Holvenstot, Richard VanEnk

In the U.S., most of the information about a developing influenza pandemic comes from data collected by State viral surveillance systems. This study explores the effect of surveillance system, and behavioral factors on the accuracy of pandemic trend prediction. The authors used a specimen submission and testing simulation developed over an existing agent based disease spread model. The results were analyzed to determine the most significant factors and interactions.

4 - Modeling and Analysis of Inpatient Care Rounds
Laila Cure, Western Michigan University, 1903 W. Michigan Ave, Kalamazoo, MI, 49008-5336, United States of America, laila.cure@wmich.edu, Ewing Tiong

We study the problem of planning patient care rounds in a shift by a healthcare provider assigned to a specific set patients within an inpatient care unit, when personnel has been scheduled and resources have been allocated. This research investigates inpatient care work planning decisions and proposes an OR- based model to study such decisions. The model will help identify needs and challenges in developing decision-support tools for the provision of high quality care using available resources.

Co-Chair: Satish Bukkapatnam, Texas A&M University, College Station, TX, United States of America, satish@tamu.edu

1 - Personalized Prognostics of Cardiorespiratory Disorders: A Case Study for Obstructive Sleep Disorder
Trung Le, Texas A&M, College Station, TX, United States of America trung.le@okstate.edu, Satish Bukkapatnam

A personalized prognosis method based on a nonparametric statistical (Dirichlet Process Mixture Gaussian Process-DPMG) model to estimate the state evolution from a normal to an anomalous state and hence the distribution of the time till impending disorders has been reported. Validations using data from ECG Apnea Database-Physionet suggest that the model can predict the time till the onset of a disorder (apnea episode) to within 15% of the actual observed times 1-45 minutes ahead of inception.

2 - Statistical Shape Analysis and Prediction of Soft Tissue Insertions on the Tibial Plateau
Cao (Danica) Xiao, PhD Student, University of Washington, Seattle, 3900 Northeast Stevens Way, Mechanical Engineering Building, room G6, Seattle, WA, 98195, United States of America, danicaxiao@gmail.com, Liying Zheng, W. Art Chaovalitwongse, Xudong Zhang

Our study characterized the soft tissue insertion centroids and outlines on the tibial plateau and their inter-relationships with tibia outlines. We use coordinates conversion, outline detection, and windowing to extract 36 features from tibia outlines. Then we use KNN with three different measures to predict soft tissue locations(centroid and outlines) based on tibia outline features. Results show high prediction accuracy.

3 - Penalized Estimation of DAGs from Partial Orderings
Ali Shojaie, University of Washington, F646 Health Sciences Building, Department of Biostatistics, Seattle, WA, 98195, United States of America, ashojaie@uw.edu

Directed acyclic graphs (DAGs) are widely used to define causal relationships among variables, and play a critical role in diverse application areas. Although, learning DAG structures from observational data is very challenging, it can be efficiently performed if the causal ordering among the variables is known. In this talk, we will extend discuss estimation of DAGs from partial or set orderings, and present an efficient algorithm for learning the structure of high dimensional DAGs.

Chair: Jason Sauppe, PhD Candidate, University of Illinois at Urbana-Champaign, 201 North Goodwin Avenue, Urbana, IL, 61801, United States of America, sauppe1@illinois.edu

1 - The Role of Optimization and Covariate Balance in Observational Studies
Jason Sauppe, PhD Candidate, University of Illinois at Urbana-Champaign, 201 North Goodwin Avenue, Urbana, IL, 61801, United States of America, sauppe1@illinois.edu, Sheldon Jacobson

Observational, or non-random, data exist in many areas of study. However, such data require the use of appropriate methods of adjustment in order to derive unbiased causal estimates. Matching methods have long been used for this purpose, but improvements in computational power and optimization techniques now allow for the use of more general adjustment methods based on covariate balance measures. This talk will explore several assumptions and models related to these adjustment methods.

2 - Second-Order Cone Programming for Nonnegative Regression with P-Spline
Yu Xia, Assistant Professor, Lakehead University, Business Administration, 955 Oliver Rd., Thunder Bay, ON, P7B 5E1, Canada, yxia@lakeheadu.ca, Farid Alizadeh

We consider regression by B-splines with a penalty on high-order finite difference of the coefficients of adjacent B-splines. The penalty prevents overfitting. The underlying function is assumed to be nonnegative. The model is casted as a second-order cone programming problem, which can be solved efficiently by modern optimization techniques. The method is implemented in MATLAB.

3 - Cooperative Data Analysis in Supply Chains Using Selective Information Disclosure
Michael Hahsler, SMU, P. O. Box 750123, Dallas, TX, 75275, United States of America, mhahsler@lyle.smu.edu

Many modern products (e.g., consumer electronics) consist of hundreds of complex parts sourced from a large number of suppliers. In such a setting, finding the source of defects in the final product becomes more difficult and may be hampered by limited information disclosure between parties. In this work we investigate the effectiveness of strategies of selective information disclosure in order to perform cooperative data analysis in a supply chain context.

1 - Influence of Social Media in Flash Sales: An Exploratory Study
Karthik Babu Nattamai Kannan, PhD Student, Scheller College of Business, Georgia Institute of Technology, 800 West Peachtree NW, Office # 4277, Atlanta, GA, 30308, United States of America, KarthikBabu.NK@scheller.gatech.edu, Yu Jeffrey Hu, Sridhar Narasimhan

In this study, we explore the role played by social media activities in promoting sale of products sold in flash sales. We collected both sales and aggregate social media data for new products launched by a popular e-commerce firm. We use this data to evaluate how Facebook likes, Pinterest pins and internal social media activities impact sales.

2 - Economics of Online Distribution of Video Content
Marius Florin Niculescu, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree St. NW, Atlanta, GA, 30308, United States of America, Marius.Niculescu@scheller.gatech.edu, Hemant Bhargava

In this study, we explore the strategic decision faced by video content aggregators whether to release fresh content for binge or staggered consumption. We consider various video content consumption patterns as well as different types of content.

3 - What is the Relationship between Market Structure and Digitized Customer Experience?
Philipp Herrmann, University of Paderborn, Warburger Strafle 100, Paderborn, Germany, Philipp.Herrmann@wiwi.uni-paderborn.de, Mohammad Rahman

We study the relationship between local market structure and digitized customer experience in the form of online ratings. We find a small negative correlation between market size and the average of the digitized customer experience. Also, larger markets allow for a substantially broader range of qualities. These relationships are best explained by a model were the provisioning of a higher quality increases marginal costs but does not affect fixed costs.

4 - Electronic Commerce and Spatial Arbitrage
Hemang Subramanian, PhD candidate, Information Technology and Management, Georgia Institute of Technology, 800 W Peachtree Street, Atlanta, GA, 30308, United States of America, Hemang.Subramanian@scheller.gatech.edu, Eric Overby

The lack of market efficiency creates opportunities for spatial arbitrage in which an arbitrageur purchases products in low-priced locations and resells them in high-priced locations. We study spatial arbitrage in a wholesale used vehicle industry, where two e-channels operate i.e. a webcast and a standalone e-market. Overall, using a quasi-natural experiment, we find that arbitrage reduced as e-commerce diffused, while some arbitrage shifted from the physical market to the standalone e-market.

Modeling Human Behavior in OM

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Karen Zheng, Massachusestts Institute of Technology, Sloan School of Management, Cambridge, MA, 02142, United States of America, yanchong@mit.edu

1 - Newsvendor Selling to Loss Averse Consumers with Stochastic Reference Points
Sami Najafi-Asadolahi, Assistant Professor, Santa Clara University, Leavey School of Business, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, snajafi@scu.edu, Opher Baron, Ming Hu, Qu Qian

We study a newsvendor who repeatedly sells a single perishable product to two types of consumers: regular consumers, who have a given consumption utility and whose market size is uncertain, and bargain hunters, who have a low valuation and are abundant. The regular consumers are loss averse with random reference levels that represent their beliefs about possible price and availability. We show the impact of loss aversion on the newsvendor's inventory and pricing decisions.

2 - Bounded Rationality in Supply Chain Interactions
Basak Kalkanci, Associate Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, Basak.Kalkanci@scheller.gatech.edu, Georgia Perakis

We investigate the impact of a retailer's bounded rationality in a two-tier supply chain. We show that the supplier's and retailer's profit are not necessarily monotone in the retailer's rationality. We quantify the value of using minimax regret criterion when the retailer's rationality is not known.

3 - The Design of Experiential Services with Acclimation and Memory Decay
Uday Karmarkar, UCLA, 110 Westwood Plaza, Gold Hall, Suite B-512, Los Angeles, CA, 90066, United States of America, uday.karmarkar@anderson.ucla.edu, Aparupa Das Gupta, Guillaume Roels

In this talk, we study how to schedule activities and allocate duration to them in a service encounter so as to maximize ex-post customer satisfaction, when customers are subject to acclimation and memory decay. We show that, when considered individually, memory decay and acclimation yield the same encounter designs, whereas when they are considered jointly, they act as opposing forces.

4 - Pricing with Anticipation
Javad Nasiry, Assistant Professor, HKUST, LSK Building, HKUST, Hong Kong, Hong Kong - PRC, nasiry@ust.hk, Ioana Popescu

We study a market where customers derive emotional utility from anticipating pleasurable purchase outcomes, but experience disappointment if outcomes fall short of what they anticipated. In this context, we show that firms can profit by adopting randomized pricing policies.

Sponsored Session

Chair: Fatma Kilinc-Karzan, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, fkilinc@andrew.cmu.edu

1 - Techniques in Convexification of Separable Polynomial Inequalities
Mohit Tawarmalani, Professor, Purdue University, 403 W. State Street, West Lafayette, IN, United States of America, mtawarma@purdue.edu, Jean-Philippe P Richard

We develop convexification techniques for inequalities defined using a separable polynomial. Within this framework, we discuss various decomposition results in convexification. We highlight the important role played in convexification by transformations to positive-homogeneity. We discuss their merits vis-à-vis concavifying transformations. We provide explicit convex hull descriptions when variables are unbounded and discuss their use with bounded variables.

2 - How to Convexify the Intersection of a Second Order Cone and a Nonconvex Quadratic
Fatma Kilinc-Karzan, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, fkilinc@andrew.cmu.edu, Samuel Burer

We study sets defined by the intersection of a second-order-cone representable (SOCr) constraint, a single homogeneous nonconvex quadratic and an affine hyperplane. Under mild conditions, we derive simple, computable convex relaxations given by a new SOCr constraint. Under further conditions, we prove that our relaxations capture precisely the corresponding convex hull. Our approach unifies and extends previous results, and we illustrate its applicability and generality with many examples.

3 - The Power of a Negative Eigenvalue: Aggregation Cuts for Nonlinear Integer Programming
Sina Modaresi, Graduate Research Assistant, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, sim23@pitt.edu, Juan Pablo Vielma

Aggregation technique is a cut generating procedure which can be used to obtain general intersection cuts. However, it might fail to yield convex constraints or closed form expressions even in the quadratic case. We study an extension of the aggregation technique which is to relax the convexity requirement on the implied inequality and allow one negative eigenvalue. We then show that convex hull of any set described by two quadratic inequalities (convex or not) is conic quadratic representable.

4 - A Computational Study on Non-convex QCQP's
Gonzalo Munoz, Columbia University, 500 W. 120th Street, New York, NY, 10027, United States of America, gonzalo@ieor.columbia.edu, Daniel Bienstock

In this talk we present experimental results solving difficult QCQP instances using a variety of nonstandard formulations, branching and cutting plane techniques. Joint work with D. Bienstock.

Risk-Averse Dynamic Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Andrzej Ruszczynski, Distinguished Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08550, United States of America, rusz@business.rutgers.edu

1 - Dynamic Risk Measure for Controlled Discrete-Time Stochastic Processes with Application to POMDP
Jingnan Fan, PhD Student, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, kellyfjn@gmail.com, Andrzej Ruszczynski

We consider dynamic risk measures for general controlled discrete-time stochastic processes. We introduce the condition of stochastic conditional time-consistency. We prove that the risk measure must have a special structure involving a risk transition mapping as a law-invariant risk measure on the state space. Then we apply the results to two classes of problems: controlled fully-observable Markov processes and controlled partially-observable Markov processes.

2 - Methods for Solving Infinite-Horizon Risk-Averse Dynamic Programming Problems

Andrzej Ruszczynski, Distinguished Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08550, United States of America, rusz@business.rutgers.edu, Ozlem Cavus

The total cost problem for discrete-time controlled Markov models is considered. The objective functional is a Markov dynamic risk measure of the total cost. Two solution methods, value and policy iteration, are proposed, and their convergence is analyzed. In the policy iteration method we analyze a version of the nonsmooth Newton's for policy evaluation. The results are illustrated on a credit limit control problem.

3 - Risk-averse Dynamic Programming for Clinical Trial Design

Curtis McGinity, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, curtis.mcginity@gmail.com, Andrzej Ruszczynski

We consider the problem of optimal dose escalation for early stage clinical trial design. We formulate the risk-averse dynamic programming problem, develop dynamic programming equations, and compare the risk of several myopic and look-ahead optimal policies under dynamic measures of risk.

4 - Time-consistent Approximations: Empirical Results for the Dow Jones Industrial Average

Tsvetan Asamov, Post-doctoral associate, Princeton University, Sherrerd Hall, Princeton, NJ, 08544, United States of America, tasamov@princeton.edu, Andrzej Ruszczynski

We use dynamic time-consistent formulations to approximate problems having a single coherent risk measure applied to the aggregated costs over all time periods. The dual representation of coherent risk measures is used to create a time-consistent cutting plane algorithm. Additionally, we also develop methods for the construction of universal time-consistent upper bounds. The performance of the techniques is tested using monthly return data for the components of the Dow Jones Industrial Average.

1 - Flow Shop Machines Just-in-Time Scheduling

Muminu Adamu, Dr, University of Lagos, Akoka Yaba, Lagos, Nigeria, madamu@unilag.edu.ng

In this paper, the scheduling to maximize the weighted number of Just-In-Time (JIT) jobs on flow shop machines is considered. This problem is known to be NP Complete for due dates involving interval in time. The problem formulation is suggested, two greedy heuristics are proposed for solving the problem. A numerical example to illustrate its use and extensive computational experiments performed with promising results are presented. Likely areas of extensions are provided.

2 - A Catalog of ILP Formulations for the Job Sequencing and Tool Switching Problem

Daniele Catanzaro, Professor, Rijksuniversiteit Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands, d.catanzaro@rug.nl

We investigate the a particular version of path dependent Traveling Salesman Problem, called the Job Sequencing and Tool Switching Problem. We develop new integer linear programming formulations for the problem and we prove theoretically and computationally that they are better than the alternative ones currently described in the literature.

3 - Two-dimensional Bin Packing Problem with Hatch Constraint

Takashi Imamichi, Researcher, IBM Research - Brazil, Av. Pasteur 138/146, Botafogo, Rio de Janeiro, RJ, 222700-50, Brazil, tima@br.ibm.com, Bruno da Costa Flach

Two-dimensional bin packing problem asks us to find a layout of a set of given rectangular items into a set of given rectangular bins. The objective is to minimize the number of bins. In this talk, we introduce an additional "hatch constraint" that requires finding a sequence of items to place into the bin through the "hatch". The hatch constraint arises from the ship hold packing problem as a real-world application. We introduce a heuristic approach and preliminary computational results.

4 - Optimal Assignment for In-Air Training

Yasaman Khodadadegan, Consultant, American Airlines, 1920 W University Dr, Tempe, AZ, 85281, United States of America, Yasaman.Khodadadegan@aa.com, Xin Liu, Tuell Green

When it comes to training pilots on a different aircraft type, time is money. The quicker the pilot can get fully qualified on the new aircraft type, the sooner the pilot will be available for productive work. Using the existing flight sequences, required training hours and cycles, pilot start date, instructor availability, and air operation rules, we determine the schedule for the pilots and instructors that minimizes the time required to complete the air-operation training.

Social and Economic Network Models

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Alexander Nikolaev, University at Buffalo (SUNY), 312 Bell Hall, Buffalo, NY, 14260, United States of America, anikolae@buffalo.edu

1 - Potential Games with Exogenous Uncertainty

Harikrishnan Sreekumaran, Doctoral Candidate, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, harikrishnan@purdue.edu, Andrew Liu

Potential games are a class of games in which best response dynamics can be proven to converge to Nash equilibria. In this work, we analyze potential games with exogenous uncertainty under common knowledge assumptions. We show that sampling-based approximation schemes can be combined with decentralized algorithms to compute the equilibria of such games. Numerical results will be presented with the proposed approach applied to several application examples such as network design games.

2 - Stochastic Optimization Model for Capacity Expansion in Transportation Networks

Areesh Mittal, Graduate Student, University of Texas at Austin, 2900 Cole Street, #202, Austin, TX, 78705, United States of America, areeshmittal@utexas.edu, Jennifer Duthie, Bismark Singh, David Morton

We consider the problem of selecting links for capacity expansion in a transportation network, when the budget is uncertain, with the goal of minimizing expected total system travel time. To obtain nested solutions for increasing values of budget, we build a two-stage stochastic optimization model in which links are prioritized in the first stage and then selected in the second stage according to that priority list. We demonstrate our work on the Sioux Falls network.

3 - Interdicting Social-Functional Networks

Paul (Lee) Ewing, Research Associate Professor, Operations Research, Naval Postgraduate School, 1411 Cunningham Rd., Monterey, CA, 93943, United States of America, plewing@nps.edu, Matt Carlyle, Peter Nesbitt

We offer a targeting tool that quantitatively analyzes the effects of interdicting managers in a network constructed from disparate sources. We model the adversary with a bi-level optimization model to include the managers, resources and processes necessary to its function. This model delivers a quantitative assessment of an adversary's ability to achieve its goals and suggests interdiction plans to delay the adversary's activities.

4 - A Subjective Evidence Model for Influence Maximization in Social Networks

Mohammadreza Samadi, Graduate research Assistant, University at Buffalo (SUNY), 327 Bell Hall, Buffalo, NY, 14260, United States of America, msamadi@buffalo.edu, Alexander Nikolaev, Rakesh Nagi

We introduce a new model of subjective evidence propagation in social networks. Investigations with the model in the presence of competition shed light on the phenomena of belief reinforcement and viral spread of products/technologies. The NP-Hard influential seed selection problem is first solved as an MIP. Second, an efficient Lagrangian Relaxation heuristic with guaranteed bounds is designed. Third, problem-specific iterative seed selection procedures are explored via extensive testing.

5 - Understanding the Emergence of Power Laws in Empirical Data

Sushant Khopkar, University of Buffalo (SUNY), Buffalo, NY, United States of America, skhopkar@buffalo.edu, Alexander Nikolaev, Rakesh Nagi

Many online social network account owners have lots of connections, surpassing the Dunbar number of 150. We present a model that explains tie formation by bridging the gap between small and scale-free worlds. It explains how the information about a person may propagate from friends to the masses. It shows that a power law emerges, by the principles that are different from those of preferential attachment. It provides a means for evaluating how likely a talented individual is to become popular.

Optimization Methodologies 1

Contributed Session

Chair: Firdevs Ulus, Princeton University, Princeton University ORFE, Sherrerd Hall 322, Princeton, NJ, 08544, United States of America, fulus@princeton.edu

1 - Building Collaborative Optimization Model of the Electric Vehicles Business Ecosystem

Chunyan Duan, Doctoral Student, 1. Tongji University, School of Economics and Management; 2. University of Washington, Department of Industrial & Systems Engineering;, 1. A403, Sino-French Center, Tongji University, No.1239, Siping Road, Shanghai, 200092, China, duanchunyan77@163.com, Jianxin You

Recently, the industrialization and commercialization of the electric vehicles are urgent for more and more countries in the world. However, the current research mainly focuses on the framework and the definition of the concept. In this paper, we build collaborative optimization model of the electric vehicles business ecosystem by using the method of collaborative optimization, and finally propose the strategies and policy suggestions.

2 - Parametric Simplex Algorithm for Linear Vector Optimization Problems

Firdevs Ulus, Princeton University, Princeton University ORFE, Sherrerd Hall 322, Princeton, NJ, 08544, United States of America, fulus@princeton.edu, Birgit Rudloff, Robert Vanderbei

We propose a parametric simplex algorithm for linear vector optimization problems; it works for any dimension. In each iteration, it provides a set of inequalities, which defines the current partition of the parameter space. In addition to the simplex arguments, one needs to eliminate the redundant inequalities. This is similar to the vertex enumeration procedure, used in most of the objective space based algorithms. However, this algorithm doesn't require to solve a LP in each iteration.

3 - Nonlinear Time Series Generation Model Change Estimation for Individual and Business Service

Jianjun Lu, Associate Professor, College of Economics and Management, China Agricultural University, No. 17, Qinghuadong Road, Haidian Distri, Beijing, 100083, China, ljjun@cau.edu.cn

We deal with the individual and business service prediction by using the method of estimation of changes in nonlinear time series generation model. Particle Filters(PF) is applied to determine the best description of the time-varying nonlinear system based on the measure of likelihood, Genetic Programming(GP) is applied for online detection of changes in models and the estimation of functional forms of dynamics by assuming that the state equation is modified from the current functional form.

4 - Government's Fund Allocation to Small Medium Size Businesses After Disaster Hits: Optimization Model

Saba Pourreza, University of North Texas, 1155 Union Circle #311160, BLB. 399A, Denton, TX, 76203, United States of America, saba.pourrezajourshari@unt.edu, Cigdem Kochan, Brian Sauser

Access to government funding is an effective way to enhance the resilience for disturbed small medium size businesses (SMB). This study constructs an optimization model to maximize the community impact of SMBs. The model finds the optimum quantity that each SMB needs to create enough number of jobs and productions. KEYWORDS:Resource allocation, Resilience, Government funding, Mathematical modeling, Optimization model, Small medium size firm, Disaster relief

1 - From Predictive to Prescriptive Analytics

Nathan Kallus, MIT, 77 Massachusetts Ave., E40-149, Cambridge, MA, 02139, United States of America, kallus@mit.edu, Dimitris Bertsimas

We construct novel predictive-prescriptive mechanisms that optimize decisions based directly on historical data and predictive observations. We prove almost-sure convergence to the prescient policy even when data is not IID but rather observations from an evolving system like a market or social network. We consider real-world examples in inventory management.

2 - Recent Progress on the Power of Static-robust Solutions

Vineet Goyal, Columbia University, New York, NY United States of America, vgoyal@ieor.columbia.edu, Brian Lu

In this talk, I will present recent progress on the performance of static robust solutions for two-stage adjustable robust linear programs under constraint-coefficient uncertainty. Our analysis provides important insights for developing near-optimal solution policies for adjustable robust linear optimization problems.

3 - Decomposable Markov Decision Processes: A Fluid Optimization Approach

Velibor Misic, Massachusetts Institute of Technology, 77 Massachusetts Ave E40-149, MIT ORC, Cambridge, MA, 02139, United States of America, vvmisic@mit.edu, Dimitris Bertsimas

Decomposable MDPs are problems where the system and its dynamics can be decomposed along multiple components. We propose a fluid optimization approach for such problems that achieves tractability by exploiting decomposability. We show that this approach achieves strong performance in restless bandit problems, optimal stopping problems and network revenue management.

1 - A Polynomial-time Rescaled von Neumann Algorithm for Linear Feasibility Problems

Dan Li, ISE Department, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, dal207@lehigh.edu, Kees Roos, Tamas Terlaky

We propose a rescaled von Neumann algorithm with complexity O(n^5size(A)). This is the first polynomial-time variant of the von Neumann algorithm. It is based on Chubanov's so called Basic Procedure, whose outcome is an evidence that the solution has at least one small coordinate so that we are able to rescale the linear system without changing the problem. Some numerical experiments are presented as well. We also improve the performance of Chubanov's method.

2 - Steplength Thresholds for Invariance Preserving of Discretization Methods of Dynamical Systems

Yunfei Song, PhD Student, Lehigh University, 337 S. New St. Apt. 202, Bethlehem, PA, 18015, United States of America, yus210@lehigh.edu, Zoltan Horvath, Tamas Terlaky

Steplength thresholds for invariance preserving of two discretization methods on a polyhedron are considered. For Hilton- Taylor Approximation type methods, we prove that a valid threshold can be obtained by finding the first positive zeros of a finite number of polynomial functions. Furthermore, an efficient algorithm is proposed to compute the threshold. For rational function type methods, we derive a valid threshold, which can be computed by using the analogous algorithm, for invariance preserving.

3 - Iteration-Complexity for IPMs Based on the Central Path Curvature

Murat Mut, Lehigh University, 200 W. Packer Ave, Bethlehem, PA, United States of America, mhm309@lehigh.edu, Tamas Terlaky

This talk centers around the theoretical iteration-complexity of certain interior-point algorithms in Linear Optimization. I highlight two curvature measures of the central path relevant to the complexity, the geometric and Sonnevend's curvature. Based on the new research by Mut-Terlaky 2013-2014, I discuss future research problems and the possibility of attempting to relate the two curvatures in a general setting and its further implications for IPMs.

4 - Worst-case Linear Optimization under Uncertainties

Jiming Peng, University of Houston, Houston, TX United States of America, jopeng@uh.edu

In this talk, we consider the so-called worst-case linear optimization (WCLO) with uncertain data. Particularly, we consider a scenario where the uncertainty arises in the right-hand-side of the constraints. When the generic L_2 norm is used to define the uncertain set, the WCLO is NP-hard. We then discuss how to obtain a lower bound to WCLO via tractable non-convex relaxation and when the relaxation is exact. preliminary numerical results will be reported as well.

1 - A Study of the Behavior of the Peso/USD Exchange Rate

Abul Jamal, Professor, Southeastern Louisiana University, College of Business, Hammond, LA, 70402, United States of America, ajamal@selu.edu, Yu Hsing

This Study examines the movements of the Peso/USD exchange rate based on the monetary model. It assumes that the purchasing power parity holds and that the nominal exchange rate is equal to the relative prices in the two countries. We will compare the Frankel, Bilson and the Dornbusch models. The estimates based on time series data were adjusted for autocorrelaton and heteroskedasticity. Results show the relationship of the exchange with relative money supply, interest rates, inflation and GDP.

2 - Are Targets for Renewable Portfolio Standards Too Low? A Complementarity-Based Policy Analysis

Afzal Siddiqui, University College London, Gower Street, London, United Kingdom, afzal.siddiqui@ucl.ac.uk, Makoto Tanaka, Yihsu Chen

We compare optimal renewable portfolio standards targets under a benchmark central planning setting with those under deregulated ones with and without market power. The latter two are formulated as bi-level problems. We show that setting a renewable portfolio standards target without considering the market structure could lead to sub-optimal market outcomes.

3 - How do Investor Relations Related Disclosures on Facebook Contribute to the Information Environment?

Tawei Wang, University of Hawaii at Manoa, 2404 Maile Way, BUSAD E602C, Honolulu, HI, 96822, United States of America, twwang@hawaii.edu, Ju-Chun Yen, Hsiao-Lun Lin

This paper focuses on how investor relations related disclosures on Facebook contributes to a firm's information environment. We first explore what investor relations related disclosures are made on Facebook by S&P 1500 firms in the one year period from October 2012 to September 2013. Then we investigate the association between such disclosures and a firm's information environment. Implications are discussed.

4 - The Stock Market Effects of Implementing ERP: Evidence from China

Xia Pan, Associate Professor, Sun Yat-sen University, Lingnan College, Guangzhou, Ch, 510275, China, panxia@mail.sysu.edu.cn, Yongqin Xie, Liujie Xu

We collect data on the events that Chinese publicly listed companies implement ERP systems and investigate the reaction on these companies' stock prices. Following the methodology that was used in financial research, we did an event study to test if the implementation ERP system has positive effect on the companies' stock market performance.

5 - Is the Ranking from Data Envelopement Analysis Useful for Stock Selection?

Liujie Xu, Student, Sun Yat-sen University, Lingnan College, Sun Yat-sen University, Guangzhou, 510275, China, panxpapers@gmail.com, Xia Pan

We applied Data Envelopement Analysis on a input and output data from publicly listed companies of retail industry. After the ranking results obtained from DEA, we compare the results with measures of the companies stock. We found out that DEA selection is partially useful in stock selection for investments.

Sponsored Session

Chair: Marcia Fampa, Universidade Federal do Rio de Janeiro, PESC/COPPE- Cidade Universitaria, Centro de Tecnologia, Bloco H, Sala 319, Rio de Janeiro, Brazil, fampa@cos.ufrj.br

1 - Solving Euclidean Steiner Tree Problems in n-space

Marcia Fampa, Universidade Federal do Rio de Janeiro, PESC/COPPE- Cidade Universitaria, Centro de Tecnologia, Bloco H, Sala 319, Rio de Janeiro, Brazil, fampa@cos.ufrj.br, Wendel Melo, Jon Lee

The Euclidean Steiner tree problem in n-space is defined as follows: Given a set of points in R^n, find a tree of minimal Euclidean length that spans these points, using or not additional points in its construction. We present a branch-and-bound framework for solving this NP-Hard problem, with procedures to improve upper and lower bounds at the nodes of the enumeration tree, as well as a procedure to avoid the evaluation of symmetric solutions.

2 - Exploiting Symmetry in the Discretizable Molecular Distance Geometry Problem

Carlile Lavor, Associate Professor, University of Campinas, IMECC - UNICAMP, Campinas, Brazil, clavor@ime.unicamp.br, Leo Liberti

The Discretizable Molecular Distance Geometry Problem (DMDGP) is a subset of the Distance Geometry Problem, where the search space can be represented by a binary tree that can be explored by employing a Branch & Prune (BP) algorithm. This binary tree may contain several symmetries, which are directly related to the total number of solutions of the DMDGP. We will show how these symmetries can be used to speed up the BP algorithm.

3 - Euclidean Hub-and-Spoke Networks

John Carlsson, Assistant Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, jgc@umn.edu

We consider the problem of designing an optimal hub-and-spoke network in Euclidean space: the "spokes" of the network are distributed continuously over a service region, and our objective is to determine the optimal number of hubs and their locations. We consider seven different backbone network topologies for connecting the hub nodes, namely the Steiner and minimum spanning trees, a TSP tour, a star network, a capacitated vehicle routing tour, a complete bipartite graph, and a complete graph.

4 - Some Challenges in n-dimensional Euclidean Distance Geometry Problems

Rosiane deFreitas, Professor PhD, Institute of Computing - UFAM, Av. Rodrigo Otavio, 3000, Aleixo, Campus, Campus Setor Norte, Bl. IComp, Manaus, AM, 69077-000, Brazil, rosiane@icomp.ufam.edu.br, Jayme Szwarcfiter, Nelson Maculan, Bruno Raphael Dias, Clarice Santos

The relationship between Euclidean distance geometry and graph theory will be explored, where some operational research problems will be considered, involving theoretical models and computational techniques proposed for channel allocation problems in wireless networks, and determining of the structure of protein molecules. Implicit enumeration algorithms will be presented, addressing issues of feasibility and optimality of solutions, with emphasis on the method of branch-prune-and-bound.

1 - The Flipped Classroom of Operations Management: A Not-For-Cost-Reduction-Platform

Ardavan Asef-Vaziri, Professor, California State University Northridge, 18111 Nordhoff Street, Northridge, CA, 91330-8245, United States of America, ardavan.asef-vaziri@csun.edu

By delivering lectures via screen capture technology, the class time is no longer spent on teaching basic concepts, but rather on more value-added activities. A flipped classroom is an online course because its online components must outperform the best of the online courses. It is also a traditional course because not even a single class session is cancelled while all the lectures are delivered online.

2 - Flipping Engineering Probability and Statistics – Lessons Learned

Rick Olson, Assoc. Dean, Shiley-Marcos School of Engineering, University of San Diego, 5998 Alcala Park, San Diego, CA, 92110, United States of America, r_olson@sandiego.edu

This paper summarizes the lessons learned while teaching Engineering Probability and Statistics using the Flipped Classroom strategy. Compared to earlier offerings, the material was covered in less time and test scores on a common final exam increased. Class organization is described. The preparation of online materials is summarized. Student performance is analyzed and compared to previous offerings. Course evaluations are examined to gain insight into student attitudes to flipped classes.

3 - Flipping through the Field: Guiding Real-World Projects

Patrick Noonan, Professor & Assoc. Dean, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30322, United States of America, patrick.noonan@emory.edu

Working on real problems with real clients can provide students with rich learning opportunities. However, they can be train wrecks for everyone: students who gain only frustration; clients disappointed with return on investment; faculty who struggle to provide the right guidance to all. Faculty can steer students and clients toward success by drawing on a toolkit of best practices of the consulting profession.

Production and Scheduling 2

Contributed Session

Chair: Liang Zhang, University of Connecticut, 371 Fairfield Way, Ellington, CT, 06269, United States of America, liang@engr.uconn.edu

1 - Operation Control in Bernoulli Production Lines to Reduce Energy Consumption

Liang Zhang, University of Connecticut, 371 Fairfield Way, Ellington, CT, 06269, United States of America, liang@engr.uconn.edu, Zhiyang Jia, Jorge Arinez, Guoxian Xiao

In this work, we study the performance evaluation and control of Bernoulli serial lines to reduce energy consumption in the system. Specifically, the Markov chain model of the system is derived and closed-form formulas for calculating the performance measures are provided. Then, based on these formulas, properties of the performance measures as functions of system and control parameters are investigated. The efficacy of the analysis is demonstrated by numerical examples.

2 - Real-time Capable Heuristics for the Capacitated Lot-sizing and Scheduling Problem

Rudolf Bauer, University of Wuppertal, Gauflstrafle 20, Wuppertal, 42119, Germany, rbauer@winfor.de, Stefan Bock

Motivated by a real-world application, we consider the capacitated lot-sizing problem with linkage, sequence dependency and backorders. In order to tackle the problem, a variable neighborhood search and a genetic algorithm are applied. Moreover, dynamic events, such as incoming requests or machine breakdowns, have to handled. Therefore, we propose a new real-time approach that is based on a rolling-horizon scheme. First results of applying our procedure to real-world instances are presented.

3 - Risk-based Capacity Planning for Biotherapeutic Production Operations

Martin Wortman, Professor, Texas A&M Unversity, Dept of ISEN, College Station, TX, 77843-3131, United States of America, wortman@tamu.edu, Cesar Malave

Commitment and expansion of production capacity in the manufacture of biotherapeutics presents challenges that are dissimilar to traditional productions operations. We report a risk-based approach to capacity planning that is particularly useful in exploring the impact of emerging single-use systems as a technology for biotherapeutic production.

4 - A Preventive Maintenance Framework in Dairy Production Operations

Hiram Moya, Assistant Professor, The University of Texas-Pan American, 1201 West University Drive, Edinburg, TX, 78539, United States of America, MoyaH@utpa.edu, Maria Fernanda Vargas Zuluaga

Dairy plant operations suffer frequent downtime due to cleaning operations and different adjustments. This highly perishable product is delivered daily to different locations regionally; and any downtime reduces production capacity and limits operations. This work proposes a troubleshooting process to identify causes of downtime and minimization of operation disruptions by applying a combination of heuristics and linear programming to improve preventive maintenance and standardization.

5 - A Production Model with a Flexible Period of Order Satisfaction

Cristian Palma, Assistant Professor, Universidad del Desarrollo, Avda Sanhueza 1750, Concepcion, Ch, 4040418, Chile, cristianpalma@ingenieros.udd.cl

Customers demand multiple products in what is known as a production order. Optimization models for production planning aggregate different orders and meet product demands by periods based on the orders deadlines. We present a model that explicitly considers production orders rather than products, and provides the flexibility of completing an order before its deadline, allowing a more flexible use of resources when possible. The formulation of the model and its benefits are discussed.

Inventory Management I

Contributed Session

Chair: Nicholas Leifker, Asst. Professor, St. John Fisher College, 3690 East Ave., Rochester, NY, 14618, United States of America, nleifker@sjfc.edu

Chair: Bhavin Shah, Assistant Professor, Indian Institute of Management Indore, Faculty Block C, First Floor,, Prabandh Shikhar, Rau-Pithampur Road,, Indore, MP, 453556, India, bhavinj@iimidr.ac.in

1 - Nonperishable Inventory Control when Demand is Unknown

Tingting Zhou, Rutgers Business School, 1003B, 1 Washington Park, Newark, NJ, 07102, United States of America, tingzhou@pegasus.rutgers.edu, Michael N. Katehakis, Jian Yang

We study the periodic control of a nonperishable product inventory when demand is i.i.d. with an unknown distribution. In the backlogging case, we find that the regret will not grow much over time when we use the newsvendor formula on the empirical demand distribution. We also plan to address lost sales with demand censoring and various other topics.

2 - Optimal Ordering Policy for Brownian Inventory Models with Quantity-dependent Set-up Costs

Dacheng Yao, Assistant Professor, Chinese Academy of Sciences, No.55, Zhong Guan Cun East Road, Haidian District, Beijing, 100190, China, dachengyao@amss.ac.cn, Shuangchi He, Hanqin Zhang

We study a stochastic inventory system whose demand is modeled as a Brownian motion with a positive drift. When the system manager places an order to replenish the inventory, a setup cost that depends on the order quantity is incurred. Assuming the holding and shortage cost to be a convex function of the inventory level, we investigate the optimal ordering policy that minimizes the long-run average cost. We prove that the optimality can be achieved by an (s; S) policy with s<=S.

3 - Dynamic Inventory Control using Leading Economic Indicators

Benjamin Roujas, Master's Degree Candidate, Tsinghua University, Department of Industrial Engineering, Beijing, 100084, China, broujas@gmail.com, Wanshan Zhu

We consider a single item, finite horizon, periodic review inventory system where the demand is forecasted by Bayesian Linear Regression. The explanatory variables in the regression are leading economic indicators that are assumed to be independent and identically distributed. We study the impact of the indicators on the optimal policy, and evaluate the value of observing them. Finally, to reduce the computational complexity , we compare several heuristics .

4 - An Integrated Model of Optimization of the Final Order of Spare Parts

Nicholas Leifker, Asst. Professor, St. John Fisher College, 3690 East Ave., Rochester, NY, 14618, United States of America, nleifker@sjfc.edu, Philip Jones, Timothy Lowe

At the end of a product's life cycle, companies may place a final order of spare parts to satisfy all future demand for the part. Determining the optimal policy can be complicated when products contain multiple types of parts in which the failure rates of the parts and products are not independent; in such cases, the optimal final order quantities for all part types must be determined simultaneously. We explore the concavity properties of this optimization problem, and present a solution method.

5 - Multimodularity of Industrial Ecosystem with a Generalized Serial Multi-Echelon Inventory System

Wei Yang, Associate Professor, Long Island University at Post, 720 Northern Blvd, Brookville, NY, 11545, United States of America, wei.yang@liu.edu, Youyi Feng, Baichun Xiao

We study the sustainability and multimodularity of an industrial ecosystem where there exists a generalized serial multi-echelon inventory system with multiple locations. Each location creates a main product to serve its external demand and a byproduct as the input to its immediate downstream location.

1 - Influence by Design

Karen Guttieri, Professor, Naval Postgraduate School, 3642 Arbutus Ave, Palo Alto, CA, 94303, United States of America, karen.guttieri@gmail.com

Military Information Support Operations inform and influence behavior of foreign populations. Doctrine takes a linear problem-based approach to develop products (pamphlets, messages) to address ill-defined problems in dynamic media environments. Alternatively, design thinking is an iterative, solution-based approach. Using mock examples, the paper demonstrates the use of visual analogies, redefining problems, coding requirements to build products, and the development and testing of prototypes.

2 - Incorporating the Rule of Law In Resiliency Analyses

John Hummel, Argonne National Laboratory, 9700 S. Cass Avenue/DIS-221, Argonne, IL, 60440, United States of America, jhummel@anl.gov, L. Paul Lewis, Ignacio Martinez-Moyana

The "Rule of Law" is a critical feature of stable countries. There is no definition for the rule of law, but its core relates to the influence and authority of law within society and the constraints it creates on the behavior of officials and the general population. We will focus on how rule of law assessment data can be incorporated into regional resiliency assessments and address some of the challenges associated with the data and how the contexts behind the data can be captured and assessed.

3 - Engineering an IW Model using the IW Ontology

Dean Hartley, Principal, Hartley Consulting, 106 Windsong Ln, Oak Ridge, TN, 37830, United States of America, DSHartley3@comcast.net

Using the IW Ontology, discussed in an earlier presentation, we will see how one can "engineer", rather than "dream up", IW models. I will use analogies with LegoÆ modeling and HO gauge railroad modeling to illustrate the concept and connect these concepts to the elements of the IW Ontology.

Scheduling of Queues

Sponsor: Applied Probability Society

Sponsored Session

Chair: Douglas Down, McMaster University, 1280 Main Street West, Hamilton, ON, Canada, downd@mcmaster.ca

1 - Approximations and Optimal Control for State-dependent Limited Processor Sharing Queues

Varun Gupta, Assistant Professor, University of Chicago, 5807 S Woodlawn Avenue, Chicago, IL, 60637, United States of America, varun.gupta@chicagobooth.edu, Jiheng Zhang

We study the problem of control of a processor sharing (PS) server where the service rate depends on the number of jobs occupying the server. Our principle contributions are: (1) We propose an axiomatic approach to derive a state-dependent drift function starting from a discrete system we desire to control. This drift function is used to formulate a diffusion control problem. (2) We propose a novel numerical algorithm, average cost iteration, to solve the resulting diffusion control problem.

2 - Scheduling and Job Assignment in Server Farms with Setup Delays

Esa Hyytia, Docent, Senior Research Scientist, Aalto University, Department of Communications and Network, P.O.Box 13000, Aalto, 00076, Finland, esa.hyytia@aalto.fi, Samuli Aalto, Rhonda Righter

We consider the job assignment problem to heterogeneous parallel servers, that can be switched off to save energy. Costs include energy related running costs and performance related mean response times. Servers have a setup delay and they process jobs according to FCFS, PS or LCFS, among which LCFS turns out to be the most robust discipline under the presence of setup delays. It is insensitive to job size distribution and works especially well when service times are highly variable.

3 - Stragglers and Phase Overlapping in Mapreduce Systems

Adam Wierman, California Institute of Technology, 1200 E California Blvd, Pasadena, CA, United States of America, adamw@caltech.edu, Xiaoqi Ren, Ganesh Ananthanarayanan, Minlan Yu, Micheal Chien-Chun Hung

MapReduce is a scalable parallel computing framework for big data processing. It exhibits multiple processing phases, and thus an efficient job scheduling mechanism is crucial for ensuring efficient resource utilization. This talk will discuss scheduling techniques for mitigating the impact of stragglers and optimizing the overlapping between phases in MapReduce systems.

4 - Control of Energy-Aware Servers

Vincent Maccio, McMaster University, 1280 Main Street West, Hamilton, Canada, macciov@mcmaster.ca, Douglas Down

We consider routing customers to servers that are energy aware, i.e. they can be turned on or off according to a particular policy. We show that it is in general preferable to configure the queues differently. We then present initial results on how queues should be configured when there are multiple servers and a single queue (i.e. no routing decision is required on arrival).

Technometrics Invited Session: Novel Statistical Methods with Interesting Applications

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Peihua Qiu, Professor, University of Florida, 2004 Mowry Road, 5th Floor CTRB, Gainesville, FL, 32611-7450, United States of America

1 - Modeling Conditional Distributions For Functional Responses, With Application to Traffic Monitoring

Kehui Chen, Assistant Professor, University of Pittsburgh, 2706 Cathedral of Learning, Pittsburgh, PA, 15260, United States of America, Khchen@pitt.edu, Hans-George Mueller

Motivated by problems involving a traffic monitoring system in which trajectory data are obtained from GPS-enabled mobile phones, we propose a novel approach to functional regression, where the mean and covariance function of the response are assumed to depend on predictors. We demonstrate the method by constructing predicted curves and corresponding prediction regions for traffic velocity trajectories for a future time period, using current traffic velocity fields as predictor functions.

2 - Dynamic Factor Model Applied to Hourly Electricity Price Analysis

Jesus Juan, Professor, Universidad Politécnica de Madrid, C/ José Gutierrez Abascal, 2, Madrid, 28006, Spain, jesus.juan@upm.es, Jaime Carpio, Damian Löpez

Exponential smoothing has become a popular technique to forecast time series. In this work we show the advantages of its multivariate version and present some properties of the model which allows us to perform a dynamic factor analysis. The practicality of the method is demonstrated by its application to hourly electricity price predictions in some day-ahead markets, such as Omel, Powernext, and Nord Pool markets.

3 - Statistical Methods for Degradation Data with Dynamic Covariates & an Application to Weathering Data

Yili Hong, Associate Professor, Department of Statistics, Virginia Tech, 213 Hutcheson Hall, Blacksburg, VA, 24060, United States of America, yilihong@vt.edu, Deborah Stanley, Xiaohong Gu, Yuanyuan Duan, William Meeker

Degradation data are widely used to obtain reliability information. It is common nowadays to dynamically record usage and other environmental variables (e.g., temperature and humidity). We introduce a class of models for analyzing degradation data with dynamic covariate information. We use general path models with random effects to describe degradation paths. The proposed methods are illustrated with an application for predicting life of organic coatings in a complicated dynamic environment.

Co-Chair: Chia-Jung Chang, Assistant Professor, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States of America, cchang@psu.edu

1 - Statistical Monitoring of the Hand, Foot and Mouth Disease

Peihua Qiu, Professor, University of Florida, 2004 Mowry Road, Gainesville, FL, 32610, United States of America, pqiu@ufl.edu

To prevent the outbreak of infectious diseases like the Hand, Foot and Mouth Disease (HFMD), effective disease surveillance systems would be especially helpful to give signals of disease outbreaks as early as possible. In this paper, we propose a three-step procedure for analyzing disease surveillance data, and our procedure is demonstrated using the HFMD data collected during 2008-2009 in China.

2 - Simultaneous Monitoring of Process Mean and Covariance Matrix via Penalized Likelihood Estimation

Arthur Yeh, Professor, Bowling Green State University, Dept. of Applied Stats and ORs, Bowling Green, OH, 43403, United States of America, byeh@bgsu.edu, Kaibo Wang, Bo Li

The advantage of utilizing the penalized likelihood estimation in constructing multivariate control charts is that it produces sparse and more focused estimates of the unknown population parameters which can improve the performance of the resulting charts. We propose new penalized likelihood estimation based control charts for simultaneously monitoring the mean vector and the covariance matrix. The performance of the proposed charts is assessed by Monte-Carlo simulations and a real example.

3 - Information Sources Selection in Multi-Mode Statistical Process Monitoring

Hila Chalutz Ben-Gal, Afeka College of Engineering, Industrial Engineering, Tel Aviv, Israel, hilab@afeka.ac.il, Marcelo Bacher

We consider a monitoring of multi-mode dynamic systems, where data gathered from multiple distributed sensors do not represent unequivocally the mode the system is operating in. A major goal is to identify in which mode the system is operating and distinguish between a situation of gradual deviation from a mode, which is a classical SPC task, and a situation of a sudden change from one operation mode to another, which is a clustering task.

4 - Fast Output Analysis via Sparse Grid Experimental Designs

Matthew Plumlee, Georgia Institute of Technology, Atlanta, GA, United States of America, mplumlee@gatech.edu

Random field models are widely employed to develop a predictor of an expensive function based on observations. In high dimensional settings, the traditional framework for developing a predictor is often too computationally expensive to be practical. We demonstrate that when sparse grid experimental designs are employed the resulting optimal predictor is quick to compute and has reasonable accuracy.

Learning in Optimization and the Exploration/Exploitation Tradeoff

Sponsor: Simulation

Sponsored Session

Chair: Peter Frazier, Assistant Professor, Cornell University, 232 Rhodes Hall, Ithaca, NY, 14853, United States of America, pf98@cornell.edu

1 - Parallel Bayesian Global Optimization, with Application to Metrics Optimization at Yelp

Jialei Wang, PhD Student, Cornell University, Frank HT Rhodes Hall, 292, Ithaca, NY, 14853, United States of America, jw865@cornell.edu, Scott Clark, Eric Liu, Peter Frazier

We consider parallel global optimization of expensive-to-evaluate functions, and propose an efficient method based on stochastic approximation for implementing a conceptual Bayesian optimization algorithm proposed by Ginsbourger et al. (2010). We also introduce an open-source software implementation of this algorithm, called Metrics Optimization Engine, developed in collaboration with engineers at Yelp, Inc. and used internally at Yelp to optimize prediction models and performance metrics.

2 - Learning in Combinatorial Optimization: What and How to Explore

Sajad Modaresi, PhD Candidate, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, sajad.modaresi@duke.edu, Juan Pablo Vielma, Denis Saure

We study sequential combinatorial optimization under model uncertainty. We show resolving implied exploration vs. exploitation trade-off efficiently is related to solving an Optimality Cover Problem (OCP) which simultaneously answers the questions of what information to collect and how to do so. We develop a policy that adaptively constructs and solves OCP at a decreasing frequency and show it is efficient. We extensively test performance against relevant benchmark in both long- and short-terms.

3 - Parallel Bayesian Policies for Finite-Horizon Multiple Comparisons with a Known Standard

Weici Hu, PhD Candidate, Cornell University, 295 Rhodes Hall, Ithaca, NY, 14853, United States of America, wh343@cornell.edu, Peter Frazier

We consider the problem of multiple comparisons with a known standard, in which we allocate simulation effort across a finite number of alternatives, so as to determine which alternatives have mean performance above a known threshold. We assume parallel computing resources and a fixed simulation budget. We consider this problem in a Bayesian setting. We provide tractable upper bounds on the value of the Bayes-optimal policy, and a heuristic index policy motivated by the upper bounds.

4 - Bayesian Optimal Learning with Discrete Prior Resampling

Si Chen, Princeton University, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, sichen@princeton.edu, Kristofer Reyes, Warren Powell

We propose a knowledge-gradient policy based on a small set of discrete priors sampled from a multi-dimensional nonlinear parametric model. At each time step, the policy utilizes the value of information and Bayesian statistics to make decisions, and resamples the discrete priors according to their assigned weights. We present an application to solve a Bayesian optimal search program in material science, namely discovering the set of controllable parameters to match a specific release profile.

Socially-Responsible Operations Management

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Mili Mehrotra, University of Minnesota, 321 19th Ave South, Minneapolis, MN, United States of America, milim@umn.edu

1 - The Impact of Buyer-Manufacturer Interaction on Energy Efficiency Investments

Jason Nguyen, Carlson School of Managment, University of Minnesota, Minneapolis, MN, United States of America nguy1762@umn.edu, Mili Mehrotra, Karen Donohue

We investigate the equipment-focused EE investment decision in the context of a supply chain where a capital constrained manufacturer sets the investment level and its buyer sets contract prices. We solve for the investment level and pricing strategy both when the buyer is and is not informed of the EE improvement opportunities. We delineate the impact of the buyer's awareness and different contracting mechanisms on the optimal investment level as well as the resulting profit levels.

2 - Design Implications of Extended Producer Responsibility: Durable or Recyclable Products?

Ximin (Natalie) Huang, PhD Student, Georgia Institute of Technology, Atlanta, GA, United States of America, ximin.huang@scheller.gatech.edu, Beril Toktay, Atalay Atasu

We consider a monopolist who has two product design options to manage the end-of-life costs/revenues associated with its products: making products more durable or recyclable. We explore how the recyclability and durability choices are affected by the requirements of take-back legislation.

3 - Sustainability Planning for Healthcare Information Exchanges

Tharanga Rajapakshe,University of Florida, Gainesville, FL, United States of America, tharanga.rajapakshe@warrington.ufl.edu, Chelliah Sriskandarajah, Subodha Kumar

Even though there has been a substantial federal funding since 2010, very few Healthcare Information Exchanges (HIEs) are currently operational. A key obstacle faced by HIEs is long-term financial sustainability. Motivated by this observation, our focus in this work is to understand the operational decisions of an HIE and provide insights that would ensure the long term survival.

4 - Promoting Clean Technology Products: To Subsidize Consumers or Manufacturer?

Guangrui Ma, The Hong Kong University of Science and Technology, Room 3208, Dept. of IELM, Clear Water Bay, Kowloon, Hong Kong - PRC, magr@ust.hk, Ho-Yin Mak, Michael Lim, Zhixi Wan

We study the dynamic adoption process of Clean Technology Products (e.g., electric vehicles, solar panels), which is often hampered by the chicken-and-egg dilemma: firms are reluctant to invest in support infrastructure before sufficient adoption; in contrast, consumers hesitate to adopt CTPs without such infrastructure. We study how the government interventions such as subsidies (either to the firm or consumers) and mandated information disclosure can help or harm the CTP adoption.

Natural Resources

Contributed Session

Chair: Bruno da Costa Flach, Research Staff Member, IBM Research - Brazil, Av. Pasteur 138/146, Botafogo, Rio de Janeiro, RJ, 222700-50, Brazil, bflach@br.ibm.com

1 - Incorporating Covariates in Hierarchical Deterministic Models

Edward Boone, Associate Professor of Statistics, Virginia Commonwealth University, 1015 Floyd Ave, Richmond, VA, 23112, United States of America, elboone@vcu.edu

Deterministic models, such as differential equations, are common to understand complex relationships through time. An additional complexity is introduced when covariates that drive parameters are employed. We present a Bayesian approach using a hierarchical model structure to incorporate covariates in these models. This is illustrated using an environmental example concerning fish in the Murray-Darling River.

2 - Intertemporal Fairness and the Exploitation of Nonrenewable Resources

Thomas Weber, Associate Professor, Ecole Polytechnique Federale de Lausanne, EPFL CDM MTEI OES, ODY 3 01, Station 5, Lausanne, 1015, Switzerland, thomas.weber@epfl.ch

The multitude of possible rules and the lack of justification for any single one of them renders the sharing of resources across generations difficult and subjective. We propose a notion of intertemporal fairness, in discrete and continuous time, which is robust, as it singles out an allocation that is 'simultaneously best' relative to all feasible Lorenz-undominated allocations. For exhaustible resources, the resulting fair allocation ensures positive consumption by all future generations.

Auctions and Mechanism Design

Cluster: Auctions

Invited Session

Chair: Rudolf Müller, Maastricht University, Maastricht, Netherlands, r.muller@maastrichtuniversity.nl

1 - Cake Cutting Algorithms for Piecewise Constant and Piecewise Uniform Valuations

Chun Ye, PhD Candidate, Columbia University, 500 West 120th Street, IEOR Department Rm 315, New York, NY, 10027, United States of America, cy2214@columbia.edu, Haris Aziz

Cake cutting is one of the most fundamental settings in fair division and mechanism design without money. In this work, we consider different levels of three fundamental goals in cake cutting: fairness, Pareto optimality, and strategy-proofness. We identify maximal subsets of properties that can be attained by certain cake cutting algorithm and minimal subsets of properties that are incompatible with each other.

2 - Optimal Mechanisms with Simple Menus

Pingzhong Tang, Assistant Professor, Tsinghua University, Beijing, China,, kenshinping@gmail.com, Zihe Wang

We consider revenue-optimal mechanism design for one buyer and two independent items. We obtain two categories of structural results on the optimal mechanisms. The first category of results states that, under a certain condition, the optimal mechanism has a monotone menu. The second category of results states that, under certain conditions, the optimal mechanisms have few menu items.

3 - A Dynamic Mechanism Design for Scheduling with Different Use Lengths

Ryuji Sano, Kyoto University, Yoshida-Honmachi, Sakyo-ku, Kyoto, Japan, 606-8501,sano@kier.kyoto-u.ac.jp

This paper considers a dynamic allocation problem in which many perishable goods are allocated at each period. Agents want to keep winning goods for a long time, and the necessary lengths are private information. We characterize incentive compatibility and analyze the efficient and optimal mechanisms.

4 - Multi-item Auctions with Exclusivity Margin

Rudolf Müller, Maastricht University, Maastricht, Netherlands, r.muller@maastrichtuniversity.nl, Greg Csapo, Hemant Bhargava

We study the problem of finding the profit-maximizing multi-item mechanism that is deterministic, individually rational, and incentive compatible in a setting, where bidders attach additional value for getting the item exclusively, thus hold two-dimensional private information. We design simple and practical mechanisms for a modest sacrifice on revenue. Their performance is demonstrated by approximation guarantees via provable upper bounds on the optimal revenue and by numerical simulations.

Energy - Optimization

Contributed Session

Chair: Heungjo An, Assistant Professor, King Fahd University of Petroleum & Minerals, KFUPM POBox 167, Dhahran, 31261, Saudi Arabia, hjan@kfupm.edu.sa

1 - An Acceleration Technique for Solving Non-linear Problems in the Chemical Industry

Heungjo An, Assistant Professor, King Fahd University of Petroleum & Minerals, KFUPM POBox 167, Dhahran, 31261, Saudi Arabia, hjan@kfupm.edu.sa

This paper provides an acceleration technique of distributive recursion to solve a large-scale planning problem which involves the non-linear pooling problem. The embedded structure of a linearized problem can be transformed to a generalized flow problem in a cyclic network. This study proposes an effective dynamic programming algorithm to solve the generalized flow sub-problem under Column Generation scheme. Computation tests evaluate the efficacy of the approach and analyze solvability.

2 - A Mixed-integer Linear Program for the Optimal Design of Human-powered Fitness Facilities

Kristopher Pruitt, Assistant Professor of Mathematics, US Air Force Academy, 2354 Fairchild Dr. Ste 6D-222, USAFA, CO, 80840, United States of America, kristopher.pruitt@usafa.edu

We present an optimization model with distributed-energy applications in the health and fitness industry. The mixed-integer linear program determines the blend of memberships, facility size, and equipment (power generating, neutral, and consuming) that maximizes profit (membership revenue less capital and operational costs) subject to the demands for floor space, power, and equipment-types. The presentation includes both analytical conditions for economic viability and a numerical case study.

3 - A Combined Approach of Simulations and DP to Value Storage Facilities

Marcus Hildmann, Doctoral Student, ETH Zurich, Physikstrasse 3, ETL G 24.2, Zurich, 8092, Switzerland, hildmann@eeh.ee.ethz.ch, Sebastiano Rossi

Large scale deployment of renewable energy increase the need for storage. Then again, the market conditions become less and less profitable for storage plants. We present an algorithm to value storage participating at several markets, such as day-ahead, real time and ancillary services markets simultaneously. We use a combined approach of simulations and dynamic programming to value the plant as a set of convex optimization problems. This allows to determine the revenue streams from the markets.

4 - Deadline and Quantity-differentiated Pricing of Energy Services

Florian Salah, PhD Student, Institute of Information Systems and Marketing, KIT, Englerstr. 14, Karlsruhe, 76131, Germany, florian.salah@kit.edu, Christoph Flath

Demand side flexibility is key to stable and cost-efficient integration of variable energy resources. Current energy-only transactions in power markets fail to properly incentivize this flexibility. Consequently, new market designs and transaction objects are required. To this end, quality-of-service concepts can play an important role. We present an extended deadline-differentiated pricing model facilitating both temporal and quantity-based service differentiation.

Multilevel Optimization Problems in Energy I

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N Charles St, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu

1 - Network Expansion to Mitigate Market Power

Daniel Huppmann, German Institute for Economic Research (DIW Berlin), Mohrenstrafle 58, Berlin, Germany, dhuppmann@diw.de, Alexander Zerrahn

Lack of transmission capacity hampers the integration of the electricity market and thereby precludes reaping the full benefits of competition. We investigate the extent to which transmission grid expansion promotes competition, efficiency and welfare. This work proposes a three-stage model for grid investment, endogenizing the trade-off between costs of grid investment and benefits from reduced market power potential.

2 - Modeling Decisions of Plug-in Electric Vehicle (PEV) Aggregators: An MPEC Approach

Sonja Wogrin, Comillas Pontifical University, Calle Alberto Aguilera 23, Madrid, Spain, sonja.wogrin@iit.upcomillas.es, Tomas Gómez, Ilan Momber

Coordinated charging schedules of plug-in electric vehicles (PEVs) by an aggregator may lead to increased system efficiency in allocating resources in generation, transmission and distribution. Hence, we propose an MPEC to optimize the PEV aggregator's decisions in different electricity markets, using indirect load control by determining optimal retail prices for the PEV. Results of a case study indicate that the aggregator's profits depend on providing the right price signals to the customers.

3 - Optimizing Wind and Hydropower Systems with Bi level Stochastic Dynamic Programming

Christine Shoemaker, Professor, Cornell University, 210 Hollister Hall, CEE, Ithaca, NY, 14853, United States of America, cas12@cornell.edu, Kyle Perline, Sue Nee Tan

We present a bi level Stochastic Dynamic Programming for managing interconnected wind and hydropower systems, based on data from Bonneville Power Authority. Computational effort is reduced with a response surface approximation of the future value function. The decisions in the upper level are day-ahead market commitments and in the lower level are related to the volume of water released to produce power. The stochastic factor is the wind energy produced by the system over a short time step.

4 - Strategic Bidding of a Large Electricity Consumer: A Complementarity Approach

Jalal Kazempour, Postdoctoral fellow, Johns Hopkins University, 3400 N Charles St. Mechanical Eng. Dep., Latrobe 223, Baltimore, MD, 21218, United States of America, skazemp1@jhu.edu, Antonio J. Conejo, Carlos Ruiz

We describe a complementarity model to assist an electricity consumer in making bidding decisions to alter pool prices to its own benefit. The strategic behavior of this consumer is represented through a bilevel model: the upper-level problem represents strategic bidding actions while the lower-level problems represent pool clearing. Uncertainties on actions of producers and other consumers are characterized through of scenarios. The resulting model is a large-scale mixed-integer LP problem.

Accounting for Risk in Investments in Electric Power Systems

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Fernando de Sisternes, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, ferds@mit.edu

Co-Chair: John Parsons, Senior Lecturer, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, jparsons@mit.edu

1 - Conditional CAPM Models in Capacity Investment Equilibrium Models

Andreas Ehrenmann, GDF Suez, Bruxelles, Belgium, Andreas.Ehrenmann@gdfsuez.com, Gauthier De Maere, Yves Smeers

Investment decisions are commonly based on the CAPM model in practice. We consider different formulations of conditional CAPM as stochastic discount rate that we use in capacity expansion models. These formulations are meant to account for the impact of renewable penetration in the European power market. The models are of the equilibrium type and formulated as complementarity problems. We discuss their properties and implementation.

2 - Risk Adjustment in Stochastic Investment Planning Models

Gauthier De Maere, GDF Suez, Bruxelles, Belgium, gauthier.demaeredaertrycke@gdfsuez.com, Andreas Ehrenmann, Daniel Ralph, Yves Smeers

We consider a stochastic version of the standard capacity expansion model with risk averse agents with behaviour represented by the so called "Good Deal" risk measure. We consider two counterfactuals for representing risk trading: no risk trading and a complete risk trading. We apply the model to a real situation of decommissioning of conventional plants in the European power market.

3 - A Dynamic Model for Risk Pricing in Generation Investments

Fernando de Sisternes, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, ferds@mit.edu, John Parsons

We show how to incorporate standard risk pricing principles into the popular Monte Carlo simulation analysis. Using this new framework we illustrate how different risk premia can be naturally derived from first principles for different electricity generation technologies, and how the risk attributable to each technology depends on the electricity price level at the time that the investment takes place.

4 - Risk Aversion in Transmission Infrastructure Planning using Two-Stage Programming

Harry van der Weijde, Vrije Universiteit Amsterdam, Department of Spatial Economics, De Boelelaan 1105, Amsterdam, 1081HV, Netherlands, h.vanderweijde@gmail.com, Ben Hobbs, Francisco Munoz

In the context of applications to the UK and WECC regions, we discuss how explicit consideration of risk aversion in transmission planning can affect optimal first stage investments in a large two-stage planning model. We consider risk-neutral, risk-averse, and min max regret formulations and results, considering long run technological, economic, and policy uncertainties. Theoretical and practical challenges include generator risk aversion and solving large-scale nonlinear models.

Parc- Mission III

Stochastic Processes

Contributed Session

Chair: Fikri Kucuksayacigil, Iowa State University, 240 Raphael Avenue, Unit 15, Ames, IA, 50014, United States of America, fksayaci@iastate.edu

1 - Modeling the Electricity Supply Stack with Time-changed Processes

Vishwakant Malladi, Doctoral Student, UT Austin, 1 University Station B65000, McCombs School of Business, Austin, TX, 78712, United States of America, vishwakant@gmail.com, Stathis Tompaidis, Rafael Mendoza-Arriaga

We present a framework for modeling the supply stack of electricity generators using time-changed processes. We demonstrate how the use of time-changed processes can be adapted to a factor structure that allows to model for correlated outages across generator types, locations, and links to the transmission network. Results of the calibration of the models using real data are presented.

2 - Monotonicity Properties of Processor Sharing Queues with Abandonments

Dwi Ertiningsih, PhD Student, Leiden University, Niels Bohrweg 1, Leiden, Netherlands, dwiertiningsihd@math.leidenuniv.nl, Flora Spieksma

Consider a processor sharing queue with abandonments and retrials. This can be modelled as a process on a two-dimensional state space. The service time distribution is not required to be exponential and the immediate cost is assumed linear. The aim is to study properties of the average and discounted cost value functions. By a coupling argument we show that the value function is convex and supermodular.

3 - Hybrid Kriging Optimization Using Gradient Estimation

Sayak Roychowdhury, Graduate Research Associate, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, roychowdhury.6@osu.edu, Theodore Allen

In stochastic black box optimization, we aim to reach the optimal solution using fewer number of evaluations. In our proposed hybrid algorithm, we are determining the next best point of evaluation using alternatively the expected improvement function and gradient decent. Then, we prove convergence of the hybrid method to a KKT point under general assumptions. Performances of various gradient estimation methods are compared on a number of test functions.

4 - Malmquist Productivity Index Analysis Based on StoNED: Case of Norwegian Electricity Distribution Company

Xiaomei Cheng, Norwegian School of Economics, Department of Business and Management, Science, NHH, Helleveien 30, Bergen, 5045, Norway, xiaomei.cheng@nhh.no, Endre Björndal, Mette Björndal

In the study of regulating electricity distribution utilities, estimates of the past productivity performance play a key role in the future requirements. The main purpose of this paper is to construct a Malmquist productivity index based on stochastic non-parametric envelopment of data (StoNED) to study the recent productivity change in terms of 123 Norwegian electricity distribution companies during 2004-2012.

5 - Revenue Management: A Continuous-time Application to Airport Carparks

Andreas Papayiannis, Post-Doctorate Researcher, The University of Manchester, Flat 502, The Lock Building, Manchester, M1 5BD, United Kingdom, andreas.papayiannis@manchester.ac.uk, Paul Johnson, Dmitry Yumashev, Peter Duck

We investigate the revenue management (RM) problem encountered in airport carparks, where spaces are sold in advance online. Currently, most RM practices in this sector are simple adjustments to those developed for hotels, exploiting the strong similarities of the two industries. However, unlike in hotels where the day of the week strongly affects the price of a room, a distinct setting appears where the daily price of a parking space depends heavily on the length-of-stay of the booking.

Sponsored Session

Chair: Thomas Groleau, Business Division Chair, Carthage College, 2001 Alford Park Drive, 210 Clausen Center, Kenosha, Wi, 53140, United States of America, tgroleau@carthage.edu

1 - Leveraging Analytics to Drive Business Decisions in Agriculture

Vardges Ter-Hovhannisyan, Strategic Scientist, Monsanto, 800 N Lindbergh, St. Louis, MO, 63167, United States of America, vardges.ter-hovhannisyan@monsanto.com, Naveen Singla, Nalini Polavarapu, William Leeds, Paul Skroch

An analytics strategy is an essential part of any data-driven business. We present an integrated analytics platform designed to drive business decisions and provide prescriptive solutions for an agricultural R&D pipeline. The main pillars of the platform (OR, predictive analytics, and geospatial modeling) are leveraged to solve real-life complex problems in agriculture. We discuss the scientific approach of the analytics platform and the resulting business impact provided to our organization.

2 - Growth Model for a Large Medical Center

Dustin Kuchera, Operations Manager, Mayo Clinic, 626 8th St SW, Rochester, MN, 55902, United States of America, Kuchera.Dustin@mayo.edu

This model depicts a complex medical center as many small components, including outpatient appointments, surgeries, and inpatient stays. A decision-maker can adjust these components in the model and estimate the impact on resources throughout the larger system.

3 - Pimp My Spreadsheet

Thomas Groleau, Business Division Chair, Carthage College, 2001 Alford Park Drive, 210 Clausen Center, Kenosha, Wi, 53140, United States of America, tgroleau@carthage.edu

There are many user-developed spreadsheets in use that work well for their designed purpose but, like early computer programs, are poorly documented and difficult for anyone other than the original developer to understand. We will show before and after examples of spreadsheets that were revised for improved usability.

Spatial Analysis for Multicriteria Decisions

Sponsor: Decision Analysis

Sponsored Session

Chair: Jay Simon, Assistant Professor, Naval Postgraduate School, Monterey, CA, United States of America, jrsimon@nps.edu

1 - Decision Analysis with Geographically Varying Outcomes: Preference Models and Applications

L. Robin Keller, Professor, Operations & Decision Technologies, The Paul Merage School of Business, University of California, Irvine, University of California, Irvine, Irvine, CA, United States of America, lrkeller@uci.edu, Craig Kirkwood, Jay Simon

We present decision analysis methodology for decisions based on data from geographic information systems. We discuss conditions that may conform with the decision maker's preferences over a set of alternatives, and we present specific forms for value or utility functions that are implied by these conditions. The methodology is applied to 2 hypothetical urban planning decisions involving water use and temperature reduction in regional urban development, and fire coverage across a city.

2 - Multi-criteria Spatial Risk Analysis

Valentina Ferretti, Dr. PhD, Technical University of Turin, Corso Castelfidardo 30/A, Turin, 10138, Italy, valentina.ferretti@polito.it, Gilberto Montibeller

There is a broad literature on spatial multi-criteria evaluation in the environmental domain, and some attempts of conducting risk analysis in this context. Most of these attempts neither employ a proper risk analytical framework nor provide a clear conceptual framework for allocating resource on mitigating actions. To address these weaknesses, in this paper we conceptualize a multi-criteria spatial risk analysis assessment to support spatial environmental decision-making processes.

3 - D2M2: Multi-Objective, Spatial Optimization for Regional Material Management

Matthew Bates, Research Environmental Engineer, US Army Corps of Engineers, 696 Virginia Rd, Concord, MA, 01742, United States of America, Matthew.E.Bates@usace.army.mil, Kelley Philbin, Igor Linkov, Todd Bridges

The D2M2 (Dredged Material Management Decisions) software model brings transparency, flexibility, and mathematical rigor to regional material management by analyzing thousands of combinations of source and placement sites to allocate material along various possible routes. We demonstrate optimization for economic and multiple impact objectives for dredging planning in the Long Island Sound region of NY/CT, based on site distribution, equipment, transportation links, storage availability, etc.

4 - Markov Cost-Effectiveness Analysis for Cancer Treatment

Jiaru Bai, University of California-Irvine, Irvine, CA, United States of America, jiarub@uci.edu, L. Robin Keller

We present a way to build a Markov decision tree to model cancer progression and cost-effectiveness analysis for two or more cancer treatments. We propose several problems researchers can encounter in this kind of research and provide possible solutions. The method is used for a clinical study comparing two cervical cancer treatments.

Organizational Challenges in Decision Making

Sponsor: Decision Analysis

Sponsored Session

Chair: John Lehman, Galway Group, LP, 3050 Post Oak Boulevard, Suite 1300, Houston, TX, 77056, United States of America, johnlehman@att.net

1 - Making Collaborative Decisions

Daniel Owen, Managing Director, Strategic Business Processes, Inc., 146 Windward Way, Indian Harbour Beach, FL, 32937, United States of America, owendl@aol.com

Combining the work of four noted authors has provided a theoretical framework for collaborative decisions built on the foundation of decision analysis. The resulting collaborative process aggregates, rather than compromises, the understandings of decision makers at four steps. The value increase from the collaborative process is typically fifty to one-hundred percent.

2 - Auditing Decisions: How to Check for Build-in Decision Quality
Roberto Ley-Borras, Director, Consultoria en Decisiones, Orizaba, Orizaba, Veracruz, Mexico, rley@decidir.org

Since the quality of a decision is given by the quality of the decision process it is derived from, we can audit the decision's quality by verifying that the decision frame was well selected, the set of fundamental objectives is complete and pertinent, alternatives are creative and span the whole range of possibilities, and similarly verifying key aspects of the remaining DA process. This talk presents a nine-factor decision quality audit approach that is easy to apply yet fairly comprehensive.

3 - The Collaborative Design Process
Stephen Barrager, Publisher, Baker Street Publishing, San Francisco, CA, 94123, United States of America, steve@bakerstreetpublishing.com

Most big decisions involve many people: decision makers, stakeholders, and experts. Typically the people involved have different motives, different cultures, different experience, and differenct educational backgrounds. What are the norms for decision making in these situations? This talk reviews several group process and learning norms. We discuss how the Collaborative Design process supports these norms. It provides a normative framework for applying both hard and soft tools.

4 - What the Mating Behavior of Birds Can Teach Us about Corporate Decision Making
John Lehman, Galway Group, LP, 3050 Post Oak Boulevard, Suite 1300, Houston, TX, 77056, United States of America, johnlehman@att.net

The combination of technology and theory has failed to produce the dramatic improvement in the quality of corporate decisions that some predicted. In this presentation I suggest that this failure comes in part because too little attention has been paid to the environment in which decisions are made. Specifically, I propose that organizational decision processes are not constructivist rational, but rather resemble the ecological rationality of biological systems shaped by natural selection.

■ TB80

Parc- Powell II

Behavioral Decision Theory

Sponsor: Decision Analysis

Sponsored Session

Chair: Enrico Diecidue, INSEAD, Bd de Constance, Fontainebleau, France, Enrico.Diecidue@insead.edu

1 - Beta-Delta or Tau-Delta? A New Parameterization of Quasi-Hyperbolic Discounting
Han Bleichrodt, Professor, Erasmus University, 3000 DR Rotterdam, Netherlands, bleichrodt@ese.eur.nl

In the quasi-hyperbolic (beta, delta) model, beta is commonly taken as an index of time inconsistency. We show that beta is not suited for this purpose because it interacts with delta. We propose a proper index of time inconsistency, which has a natural interpretation as the time period over which the decision maker is vulnerable to dynamic inconsistencies. We give an empirical illustration of our index by reanalyzing the data from Tanaka et al. (2010).

2 - Testing for Excess Movement in Beliefs
Ned Augenblick, University of California, Berkeley, 545 Student Services Building, 1900, Berkeley, CA, 94720-1900, United States of America, ned@haas.berkeley.edu, Matthew Rabin

We develop a new method to test if belief streams are consistent with Bayesian updating, with an emphasis on whether beliefs move around too much or too little to reflect rational use of information. Our tests do not make any a priori assumptions about the informational structure by taking advantage of a universal property of any Bayesian process: in expectation, the sum of squared changes of beliefs must equal the change in uncertainty. We apply the test to three belief datasets.

3 - Measuring Ambiguity Aversion: Experimental Tests of Subjective Expected Utility
Charlie Sprenger, Assistant Professor, Stanford University, Landau Economics Building, Stanford, CA, United States of America, cspreng@stanford.edu

The canonical model of decisionmaking under subjective uncertainty, Subjective Expected Utility (SEU), is routinely rejected by the phenomena first introduced by Ellsberg (1961), wherein behavior between two subjective bets is inconsistent. We return to the consistency implications of SEU to consider another form of inconsistency: incoherent treatment of a single subjective bet when mixing with objective outcomes.

4 - Delayed Resolution of Uncertainty: a Measurement
Enrico Diecidue, INSEAD, Bd de Constance, Fontainebleau, France, Enrico.Diecidue@insead.edu

We report the results of an experiment measuring preferences for delayed resolution of uncertainty. We detect a systematic effect: decision makers are willing to reduce their probability of winning a prize in a lottery in order to resolve the uncertainty at an earlier stage. In addition we model the impact of resolution of uncertainty under prospect theory. Implications are discussed.

Analytics for Network and Text Data

Sponsor: Data Mining

Sponsored Session

Chair: Shawn Mankad, Assistant Professor, University of Maryland, 4316 Van Munching Hall, College Park, MD, 20742, United States of America, smankad@rhsmith.umd.edu

1 - Charting Collections of Connections in Social Media: Creating Maps and Measures with NodeXL
Marc Smith, Chief Social Scientist, Social Media Research Foundation, 2617 Hallmark Drive, Belmont, CA, 94002, United States of America, marc.smith.email@gmail.com

Social media can be a bewildering stream of comments, a daunting fire hose of content. With better tools and a few key concepts from the social sciences, the social media swarm can be brought into clearer focus to reveal key people, topics and sub-communities. The Social Media Research Foundation's NodeXL project makes analysis of social media networks accessible to most users of the Excel spreadsheet application. With NodeXL, network charts become as easy to create as pie charts.

2 - Large Exposure Estimation with Automatic Business Group Identification
Margrét Bjarnadóttir, University of Maryland, 4324 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu, Sigridur Benediktsdottir

Empirical evidence suggests that large exposure rules are difficult both for regulators to enforce and for financial institutions to implement. We present a data-driven analytical network model that automatically and algorithmically creates groups of related parties, highlights missing critical information, and identifies unreported business partners. We include a case study highlighting large exposure violations and systemic risk leading up to the banking crash in 2008.

3 - Measuring Influence in Social Networks through Information Diffusion Modeling
George Michailidis, University of Michigan, Ann Arbor, MI, United States of America, gmichail@umich.edu

A key question in many social platforms is to determine who are the most influential members in such networks. We modify a popular rank prestige algorithm, by modeling the weights used to reflect users' activity, as opposed to users connectivity. Such activity is captured through the information they post, rebroadcast or comment on and modeled as multivariate interacting counting processes. We discuss estimating the model parameters and illustrate the results on a real data set from Twitter.

4 - Structural Topic Models
Margaret Roberts, molly.e.roberts@gmail.com, Brandon Stewart, Edoardo Airoldi

Social scientists often want to make inference about social processes that drive discourse. We develop a topic model which supports this type of research by modeling the relationships between observed covariates and topics. In our model, topical prevalence and content are specified as a generalized linear model with arbitrary numbers of document covariates. We apply to model to news reports about China, where we allow the prevalence of topics to evolve over time and vary across newswires.

Advances in Multiobjective Programming

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret Wiecek, Clemson University, Mathematical Sciences, Clemson, SC, United States of America, wmalgor@clemson.edu

1 - The Triangle Splitting Method for Biobjective Mixed Integer Programming

Natashia Boland, Unversity of Newcastle, University Drive, Newcastle, Australia, natashia77@gmail.com, Hadi Charkhgard, Martin Savelsbergh

We present the first criterion space search method, the triangle splitting method, for finding all nondominated points of a biobjective mixed integer program. The algorithm maintains, at any point in time, a diverse set of nondominated points, and is ideally suited for fast approximation of the nondominated frontier.

2 - Efficient Storage of Nondominated Data in Biobjective Mixed Integer Programming

Nathan Adelgren, Graduate Assistant, Clemson University, E-1a Martin Hall, Clemson University, Clemson, SC, 29634, United States of America, nadelgr@g.clemson.edu, Pietro Belotti, Akshay Gupte

Branch-and-bound (BB) methods for biobjective mixed-integer linear programs (BOMILP) use upper and lower bound sets for fathoming, so it is desirable to efficiently store the data which defines these sets. To this end, we present a new data structure in the form of a modified binary tree. The structure takes points and line segments as input and stores the nondominated subset of the input. Experimental results show that use of the structure improves the performance of BB.

3 - New Polyhedral Cone Models for Pointwise Preferences in Variable Domination Structures

Alexander Engau, Assistant Professor, University of Colorado Denver, 1250 14th Street, Denver, CO, 80202, United States of America, alexander.engau@ucdenver.edu

We present several new results and models for variable preferences in multiobjective programming and multiple-criteria decision-making. Unlike a few related approaches in the existing literature, our new preference models can be characterized by classes of polyhedral ordering cones , which facilitate their use both for modeling and computational optimization. A detailed analysis of the underlying cones will be given, and a few computational consequences and preliminary results will be addressed.

Image and Functional Data Analysis: Methods and Applications

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Kamran Paynabar, Georgia Institute of Technology, 765 Ferst Drive, Atlanta, GA, 30327, United States of America, kamran.paynabar@isye.gatech.edu

1 - An Adaptive Measurement Strategy for Characterizing Time Variant Surfaces using Image Data

Chenhui Shao, University of Michigan, Ann Arbor, 2350 Hayward St., Ann Arbor, MI, 48109, United States of America, chshao@umich.edu, S. Jack Hu, Judy Jin

A new adaptive measurement strategy is developed to characterize time varying tool surface conditions due to degradation. The proposed multi-scale spatial model of surface image data captures both the global degradation trend and local spatial variability of tool surfaces. The model goodness of fit, which uses residual, gradient, and spatial autocorrelation, is used to provide a systematic decision where adaptive measurements are most necessarily needed under a given accuracy requirement.

2 - Image Defect Detection with Smooth-Sparse Decomposition

Hao Yan, PhD Student, Georgia Institute of Technology, 755 Ferst Dr, NW, Atlanta, GA, 30332, United States of America, yanhao@gatech.edu, Kamran Paynabar, Jianjun Shi

Image based defect detection is popular for product inspection due to recent development in sensing technology. Existing techniques are all two-step 'first smooth then detect' approach. We propose a one-step smooth-sparse decomposition technique, which combines smoothing technique and variable selection to separate the defect region from smooth background under noisy environment. The effectiveness and efficiency of the proposed method has been tested in both simulation and case study.

3 - Sparse Particle Filtering for Modeling Space-Time Dynamics in the Stochastic Sensor Network

Yun Chen, USF, 14219 Les Palms Circle, Apt. 101, Tampa, FL, 33613, United States of America, yunchen@mail.usf.edu, Hui Yang

Wireless sensor network has emerged as a key technology for monitoring space-time dynamics of complex systems. However, traditional sensor networks demand reliable sensor readings. This paper presents a novel strategy of stochastic sensor networks that relax the hardware constraints. Experimental results demonstrated the effectiveness of sparse particle filtering to support the stochastic design and harness the uncertain information for modeling space-time dynamics of complex systems.

Tuesday, 12:30 - 2:30pm

INTERACTIVE SESSION

Interactive Session

Hilton Grand Ballroom A – B

Tuesday Interactive Session

Chair: Hari Balasubramanian, University of Massachusetts-Amherst, Amherst, MA, United States of America, hbalasub@admin.umass.edu

1 - Evaluation of Courses in a Higher Education Institution

Cesar Pandolfi - Docíncia, Universidade do Rio Grande do Sul, Alvaro Ferreiro Porto, Caxias do Sul, Brazil, cesar.pandolfi@fsg.br

The objective is to evaluate the changes in data collection for courses evaluation in a higher education institution. It has been used the internal consistency analysis and multivariate analysis. It is characterized as a case study, applied and descriptive. It has shown that the results can be grouped into three levels of satisfaction. It serves as basis for analysis and reorganization of the practices adopted by the courses.

2 - Clustering Items on the Web through Modelling user Communities

Masssey Cashore, University of Waterloo, Waterloo, ON, Canada, jmcashor@uwaterloo.ca, Xiaoting Zhao, Peter Frazier

The challenge of discovering structure in unlabelled data is important as ever in today's society. The cornerstone problem in this setting is clustering, that is, partitioning the items in a manner that coincides with the structure of the items. In this paper we present a probabilistic model of user-item interaction that allows us to cluster items and users, taking into account both user interaction data and item content. The model hinges on the assumption that users exist in communities and items exist in clusters such that the interest of a user in an item is completely determined by the user's community membership and the item's cluster membership. We construct a Gibbs sampler for inference, and apply the Gibbs sampler to a real life dataset from arXiv.org. Comparing the community clusters to a simpler clustering methods, we see several improvements in recommendation system accuracy, and the ability to partition items based on a real-world phenomenon from arXiv.org.

3 - Delivery Vehicle Routing at the Regional Food Bank of Oklahoma

Weikao Wu, Oklahoma State University, Stillwater, OK, United States of America, weikao@ostatemail.okstate.edu, Andrea Lewis, Katie Luster

The Regional Food Bank would like to meet the needs of the growing population of hungry in Oklahoma. To do this, they have to improve the efficiency of their operations, reduce their delivery costs and increase their delivery capacity. This paper reports on our project seeking improvements in the routing of their delivery operations. We identified several improvements to their current software usage which will enable the Food Bank to better route deliveries. Resulting cost savings will allow for over 6 million additional meals to be provided annually by the Food Bank based on projections developed from the test cases.

4 - Location Optimization for AYGAZ Auto Gas Facilities

Birce Sari, Koc University, Istanbul, Turkey, birsari@ku.edu.tr, Kerem Uzun, Ceren Yavuz, Beyza Turan

A location decision for distribution centers and their service regions is often one of the most critical fundamentals for success of an organization. This project summarizes the system and dynamics of Aygaz auto gas business in Turkey and suggests the deterministic model formulation of facility location problem in order

to minimize the overall cost. Our aim is to allocate feasible number of auto gas storage facilities in different cities, creating a new supply channel for Aygaz; in addition to Aygaz's six port terminals. The results of the project will be taken into consideration by strategic management of Aygaz for prospective investments.

5 - Missed Opportunities in Preventing Hospital Readmissions: Redesigning Post-discharge Checkup Policies

Michael Hu, University of Michigan, Ann Arbor, MI, United States of America, humich@umich.edu, Xiang Liu, Jonathan E. Helm, Mariel S. Lavieri, Ted A. Skolarus, Kedi Wu

Hundreds of thousands of patients experience hospital readmissions every year, negatively impacting patients and placing a tremendous burden on the national healthcare system. Post-discharge checkup policies can reduce readmissions through early detection of health conditions, however, the methods behind designing effective checkup policies are poorly understood. Under current practice, up to 67% of patients are readmitted before the first scheduled checkup. We develop an analytical model based on delay-time analysis to identify the optimal type, number, and timing of checkups. Analyzing the structure of optimal policies, we develop schedules that avert at least 32% more readmissions than current practice.

6 - System of Systems Architecture Generation using Evolutionary Algorithms & Negotiation Strategy

Siddhartha Agarwal, Missouri University of Science and Technology, Department of Engineering Management Rolla, MO, 65401, United States of America, sa265@mst.edu

Our attempt is to present a module within integrated SoS architecting model called FILA-SoS (flexible intelligent and learning architectures for systems of systems). FILA-SoS capabilities include SoS meta architecture generation, flexible and robust architecture assessment, and final architecture implementation through simulated negotiations.The paper uses evolutionary algorithms-Fuzzy nets to generate meta-architectures.

7 - Multi-resolution Analysis (MRA): Integrating Methodologies for Today's Analytical Challenges

John Tindle, Director, Analytical Services, TASC, Inc., 1795 Jet Wing Drive, Suite 100, Colorado Springs, CO, 80916, United States of America, john.tindle@tasc.com

The premise of Multi-Resolution Analysis (MRA) is that complex domains of capability should be analyzed from different perspectives with tailored models and tools appropriate for each perspective, but with the 5 OR & DA segments of the analysis integrated to provide traceability of cause and effect for combined total impact.

8 - Optimal Bidding Strategy Based on Parametric Linear Programming Considering Incomplete Information

Feng Gao, Ventyx, an ABB Company, 451 El Camino Real, Santa Clara, CA, United States of America, feng.gao@ventyx.abb.com, Kory Hedman

Electricity market participants face risks and uncertainties associated with the changing market environment. A profit-driven bidding system is crucial for generation companies to maintain a competitive position. This paper presents an optimal bidding strategy derived by parametric linear programming and extends it to consider incomplete information. We show that the proposed algorithm is able to utilize the characteristics of piecewise staircase offer curves in contrast to existing methods.

9 - Optimization of Treatment Decision for Glycemic Control for Patients with Type 2 Diabetes

Yuanhui Zhang, Center for Disease Control and Prevention, 4770 Buford Highway, Chamblee, GA, 30341, United States of America, yuanhui.zhang@gmail.com, Nilay Shah, Steven Smith, Jennifer Mason, Brian Denton

The main objective for care of type 2 diabetes is to control the patient's glycated hemoglobin (HbA1c) to reduce the risk of the diabetes complications. Uncertainty in the progression of HbA1c and the treatment effects make treatment decisions challenging. We present a Markov decision process to maximize the patient's expected quality-adjusted life years prior to major complications. We present the structure of the optimal policy and compare it to current guidelines.

10 - A Web Tool for Model-based Decision Support

Joseph Kahn, Novartis Pharmaceuticals, 1 Health Plaza, East Hanover, NJ, 07960, United States of America, joseph.kahn@novartis.com, Richard Nixon, Peter Danenberg, Vineet Joshi, Chien-Hsun Huang, Dipika Mukherjee

Decision models yield insights for drug development, but lack of automation hampers systematic use. Hence, we developed a web-based tool, incorporating decision analysis best practices. The tool compares "strategy table" scenarios, identifying influential parameters and risks. Its uses have included trial design, and prioritizing among indications. The tool drives models in the open-source R language. By automating decision models, the tool facilitates faster insights and reduces manual errors.

11 - Evaluation of Breast Cancer Mammography Screening Policies Considering Adherence Behavior

Mahboubeh Madadi, University of Arkansas, 900 N Leverett, Fayetteville, AR, 72701, United States of America, mmadadi@email.uark.edu, Louise Henderson, Shengfan Zhang

Incorporating heterogeneity in women's adherence behavior, a randomized partially observable Markov chain model is developed to evaluate a wide range of screening mammography policies. Screening policies are compared in terms of quality adjusted life years (QALYs) and breast cancer lifetime mortality risk. Our results show that women with perfect adherence do not always experience higher QALYs. However, in terms of lifetime mortality risk women with higher adherence rate always have lower risk.

12 - Hospitalists and Hospital Productivity

Rezwan Haque, Harvard Business School, Soldiers Field Road, Boston, MA, 02163, United States of America, rhaque@hbs.edu, Robert Huckman

We investigate an important recent trend in inpatient care: the emergence of primary care doctors, known as hospitalists, who spend all of their professional time in the hospital. We find that hospitalist use is associated with reductions in length of stay for the most complex patients. This outcome could be due to the fact that hospitalists develop more process familiarity, which enables them to be better at tasks such as care coordination that are especially important for complex patients.

13 - Bank Marketing Analysis using Multivariate Techniques

Nasim Nezamoddini, State University of New York at Binghamton, 13 Goethe St., Binghamton,NY, 13905, United States of America, nasim.nezam@gmail.com

This research applies multivariate techniques to find customers willing to invest in new projects. To increase the accuracy of the predictions, different types of customers are identified using clustering techniques. Then specialized prediction models are built in terms of advertisement strategies, customers' characteristics and their attitude obtained by factor analysis.

14 - Integrating Relativity into Multi-attribute Utility Model: An Application on Product Improvements

Selin Erguncu, Doctoral Candidate, Koc University, Istanbul, Turkey, serguncu@ku.edu.tr

Building on MAUT, we propose a framework that recognizes 'relativity' effect in multi-alternative evaluations. We show that each alternative under consideration acts as a 'reference point' for others and choosing an alternative (vs. rating it) decreases its perceived utility. Applying our framework on the assessment of product improvements, we further show that improving a poor (vs. strong) attribute is a better strategy and improvements are more attractive for first-time buyers (vs. switchers).

15 - A Statistical Human Resources Planning in a Call Center

Kosuke Shaku, Tokyo Gas Co., Ltd., 5-20 Kaigan 1-chome, Minato-ku, Tokyo, Japan, shaku@tokyo-gas.co.jp, Toshinori Sasaya, Koji Takayasu

A call center is considered as a queueing network and some results from queueing theory are often applied to calculate the necessary number of agents to maintain a desired service level. However, the actual situation in a call center is complicated compared to the prerequisites of basic formulae in queueing theory such as Erlang C formula because of varieties in both inbounding calls and agent skills. We present a new statistical human resources planning to avoid such problems.

16 - Linguistic Indicators of Satisfaction and Intent in Online Text-based Customer Service Chats

Justin WIlliams, University of Arizona, 1130 E. Helen St., McClelland Hall 430, Tucson, AZ, 85721, United States of America, jwilliams@cmi.arizona.edu, Lee Spitzley

Online, text-based chat is an important way for companies to provide customer support through a web interface. It is unclear how the customer service representative's (CSR) language influences the customer's satisfaction and likelihood to recommend the product. We propose to study the language of CSRs in an online customer support scenario to identify meaningful language characteristics that have an ability to predict satisfaction and likelihood to recommend the product.

17 - Real-time Integrated Airport Surface Operations Management

Yu Zhang, Assistant Professor, University of South Florida, 4202 E. Fowler Ave, ENB 118, Tampa, FL, 33620, United States of America, yuzhang@usf.edu, Qing Wang

This paper describes a real-time integrated airport surface operations management (RTI-ASOM) that provides optimal 4-D trajectories for aircraft between gate and runway with the objective of minimizing taxi delay and maximizing runway throughput. The use of MIP formulation, Dynamic Programming for runway sequencing, and Visual Basic scripted interface solve the large-scale optimization problem instantly, with examples based on one-day track data at LaGuardia Airport (LGA).

18 - Monitoring and Predicting the Patient's Length of Stay in Hospital Using Regression Control Charts

Nasibeh Azadeh-Fard, PhD Student, Virginia Tech, 250 Durham Hall, Blacksburg, VA, 24060, United States of America, nasibeh@vt.edu, Jaime Camelio

Modified Early Warning Scoring (MEWS) system, a triage tool that is widely used by healthcare providers, can quickly determine the severity of patient's illness. The goal of this study is to assess the correlation between admission MEWS and patient's length of stay in the hospital. We utilize this correlation to further monitor the length of stay using the regression control charts. This tool can help hospital staff to predict patient's length of stay, which can lead to more effective management of patient's needs, as well as early resource allocation.

19 - Integrated Optimization on Outsourcing and Production Decisions in Global Supply Chain

Lu Zhen, Professor, Shanghai University, Shang Da Road 99#, School of Management, Shanghai, 200444, China, lzhen@shu.edu.cn

Manufacturers in China are facing decisions on supplier adoption in overseas and domestic markets, production plans for customers in the two markets. These decisions are intertwined. This paper studies an integrated optimization problem on outsourcing and production decisions under environment of global supply chain and China's export-oriented tax policies. A three stage decision model is proposed. A cross entropy based solution method is also developed for solving the three stage model.

20 - Children for Wealth- Fertility Competetion

Bumi Camara, University of Goettingen, Platz der Sieben 5, Goettingen, 37073, Germany, bcamara@uni-goettingen.de

This paper examines the inter-play between inheritance laws and poverty among women in Africa and how this interaction induces high fertility for women in polygamy. I provide evidence of fertility competition among women in polygamy. Polygamy but not monogamy is associated with high fertility if the husband is affluent. Birth spacing is much shorter and contraceptive use is less likely among co-wives whose husband owns inheritable wealth. Results imply intergenerational poverty in Africa.

21 - Salesforce Contracts Equilibrium for Inventory Optimum with Customer Loyalty Moderating Effects

Yu-Ching Chern, National Taiwan University, No. 1, Sec. 4, Roosevelt Road, Taipei, Taiwan - ROC, d02546004@ntu.edu.tw, Gwo-Hshiung Tzeng

We present a multistage model to optimize firm's contracts which induce salesmen's productive behaviors and elicit market demand information.Our model aims to simultaneously resolve the moral hazard and the adverse selection problems.Employing the firm's equilibrium strategy and salesforce's optimal actions,the inventory cost and profits outperforms other existing compensation schemes.Results also indicate that loyal customer base act as implicit incentives to motivate salesperson's performance.

22 - Clinical Prediction of Metastatic Disease among Newly Diagnosed Prostate Cancer Patients

Maria Correa, Department of Industrial Engineering, St. Mary's University, 1 Camino Santa Maria, San Antonio, TX, 78228, United States of America, marifercorreag@hotmail.com, Brian Denton, Selin Merdan, Paul Womble, David Miller, Jianyu Liu

Computed Tomography (CT) and Bone Scan (BS) are imaging tests for detection of metastatic disease among prostate cancer patients. We performed statistical validation of predictive models for CT and BS outcomes to help physicians decide when to recommend patients for imaging. We applied several methods for internal and external validation including leave-one-out and bootstrapping. We present results from our analysis and discuss plans for implementation of the models in a smart phone application.

23 - Multi Sales Channel Competition with Product Returns: The Impact of Restocking Fee Legislation

Rita Difrancesco, WHU-Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, rita.difrancesco@whu.edu, Arnd Huchzermeier

With the explosive growth of the internet, the brick-and-mortar stores are either integrated or substituted by the online channel. We model the multiple sales channels competition with product returns and analyze the equilibrium structure. We investigate the effect of restocking fees and a new EU legislation concerning free returns.

24 - A Comprehensive Sensitivity Analysis of Travel Time Reliability

Meredith Cebelak, University of Texas at Austin, 1616 Guadalupe St., Suite 400, Austin, TX, 78701, United States of America, mcebelak@utexas.edu, Jia Li, C. Michael Walton

Travel time reliability is a key performance measure of transportation systems. This study examines the simultaneous impacts of infrastructure capacity variability due to inclement weather, incidents, and infrastructure maintenance, and demand variations due to feedback mechanisms and elasticity. A comprehensive sensitivity analysis is perform on travel time using a HCM tool and experiment design, revealing critical contributing factors on daily travel time uncertainty along freeway corridors.

25 - International Analysis of Government Strategies for Service Sector Innovation

Jessica Brooks, Science Policy Fellow, IDA - Science and Technology Policy Institute, 100 I St. SE, Washington, DC, 20003, United States of America, jnbrooks@ida.org

To observe the position of service innovation in the context of broader science and technology innovation policy, the innovation strategies of 15 nations were analyzed. Trends in policy content, including the relationship to IT innovation strategy, are described in order to understand the global landscape of service innovation policy.

26 - Flow Path Design in Automated Material Handling Systems

Kelly Bartlett, Georgia Institute of Technology, 755 Ferst Dr., Atlanta, GA, 30332, United States of America, kelly.bartlett@gatech.edu, Shabbir Ahmed, Junho Lee, George Nemhauser, Joel Sokol

In automated material handling systems, dynamic routing has been shown in improve routing efficiency over traditional static routing methods. We demonstrate via high-fidelity simulation that altering flow path design for use with dynamic routing improves routing efficiency by an additional 25%. To facilitate this analysis, we present an automated layout generation tool that allows efficient generation of thousands of potential configurations.

27 - Deductible Insurance and the Transfer of Risk

Christopher Gaffney, Stevens Institute of Technology, 1 Castle Point Terrace, Hoboken, NJ, United States of America, cgaffney@stevens.edu

We provide a mean-variance analysis of insurance demand, showing that deductible insurance is preferable to coinsurance. Furthermore, adding either a stop-loss limit or a deductible to the coinsurance model results in an optimal insurance plan equivalent to deductible insurance. An argument concerning the societal benefit of insurance is also given.

28 - A Lagrangian Decomposition Approach for Renewable Energy Investment and Operational Decision Model

Alireza Ghalebani, PhD Student, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33613, United States of America, alireza@mail.usf.edu, Tapas Das

We studied the structural property of a distributed green energy generation optimization model in order to solve it more efficient comparing to the commercial solvers. The model is an incentive based mixed integer programming optimization for design and control of grid-connected hybrid power systems. It fits well for regions with net-metering policy and time varying price of electricity.

29 - Evaluating Cost and Service Level Tradeoffs in a Production and Inventory System with Disruption

Jue Gong, Graduate Student, University of Pittsburgh, 3700 O'Hara St., Pittsburgh, PA, 15261, United States of America, jug29@pitt.edu, Louis Luangkesorn

In a production and inventory system with production disruptions, production uncertainty can be managed through setting the produce-up-to level and sizing the production capacity to provide resiliancy. But these choices result in costs for inventory holding and production capacity and the service level of the system. We develop a Markov-chain model for both periodic and continuous-review policies to explore and illustrate the tradeoffs between operating costs, capacity costs, and service level.

30 - Modeling of Emergency Management of Urban Extreme Storm Floods Based on Strong Reciprocity

Liu Gaofeng, Hohai University, No.200, North Jinling Road, Xinbei District, Changzhou, 213022, China, gaofengliu@hhu.edu.cn

Strong reciprocity theory is introduced into modeling of emergency management of urban extreme storm floods (UESF). Simulations are performed in the example of Jingdezhen city, and the results show that the government strong reciprocity helps to promote emergency cooperation. Besides, rewards and punishment, strong ability of acquiring and processing information, extensive publicity and education can all improve emergency cooperation efficiency and effectiveness of UESF.

31 - Analysis of Nonselective and Selective Advertising Strategies in an Oligopoly Setting

Chloe Fletcher, College of Charleston, 66 George Street, Charleston, SC, 29424, United States of America, fletcherca@g.cofc.edu, Jason Howell

Firms with the ability to identify customers of other firms may implement a strategy where the advertising effort towards competitors' customers differs from that towards uncommitted customers. We present dynamic models for advertising in an oligopoly with fixed market size and sales decay: a nonselective model in which the advertising effort is the same for both types of customers, and a selective model that gives firms the capability to allocate effort across the two categories differently.

32 - Food vs Biofuel: Analysis of Land-use Competition And Environmental Impacts

Halil Cobuloglu, Wichita State University, 1845 Fairmount St, Wichita, KS, United States of America, halil.cobuloglu@gmail.com, Esra Buyuktahtakin

In this study, we develop a mixed integer optimization model in order to investigate the economic and environmental tradeoffs between biofuel and food production. This model maximizes the total profit of farmers while satisfying sustainable food supply. Optimal decisions include allocation of lands to food and energy crops, seeding time, harvesting time and amount, and budget allocations to farm operations. The model is applied in Kansas by considering the production of corn and switchgrass.

33 - Re-envisioning Decision Quality at ConocoPhillips

John Hasar, Development Lead, ConocoPhillips, Rubislaw House, Anderson Drive, Aberdeen, AB15 6FZ, United Kingdom, john.hasar@conocophillips.com, Sharon Rode

ConocoPhillips is changing how and what they share around Decision Quality. Earlier emphasis focused on translating data into quantitative format. While modeling and analysis are needed, not everyone has to be an analyst. Better alternatives are reached by teams highly involved in framing the decision and communicating their knowledge.

34 - Efficient Batch Scheduling for a Petrochemical Blending Plant with a Shared Pipeline Network

Alessandro Hill, University of Antwerp, Prisstraat 13, Antwerp, 2018, Belgium, alessandro.hill@uantwerpen.be, Trijntje Cornelissens, Kenneth Sorensen

We develop an effective scheduling heuristic for realistic production planning of a multi-product, multi-BOM petrochemical blending plant with a complex shared pipeline system. The model takes takes into account component pumping, blending, intermediate storage and filling of the finished products. Our algorithm dynamically prioritizes the production orders and the used dedicated resources to optimize multiple operational objectives. We apply the algorithm to real-world scenarios.

35 - Optimization Strategies for the Best Performance of Healthcare Authority Databases using DM

Yohany Jimenez, Researcher, LOGYCA, Avenida El Dorado N∫ 92 - 32 Modulo G5 P, Bogota, Colombia, yjimenez@logyca.org, Miguel Jimenez, Lauren Castro, Laura Manotas, Diana Ramirez, Heyder Paez, Luis Ramirez

This paper deals with the application of Data Mining (DM) algorithms as an approach to optimize the performance of data processing of the healthcare authority databases, where huge amount of data is managed regarding the new affiliations to the National Healthcare System and reports on the validation of this data are done at a monthly basis. This strategies are integrated to a Decision Support System (DSS) that was implemented as part of the research project.

36 - The Impact of Security in Maintaining Reliable Distributed Control Systems

M. Eric Johnson, Professor, Vanderbilt University, Owen Graduate School of Management, Nashville, TN, 37203, United States of America, Eric.Johnson@vanderbilt.edu, Andrei Sleptchenko

We consider the role of security in the maintenance of an automated system, controlled by a network of sensors and simple computing devices. Such systems are widely used in transportation, utilities, healthcare, and manufacturing. We formulate a stochastic model to examine the repair policies for both real and suspected failures.

37 - The Impact of Multi-skilling on Personnel Scheduling in the Retail Industry

Cesar Henao Botero, PhD Student, Pontificia Universidad Catolica de Chile, Avda. Vicuña Mackenna 4860, Macul, Department of Transportation Engineering, Santiago, Chile, cahenao@uc.cl, Juan-Carlos Muñoz Abogabir, Juan-Carlos Ferrer Ortiz

Retail personnel inflexibility is one of the sources for over- and understaffing. We propose analyze the impacts of assigning multi-skilled personnel to different store departments and its potential for improving schedule efficiency. Our model determines which employees are trained to work in which departments and their assignments over a one-week planning horizon. Some multi-skilling policies are derived from data obtained from a large retail firm in South America.

38 - The Effect of Socioeconomic Inequalities on Public Education Performance in Developing Countries

Maria Cristina Gramani, Insper, Rua Quata, 300, Vila Olìmpia, Sao Paulo, 04546042, Brazil, mariacng@insper.edu.br

The main objective of this study was to add evidence of the effects of the socioeconomic inequalities on the educational performance. The main question here is: What socioeconomic factor more influences the educational performance? How can we do better? We propose a two-stage model which includes: (1) an educational performance model and, (2) a socioeconomic-education model that identifies characteristics that differentiate the most and least efficient groups.

39 - Integrating Timetabling and Vehicle Scheduling: Tradeoff Between Transfers and The Fleet Size

Omar Ibarra, Post-doc Researcher, Pontificia Universidad Catolica de Chile, Vicuña Mackenna 4860, Macul, Santiago, Chile, oibarrar@uc.cl, Ricardo Giesen, Yasmin Rios-Solis

In transit systems there is a trade-off between the level of service and operating costs. This study presents a bi-objective integrated model for timetabling and vehicle scheduling problems that maximizes passenger transfers and minimizes the fleet size. We implement an epsilon-constraint method to solve our formulation and analyze the trade-off between the two criteria in terms of Pareto fronts. Numerical experiments show that our proposed approach can solve scenarios with up to 50 bus lines.

40 - Evaluation of Construction and Improvement Heuristics for Classification Using Markov Blankets

Daniel Gartner, TUM School of Management, Arcisstr. 21, Munich, Germany, daniel.gartner@tum.de, Rema Padman

This study examines a construction heuristic in connection with a tabu search-based improvement heuristic for classification in high dimensional data sets. Using the UCI machine learning data repository, we evaluate computation times and information about the evolution of the Markov blanket graphical models during the construction and the improvement phase. We compare the performance of the construction and improvement heuristic using classification accuracy as evaluation measure.

41 - Profiling Facebook Users' Privacy Behaviors

Bart Piet Knijnenburg, University of California, Irvine, Informatics Department, Irvine, CA, 92617, United States of America, bart.k@uci.edu, Heather Richter Lipford, Pamela Wisniewski

Social Networks users typically exploit only a subset of the available privacy controls. Using factor analysis and clustering techniques on Facebook users' privacy behaviors, we uncovered six privacy management profiles. We demonstrate that the variability in these profiles is partially due to a lack of awareness regarding the available controls.

42 - Clustering Subgraphs for Repeated Motifs

Nam Lee, Johns Hopkins University, 100 Whitehead Hall, 3400 North Charles Street, Baltimore, MD, 21214, United States of America, nhlee@jhu.edu

We consider a problem of grouping multiple graphs into several clusters using singular value thesholding and non-negative factorization. We derive a model selection information criterion to estimate the number of clusters. We demonstrate our approach using ``Swimmer data set" as well as simulated data set, and compare its performance with two standard clustering algorithms.

43 - Are You Sure this is the Clothing Style You Defined?

Yusan Lin, PhD Candidate, Pennsylvania State University, 301D Grubb, White Course Apartments, University Park, PA, 16802, United States of America, yusan@psu.edu

When marketing clothing products, it is necessary for the sellers to be aware of the styles of their products, and the kind of consumers they are targeting. However, how does one make sure the style they define is correct? We leveraged the fashion-focused social network, lookbook.nu, and examined whether their definition of styles corresponds to the network structure.

44 - Entropy Maximization with Stochastic Dominance and Moment Constraints for Distribution Approximation

Alexander Mafusalov, PhD Student, University of Florida, 303 Weil Hall, Gainesville, FL, 32611-6595, United States of America, mafusalov@ufl.edu

Entropy maximization with linear constraints (second order stochastic dominance constraint, first and second moment constraints) is proposed for sample distribution approximation problem. Solution is a piece-wise Gaussian function. The second moment convergence implies solution convergence to sample distribution. Cross-validation with likelihood maximization is used to adjust second moment proximity.

45 - Issues in Resiliency for the Australian Food Supply Chain

Leorey Marquez, Research Scientist, CSIRO, Gate 5, Normanby Road, Clayton, VI, 3168, Australia, leorey.marquez@csiro.au, Rodolfo Garcia-Flores, Simon Dunstall

Roughly one-third of food produced for human consumption is lost or wasted globally. At the same time, food production is under threat from climate change, competing land uses, erosion and clean water shortages. This poster showcases recent work aimed at understanding key elements of resilience in the Australian food supply chain. These studies investigate points of vulnerability, the types of threats that can occur in the event of a severe emergency and the strategies needed to address them.

46 - Optimal Combination of Multiple Diagnostic Tests with Application to Prostate Cancer

Selin Merdan, Department of Industrial and Operations Engineering, University of Michigan, 1640 McIntyre Street, Ann Arbor, MI, 48109, United States of America, smerdan@umich.edu, Brian Denton, Christine Barnett

In the early detection and diagnosis of disease, multiple tests are used to discriminate between patients with and without the disease. In the context of cancer, there are several risk factors that predict the presence of the disease; however, the optimal assignment of diagnostic tests to patients based on these risk factors is not known. We present a new model to optimally classify patients for composite diagnostic testing such that false positive and false negative results are minimized.

47 - Bayesian Analysis to Determine Phase Change Time in Stem Cells

Louis Luangkesorn, Research Assistant Professor of Industrial Engineering, University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara St., Pittsburgh, PA, 15261, United States of America, lol11@pitt.edu, Ali Hjaar

Understanding the dynamics of stem cell differentiation can help in using stem cells in therapeutic and other medical applications. However, measuring the change in cell samples is difficult. This makes it difficult to parameterize mathematical models. Bayesian calibration methods are useful in cases where there are few samples and measurement error. We apply Bayesian methods and show how they lead to more useful estimates of parameters relating to the stem cell reproductive cycle.

48 - A Game-theoretic Procedure for Bridge Construction Cost Allocation

Saurav Kumar Dubey, PhD Student-Department of Industrial and Systems Engineering, University of Tennessee at Knoxville, 1615 Laurel Avenue, Knoxville, TN, 37916, United States of America, skumardu@utk.edu, Alberto Garcia-Diaz, Dongju Lee

The proposed method integrates traffic capacity and load requirements to allocate bridge costs among vehicle classes, using two game-theoretic criteria known as Aumann-Shapley value and Shapley value, and an incremental allocation procedure.Players are defined as vehicle classes, axle load applications, or lanes.The gross-weight based incremental procedure determines marginal costs.

49 - Cost Estimation Method for R&D Research Fund of Government in Korea

Dong-Guen Kim, Associate Research Fellow, Korea Institute of S&T Evaluation and Planning (KISTEP), Dongwon Industry Bldg., 275 Yangjae-dong, Seoul, Korea, Republic of, dgkim@kistep.re.kr

In Korea, the preliminary feasibility study(PFS) is carried for the newly proposed large-scaled government programs. In case of a PFS on R&D programs, the estimation of project cost is needed. In this study, the method of estimation on R&D project cost are researched. Using the historical data about simliar R&D project, the distributions of R&D project costs are investigated and the methodology for estimation on parameters of project cost is developed.

50 - Multiple Criteria Simulation Optimization: Further Refinements

Esmeralda Niño, Graduate Student, University of Puerto Rico at Mayagüez, PO BOX 9000, Mayagüez, 00680, Puerto Rico, esmeralda.nino@upr.edu, Mauricio Cabrera-Rìos, Bryan Rosas

In particular, this work improves upon the use of Data Envelopment Analysis to determine the efficient frontier, as well as, the use of a single-pass algorithm previously proposed by our research group. The results show a rapid convergence to a more precise characterization of the Pareto-efficient solutions. The revised algorithm is illustrated by a series of cases in manufacturing systems simulation.

51 - Iterated Local Search for Flexible Job Shop Scheduling Problems with Resource Constraints

Dimitris Paraskevopoulos, Assistant Professor, University of Bath, Claverton Down, Bath, BA2 7AY, United Kingdom, dp465@bath.ac.uk, Christos Tarantilis, Panagiotis Repoussis

This work presents an Iterated Local Search (ILS) algorithm for flexible Job shop scheduling problems with deadlines, sequence dependent setup times, machine availabilities and most importantly resource constraints. The proposed ILS introduces new compound moves and consorts with an adaptive perturbation mechanism. Experiments on randomly generated problem instances are reported.

52 - Consumer Loan Acquisition Decisions in the Context of Economic Uncertainty

Kanshukan Rajaratnam, University of Cape Town, 4.70 Leslie Social Science Building, Rondebosch, 7700, South Africa, kanshukan@gmail.com

We incorporate forecasts of future economic conditions into acquisition decisions for scored consumer loan portfolios. The portfolio manager must choose both a cutoff score and its associated level of capitalization prior to account performance. In this research, we consider the scoring and regulatory capital decision under multiple economic scenarios. We construct the set of efficient operating points in the market-share and profit space.

53 - How to Complete Subsequent Deals? Breadth and Depth of M&A Success in Semiconductor industry

Jieun Hwang, Seoul National University, LG #59-110, Daehak-dong, Gwanak-gu, Seoul, Korea, Republic of, jieun_sara@hotmail.com, Taewoo Roh

Previous studies on M&A have neglected the importance of deal completion. Based on organizational learning theory, we find that firms can learn to complete the deal from prior success acquisition experience. We examine that intra-industry acquisition experience increases the deal completion and the deal speed in semiconductor industry. Moreover, inter-industry acquisition experience moderates the relationship.

54 - The KANBAN Gamification in a Strategic Operation Management Simulation

Felipe Reis Graeml, Centro Universitario da FEI, Departamento de Engenharia de Produçao, Brazil, fgraeml@fei.edu.br, Mauro Sampaio

This article presents the results of a simulation performed with students, using gamification to teach KANBAN in an Operations Management context. The article defends and justifies the use of "gamification" as an alternative to support theoretical classes, diminishing the effect of learning inhibits, increasing the retention of knowledge for longer period, and stimulating skills development on students.

55 - A Fuzzy Linguistic Based Decision Support System for Evaluating Remanufacturability of Products

Thomas Omwando, University of Wisconsin Milwaukee, 3200 N Cramer Street, EMS 503, Milwaukee, WI, 53211, United States of America, tomwando@uwm.edu, Anthony Ross, Wilkistar Otieno

Remanufacturing as an end of life disposal option faces challenges due to uncertainties associated with product attributes. This work presents a decision support system based on a 2-tuple fuzzy linguistic computing approach to integrate qualitative and quantitative product attributes in determining the remanufacturability of a product. The model is applied to assess the suitability of remanufacturing two products manufactured by a global industry based in the mid-west region of the USA

56 - Extending the Complexity of Covering-routing Problem Considering Maximum Returns to Critical Areas

Maria Jose Pinto Lamosa, Dra., IEAv/CTA, Trevo Cel Av. Jose A. A. do Amarante, 1, S„o José dos Campos, Brazil, maju@ieav.cta.br, MÖnica Maria De Marchi

The problem consists on determining routes with minimum costs and maximum returns to critical areas. We had solved it using a multi-objective model, but the simplifications considered in that model became difficult to apply it in real scenarios. A new model is proposed including features and limitations to the problem, as the associated time and the entity autonomy/capacity. The problem has been applied in scenarios where monitoring is required like disaster management and airspace surveillance.

57 - Predictive Dialing in the Cloud

Douglas Samuelson, InfoLogix, Inc., 8711 Chippendale Court, Annandale, VA, 22003, United States of America, infologix1@aol.com

We extend earlier methods to perform predictive dialing in a Cloud-based virtual call center, with much more flexibility of operational behaviors and consequently a more complex control problem. Big Data and Big Computing methods yield high utilization with acceptably low numbers of abandoned calls.

58 - Destructive Leadership and its Organizational Impact: A Critical Discourse Perspective

Masato Suzuki, Tokiwa University, 1-430-1,Miwa, Mito-shi, Japan, msuzuki0107@gmail.com

The purpose of this study is to investigate leaders' abuse to subordinates and its organizational impact from critical discourse perspectives. While a lot of studies have examined destructive leadership, little is known about how organizational abuse unfolds in organization. Combining dairy analysis and follow up interviews, this study shows that the impact of leaders' abuse to subordinates is not confined to a worker abused, but to behaviors which not abused employees do in organization.

59 - Deducing Patient Placement Decisions in Hospitals; An Integer Programmin Approach

Nooshin Valibeig, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States of America, n.valibeig@neu.edu, Jacqueline Griffin

Hospitals operations are captured in several independent information systems, resulting in lost information about underlying decision processes. We use integer programming to integrate a flow and a census data set to extract important underlying characteristics of the system. Additionally, we analyze the accuracy and robustness of the model using simulated data.

60 - Method of Characteristic Functions for Networks with Fixed Node Degrees
Vladimir Tsurkov, Head of Department, Computing Centre of Russian Academy of Sciences, Vavilov Str., 40, Moscow, 119333, Russia, tsur@ccas.ru

Classes of networks with fixed node degrees and weights of arcs and loops not exceeding a given parameter are studied. Characteristic functions are found that depend on vector components and a parameter; the non-negativeness of this parameter is the network existence criterion. The sums of arc weights on each subset after decomposition and the sum of arc weights incident upon the nodes of subsets are treated as variables. Formulas for the upper and lower bounds for these variables are obtained.

61 - Scheduling Urgent and Normal Jobs in a Two-machine Flowshop
Sang-Oh Shim, Hanbat National University, Dept of Business Administration, Hanbat, Deokmyung-Dong Yuseong-Gu, Daejeon, Ko, 305-719, Korea, Republic of, mizar0110@gmail.com

In this research,a problem of scheduling urgent and normal jobs in a two-machine flowshop is addressed to minimize total tardiness and the maximum completion time for urgent jobs and normal normal jobs, respectively. Several heuristics to obtain an feasible solution in a reasonable time are developed. To evaluate the performance of the proposed algorithms, computational experiments are done on randomly generated instances.

62 - Using Mixed-effect Models to Monitor Product Quality in Interchangeable Manufacturing Processes
Abbase Saghaei, Science and Research Branch Islamic Azad University, Hessarak, 1477893855, Tehran, Iran, a.saghaei@srbiau.ac.ir, zahra pishravian, Mehrdad Nikoo

Interchangeable Manufacturing Processes create different distributions of data, which usually the traditional methods cannot model them. This paper presents a new method for phase II monitoring geometric profiles of gears with different distributions of data. At first, a functional data clustering method is used to cluster the profiles. Then, a mixed-effect model is proposed to consider both within and between clusters variations. The proposed method has shown good performance in such processes.

63 - Stochastically Constrained Simulation Optimization on Integer-ordered Spaces
Kalyani Nagaraj, Virginia Tech, 250 Durham Hall, Blacksburg, VA, United States of America, kalyanin@vt.edu

We present a provably efficient algorithm for optimizing a system whose objective function and the functions forming the set of constraints are observable only via a stochastic simulation parameterized by a finite number of integer-ordered variables. Additionally, we present heuristics for automatically tuning the algorithm parameters that demonstrated good finite-time performance.

64 - Robust Dynamic Pricing for Oligopolistic Service Providers with Fixed Inventories
Yiou Wang, Pennsylvania State University, 244 Leonhard Building, University Park, PA, 16801, United States of America, yiw5120@psu.edu, Terry Friesz, Tao Yao, Ke Han

The problem of robust dynamic pricing of an abstract commodity with fixed inventories specified at initial time is formulated as a continuous time generalized dynamic Nash game and developed into a robust continuous time quasi-variational inequality. We then show the equivalent variational inequality and give effective algorithms based on this. Numerical examples consist of the comparison between robust and stochastic formulations and quantification of efficiency of such supply chain.

65 - Price Discount and Inventory Planning with Binding Reservation
Jianghua Wu, Associate Professor, Renmin University of China, School of Business, 59 Zhonguancun Street, Beijing, China, jwu@ruc.edu.cn

In this paper, we consider the strategy of a firm to use price discounts to implement binding reservation. The firm offers a price discount to customers in exchange for the option to fulfill their orders at the end of the selling season if there is inventory available. The firm can use the advance order information to update demand information. We derive the optimal discount and inventory decision, and then evaluate the impact of various parameters on the performance.

66 - Portfolio Optimization for Options: An Approximate Dynamic Programming Approach
Yaxiong Zeng, Northwestern University, 2145 Sheridan Road, IEMS, Evanston, IL, 60208, United States of America, yaxiongzeng2015@u.northwestern.edu, Diego Klabjan

In portfolio optimization, option has played a relatively small role with few papers discussing its potential impact. In our paper, we design a novel ADP algorithm for European option portfolio and an ADP-embedded non-standard progressive hedging algorithm for American option portfolio. We are the first to add American options into portfolios and explicitly take optimal exercise time into account. By simulation, we compare our algorithms against existing ones and conclude ours perform better.

67 - The Impact of Information Sharing and IT on Customer Service Performance
Wenjie Zhang, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, 710049, China, wenjie363@qq.com, Gang Li

Information sharing and IT constitute an important base of competitive advantage for organizations, as they enable the level of customer service. This study proposes a model to analyze the effects of Information sharing and IT on delivery service and after sale support service,and considers the Interaction effects of Information sharing and IT. A large-scale survey was used to tests these relationships and findings provide several theoretical and practical implications for future research.

68 - Adaptive Decision Making of Breast Cancer Mammography Screening: A Heuristic Regression-Based Model
Fan Wang, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, fxw005@uark.edu, Shengfan Zhang

Mammography screening, although effective in reducing breast cancer morality, has high false-positive rates. We develop a regression-based decision model to determine if a mammogram is necessary for various women. The explanatory variables include several risk factors. The optimal decisions are expected to result in the least loss of life expectancy.

69 - From Theory to Practice: Implementation of a Resource Allocation Model in Health Departments
Emine Yaylali, Senior Service Fellow, Centers for Disease Control and Prevention, 1600 Clifton Road, Atlanta, GA, 30329, United States of America, wqq3@cdc.gov, Stephanie Sansom, Arielle Lasry

HIV resource allocation models can synthesize surveillance, programmatic and research data to guide the distribution of HIV prevention dollars among people and programs. Many theoretical models for HIV resource allocation have been developed, although few have been used and evaluated across multiple sites. We developed an HIV resource allocation model that was piloted and evaluated in four health departments. We present health departments' evaluations of their use of the model and its results.

Mission Planning III

Sponsor: Military Applications Society

Sponsored Session

Chair: Chase Murray, Auburn University, 3301 Shelby Center, Auburn, AL, United States of America, CCM0022@auburn.edu

1 - Usability Analysis of a Task-based Mission Supervisory Control Interface
Luca Bertuccelli, United Technologies Research Center, 411 Silver Lane, East Hartford, CT, 06108, United States of America, luca.bertuccelli@utrc.utc.com, Francesco Leonardi, Jeffrey Peters, Amit Surana

Task-based supervisory control enables an operator to provide a list of tasks that the vehicle team must accomplish and has been shown to have advantages over vehicle-level supervisory control, where an operator manages single vehicles. However, there is little understanding into how users make decisions while using a task-based user interface. This work presents early usability results in user interaction with a task-based user interface under varying number of total vehicles supervised.

2 - Anticipatory Routing of UAVs Using a Game Theoretic Approach
Michael Couche, University at Buffalo, 342 Bell Hall, Buffalo, NY, 14260, United States of America, mjcouche@gmail.com

The UAV routing algorithm takes advantage of game theory solution principles to predict routing in different scenarios. One of the most interesting scenarios is that in which UAVs are modeled as competitive players in the search for information. This scenario provides insights to effective search and routing when the UAVs are decentralized, over an n-step planning horizon. An in depth look into mixed strategy equilibria is also given.

3 - An Approach to Decision Making for Performance Improvement of Military Weapon Systems

Tae Bo Jeon, Professor, Kangwon National University, IE Dept,, 192-1 Hyoja 2 Dong, Chuncheon, 200-701, Korea, Republic of, tbjeon@kangwon.ac.kr

PI (Performance Improvement) is a widely accepted acquisition alternative for existing military weapon systems. A revised hierarchical model for PI has been presented in this study. Through careful examination of PI characteristics, we deducted major evaluation components - maintainability/operability, fulfillment of performance, easiness/effectiveness in PI, and battlefield environment/mission adaptability. We then drew sub-components within each category with carefully designed questions.

4 - Maximizing Autonomous Agent Connectivity

Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

In this research, we consider the problem of maximizing the connectivity for a set of autonomous agents in a mobile ad-hoc network. Each agent has a starting point and an ending point, and there are certain locations that must be visited by at least one agent. Heuristics are developed and results are presented.

The Social Crowd: New Research in Social Media and Crowdsourcing

Sponsor: eBusiness

Sponsored Session

Chair: Kevin (Yili) Hong, Assistant Professor, Arizona State University, 300 E Lemon St, Tempe, AZ, 85287, United States of America, ykhong1@asu.edu

Co-Chair: Gordon Burtch, Assistant Professor, University of Minnesota, 321 19th Ave. S, Minneapolis, MN, 55455, United States of America, gburtch@umn.edu

1 - The Value of Multi-dimensional Rating Systems: An Information Transfer View

Kevin (Yili) Hong, Assistant Professor, Arizona State University, 300 E Lemon St, Tempe, AZ, 85287, United States of America, ykhong1@asu.edu, Pei-yu Chen, Ying Liu

This paper examines the value of multi-dimensional online rating systems from an information transfer perspective. Our identification hinges on a natural experiment on TripAdvisor that allowed us to identify the causal effect of adopting a multi-dimensional rating system with a difference-in-difference approach. Based on data from TripAdvisor and Yelp, we find consumers' ratings for the same restaurants are higher in TripAdvisor after its adoption of the multi-dimensional rating system.

2 - The Effect of Social Media Marketing Content on Consumer Engagement: Evidence from Facebook

Dokyun Lee, PhD Student, University of Pennsylvania, JHH 5th Floor, 3730 Walnut Street, Philadelphia, PA, 19104, United States of America, leedok@wharton.upenn.edu, Harikesh Nair, Kartik Hosanagar

We study the effect of social media content on customer engagement using data on Facebook. We do so by content-coding more than 100,000 messages with Natural Language Processing algorithms. We find that inclusion of persuasive content - like emotional content - increases engagement with a message. We find that informative content - like mentions of prices - reduce engagement when included in messages in isolation, but increase engagement when provided in combination with persuasive attributes.

3 - A Double Digital Divide? Matching Platforms and HIV Incidence among the Digitally Disadvantaged

Brad Greenwood, University of Maryland, College Park, MD, United States of America, brad.n.greenwood@gmail.com, Ritu Agarwal

We examine how platforms for the solicitation of casual sex influences the incidence rate of HIV by race, gender, and SES. Using a census of 12 million patients in Florida, we find that the largest negative effect accrues to historically at risk populations (i.e. African Americans and the socio-economic lower class) that, ironically, are also disadvantaged with respect to digital inequalities. Economically, this translates into a financial burden of $592 million in the State of Florida alone.

4 - Asymmetric Social Influence from Personalized Social Cues

Sean Taylor, Research Scientist, Facebook, 1 Hacker Way, Menlo Park, CA, 94025, United States of America, sjt@fb.com, Eytan Bakshy, Dean Eckles, Sinan Aral

We aim to characterize which social relationships transmit the most social influence. Our methodology characterizes the dyadic factors which moderate influence, conditional on exposure to peer behaviors. In our experiment, we select ad exposures where viewers could potentially be exposed to social cues involving two different peers and randomly choose one of the two peers, providing exogenous variation in the dyadic characteristics of friends displayed in the social cue component.

Hilton- Continental 1

Energy Markets and Demand Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Owen Wu, Indiana University, Bloomington, IN, United States of America, owenwu@indiana.edu

1 - Demand Response in Energy Markets: Voluntary and Involuntary Load Curtailment Contracts

Ruben Lobel, University of Pennsylvania, 3730 Walnut St, JMHH - Suite 500, Philadelphia, PA, 19104, United States of America, rlobel@wharton.upenn.edu, Kaitlin Daniels

As energy consumption grows, electricity grids are turning to demand response (DR) to meet peak demand and lower prices. These programs allow forgone energy consumption to be sold on the market during peak demand events. This project compares the performance of two types of DR contracts: involuntary, under which consumers relinquish control of their energy consumption in return for payment, and voluntary, which allow consumers to decide to reduce their load during each peak event.

2 - Demand Side Management Programs in Energy Markets: An Empirical Approach

Ozge Islegen, Assistant Professor of Managerial Economics and Decision Sciences, Northwestern University, Kellogg School of Management, 2001 Sheridan Road, Evanston, IL, 60208, United States of America, o-islegen@kellogg.northwestern.edu, Baris Ata

Demand side management (DSM) programs flatten or shift peak electricity demand by modifying the consumption patterns of end-consumers. These programs have become widely applicable with the introduction of "smart grids" which can communicate the consumption and price data throughout the power system. In this study, we model the decision-making process of individual electricity consumers under DSM programs and estimate the impact of these programs via a series of counterfactual analyses.

3 - Smart Homes with Price-Responsive Thermostats

Dan Adelman, Professor of Operations Management, University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, dan.adelman@chicagobooth.edu, Canan Uckun

We develop a framework for a smart home's thermal appliances to respond optimally to dynamic electricity price signals, and for assessing the resulting market price equilibrium in a large service region. We show that under certain conditions it is socially optimal for the electricity utility to pass spot prices down to consumers. We present extensive numerical results on ComEd's residential electricity service.

4 - Curtailment and Subsidies: How Renewable Energy Policies Affect Power Market Competition

Owen Wu, Indiana University, owenwu@indiana.edu, Majid Al-Gwaiz, Xiuli Chao

We study the impact of intermittent renewable generation (such as wind and solar power) on electricity market competition, with the focus on the effects of renewable energy policies. Two sets of policies are considered: the production-based subsidies and the operating policies on renewable energy curtailment. The power market competition is modeled as a supply function competition between generators with different levels of flexibility.

■ TC05

Hilton- Continental 2

Retail Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Vidya Mani, Assistant Professor, Pennsylvania State University, 461 BB, University Park, State College, PA, 16802, vmani@psu.edu

1 - Allocation of Decision Rights in Retail Supply Chains

Qingning Cao, Vanderbilt University, 401 21st Ave S, Nashville, 37203, United States of America, qingning.cao@vanderbilt.edu, Mumin Kurtulus, Sezer ‹lkü

Our paper studies the implications of allocating decision rights (retail assortment, inventory ownership) in a supply chain. In particular, we identify product and market characteristics that lead to a win-win situation for the manufacturer and the retailer, when the manufacturer takes over both the assortment and inventory decisions and the associated risks.

2 - Flexible Products and Dynamic Preferences

Karthik Ramachandran, Associate Professor, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Karthik.Ramachandran@scheller.gatech.edu, Aydin Alptekinoglu

Consumers often have needs that change in a dynamic fashion over time due to physiological, mental or environmental variations. We address a product design dilemma in satisfying such dynamic preferences: should a firm offer multiple standard products, each designed for a specific purpose, or a flexible product that can be reconfigured by consumers as their preferences change?

3 - Inventory Stocking and Rationing for an Omni-Channel Retailer

Elnaz Jalilipour Alishah, PhD Student, University of Washington, Michael G. Foster School of Business, ISOM Department, Seattle, WA, 98195, United States of America, jalilipo@uw.edu, Kamran Moinzadeh, Yong-Pin Zhou

We consider a retailer operating an online and offline store with independent demand. Online demand can be satisfied using offline inventory at a cost, but not vice versa. For a given stocking level, we characterize the offline store's rationing policy; at any time, there exists an inventory threshold above which online demand will be satisfied. We develop and test heuristics to simplify implementation of rationing policy. We then extend the heuristics to retailer with multiple offline stores.

4 - Inventory Management in Online Retailing under Operational Realities

Jason Acimovic, The Pennsylvania State University, 462 Business Building, University Park, PA, 16802, United States of America, jaa26@smeal.psu.edu, Stephen Graves

Inventory management in online retailing presents new challenges. We partner with an online retailer to discover, investigate, and overcome these challenges. Specifically, we investigate how the status quo decentralized replenishment policy performs suboptimally. This is especially true under operational realities such as supply perturbations. We find evidence of these operational realities on actual data and propose a policy that is robust to them.

Managing Supply Chain Disruptions

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Sang Kim, Yale School of Management, 165 Whitney Ave, New Haven, CT, 06511, United States of America, sang.kim@yale.edu

1 - Disruption Risk and Optimal Sourcing in Multi-Tier Supply Networks

Erjie Ang, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States of America, erjieang@stanford.edu, Robert Swinney, Dan Iancu

We study a supply chain with three levels: Tier 2 suppliers prone to disruption risk that sell to Tier 1 suppliers who sell to a manufacturer that sells finished goods to the market. We show that as overlap in Tier 2 increases, the manufacturer should rely less on direct mitigation (procuring excess inventory and multi-sourcing from Tier 1) and rely more on indirect mitigation (inducing Tier 1 to procure excess inventory and multi-source).

2 - Global Sourcing: Impact of Sourcing Strategies on Supply Chain Resilience

Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, serguei.netessine@insead.edu, Nitish Jain, Karan Girotra

We use ship manifest data to study the impact of supply chain structure upon resilience of global supply chains.

3 - Multi-Sourcing and Miscoordination in Supply Chain Networks

Kostas Bimpikis, Assistant Professor, Stanford GSB, 655 Knight Way, Stanford, CA, United States of America, kostasb@stanford.edu, Alireza Tahbaz-Salehi, Douglas Fearing

This paper studies the endogenous formation of supply chain networks when procurement is subject to disruption risk. We argue that the presence of non-convexities in the chain (e.g., due to non-convex production technologies or financial constraints) may create a wedge in the sourcing incentives of firms at different tiers, leading to the formation of overly fragile supply chains.

4 - Preventing and Mitigating Supply Disruptions Under Inventory Competition

Sang Kim, Yale School of Management, 165 Whitney Ave, New Haven, CT, 06511, United States of America, sang.kim@yale.edu

Motivated by recent shortages of generic injectable drugs in the U.S., we analyze a model that captures random production shutdown and restoration and the competing firms' decisions on inventories to mitigate the impact of resulting supply shortages. We identify conditions under which product availability becomes higher or lower due to inventory competition.

Identification, Assessment and Correction of Ill-Conditioning and Numerical Instability in Linear and Integer Programs

Cluster: Tutorials

Invited Session

Chair: Ed Klotz, IBM, Incline Village, NV, United States of America, klotz@us.ibm.com

1 - Identification, Assessment and Correction of Ill-Conditioning and Numerical Instability in Linear and Integer Programs

Ed Klotz, United States of America, klotz@us.ibm.com

The implementation of linear (LP) and mixed integer programming (MIP) algorithms on finite precision computers can create numerical challenges which are not addressed in the mathematical descriptions of these algorithms given in many introductory and more advanced textbooks and courses. Rounding errors associated with finite precision can be magnified due to ill-conditioning or numerical instability, resulting in unexpected, possibly inconsistent results. This tutorial helps the optimization practitioner identify sources of ill-conditioning and numerical instability, assess the cause and take appropriate remedial action. After discussing some finite precision computing fundamentals, it considers different measures of ill-conditioning, each one of which provides the simplest explanation of ill-conditioning on certain types of LP and MIP models. We then consider remedies for these numerical challenges: (i) optimizer parameter settings that treat the symptoms and (ii) diagnostic tactics that resolve the underlying MIP or LP issue.

Joint Session Social Media/MAS: Diplomacy, Sentiment, & Social Network Analysis Using Social Media

Cluster: Social Media Analytics & Military Applications Society

Invited Session

Chair: Christopher Smith, Director, TRAC-MTRY, U.S. Army, 700 Dyer Road, Monterey, CA, 93943, United States of America, cmsmith1@nps.edu

1 - What's the Story with Digital Diplomacy and Credibility: Twitter, Narrative and Op. Pillar of Defense

Theo Mazumdar, Doctoral Candidate and Annenberg Fellow, USC, 500 N. Rossmore Ave., Apt. 315, Los Angeles, CA, 90004, United States of America, bmazumda@usc.edu

During Operation Pillar of Defense, the Israel Defense Forces (IDF) launched the most comprehensive digital diplomacy program ever undertaken by a warring nation. Focusing on the IDF's unprecedented use of Twitter, identifying and manipulating narrative elements, and through an experimental design and survey, this study is the first to empirically assess the effect of narrative on source credibility in a social media crisis diplomacy campaign.

2 - Modeling and Sensitivity Analysis to MADM Overlay to SNA

William Fox, Professor, Naval Postgraduate School, Department of Defense Analysis, Monterey, CA, 93943, United States of America, wpfox@nps.edu

We address several networks with various approaches such as DEA, AHP, TOPSIS, and SWA in order to identify the key nodes in the network. Of critical importance is being able to apply some sensitivity analysis to these methods. We suggest some sensitivity analysis method and illustrate them in context of SNA.

3 - Mapping Sentiment Polarity during a Real-Time Event at a Local and Global Level

Patrick Dudas, CIV/PhD Student, University of Pittsburgh, 135 N. Bellefield Ave., Pittsburgh, PA, 15213, United States of America, pmdudas@nps.edu

Provided is an exploratory and deterministic mapping of sentiment polarity of Twitter data at both the local-level to a dynamic, interactive visualization and presenting this representation at a higher, global level utilizing a map to showcase sentiment changes as time and location change. Coupling the two approaches may yield a more complete understanding of user-driven sentiment as real-time events or moments occur.

4 - Using Probabilistic Modeling and Data Facilitators to Filter Out the Noise in Social Media

Mark Gerner, Booz Allen Hamilton, Washington, DC, United States of America, Gerner_Mark@bah.com, Michael Abramovich, Alex Golub-Sass

Though prevalence and volume of social media data continues to grow exponentially, there has been little advancement in methods used by analysts to distinguish noise from the signal. We examine a process we've implemented at a Fortune 100 company to connect 4 years of social media conversation to internal investment and business-outcome related datasets. The resulting model helps marketing and communication departments focus their attention on signals in order to optimally allocate resources.

Cognitive Decision Support Tool for Policy Makers

Cluster: Cognitive Analytics

Invited Session

Chair: Michal Rosen-Zvi, IBM, 27 Halamed He St, Jerusalem, Israel, ROSEN@il.ibm.com

1 - Using Decision Analysis in a Healthcare Institution

Adriana L. Chavez, MD Anderson, 1400 Holcombe Blvd, Unit 0466, Houston, TX, 77030, United States of America, alchavez@mdanderson.org

The use of decision analysis increases clarity in health care decision situations by helping to efficiently drive projects towards value creation and consensus building. DA is particularly useful in healthcare institutions because of the multiple stakeholders and high-stakes outcomes such as patient health and safety. Examples of DA applications in an internal consulting setting at MD Anderson Cancer Center will be presented.

2 - Decision Practice in Pharma

Keith Gardner, Principal Decision Scientist, AstraZeneca, 1200 Trinity Dr, Alexandria, VA, 22314, United States of America, keith.gardner@astrazeneca.com

We present a strategic view of risk structure and assessment for pharmaceutical development. This includes a model for combining probability of success, time to launch and net present value. We also discuss organizational challenges and behavior mitigation, graphical presentation of results and our effort to build and expand the practice. We present examples of MCDA, decision trees, probabilistic modeling, portfolio methods, processing of data and handling uncertainty, and some outcomes.

3 - A Simulation Based Decision Support System for Policy Makers

Michal Rosen-Zvi, IBM, 27 Halamed He St, Jerusalem, Israel, rosen@il.ibm.com

A simulation model of cervical cancer progression and for HIV is presented. This model can be used for making complex decisions such as vaccination plans (for cervical cancer) and resource allocations for prevention treatments.

■ TC10

Hilton- Continental 7

Information and Competition in Supply Chains and Service Systems

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Xin Geng, PhD Candidate, The University of British Columbia, 2329 W Mall, Vancouver, Canada, Xin.Geng@sauder.ubc.ca

1 - On the Value of Imperfect Advance Demand Information for Lost-Sales Inventory Systems

Engin Topan, Eindhoven University of Technology, Postbus 513, Eindhoven, 5600MB, Netherlands, e.topan@tue.nl, Rommert Dekker, Geert-Jan Van Houtum, Tarkan Tan

Motivated by real-life applications, we consider a lost-sales inventory system with imperfect advance demand information (ADI). We assume that ADI is imperfect in reliability and timing, there are yet demand occurrences without ADI and excess stock due to imperfect ADI can be cleared. We propose a model with a general representation of imperfect ADI to investigate the value of ADI. A partial characterization of the optimal policy and also an extensive numerical study are provided.

2 - Online Exchanges for Coordinating Industrial Surplus Chains

Suvrat Dhanorkar, PhD Candidate, University of Minnesota, 321 19th Avenue South, Minneapolis, MN, 55455, United States of America, dhano002@umn.edu, Kevin Linderman, Karen Donohue

Increasingly, Online Material & Waste Exchanges (OMWEs) facilitate the transaction of industrial surplus consisting of unused materials, by-products and waste. We examine opportunities for effectively matching buyers and sellers on these exchanges. Empirical analysis is conducted using archival data on more than 4500 surplus items and 100,000 buyer-seller interactions.

3 - Complete versus Partial Collusion in Competing Coalitions

Omkar Palsule Desai, Assistant Professor, Indian Institute of Management Indore, Rau Pithampur Road, Indore, India, omkardpd@iimidr.ac.in

In view of the merger paradox, a grand coalition of small producers seems to be a natural outcome. Multiple competing coalitions exhibiting distinct performance efficiencies depending on technologies and coalition forms adopted exist in industries such as milk, coffee. We adopt endogenously determined sharing rules to provide an alternate explanation to coalition formation. We show that the competing coalitions need not have (a)symmetric forms and they necessarily not form complete collusion.

4 - Fairness among Servers when Capacity Decisions are Endogenous

Xin Geng, PhD Candidate, The University of British Columbia, 2329 W Mall, Vancouver, Canada, Xin.Geng@sauder.ubc.ca, Tim Huh, Mahesh Nagarajan

We look at a service system with two servers and a single class arrivals. We examine the effect of routing policies on servers when they care about fairness, and when they can endogenously choose capacities. We study the two-server game where the servers' objective functions have a term explicitly modeling fairness. Theoretical results concerning the existence and uniqueness of the Nash equilibrium are proved for some policies. Further managerial insights are given based on simulation studies.

■ TC11

Hilton- Continental 8

Supply Chain Risk Management

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Loo Hay Lee, Associate Professor, National University of Singapore, 10 Kent Ridge Crescent, Singapore, Singapore, iseleelh@nus.edu.sg

1 - Mitigation Strategies for a Manufacturer Subject to Supply and Demand Risk

Nickolas Freeman, University of Houston, Melcher Hall Room 280, Houston, TX, 77204, United States of America, nfreeman@bauer.uh.edu, Sharif Melouk, John Mittenthal, Burcu Keskin

We consider disruption mitigation strategies for a capacitated manufacturer with supply and demand uncertainty. Sub-components dictate the quality of the manufactured products. Using an analytical model, we investigate and compare mitigation strategies including multi-sourcing, downward substitution, and in-house production.

2 - Assessing the Efficiency of Risk Mitigation Strategies in Supply Chains

Hakan Yildiz, Assistant Professor, Michiagn State University, 632 Bouge Street, East Lansing, Mi, 48824, United States of America, yildiz@bus.msu.edu, Srinivas Talluri, Thomas Kull, Jiho Yoon

We evaluate supply chain risk mitigation strategies in the presence of a variety of risk categories, risk sources, and supply chain configurations. We combine an empirically grounded simulation methodology with data envelopment analysis to analyze and rank alternative mitigation strategies. Our research presents several interesting and useful managerial insights for deciding what strategies are most capable of mitigating risks in a variety of contexts.

3 - Study of Supply Chain Risk under information Sharing

Loo Hay Lee, Associate Professor, National University of Singapore, 10 Kent Ridge Crescent, Singapore, Singapore, iseleelh@nus.edu.sg, Ek Peng Chew, Yi Tao

The increasing complexity of supply chains worldwide has caused them to be susceptible to supply chain disruptions. However, if different echelons in a supply chain are willing to share the information, the impact of the disruptions can be minimized. In this talk, we will demonstrate how systems dynamics model can be used to estimate the value of the information sharing.

Sustainability Issues in Supply Chain Management

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Damian Beil, Associate Professor, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI, 48109, United States of America, dbeil@umich.edu

Co-Chair: Sam Aflaki, Assistant Professor, HEC Paris, 1 Rue de la Liberation, Paris, France, aflaki@hec.fr

1 - Total-Cost Procurement Auctions with Sustainability Audits to Inform Bid Markups

Damian Beil, Associate Professor, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI, 48109, United States of America, dbeil@umich.edu, Luk Van Wassenhove, Karca Aral

In this paper, we explore whether the buyer should conduct sustainability audits in order to make a more informed total-cost procurement decision. We find that although the audits are used for resolving uncertainty about suppliers' relative sustainability levels, greater uncertainty about supplier sustainability levels and a less sustainable supplier base do not necessarily make the audits more valuable for the buyer.

2 - Recovery Legislations or Taxation/Subsidy Based Policies? A Mixed Approach Might be More Effective

Shumail Mazahir, PhD Candidate, HEC, Jouy en Josas, 78350, France, shumail.mazahir@hec.edu, Sam Aflaki

We study the take back schemes such as recovery legislations and compare them with taxation/subsidy based schemes in a stackelberg game setting where the policy maker selects a policy and its policy parameters based on its welfare function and the firms maximizes their profits considering these policy parameters.We compare the environmental and economical performance with each of these schemes and present conditions where one policy performs better than the other.

3 - Optimal Feed-in-tariff Policies: The Role of Supply Chain Intermediaries

Shadi Goodarzi, HEC Paris, 1 rue de la Liberation, Jouy en Josas, 78350, France, shadi.goodarzi@hec.edu, Andrea Masini, Sam Aflaki

We assess the effectiveness of FIT policies in promoting renewable technologies taking into account the decisions of supply chain intermediaries. Modeling a three-tire supply chain that includes potential adopters, technology manufacturers and an electricity supplier, we show that the ability of policy makers in inducing adoption is greatly affected by the intermediaries market characteristics, an understanding of which sheds new light on the structure and magnitude of optimal FIT policies.

4 - Extended Producer Responsibility (EPR) for Pharmaceuticals

Beril Toktay, Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, beril.toktay@scheller.gatech.edu, Isil Alev, Atalay Atasu, Ozlem Ergun

EPR, which holds producers responsible for environmentally safe treatment of their products, has emerged as the preferred policy for managing pharmaceutical overage. To analyze its effectiveness, we develop a game-theoretic model representing interactions in the pharmaceutical chain with a focus on factors causing overage. We uncover conditions for effective EPR implementation and critical factors determining stakeholder perspectives on EPR in the pharmaceuticals context.

Chair: Esra Buyuktahtakin, Assistant Professor, Wichita State University, Wichita, KS, United States of America, esra.b@wichita.edu

Co-Chair: Robert Haight, USDA Forest Service Northern Research Station, 1992 Folwell Ave, St. Paul, MN, 55108, United States of America, rhaight@fs.fed.us

1 - Measuring Damages and Modeling Feedbacks between Economic and Ecological Systems

Travis Warziniack, Research Economist, USFS Rocky Mountain Research Station, 240 W. Prospect Rd, Fort Collins, CO, 80525, United States of America, twwarziniack@fs.fed.us

We describe integrated modeling efforts between social and natural scientists, sacrifices in complexity that may exist when working across disciplines, and whether those sacrifices are worth it. The session is built around a discussion about the spread of invasive species in the Laurentian Great Lakes and integrating a computable general equilibrium economic model with the Ecopath with Ecosim food web model. The speaker is an economist, and tips for working with such a species are given.

2 - The Cost of Simplicity: The Accuracy-Complexity Tradeoff for Disease Transmission Models

Danqi Luo, Bryn Mawr College, 101 North Merion Ave, BoxC-1121, Bryn Mawr, PA, 19010, United States of America, dluo@brynmawr.edu, Benjamin Armbruster

We study the differences of disease transmissions in the characteristics of an epidemic in a single population model versus a more heterogeneous model in terms of the number of subpopulations and stages of infection. The differences in attack rate and prevalence of steady states are computed in order to measure the cost of aggregation in SIR and SIS models. Under the symmetric mixing assumption, the aggregated model is a good alternative to the heterogeneous model.

3 - Investing in Classical Biological Control of Legacy Pests

Karen Jetter, Economic Researcher, University of California, Agricultural Issues Center, 1 Shields Ave, Davis, CA, 95616, United States of America, jetter@primal.ucdavis.edu, John Steggall, Dave Luscher, Mark Hoddle, Keith Warner, Charles Goodman

This study will present a risk analysis for biological control programs of legacy exotic arthropod pests that established in California prior to 1990. This project develops a selection criteria based on pest characteristics, current technology, and economics to pick legacy pests of tree and vine crops in Californian with a high probability of being effectively managed with biological controls. It then estimates the expected net benefits of investing in biological control for those pests.

4 - A Unified Model for the Analysis of the Distribution and Abundance of Invasive Species

Andrew Paul Gutierrez, Professor, University of California, Berkeley, Center for the Analysis of Sustainable, Agricultural Systems (CASAS Global), Kensington, CA, 94707, United States of America, casas_global@berkeley.edu, Luigi Ponti

The majority of invasive species are heterothermic and their distribution and abundance is largely determined by weather and by species they interact with. The biology is complex, but is simplified by analogous biological processes that determine their distribution and abundance under extant and climate change scenarios. Several systems are explored.

Data Envelopment Analysis 2

Contributed Session

Chair: Ke Wang, Dr., Beijing Institute of Technology, 5 S. Zhongguancun St., Beijing, 100081, China, kewang2083@gmail.com

1 - Identifying the Role of Foreign Technology on Efficiency Change for Achieving MDGs using Panel DEA

Bo Kyeong Lee, Yonsei University, Shinchon, Seodaemungu, Seoul, Korea, Republic of, lee.bokyeong@yonsei.ac.kr, Soyoung Sohn

We study the role of foreign technology on efficiency change in developing countries in achieving Millennium Development Goals (MDGs). To measure efficiency change in panel data, we employ a Data Envelopment Analysis based Malmquist Productivity Index. The data includes indicators of MDGs as outputs and the endogenous factors as inputs for 43 developing countries between the early 1990s and the late 2000s. We regress pure efficiency change against the factors showing foreign technology inflows.

2 - A New Method for Congestion Measurement

Jun Wang, University of Science and Technology of China, No.96, JinZhai Road Baohe District, Hefei, 230026, China, wangjun1200@mail.ustc.edu.cn, Yan Wu

The paper represents congestions theories containing the undesirable output which are widespread existed in the production practice. So our proposed methodology not only promotes the development of congestion theory, but also takes both desirable and undesirable output combine in the DEA framework. Our methodology can contribute managers' better trade-off between economic development and environmental protection.

3 - Dynamic Network Data Envelopment Analysis-DEA on Evacuation Performance

Oscar Herrera-Restrepo, PhD Candidate, Virginia Tech, 4339 Taney Avenue Apt 401, Alexandria, VA, 22304, United States of America, oscar84@vt.edu, Joseph Trainor, Kostas Triantis, Pamela Murray-Tuite, Praveen Edara

This paper proposes a theoretical representation of a slacks-based dynamic network DEA approach for measuring evacuation performance when a ramp closure strategy is considered. It includes an integrated conceptual framework that incorporates stakeholder perspectives, evacuation-related systems and processes. The approach allows for the discovery of potential performance improvement actions that can inform the definition of future requirements of transportation evacuation strategy designs.

4 - Measuring Brazilian Hospital's Efficiency with Dynamic Data Envelopment Analysis

Marianna Cruz Campos, UFRN, Av Campos Sales, Tirol, Natal, 59020300, Brazil, mariannaccampos@gmail.com, Fernanda Rocha, Mariana Almeida

Data Envelopment Analysis was applied to evaluate the performance and efficiency of brazilian public hospitals. Using dynamic model to measured the productivity and returns to scale of 49 general hospitals between 2011 until 2013. The results showed that the best practices can improve the future scenarios of inefficient units.

5 - Energy Efficiency index via Data Envelopment Analysis (DEA): Methodology and application

Ke Wang, Dr., Beijing Institute of Technology, 5 S. Zhongguancun St., Beijing, 100081, China, kewang2083@gmail.com

Within a joint production framework of considering desirable & undesirable outputs, this study proposes several energy efficiency indices based on i) traditional DEA with undesirable outputs transformation technique; ii) directional distance function relying on weak disposability assumption; iii) range adjusted measure relying on natural & managerial disposability assumptions; and iv) multi-directional efficiency analysis from which both efficiency status and efficiency patterns can be detected.

Omni-channel Retail Analytics

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Pavithra Harsha, Research Staff Member, IBM Research, 1101 Kitchawan Road, Room 34-225, Yorktown Heights, NY, 10598, United States of America, pharsha@us.ibm.com

1 - Assortment Optimization in the Presence of Multiple Channels and Consumer Preference Uncertainty

Srikanth Jagabathula, New York University, 44 West Fourth St, New York, NY, 10012, United States of America, sjagabat@stern.nyu.edu, Daria Dzyabura

Most models of consumer purchase used in operations focus on purchases from a single channel (typically brick-and-mortar). However, with the proliferation of retail channels, there is a need to account for channel switching behavior in making operational decisions. We propose a choice model that accounts for channel switching through preference uncertainty. We validate this mdoel on real-world data and quantify the gain in revenues obtained through accounting for the channel switch behavior.

2 - A Novel Approach to Demand Modeling and Pricing for Omni-channel Retailers

Pavithra Harsha, Research Staff Member, IBM Research, 1101 Kitchawan Road, Room 34-225, Yorktown Heights, NY, 10598, United States of America, pharsha@us.ibm.com, Markus Ettl, Shiva Subramanian

Consumers are increasingly navigating across multiple channels to make purchases and retailers are finding that traditional approach to pricing channels in silos needs to be reconsidered. We present a comprehensive framework for omni-channel retailing to model and estimate the substitutions across channels. Further, we present an integrated price optimization problem across retail channels and locations with cross channel effects to maximize the retailer's total profitability with computations.

3 - Integrated Pricing and Inventory Optimization in an Omni-channel Environment

Joline Uichanco, Assistant Professor, University of Michigan, Ross School of Business, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, joline.uichanco@gmail.com, Markus Ettl, Pavithra Harsha, Shiva Subramanian

Lifecycle pricing is traditionally done for a single sales channel where inventory is exogenous. However, this ignores customers channel-switching due to differences in prices in different channels. We develop an optimization model for joint price and inventory management in an omni-channel retail environment. In our model, inventory is not exclusive to one channel (e.g. buy online pickup in store). Our model also considers demand uncertainty with both a stochastic model and a robust model.

4 - Optimizing Purchasing and Handling Costs in Supply Chain Procurement

Gonzalo Romero, U. of Toronto, 105 St George Street, Toronto, ON, M5S 3E6, Canada, gromeroy@mit.edu, Georgia Perakis, Retsef Levi

We introduce a new model that minimizes the purchasing and handling costs induced by case pack selection in procurement contracts. We prove structural results that lead to a practical method to both selecting the best case pack size per SKU, and serving orders at the distribution center. Specifically, we show that a threshold policy is optimal for serving orders. Furthermore, we implement this method on real data from a large utility company, finding significant supply chain cost reductions.

Dynamic Pricing in Service Systems

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Ramandeep Randhawa, USC, Marshall School of Business, Los Angeles, CA, United States of America, ramandeep.randhawa@marshall.usc.edu

1 - Optimal Dynamic Pricing with Demand Model Uncertainty: A Brownian Model of Learning and Earning

Bora Keskin, The University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, bora.keskin@chicagobooth.edu

We consider a Brownian model of dynamic pricing with demand model uncertainty, in which a firm sells a product over a continuous time horizon. The firm is uncertain about the price-sensitivity of the demand for the product, and continuously updates its prior belief on the price-sensitivity by making observations on the market responses to prices. We derive and solve a partial differential equation to show how the value of learning should be projected onto prices in an optimal fashion.

2 - Value of Dynamic Pricing in a Congestible System

Jeunghyun Kim, USC, Marshall School of Business, Los Angeles, CA, United States of America, jeunghyun.kim.2015@marshall.usc.edu, Ramandeep Randhawa

Charging a higher premium for a highly demanded service is natural for firms seeking to increase revenue. In the context of a single server queue, we study and quantify the value of dynamic pricing. We find that surprisingly the conventional heavy traffic regime, which is optimal in large systems under a static pricing scheme, is no longer optimal. While the optimal pricing scheme is complex, we prove that a two-price policy is near optimal.

3 - Intertemporal Pricing without Priors

Ying Liu, New York University, 44 W 4th St, New York, NY, United States of America, yliu2@stern.nyu.edu, Ilan Lobel, Rene Caldentey

We consider a monopolist selling a product to a population of consumers who are heterogeneous in valuations and arrival times. We study the policies that attain minimum regret when selling to either myopic or strategic customers. We characterize the set of optimal policies and demonstrate their structural properties.

■ TC18

Hilton- Franciscan C

Managing Customer Behavior in Service and Retail Systems

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Eren Cil, University of Oregon, 1208 University of Oregon, Eugene, OR, United States of America, erencil@uoregon.edu

1 - Intertemporal Pricing and Strategic Rationing When Selling to Snobbish Consumers

Kenan Arifoglu, Assistant Professor, University College London, Gower Street, London, WC1E 6BT, United Kingdom, k.arifoglu@ucl.ac.uk, Sarang Deo, Seyed Iravani

We develop a stylized analytical model to understand why firms selling to snobbish (exclusivity-seeking) consumers display several differences in their pricing and rationing strategies. We show that the snobbish consumer behavior provides another explanation for these differences. Also we find that when selling to snobbish consumers, price markdowns are not always associated with excess inventory and the negative impact of strategic consumer behavior is lower.

2 - Sharing Aggregate Inventory Information with Customers: A Strategic Way of Cross-selling

Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Ruomeng Cui

Why do some firms share their inventory information with customers? We provide an answer to this question through an angle of product variety. We also show why firms share partial (or aggregate) inventory information with their customers rather than full information or no information by considering cross-selling of differentiated products.

3 - Strategies in Fairness-Sensitive Markets

Steven Shugan, Professor, University of Florida, 1405 W University Avenue, Room 219, Gainesville, FL, 32605, United States of America, steven.shugan@warrington.ufl.edu, Jihwan Moon

We study fairness sensitive markets where market norms determine fair and unfair fees. Rational consumers only engage in search when their firm deviates from the market norm (an information event). We find that adverse cost shocks cause firms to charge unfair fees regardless of whether consumers are fairness-sensitive. However, the transition to the new equilibrium depends on whether consumers are fairness-sensitive because high-quality firms can delay ostensibly unfair actions.

4 - From Used to New: Increasing Profit through Product Renewals

Michael Pangburn, University of Oregon, 1208 University of Oregon, Eugene, OR, 97405, United States of America, pangburn@uoregon.edu, Euthemia Stavrulaki

Product deterioration over time can benefit a manufacturer by driving repeat sales. Although planned obsolescence is an established strategy, some firms promote product longevity by offering a product renewal service. We show that such renewal service has the potential to increase revenues sufficiently to offset the additional expense, particularly for costly products. We also prove that the manufacturer can increase profits by committing in advance to the price of its refresh service.

■ TC19

Contemporary Topics in Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Fredrik Odegaard, Ivey Business School, Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, fodegaard@ivey.uwo.ca

1 - Airline Switching Revenue with Price-Guarantees

Fouad Mirzaei, Ivey Business School, Western University, London, ON, Canada, fhassanmirzaei@ivey.uwo.ca

Many airlines permit ticket holders to change the time of their fight by paying a switching fee. Although the switching fee is a revenue item for the airline, a low or high fee could cause operational challenges, such as unsold capacity or lost sales. This raises a question that what fee should be set for switching. We model a single firm, which delivers two comparable services over two sequential periods and derive the optimal switching fee.

2 - Assortment Competition with the Decoy Effect

Xinchang Wang, Georgia Institute of Technology, School of Industrial and Systems Enginee, Atlanta, GA, 30332-0205, United States of America, xwang336@gatech.edu, Anton Kleywegt

We describe product assortment competition in a duopoly with decoys among candidate products. We characterize the Nash equilibria for different settings, and use models of learning to study the evolution of the competition and the stability of the equilibria. In some settings, all pure equilibria are stable, and all mixed equilibria are unstable. We also show settings in which the learning processes cycle without convergence to any equilibrium.

3 - On the Implications of Airfare Price Volatility on Transacted Prices, Sales and Revenue

Benny Mantin, Assistant Professor, University of Waterloo, 200 University Ave. W., Waterloo, Canada, bmantin@uwaterloo.ca, Eran Rubin

The airline industry has embraced the internet to frequently update prices of airline tickets. Many markets exhibit a considerable level of price volatility. Do these price movements induce consumers to pay more for the tickets and increase sales volumes at the same time? Controlling for market characteristics, we provide new insights on the link between price volatility, transacted airfares (level and dispersion), sales (fill rates), as well as revenues.

4 - Bundling with Dependent Valuations: The Price of Independence

Mihai Banciu, Bucknell University, 119 Taylor Hall, Lewisburg, PA, 17837, United States of America, mmb018@bucknell.edu, Fredrik Odegaard

We investigate the problem of pricing bundles of products when the valuations for the underlying components are dependent. We examine all possible bundling strategies, derive near-optimal prices for both the bundle and the components, and investigate how the total revenue when dependence is accounted for compares with the revenue obtained under the typical assumption of independence. We find that sacrificing dependency for tractability can lead to arbitrarily bad outcomes for the seller.

Sponsored Session

Chair: S.Gökhan Özden, Mr., Auburn University, Shelby Center Room 3333, Auburn, AL, 36849, United States of America, sgo0002@auburn.edu

1 - Robust Design of Unit Load Storage Systems

Pratik Mital, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, pmital3@gatech.edu, Pratik Mital, Marc Goetschalckx, Edward Huang

We present a formulation for the design unit load storage system design problem under uncertainty which is a mixed-integer non-linear stochastic optimization problem. We also present a methodology that identifies all Pareto-optimal configurations with respect to the bi-objective of minimizing the expected value of the scenario costs and a risk term such as the standard deviation of the scenario costs. A case study and numerical experience will be also be shared.

2 - Optimal Assignment Models for AS/RS with Multiple In-the-Aisle Pick Positions

Faraz Ramtin, University of Central Florida, 4000 Central Florida Blvd, Orlando, FL, 32816-2993, United States of America, faraz.ramtin@ucf.edu, Jennifer Pazour

An AS/RS with multiple in-the-aisle pick positions (MIAPP-AS/RS) is a semi-automated case-level order fulfillment technology. We provide algorithms to find the optimal assignment of SKUs to pick positions that minimizes the expected travel time subject to different operating policies, demand profiles, and shape factors. Also, we derive closed-form models by assuming an infinite number of pick positions in the aisle to approximate the optimal assignment's expected travel time.

3 - Transport, Logistics and Supply Chain Network Design: Applications and Research Gaps

Reza Zanjirani Farahani, Kingston University London, KHBS 215, Kingston Business School, Kingston Hill, Kingston Upon Thames, United Kingdom, zanjiranireza@gmail.com

Network design comprises strategic decisions including the number, location, capacity and allocation of facilities in transport, logistics and supply chain systems. Network design has wide range of applications such as in business, urban, maritime, emergency and global logistics networks. Stimulated from real-life applications and practitioners' needs, this presentation tries to review traditional applications and research works in the literature and provides new insights for academics.

4 - Optimizing Non-Traditional Warehouse Designs for Order Picking Operations

S.Gökhan Özden, Mr., Auburn University, Shelby Center Room 3333, Auburn, AL, 36849, United States of America, sgo0002@auburn.edu, Alice E. Smith, Kevin R. Gue

The proposed research offers an approach that reduces the costs of most costly operation in a warehouse - order picking. We search through non-traditional designs by using evolutionary strategies. Since every fitness calculation includes allocating products and calculating the optimal pick tours of hundreds or thousands of pick lists, function evaluation is very time consuming. We discuss techniques that shorten overall computation time. This research is funded by NSF.

Coordinating Decentralized Transportation Systems

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Luyi Gui, Assistant Professor, Paul Merage School of Business, UC Irvine, Irvine, CA, United States of America

1 - Strategies to Consolidate Freight of Perishable Products

Christine Nguyen, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States of America, nguyen7@usc.edu, Xiaoqing Wang, Alejandro Toriello

We study a supply chain of perishable products, where suppliers have low demands and consolidate their product to achieve economical shipping rates. We develop an efficient heuristic approach that balances the inventory cost with the shipping cost. The heuristic considers the trade-off between holding inventory for future shipments and consolidating to ship today. A sensitivity analysis demonstrates the effect of inventory costs on the volumes shipped at the FTL, LTL or courier rate.

2 - The Cost of Equivalence in Rationing Air Transportation Capacities

Douglas Fearing, The University of Texas at Austin, 2110 Speedway, Stop B6500, Austin, TX, United States of America, doug.fearing@mccombs.utexas.edu

In the presence of severe weather disruptions, regulators are forced to ration aircraft arrivals into impacted airports and air sectors. The ration-by-schedule approach utilized in practice does not distinguish individual aircraft based on size, passenger counts, or operational considerations. Using optimization and simulation based on historical flight data, we investigate the extent to which this creates inefficiencies in the operation of the air transportation system.

3 - Trust and Reciprocity in Firms' Capacity Sharing

Xing Hu, University of Oregon, 484 Lillis, 1208 University of Oregon, Eugene, OR, 97403, United States of America, xingh@uoregon.edu, Rene Caldentey

We study a reciprocal incentive system that facilitates efficient capacity sharing between two service firms who have limited and substitutable capacity. We model two firms each controlling an M/M/1/1 queue, where customers not served by the host firm might be rerouted to the other firm. We incorporate a scoring system that records the numbers of favors exchanged between the firms.

4 - Managing Decentralized Resource Sharing in Carrier Alliances under Demand Uncertainty

Luyi Gui, University of California-Irvine, Irvine, CA, United States of America, luyig@uci.edu, Ozlem Ergun

We study the design of market-based resource sharing agreements to motivate and regulate capacity sharing in carrier alliances under demand uncertainty. We focus on designing a robust capacity exchange mechanism, aiming at achieving high routing efficiency over the entire service network of the alliance under multiple potential demand scenarios. We characterize how the structure of the service network affects the robustness of the mechanism, and propose capacity pricing solutions accordingly.

Network Design Models and Methods

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Michael Hewitt, Loyola University Chicago, 820 N. Michigan Ave, Chicago, IL, 60611, United States of America, mhewitt3@luc.edu

1 - Filtering in B&C for Multicommodity Capacitated Network Design

Bernard Gendron, Univeristé de Montreal, Chemin de la Tour, Montreal, H3C 3J7, Canada, Bernard.Gendron@cirrelt.ca, Mervat Chouman, Teodor Gabriel Crainic

We study the impact of different filtering methods embedded into a specialized branch-and-cut algorithm for the multicommodity capacitated network design problem. Contrary to the preprocessing techniques used in state-of-the-art MIP solvers, these filtering methods exploit the structure of the problem, while being applicable to a very large class of network design problems. Computational results will be presented on a large set of randomly generated instances.

2 - Continuous Time Service Network Design Problem
Michael Hewitt, Loyola University Chicago, 820 N. Michigan Ave, Chicago, IL, 60611, United States of America, mhewitt3@luc.edu, Luke Marshall, Martin Savelsbergh, Natashia Boland

For a consolidation carrier to deliver goods in a cost-effective manner they must consolidate shipments, which in turn requires coordinating the paths for different shipments in both space and time. We propose an iterative refinement algorithm that will recognize that a truck may dispatch at any point in time without resorting to an a priori enumeration of all possible time points. We will illustrate its computational effectiveness on a wide array of instances.

3 - Integrating Resource Acquisition and Repositioning into Transportation Planning under Uncertainty
Maciek Nowak, Associate Professor, Loyola University Chicago, 1 E. Pearson, Chicago, IL, 60611, United States of America, mnowak4@luc.edu, Michael Hewitt, Walter Rei, Teodor Gabriel Crainic

Service network design formulations are often used in the planning processes of consolidation-based carriers. This research proposes a model that determines the number of resources to acquire, where to locate them, and the service network design executed by those resources to transport customer shipments. The model explicitly recognizes that there is uncertainty regarding the volume of shipments to transport, planning for the use of external resources to accommodate fluctuations in demand.

4 - A Multimodal Network Flow Problem with Perishable Products and Asset Management
Maryam SteadieSeifi, PhD Student, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, M.Steadie.Seifi@tue.nl, Nico Dellaert, Tom Van Woensel, Wim Nuijten

We present an optimization model and a solution algorithm for a horticultural transportation system with multiple transport modes, highly perishable products, demand and supply dynamics, and management of the reusable transport units. We integrate dynamic allocation and repositioning of the RTIs with a synchronized flow of products, in order to find the trade-off between quality requirements and operational considerations and costs. We also present detailed computational results and analysis.

Transportation Planning I

Contributed Session

Chair: Jens Brunner, Universit‰t Augsburg, Universitatsstrafle 16, Augsburg, Germany, jens.brunner@wiwi.uni-augsburg.de

1 - A Hybrid Genetic Algorithm for Scheduling Food Bank Collections and Deliveries
Luther Brock, E T Care Health and Medical, 8007 N Point Blvd, Winston-Salem, NC, 27406, United States of America, lgbrockiii@hotmail.com, Lauren Davis

This research addresses vehicle routing challenges experienced by food banks. The essential features of this problem consists of constructing routes that encompass food collections, food deliveries, constraints on vehicle capacity, food spoilage, and operator workday, as well as collection and delivery frequency. A genetic algorithm-based metaheuristic is presented to solve the routing problem. Its ability to find good solutions for routing problems of varying sizes is demonstrated.

2 - Multi Traveling Salesmen Problem with Time Windows: A Real World Application
Haluk Yapicioglu, Anadolu University, Proje Birimi, Yunusemre Kampusu, Eskisehir, 26470, Turkey, hyapicio@anadolu.edu.tr

In this study, a new type of TSP problem that arises from a real world problem is introduced. Anadolu University administers exams six times a year throughout Turkey. In each city, university representatives must visit every exam location at least once. The exams are scheduled over four sessions. The mathematical programming formulation of the problem is presented with two different objective functions. Comparison of these two models is provided based on four problem instances.

3 - Type III Sensitivity Analysis of Right-hand-Side Parameters in Dual Transportation Problems
Kang-Ting Ma, National Tsing Hua University, No.101, Sec. 2, Guangfu Rd., HsinChu, 30013, Taiwan - ROC, d9734802@oz.nthu.edu.tw, Shu-Cherng Fang, Ue-Pyng Wen

Feasible solutions in transportation problems are inherent. To realize increments/decrements to/from which supplies/demands with shadow prices invariant is more important than perturbation ranges of keeping shipping pattern invariant. Type III sensitivity analysis keeps shadow prices at optimal shipping pattern invariant. In this paper, labeling algorithms are proposed to obtain the perturbation ranges of type III sensitivity analysis of the right-hand-side parameters of transportation problems.

4 - Optimizing Towing Processes at Airports
Jens Brunner, Universitat Augsburg, Universitatsstrafle 16, Augsburg, Germany, jens.brunner@wiwi.uni-augsburg.de, Jia Yan Du, Rainer Kolisch

We present a mathematical model that assigns tractors to aircraft. The objective function minimizes costs subject to operational restrictions such as technical compatibility of tractor types. The model considers a heterogeneous fleet, time windows, multiple depots, and multiple trips. To solve the model we present a column generation based heuristic. Computational results using real-world data highlight how schedulers can be supported in their daily work.

5 - A New Formulation for the Empty Railcar Distribution Problem
Ruhollah Heydari, Northeastern University, Mechanical & Industrial Engineering Dep., 360 Huntington Avenue, Boston, MA, 02115, United States of America, Emanuel Melachrinoudis

We formulate the empty railcar distribution problem as a multi-commodity capacitated network flow model with setup costs on blocks. The term "multi-commodity" refers to multiple car types considered in the model and the term "capacitated network flow" refers to the capacity constraints on the blocks and trains. Binary variables are used to formulate the "setup costs on the blocks" and gain economies of scale by making fewer larger blocks.

Transportation, Maritime I

Contributed Session

Chair: Yingfeng Wang, City U of HK, Tat Chee Ave, Kowloon, Hong Kong - PRC, gilbertwyf@gmail.com

1 - Evading the Chasing from a Maneuverable Pirate Ship
Yu Wang, PhD Candidate, Hong Kong University of Science and Technology, Academic Building, Rm 5567, Clear Water Bay, Kowloon, Hong Kong - PRC, ywag19@gmail.com

Recently piracy attacks have become a serious safety problem for maritime logistics in some areas. While various strategies have been taken, such as rerouting, the problem cannot be resolved completely. We consider a decision making problem in which a vessel being chased by a pirate needs to decide its sailing angle and speed to evade. We formulate this as a nonlinear optimal control problem. We consider the evasion condition for direct heading and also turn policy for the vessel to evade.

2 - Evaluating Risk of International Transportation for Energy Resources
Shigeki Toriumi, Dr, Chuo University, 1-13-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, toriumi@ise.chuo-u.ac.jp, Ryuta Takashima, Keisuke INADA

In Japan, energy and natural resources are imported by the maritime transport. It is, therefore, necessary to consider procurement of overseas energy resources and risk management of resource transportation. In this work, we define country risk and chokepoint risk using portfolio theory. Then, we propose a model for determining import countries and its volume. Finally, we analyze the relationship between the transport cost and risk by means of the LLI's vessel movement database.

3 - Risk Analysis of Shipbuilding-Shipping Industries: Findings from China, Japan and South Korea
Yingfeng Wang, City University of Hong Kong, Tat Chee Ave, Kowloon, Hong Kong - PRC, gilbertwyf@gmail.com, John Liu, Sheng Li

We conduct risk analysis of shipbuilding-shipping industries, with a particular focus on systemic risk measures. We use the model to address recent findings that idiosyncratic risk based models (such as the well-known mean-variance model) become ineffective or even inappropriate for asset assessment under predominance of systemic risk, in the context of national shipbuilding industries of China, Japan and South Korea, and their correlations with international shipping and trade markets.

1 - Mixed Integer Programming Model for Optimizing Multi-level Operations Process in Rail Yards
Xuesong Zhou, Associate Professor, Arizona State University, School of Sustainable Engineering and th, Tempe, AZ, United States of America, xzhou74@asu.edu, Tie Shi

This talk presents a time-expanded multi-layer network flow model to describe the connection between different layers of rail yard operations. A mixed integer programming is developed to schedule the humping and pullback engine activities by jointly considering tightly interconnected components. A novel lot-sizing modeling framework and related valid inequality formulations are introduced to model the assembling jobs for outbound trains.

2 - New Frontiers in Yard and Terminal Analytics at CSX
Jeremiah Dirnberger, Manager-Network Modeling, CSX, 500 Water St, J315, Jacksonville, FL, 32202, United States of America, Jeremiah_Dirnberger@csx.com

Rail network management can be divided into three distinct primary functions: yards, terminals and line-of-road. Traditionally, the terms yard and terminal have been used interchangeably. However, in order to get a more complete picture of network capacity, these terms should be defined separately. This presentation will show how CSX has separated the analysis of these two functions and will also discuss the advances in the analytical tools that CSX uses to monitor and improve performance.

3 - Simulation Based Yard Case Studies
Krishna Jha, Vice President, Optym, LLC, 2153 SE Hawthorne Road, Gainesville, Fl, 32641, United States of America, krishna.jha@optym.com

Yards play a vital role in railroad operations. Generally, a railcar spends more time in yards than that on line-of-roads in its itinerary. With the growing traffic demand, railroads are looking for ways to improve yard throughput while providing quality service to customers. In this talk, we will present couple of case studies performed for large hump yards using a state-of-the-art simulation system to improve the throughput and the service level.

4 - Planning of Mechanical Locomotive Facilities for Repair, Maintenance, Service and Fueling
Siyang Xie, University of Illinois at Urbana-Champaign, 3150 Newmark Civil Engineering Lab, 205 N. Mathews Ave, Urbana, IL, 61801, United States of America, sxie13@illinois.edu, Yanfeng Ouyang, Zhaodong Wang, Xi Chen, Kamalesh Somani

We present a mixed-integer model that helps plan fixed and movable facilities for multiple types of locomotive mechanical work (e.g., repair, maintenance and service, and fueling). The decisions include (i) locations, capacities and capabilities of fixed facilities, (ii) fleet mix and size, routes, and home locations for movable facilities, and (iii) assignments of work to facilities. A series of solution algorithms are developed to solve this highly complex problem via empirical cases.

Emerging Issues in Airport-Airline Gate Management and Operations

Sponsor: Aviation Applications
Sponsored Session

Chair: Jasenka Rakas, University of California, Berkeley, 107B McLaughlin Hall, NEXTOR II, Berkeley, CA, 94720, United States of America, jrakas@berkeley.edu

1 - The Role of Airports in Airline Competition: The U.S. Experience
Richard Golaszewski, Executive Vice President, GRA, Incorporated, 115 West Av, Suite 201, Jenkintown, Pe, 19046, United States of America, richg@gra-inc.com

Airline competition depends on the ability to access passengers in specific markets. Airport infrastructure can be key, especially when there are constraints on slots, gates, or other facilities. FAA and DOT policies require airports to submit competition plans in certain cases. This occurs when the airport reaches long-term agreements on airport gates, or other facilities. The FAA may intervene if an airport enters into exclusive contracts with an airline that could hamper new entrants.

2 - Dynamic Collaborative Gate Allocation
Mattan Mansoor, Associate, L.E.K. Consulting, 1453 Kyle Court, Sunnyvale, CA, 94087, United States of America, mattanmansoor@gmail.com, Joshua Sachse, Hoang Nguyen, Jasenka Rakas, Katharina McLaughlin, Alex Cuevas, Joanna Ji

Most airport gate allocations in the U.S. are currently optimized within each airline and not across the system (i.e., airport). Dynamic Collaborative Gate Allocation (DCGA) involves dynamic stochastic optimization modeling that helps airlines and airports collaboratively determine gate usage. These improved gate-sharing policies increase airport capacity without additional infrastructure and reduce flight delays, fuel usage and carbon emissions while improving the experience for passengers.

3 - Mobile Gate Design
Patrick Poon, UC Berkeley, 869 Charmain Dr., Campbell, CA, 95008, United States of America, PATRICK452@berkeley.edu, Ken Poon, Benny Chung, Graeme Scott, Steven Chen, Gohki Kobayashi, Ken Lim, Steven Van Leeuwen, Xiao Lin, Jasenka Rakas

This study addresses the shortage of gate capacity by proposing a Mobile Gate Design concept. The proposed concept increases gate maneuverability and gate physical mobility to dynamically meet different demands of aircraft-mixes by using next generation technology for maneuvering and managing parking spaces, jet bridges and gate locations. The proposed design should revolutionize traditional gate capacity management, while preserving passenger safety and jet bridge security.

4 - Solving Collaborative Gate Allocation Problem by the Bee Colony Optimization Algorithm
Jasenka Rakas, University of California, Berkeley, 107B McLaughlin Hall, NEXTOR II, Berkeley, CA, 94720, United States of America, jrakas@berkeley.edu, Milos Nikolic, Dusan Teodorovic

We develop a Swarm Intelligence-based model for the Collaborative Gate Allocation problem using the Bee Colony Optimization (BCO) metaheuristics as a problem solution. The BCO algorithm belongs to the class of population-based algorithms, mimicking the way bees look for nectar as the way to look for the best solution. We show that with the BCO algorithm, airlines and airports can significantly reduce delays and generate fast, high-quality solutions.

Project Management 3

Contributed Session

Chair: Jingwen Zhang, Northwestern Polytechnical University, No.127,Youyi West Road, Xi'an, 710072, China, zhangjingwen@nwpu.edu.cn

1 - Probabilistic Measurement of Project Delay Cost
Feng Xu, Georgia Southwestern State University, 800 GSW State University Drive, Americus, GA, 31709, United States of America, feng.xu@gsw.edu

Many projects end with cost overruns due to delays in project delivery. This risk is usually managed using contingency and management reserves included in cost baseline and budget plan. Both reserves are commonly calculated as percentages of aggregated expected value of project activities' costs. This paper analyzes delay induced cost separately using established probability distribution functions, with the purpose to provide accurate measurements for project reserve analysis.

2 - Earned Value Analysis with Stochastic Activity Durations and Costs in Project Scheduling Problems

Jingwen Zhang, Northwestern Polytechnical University, No.127,Youyi West Road, Xi'an, 710072, China, zhangjingwen@nwpu.edu.cn

The duration and cost of an activity are modelled as random variables; accordingly the upper and the lower bounds for stochastic cumulative cost curves over time statistically represent the range for the budget cost of work scheduled, so the uncertain earned value analysis (EVA) is probed. The conclusions indicate that project managers can obtain a degree of flexibility when adopting uncertain EVA to monitor status during project execution, which differs greatly from deterministic situations.

3 - Optimization of Multi-mode Cash Flow Balanced Project Scheduling in Uncertainty Environment

Minjing Ning, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, China, 344859543@qq.com, Zhengwen He

The balance between cash outflows and inflows is very significant for the smooth implementation of large and complex construction projects. However, for the disturbances of uncertainty factors, it is difficult to keep this balance throughout the execution of projects continuously. In the light of the fact above, this research involves the problem of how to schedule projects so that the balance of cash flows can be maintained under the uncertainty environment.

4 - An Operational Framework to Manage a Project

Narasimhan Ravichandran, Professor, Indian institute of management, Vastrapur, Ahmedabad, GU, 380015, India, nravi@iimahd.ernet.in

Based on a real life opportunity experienced by the author in managing a construction project an operational framework is developed to conduct detailed negotiation with the service provider for the early completion of the project with appropriate financial implications.The framework can be generalised to address similar issues in a variety of contexts.

5 - Enabling Contextual Factors Analysis for Project Risk Mmanagement

Anton Talantsev, PhD candidate, research assistant, Stockholm University, Borgarfjordsgatan 12, Kista, Stockholm, 164 40, Sweden, antontal@dsv.su.se, Aron Larsson

We approach the concept of contextual factors (CFs) and their impact on project performance with risk analysis. The approach suggests a scenario-based judgments elicitation process to define parameters of the CFs Magnitude and Impact functions, Monte-Carlo simulation to handle stochastic representation, non-additive impact aggregation function, and a Probability/Threat-Favor classification scheme to provide comprehensive and balanced risk-opportunity analysis of external project context.

Hilton- Union Sq 10

Models and Algorithms for Sequencing and Scheduling in Applied Transportation Problems

Cluster: Scheduling and Project Management

Invited Session

Chair: Brian Lemay, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, blemay@umich.edu

1 - Crash Test Scheduling for Vehicle Safety Assessment

Yuhui Shi, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, yuhuishi@umich.edu, Amy Cohn, Marina Epelman, Daniel Reich

We develop, implement, and analyze models and algorithms for scheduling the sequencing and timing of vehicle crash tests for the development and safety-testing of new vehicle lines.

2 - A Time-Constrained Vehicle Routing Problem with a Heterogeneous Fleet: Algorithms and Analysis

Young-Chae Hong, University of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, hongyc@umich.edu

We consider a new variant of the Time-Constrained Heterogeneous Vehicle Routing Problem (TCHVRP). The travel time of any given arc vary by vehicle type within a heterogeneous fleet. Each vehicle type has its own limit on total travel time allowed. We formulate TCHVRP as a path-based model, which we solve using column generation. We introduce several different methods to solve the pricing problem and conclude with empirical analyses to assess the impact of data on our algorithm performance.

3 - Optimal Download Scheduling for Multi-Satellite, Multi-Ground Station Missions

Brian Lemay, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, blemay@umich.edu

We address the problem of scheduling data downloads from a constellation of satellites to a network of ground stations. Our optimization model incorporates the energy and data dynamics of the system to ensure feasible download schedules. We introduce alternative scheduling methods for comparison purposes and test each method on a variety of scenarios. We identify the types of scenarios that benefit most from optimization and study the effects of system enhancements such as improved solar panels.

4 - Optimally Scheduling Satellite Communications under Uncertainty

Jeremy Castaing, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, jctg@umich.edu

We consider the problem of scheduling and managing the download of data from a collecting satellite to receiving ground stations. We design models to compute optimal download schedules over the planning horizon. We introduce uncertainty in the model by assuming that each ground station is only available with a certain probability and we develop algorithms to create more robust download schedules while handling the complexity of the stochastic optimization models.

Hilton- Union Sq 11

Staffing and Resource Allocation in Public and Private Service Systems

Sponsor: Service Science

Sponsored Session

Chair: Arthur Swersey, Professor of Operations Research, Yale School of Management, Box 208200, New Haven, Ct, 06520, United States of America, arthur.swersey@yale.edu

1 - Using Customer Counts to Improve Retail Labor Scheduling

Michele Samorani, University of Alberta, Edmonton, AB, Canada samorani@ualberta.ca, Armann Ingolfsson, Ivor Cribben, Osman Alp

In this project, we use data on customer traffic, transactions, and staffing to optimally schedule staff at retail stores. We use time series models to forecast customer hourly traffic, we use predicted traffic and staffing levels to forecast conversion (transactions/traffic), and we use the resulting models to develop profit-maximizing staff schedules. A Canadian retail chain has agreed to test our schedules.

2 - Optimal Staffing Policies in Robotic Surgery

Senay Solak, University of Massachusetts Amherst, Isenberg School of Management, Amherst, MA, 01003, United States of America, solak@isenberg.umass.edu, Armagan Bayram, Oz Harmanli

Based on our data-based finding that experience of each team member is a key determinant of operating room (OR) time in robotic surgery, we develop policies for hospitals to determine surgical team configurations that would maximize OR efficiency. The policies are derived through stochastic optimization, and can be implemented through spreadsheet based methods. The value of the proposed policies is assessed through comparisons with historical surgical team configurations at a major hospital.

3 - The Value of Patient Information in Allocating Emergency Medical Service Resources

Laura McLay, Associate Professor, University of Wisconsin-Madison, 1513 university ave, Madison, WI, 53706, United States of America, lmclay@wisc.edu, Soovin Yoon

This talk explores how the value of patient information affects the usage of ambulances in terms of locating, dispatching, and staffing ambulances. We focus on the revelation of patient information over the course of each call as well as performance goals across different districts. We explore these issues through a discrete optimization model and analyze the results using data from a real-world setting.

4 - Improving Fire Department Productivity: Merging Fire and Emergency Medical Units

Arthur Swersey, Professor of Operations Research, Yale School of Management, Box 208200, New Haven, Ct, 06520, United States of America, arthur.swersey@yale.edu

Under this innovative plan dual-trained teams of fire medics respond to medical emergencies or fire incidents. We describe how the plan was used in New Haven, Ct. before falling victim to political pressures. We present cost savings, and derive response time performance measures using a spatial queuing model. We then discuss how a variant of the plan is now being used in St. Paul, Minn.

Service Science - Telemarketing and Call Centers

Contributed Session

Chair: Tian Sun, Kijiji China, Guangyuan Xi Rd 55 rm1808, Shanghai, China, suntian@baixing.com

1 - Predictive Modeling to Identify Prospective Customers for Effective Telemarketing

Tian Sun, Kijiji China, Guangyuan Xi Rd 55 rm1808, Shanghai, China, suntian@baixing.com, Zhe Liang

Telemarketing often fails to identify potential customers, causing low conversion rate and poor customer experience. We present effective predictive models to generate candidate phone list based on the customer historical data obtained from a telemarketing company. Models are tested on the real-life operations, indicating significantly improved conversion rate.

2 - Call Center Staffing Optimization with Uncertainty in Arrival, Service and Abandonment Rates

Tahir Ekin, Assistant Professor, Texas State University, 601 University Dr. McCoy 411, San Marcos, TX, 78666, United States of America, tahirekin@gmail.com, Tevfik Aktekin

We consider the short term dynamic staffing problem for a call center operating with uncertainty in arrival, service and abandonment rates. Bayesian inference is utilized to deal with uncertainty. Dependency of abandonment on previous staffing decisions is also considered. To solve the resulting stochastic program, we present the use of a simulation based algorithm which is based on constructing an augmented probability model in decision and random variable spaces.

3 - A Review of Informatics-oriented Product-Service Systems: Concept, Characteristics, and Challenges

Jun-Yeon Heo, Postech, Eng Bldg. 4-316, 77 Cheongam-ro, Nam-gu, Pohang, Korea, Republic of, bluejy@postech.ac.kr, Ki-Hun Kim, Chang-Ho Lee, Kwang-Jae Kim

A product-service system (PSS) is an integrated bundle of products and services which aims at creating customer value. Recently, with the advancement of ICT and analytics technologies, informatics is utilized in PSSs. Such type of PSS is called informatics-oriented PSS and has different properties compared with conventional PSSs. In this talk, we provide a review of informatics-oriented PSS. Based on the review, we clarify the concept of the PSS and discuss its characteristics, and challenges.

4 - Experienced Based Routing in Call Center

Thomas Robbins, Associate Professor, East Carolina University, 3212 Bate Building, Greenville, NC, 28590, United States of America, robbinst@ecu.edu

We examine assumptions commonly made in modeling call centers, in particular that agents are homogeneous, statistically equivalent servers. Using empirical data we explore an environment where agents increase their productivity over time but eventually leave the organization. We consider the implication of this heterogeneity and explore a routing policy that attempts to exploit it; routing to agents based on their availability and their experience relative to other available agents.

5 - Optimizing Agent's Roles in a Large Call Center

Moeed Haghnevis, Senior Resource Planning Analyst, Progressive Casualty Insurance, 4550 S 44th Place, Phoenix, AZ, 85040, United States of America, moeed_haghnevis@progressive.com, Michael Durbin

The sets of skills assigned to agents in a call center define their role (profile) within a workgroup. The goal of this project is to minimize the number of roles needed to staff and schedule workgroups while staffing needs are met for each skill given call type and workload requirements. Moreover, this project improves overall utilization of agents by standardizing the sets of skills assigned to agents in each workgroup and eliminating specialization that does not add value.

■ TC33

Hilton- Union Sq 13

Operations/Finance Interface 2

Contributed Session

Chair: Zhan Pang, Lancaster University, Management School, Lancaster, LA1 4YX, United Kingdom, z.pang@lancaster.ac.uk

1 - Dynamic Financial Hedging and Inventory Control under Demand and Price Uncertainty

Zhan Pang, Lancaster University, Management School, Lancaster, LA1 4YX, United Kingdom, z.pang@lancaster.ac.uk, Qing Ding, Panos Kouvelis

Many firms are experiencing the challenge of increasing commodity price volatilities in procurement while facing uncertainty in demand. Financial derivative and inventory are typical instruments to hedge against the price and demand risks. How should a firm coordinate the hedging and inventory control strategies under both demand and price uncertainties? What is the relationship between financial hedge and inventory in a dynamic environment?

2 - Pooling Operations and Receivables

Kasper van der Vliet, Eindhoven University of Technology, Den Dolech 2, 5612 AZ, Eindhoven, Netherlands, k.v.d.vliet@tue.nl, Matthew Reindorp, Jan C. Fransoo

Risk pooling has many applications in operations research and finance, but these are often studied independently. We explore the possibility of interaction between pooling applications: two firms can pool operations, which allows for a reduction in the marginal cost of production; pool receivables, which allows for a reduction in capital cost by factoring; or both. We determine the value of each pooling application and identify conditions that entail a benefit to coordinating them.

3 - Mitigating Supplier Distress: Purchase Order Finance, Advance Payment Discount and Backup Production

Lima Zhao, Assistant Professor, WHUñOtto Beisheim School of Manage, Burgplatz 2, Vallendar, NA, 56179, Germany, lima.zhao@whu.edu, Arnd Huchzermeier

This paper examines a capital constrained supply chain consisting of one retailer and two suppliers. The retailer has three strategies to manage supplier financial distress and mismatch risk: Purchase order finance(POF), advance payment discount(APD), and backup production. Pre-shipment finance (POF/APD) and backup supply can be complements or partial substitutes for the retailer, depending on demand variability.

4 - Risk Control of Financial Logistics Based on VaR (Value at Risk) and Case Study

Shuyan Lin, The University of Hong Kong, Dept. of IMSE, The University of Hong Kong, Hong Kong, Hong Kong - PRC, shuyan.lin@yahoo.com

This paper studies the risk control of financial logistics during the cooperation of logistics firms, small and medium-sized enterprises (SME), and banks. A simple game-theoretical example shows that the win-win cooperation can be reached in some cases. A case study illustrates that there has been a new trend of using transparent and trackable information as pledge. Since credit system remains imperfect, we further assess the liquidation ability of such novel pledge using VaR methodology.

Transportation and Security under Uncertainty

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Gino Lim, Department Chair, Hari and Anjali Agrawal Faculty Fellow, Associate Professor, University of Houston, E206 Engineering Building 2, Houston, TX, 77204, United States of America, ginolim@uh.edu

1 - Robust Liquefied Natural Gas Shipping Problem under Shamal Disruptions

Jaeyoung Cho, PhD Student, University of Houston, 333 Dominion Drive, #1021, Katy, TX, 77450, United States of America, uncmac.rokag@gmail.com, Hamid Parsaei, Taofeek Biobaku, Selim Bora, Gino Lim

The purpose of this study is to propose a robust LNG supply chain management model against potential disruptions of Shamal wind. It is formulated in multi-period vehicle routing problem with time windows to maximize overall revenue and also generates optimal vessel routes visiting multiple depots with multiple vessels considering dust storm impact. We also consider cargo tank filling limits and its effects called 'sloshing' as this can cause structural damage.

2 - Supply Chain Node Resilience and Importance

Selim Bora, Texas A&M University at Qatar, PO Xob 23874, Doha, Qatar, selim.bora@qatar.tamu.edu, Taofeek Biobaku, Jaeyoung Cho, Hamid Parsaei, Gino Lim

Our goal is to design supply chain networks (SCN) that are resilient under stress by incorporating the concept of node importance. We propose node criticality index (NCI), to give a quantitative measure of the resiliency and importance of components of the SCN. The model is based on the idea of resiliency triangle. Our results show that NCI gives valuable information to decision makers for designing resilient supply chains and assessing the resiliency of existing systems.

3 - Optimal Deployment of Underwater Sonar System

Taofeek Biobaku, PhD Student, University of Houston, University of Houston, Houston, TX, United States of America, tobiobaku@uh.edu, Gino Lim, Jaeyoung Cho, Selim Bora, Hamid Parsaei

In this paper, we study optimal sonar deployment planning to detect underwater threats. We propose a new multi-optimization model to detect potential threats by placing under-water sonars within a port, estuary or waterway of interest. Results from our numerical experiments indicate that our model and deployment strategy provides adequate coverage even under strict budget limits in a multi-period deployment scheme.

■ TC35

Hilton- Union Sq 15

Models for Health Care Delivery

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Ravi Anupindi, David B. Hermelin Professor of Business Administration, Ross School of Business, 701 Tappan Avenue, Ann Arbor, MI, 48109, United States of America, anupindi@umich.edu

1 - Understanding the Efficiency of In-country Global Health Programs

Gemma Berenguer, Purdue University, 403 W. State St., West Lafayette, IN, 47906, United States of America, gemmabf@purdue.edu, Ananth Iyer, Prashant Yadav

Using population reproductive health programs as an example, the goal of this work is to study the major efficiency drivers of global health programs. In particular, we study the effects of environmental conditions and donor fragmentation on the efficiency of global health programs at the country level. To analyze these relationships, we employ a benchmarking tool (three-stage DEA-SFA model) that evaluates the efficiency of a set of sub-saharan african country programs.

2 - Giving it Away to Increase Profits? Price Discrimination and the Effect of Free Goods

Jacob Chestnut, PhD Candidate, University of Michigan, 701 Tappan St. R0400, Ann Arbor, MI, 48109, United States of America, jacob.chestnut@gmail.com, Hyun-Soo Ahn, Ravi Anupindi

We consider a provider serving customers who are heterogeneous in their willingness-to-pay and desired quality. A standard approach is to model as an adverse selection problem, which results in a non-linear pricing schedule. Motivated by empirical evidence that consumer's utility becomes discontinuous when the goods are offered for free, we examine situations where giving away for free can indeed increase the provider's profit.

3 - Public Procurement of Multiple Health Products: The Effect of Alternative Distribution Channels

Iva Rashkova, Management Science and Operations, London Business School, Sussex Place, Regent's Park, London, NW1 4SA, United Kingdom, irashkova@london.edu, Jérémie Gallien

Motivated by Global Fund grant recipients, we study the periodic inventory procurement of multiple health products subject to a common uncertain fund disbursement schedule. The objective is to minimize expected health costs when demand and delivery lags are random, and inventory may be available at alternative channels such as private pharmacies. We derive near-optimal heuristics for the dynamic allocation of funds, characterize their theoretical performance, and discuss managerial insights.

4 - Forecasting the National Deceased Donor Organ Availability for Liver Transplantation

David Hutton, University of Michigan, 1415 Washington Heights, SPH II: M3525, Ann Arbor, Mi, 48109, United States of America, dwhutton@umich.edu, Mariel Lavieri, Wesley Marrero, Neehar Parikh, Kunal Sanghani, Yongcai Xu

We performed secondary analysis of the UNOS OPTN database of adult liver transplant recipients and adult donors from 1999-2012 to project donor organ utilization from 2014-2023. It is estimated that population growth will outpace the growth of available donor organs, thus likely exacerbating the existing liver graft shortage. Strategies to increase organ availability are warranted in order to alleviate this shortage and prevent waitlist dropout.

Information Systems 1

Contributed Session

Chair: Maryam Eslamichalandar, Conservatoire National des Arts et Métiers (CNAM), Cédric, 2 Rue Conté, Paris, France, mechalandar@gmail.com

1 - Subsidizing Subscriber Internet Access by Content Providers – An Economic Analysis

Soo Hyun Cho, University of Florida, 2901 SW 13th St. Apt 251, Gainsville, FL. United States of America, soohyun.cho@warrington.ufl.edu, Subhajyoti Bandyopadhyay

Internet service providers (ISPs) are experimenting with a business model that allows content providers (CPs) to subsidize Internet access for consumers as an incentive for accessing CPs' content. We develop a game-theoretical model to analyze the effects of this business model. We find that the ISP would adopt a pricing mechanism that induces the more competitive CP to subsidize subscribers' Internet access. The results have several implications on the ongoing net neutrality debate.

2 - Obtaining Value from the Customization of Packaged Business Software: A Model and Simulation

Bryon Balint, Assistant Professor, Belmont University, 1900 Belmont Boulevard, Nashville, TN, 37212, United States of America, bryon.balint@belmont.edu

Software vendors and anecdotal evidence recommend that businesses should customize packaged software as little as possible. However, businesses continue to exceed budgets on implementing and maintaining customized software, often significantly. In this paper I model the primary factors in the customization decision. Simulation techniques are used to illustrate the conditions under which customization is likely to provide value, as well as conditions under which customization should be avoided.

3 - Listen to Your Customers! Product Feature Extraction from Online Customer Reviews

Aindrila Chakraborty, PhD Student, School of Business,University of Connecticut, 2100 Hillside Road Unit 1041, Storrs, CT, 06269, United States of America, aindrila.chakraborty@business.uconn.edu

It has always been a challenging task to determine which product/service attributes or features are the most important to the markets that influences consumers' purchasing decisions. Customer reviews provide a wealth of information regarding consumers' thoughts, beliefs and experiences with a product. The paper proposes a text mining method to extract product features from reviews which is helpful for product designers also in designing new products or modifying existing products.

4 - A Branch-and-Price Approach for Deployment of Multi-tier Cloud Services

Björn Nygreen, Professor, Norwegian University of Science and Technology, Dept. of Industrial Econ & Tech mngnt, Trondheim, 7491, Norway, bjorn.nygreen@iot.ntnu.no, Anders Nordby Gullhav

We present a branch-and-price approach for solving a deployment problem faced by a provider of multi-tier services. The problem consists of finding a cost-efficient mapping between a set of replicated service components and the infrastructure while providing a satisfactory quality of service. The main decisions are the selection of replication levels of the components and where to place the resulting replicas. Our results show that branch-and-price performs better than a direct MIP formulation.

Intelligent Heuristics and Systems

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Sam Thangiah, Professor, Slippery Rock University, Artificial Intelligence and Robotics Lab, 250 ATS, Slippery Rock, PA, 16057, United States of America, sam.thangiah@sru.edu

1 - Approximating School Buses Required for a School District using Population Data

Larry Wilson, Slippery Rock University, 250 ATS, Slippery Rock, PA, 16057, United States of America, lpw1002@sru.edu, Sam Thagiah, Cody Young, James Mullen, Sean Brown, Theresa Wajda

We describe a study done for a school district on using population and road networks data available from the U.S. Census Bureau to determine the approximate number of school buses required to transport regular students in a school district in the state of Pennsylvania.

2 - Analysis on Consensus of Opinion Dynamics using Clustered Social Networks

Kuru Ratnavelu, Professor, Institute of Mathematical Sciences, University of Malaya, Pantai Valley, Kuala Lumpur, 50603, Malaysia, kururatna2012@gmail.com,
Jeeva Sathya Theesar Shanmugam

The structure of human communication is formulated as social network where edge of the network defined by human interactions. In general non-consensus in opinion formation leads to chaos and various models were exhibited for opinion dynamics. The present theoretical opinion dynamics model is corroborated on the topology of clustered network data. The results are compared with few other opinion dynamics models. This study is expected to help in understanding the collective human decision making.

3 - A Brain-Computer Interface to Control Mobile Robots

Sam Thangiah, Professor, Slippery Rock University, Artificial Intelligence and Robotics Lab, 250 ATS, Slippery Rock, PA, 16057, United States of America, sam.thangiah@sru.edu, Jordan Schiller, Stephen Bierly, Marc Sensenich, Emily Day, Aaron Weckerly

The Brain-Computer Interface (BCI) research project uses an Electroencephalogram (EEG) to receive neural signals from a user's brain, analyze the data and filter thought patterns and commands. Once a pattern is recognized and classified as a particular command, the command is sent to a mobile robot. The goal of the BCI research project is to create a symbiosis between a user's thoughts and the actions of a mobile robot.

Health Care Modeling Optimization – Planning and Optimization

Contributed Session

Chair: Kazim Topuz, Graduate Asistant, Wichita State University, 3540 N Inwood St, Wichita, KS, 67226, United States of America, mktopuz@gmail.com

1 - Realistic Patient Scheduling Methods

Michael Samudra, KU Leuven, Naamsestraat 69, Leuven, 3000, Belgium, Michael.Samudra@kuleuven.be, Erik Demeulemeester, Brech Cardoen

In one of Belgium's largest hospitals, UZ Leuven, approximately every third patient receives surgery later than medically advised. In order to improve the current situation, the lateness of patients has to be understood. Surgeons do their scheduling themselves and do not use algorithms to support their decision. As a consequence, we analyzed scheduling mechanisms that are easy to apply manually. Additionally, we also identify those combinations that best match the hospital data.

2 - Load Balancing in Prioritized Surgery Scheduling Environment

Kazim Topuz, Graduate Asistant, Wichita State University, 3540 N Inwood St, Wichita, KS, 67226, United States of America, mktopuz@gmail.com, M Bayram Yildirim

Minimizing the waiting time is challenging due to the variability in surgery duration's with resource and time constraints. Patients are assigned to a day of operation, based on the availability of provider, room and patient desire as well as priority/target value. In this study, (1) a load balancing model formulated for weekly scheduling and (2) several heuristics proposed for in day scheduling. (3) Results of the computational experiments evaluated and best heuristic solutions presented.

3 - Care on Demand in Nursing Homes: A Queueing Theoretic Approach

Rene Bekker, VU University Amsterdam, De Boelelaan 1081a, Amsterdam, Netherlands, r.bekker@vu.nl, Karin van Eeden, Dennis Moeke

Nursing homes face ever-tightening budgets, requiring improvements in the allocation of care workers for the daily care of residents. Insight in the care delivery process is however lacking, partly due to absence of data. In this talk, we present the characteristics of care requests based on real-life `call button' data. Based on this we propose a queueing model that can be used by nursing home managers to determine the number of care workers required to meet specific service levels.

4 - Hierarchical Associative Evidential Chain-based Fusion Reasoning for Medical Diagnosis

Haiyan Yu, PhD Candidate, Tianjin Univ., Mailbox 9069, College Of Management and, 92 Weijin Road, Nankai District, Tianjin, 300072, China, yhy188@gmail.com

A fusion reasoning model is proposed for heterogeneous information in diagnostic decisions. Case sequences from multi-source information are associated with rule antecedents using evidential chains. The balance of the enhancement of reasoning accuracy and the reduction of misdiagnosis loss is traded off. The interpretable evidential chains contribute to information sharing and enhance the applicability and robustness of diagnostic decision.

1 - Stochastic Operating Room Planning with Recovery Flow

Maya Bam, University of Michigan, 1205 Beal Avenue, 2828 IOE Building, Ann Arbor, MI, 48109-2117, United States of America, mbam@umich.edu, Brian Denton, Mark Van Oyen

Surgery scheduling is impacted by operating room availability, surgeons, and downstream resources, like the post-anesthesia care unit. We present a new approach, based on our collaboration with a mid-sized hospital, that combines mixed integer programming with discrete event simulation to create schedules that optimize the tradeoff between operating room overtime and operating room blocking.

2 - Staffing Service Systems with Load Dependent Service Rate

Galit Yom-Tov, Technion-Israel Institute of Technology, Technion City, Haifa, Israel, gality@tx.technion.ac.il, Jing Dong, Pnina Feldman

Most OM literature assumes that service times are independent of the load of the system. However, in many Healthcare systems the two are correlated. For example, patients' condition may worsen if treatment is delayed, resulting in longer stays. We examine how load-related slowdown affects the operational performance. We develop and analyze fluid and diffusion approximations of an Erlang-A model with load-dependent service times. We propose methods to stabilize and improve system performance.

3 - Efficient Resource Allocation and Cost Accounting in Healthcare Networks

Fernanda Bravo, MIT, 100 Main St, E62-459, Cambridge, MA, 02139, United States of America, fbravo@mit.edu, Marcus Braun, Retsef Levi, Ali Aouad

This paper presents a novel optimization driven approach to address the issue of effective consolidation in healthcare delivery networks. Specifically, we provide a framework that allows us to understand the true cost of service and to support strategic resource allocation and system design decisions in a multi-site network. In addition, we report on the application of our approach to a real healthcare delivery network and describe the projected impact and managerial insights derived from it.

4 - Surgical Supply Inventory Management in Large Academic Medical Centers

Cecilia Zenteno, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E62-389, Cambridge, Ma, 02139, United States of America, ceciliaz@mit.edu, Matt Schlanser, Retsef Levi, Peter Dunn, Bethany Daily

Massachusetts General Hospital performs over 36,000 operations per year. Surgical supplies come either individually packaged and sterilized (soft goods), or procured in pre-assembled custom packs. We study the composition of the surgical packs and how to combine them with soft goods to satisfy the demand driven by the surgeons' requirements, while optimizing their base stock levels. We prescribe a modular pack structure to reduce inventory levels and associated costs via demand pooling.

1 - Incorporating Time-Varying, Modifiable Risk Factors in Chronic Disease Models

Margaret Brandeau, Professor, Stanford University, MS&E Department, Stanford, CA, 94305, United States of America, brandeau@stanford.edu, Jeremy Goldhaber-Fiebert

Risk factors (e.g., smoking) increase chronic disease incidence and severity. We develop a methodology for embedding time-varying, modifiable risk factors in chronic disease models, and for calibrating the models using available, cross-sectional data. We illustrate feasibility with the policy-relevant example of smoking, and smoking cessation programs, in India. We show that incorporating exposure-change rates can improve estimates of chronic disease outcomes and outcomes of interventions.

2 - Forecasting and Dynamic Adjustment of Staffing Levels in Hospital Operating Rooms

Su Xie, Stanford Graduate School of Business, 655 knight way, Stanford, CA, 94305, United States of America, xiesu@stanford.edu, Stefanos Zenios

This paper considers the problem of setting nurse staffing levels for a hospital operating room. The goal is to reduce total nurse staffing costs, which include an hourly staffing salary for scheduled nurse time plus an overtime rate when surgeries take longer than scheduled (and therefore nurses need to stay beyond their scheduled time).

3 - Admission and Discharge Decisions in ICU

Huiyin Ouyang, UNC at Chapel Hill, 2000 Baity Hill Dr, Apt 215, Chapel Hill, NC, 27599, United States of America, ouyang5@live.unc.edu, Nilay Argon

In this paper, we consider a model for an ICU with patients whose health status change during their care at the hospital. We formulate an MDP model to gain some insights into which patients have larger benefit from ICU to help make admission and discharge decisions. We find a condition under which ICU is more preferable than the general ward, and we prove that under this condition the optimal discharge policy when the ICU is full is of threshold type.

4 - Capacity Planning for Long-Term Care Networks with Homogenous Patient Population

Yan Li, Purdue University, West Lafayette, IN, 47907, United States of America, li528@purdue.edu, Nan Kong, Mark Lawley

Long-term care (LTC), mainly in the forms of nursing homes and home- and community-based services, has placed huge economic burden on the US health care system. Given a finite homogenous patient population and a finite monetary budget, we study the capacity planning for each set of services. We propose a migration network model for patient flows and a newsvendor model for network-wide profit maximization. We present both analytical solutions and numerical results to draw managerial insights.

Health Care, Strategy, and Policy 1

Contributed Session

Chair: Dawei (David) Zhang, Assistant Professor, University of Scranton, 800 Linden St, Scranton, PA, 18510, United States of America, dawei.zhang@scranton.edu

1 - The Role of Familiarity on Productivity: The Case of Cardiac Surgey Operations

Emmanouil Avgerinos, PhD Student, University College London, 10 Gough House, Windsor street, London, N18QA, United Kingdom, emmanouil.avgerinos.10@ucl.ac.uk, Bilal Gokpinar

Fluid teams are commonly used by a variety of organizations to perform similar and repetitive yet highly critical and knowledge-intensive tasks. In this paper, we develop and test a model of knowledge transfer based on team composition in fluid team operations. Using a unique dataset of 6,206 cardiac surgeries from the cardiac unit of a private hospital in Europe over seven years, we investigate knowledge transfer mechanisms through which team familiarity may influence productivity.

2 - IT and Hospital Performance

Dawei (David) Zhang, Assistant Professor, University of Scranton, 800 Linden St, Scranton, PA, 18510, United States of America, dawei.zhang@scranton.edu, Victoria Mitchell, Barrie Nault

Hospitals in the US are progressively becoming overwhelmed by the mounting number of tasks as the U.S. population continues to make strides in longevity. Consequently, hospitals have been making investments in information technology (IT), hoping to improve healthcare decisions. Surprisingly, there is a gap in the IS literature on the impact of IT on hospital performance. Our study aims to shed light on the role of health IT in affecting hospital performance.

3 - Explaining Outstanding Hospital Performance on Multiple Fronts

Carol Theokary, Assistant Professor of Business, Mills College, 5000 MacArthur Boulevard, Oakland, CA, 94613, United States of America, ctheokary@mills.edu, Kate Karniouchina

Motivated by the hospital value-based purchasing program that is designed to promote better clinical outcomes for hospital patients, as well as improve their experience of care during hospital inpatient stays, we use a large dataset featuring more than 2,000 hospitals to empirically examine how the latest addition of a cost efficiency component to the scoring system affects overall hospital performance.

4 - Saving Patient Ryan - Can Health IT Make Patient Care Safer? Evidence from Pennsylvania Hospitals

M Zia Hydari, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15146, United States of America, zia@cmu.edu, William Marella, Rahul Telang

Patient safety is widely expected to benefit from health IT but the evidence of its impact on safety is inconclusive. We estimate the impact of advanced Electronic Medical Records (EMRs) on patient safety using a panel of Pennsylvania hospitals over 2005ó2012. Using a differences-in-differences identification strategy, we find that EMRs lead to a 27% decline in patient safety events. Thus, we provide evidence to stakeholders that hospitals' adoption of advanced EMRs improves patient safety.

1 - Considering Multiple Perspectives in Simulation Modeling for Better Implementation of Interventions

Irene Vidyanti, Los Angeles Department of Public Health, 3530 Wilshire Boulevard, Los Angeles, CA, 90010, United States of America, irenevidyanti@gmail.com, Shinyi Wu

This research makes the case for considering multiple perspectives by analyzing cost-benefit of several Diabetic Retinopathy screening strategies from the societal, payer, and medical system perspectives using a simulation model. Optimal screening strategy differs based on perspective taken. As different parties have different interests but cooperation from all is required for successful implementation, having this information is useful to determine incentives to facilitate implementation.

2 - Developing Depression Symptoms Prediction Models to Improve Depression Care Outcomes

Haomiao Jin, University of Southern California, 3650 McClintock Avenue, Rm 340, Los Angeles, CA, 90089, United States of America, haomiaoj@usc.edu, Shinyi Wu, Irene Vidyanti, Paul Di Capua, Brian Wu

This study targets to develop depression symptoms prediction models from a rich dataset yielded from a recent, large-scale clinical trial. Bench model was developed using the historical scores of a depression symptom scale called PHQ-9 to predict the PHQ-9 thereafter. Additional predictors were then added to improve the accuracy of prediction. The prediction models developed in this study are useful predictive analytics tools that can assist in improving depression care outcomes.

3 - Cost-effectiveness of Colorectal Cancer Screening Interventions Incorporating Patient Choice

Maria Mayorga, Associate Professor, North Carolina State University, 111 Lampe Dr., Raleigh, NC, 27695, United States of America, memayorg@ncsu.edu, David Cornejo, Kristen Hassmiller Lich

We present an individual-based simulation model that accounts for heterogeneity in patient screening behavior; cancer progression is affected by individuals' characteristics and their screening and mode decisions. A set of discrete choice models determine patients' compliance and modality choices. We consider several distinct public health interventions that affect people's choice behavior. Cost effectiveness is evaluated with respect to several outcomes, such as life-years up-to-date.

4 - Using Microsimulation to Analyze Long-term Care Transition

Hambisa Keno, Purdue University, West Lafayette, IN, 47907, United States of America, hkeno@purdue.edu

A state-transition microsimulation model is presented for long-term care (LTC) transition processes and service utilization. The four states (care settings) in the model are home, nursing home, home care, and hospital. For each patient, the model captures the semi-Markov LTC transition process in two steps: which care setting to transition and the dwelling duration before the transition. Our model was validated based on a prospective cohort study. The model will be used to assess various intervention scenarios on service utilization.

1 - Solving Semidefinite Programs over Symmetric, Diagonally Dominant Matrices

David Phillips, U.S. Naval Academy, Mathematics Department, Annapolis, MD, 21401, United States of America, dphillip@usna.edu, R. Michael Lewis, Rui Zhang

We consider semidefinite programs (SDPs) over symmetric, weakly diagonally dominant matrices. This class of SDPs has applications to network design and large scale instances are intractable for general SDP solvers. We present a potential function method that is provably and practically efficient. A key distinction of our algorithm is that we penalize the linear matrix inequality. We know of no other work that adopts this strategy.

2 - Speeding Up Modified Support Vector Machines with Decomposition

Talayeh Razzaghi, Postdoctoral Research Fellow, School of Computing, Clemson University, Clemson, SC, 29634, United States of America, trazzag@clemson.edu, Petros Xanthopoulos, Qipeng Zheng

Modified Support Vector Machines (SVMs) with ramp loss and hard margin loss functions are usually employed when outliers are present in the data. The success of solution methods is limited due to expensive computation, particularly for large datasets. To overcome this deficiency, we present a decomposition technique aiming to speed up the training process.

3 - Bayesian Global Optimization of Expensive Functions with Low-dimensional Noise

Peter Frazier, Assistant Professor, Cornell University, 232 Rhodes Hall, Ithaca, NY, 14853, United States of America, pf98@cornell.edu, Jing Xie, Sethuraman Sankaran, Abhay Ramachandra, Saleh Elmohamed, Alison Marsden

In many applications of simulation optimization, most of the variability in the output measure of interest is determined by a small number of random exogenous inputs. Motivated by an application to the design of cardiovascular bypass grafts using a computationally-expensive physics-based stochastic simulator, we provide a new Bayesian global optimization method that exploits this low-dimensional structure to improve performance.

4 - Hierarchies of Bounds for Multistage Stochastic Mixed-integer Programs

Gabriel L. Zenarosa, PhD Student, University of Pittsburgh, 3700 O'Hara Street, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, glz5@pitt.edu, Oleg Prokopyev, Andrew Schaefer

Many practical dynamic decisions under uncertainty can be formulated as multistage stochastic mixed-integer programs (SMIPs). Unfortunately, multistage SMIP instances are large, making them nearly impossible to solve. SMIP instances must be decomposed into manageable problems. We propose a framework for scenario tree decomposition—a novel approach for multistage SMIPs—where lower and upper bounds are obtained by solving SMIPs over subsets of the scenario tree.

Sponsored Session

Chair: De Liu, University of Kentucky, 550 S Limestone St,, Lexington, KY, 40506, United States of America, de.liu@uky.edu

1 - How do Consumers use Social Shopping Sites? The Impact of Social Endorsements

Pei Xu, PhD Student, University of Kentucky, 3800 Nicholasville Rd Apt 31626, Lexington, KY, 40503, United States of America, xupei124@gmail.com, De Liu

Social shopping is a new form of e-commerce that uses social media to connect consumers and facilitate collaborative shopping. This research aims to understand how product endorsements via the social channel influence the amount of private consideration and public endorsement a product can receive. Based on the theory of social contagion, herding effect and identity-signaling theory, we argue that the working mechanisms of social endorsements differ in consumers' private and public behaviors.

2 - Examining user Content Similarity and Network Growth within Content-based Online Social Networks

Mitchell Church, Assistant Professor, Slippery Rock University, Slippery Rock, PA, 16057, United States of America, mitchell.church@sru.edu, Xia Zhao, Lakshmi Iyer

Using a unique dataset from Pinterest, our study examines how rich-media diffusion and network growth are affected by the actions and rich-media content similarity of users within content-based social networks. Our findings show that content similarity between network users impacts how Pinterest users receive, share and consume rich-media content. Additionally, we show that user actions and content similarity influence the growth and structure of content-based networks.

3 - The Role of Social Networks in Online Reviewing

Zhihong Ke, University of Kentucky, 550 S Limestone St,, Lexington, KY, 40506, United States of America, zhihong.ke@uky.edu, De Liu

Extant research on user content generation has primarily focused on what motivates users to contribute content, and less on the effects of informational and social environment surrounding these users. The aim of this study is to examine how a user's contribution to an online review platform is affected by reviews of his/her friends from both informational and social perspectives.

Behavioral Aspects in Forecasting and Inventory Decisions

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Michael Becker-Peth, Assistant professor, University of Cologne, Albertus-Magnus-Platz, Cologne, Germany, michael.becker-peth@uni-koeln.de

1 - The Effect of Group Identity on Supply Chain Forecasting and Ordering

Felix Papier, Associate professor, ESSEC Business School, Av. Bernard Hirsch, Cergy, 95021, France, papier@essec.edu, Torsten Gully, Ulrich Thonemann

We analyze a supply chain in which a demand planner provides demand forecasts to a production planner, who cannot observe the effort that the demand planner invests. We use a game theoretic model and laboratory experiments to show that social preferences affect the alignment between both planners: Some demand planners invest effort and production planners anticipate this effort. We show that group identity can be used to increase social preferences and to align the supply chains.

2 - Improving the Effectiveness of Forecasting Processes: A Case Study in the Food Industry

Stefanie Protzner, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, 3062PA, Netherlands, sprotzner@rsm.nl, Steef van de Velde, Laurens Rook

Lack of trust and transparency between sales, marketing and supply chain is a serious problem in forecasting processes of many organizations harming the credibility of the forecast and the overall process. In this study, we explore the effects of a re-design of a forecasting process. Results show that changes in ownership structure and process flow and performance based inclusion can reduce dysfunctional biases, improve forecast accuracy and the effectiveness of the forecasting process.

3 - Task Decomposition and Newsvendor Decision Making

Yun Shin Lee, Assistant Professor, Korea Advanced Institute for Science and Technology, 85 Hoegiro Dongdaemoon-gu, Seoul, Korea, Republic of, yunshin@business.kaist.ac.kr, Enno Siemsen

We separate newsvendor order decisions into point forecasts, uncertainty judgments, and service level decisions in a behavioral laboratory experiment. Point forecasts are influenced by the underlying overage and underage cost parameters, and suffer from demand chasing. Uncertainty judgments are subject to overconfidence, and service level decisions suffer from a cognitive dissonance bias where service levels are rarely set below 50 percent.

4 - Empirical Newsvendor Decisions under a Service Level Contract
Michael Becker-Peth, Assistant Professor, University of Cologne, Albertus-Magnus-Platz, Cologne, Germany, michael.becker-peth@uni-koeln.de, Stefan Minner, Ulrich Thonemann, Anna-Lena Sachs

Analyzing the newsvendors in laboratory experiments gives new insights into the behavioral aspects of decision makers. However, a valid question is whether the results of those experiments can be transferred to real world decisions. We test this by analyzing the decisions of real decision makers. Our findings indicate that real decision makers show similar decision biases as students in laboratory environments and we find a new decision bias, as our decision maker optimizing multiple products.

MIP Theory and Multi-level Applications

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: J. Cole Smith, Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, jcsmith@clemson.edu

1 - The Level-d Partial Convexification Cut for 0-1 Mixed Integer Program
Youngho Lee, Korea University, Sung Buk Ku, Seoul, Korea, Republic of, yhlee@korea.ac.kr, Junsang Yuh, Jeongyi Moon

The level-d partial convexification closure is obtained by augmenting all the partial convexification cuts generated from level-d RLT polyhedron. We present an algorithm for approximately optimizing over the level-d partial convexification closure. This is accomplished by iteratively solving the separation problem that projects the extended space of the RLT formulation into the original space. We present computational results on well-known benchmark instances from MIPLIB 3.0.

2 - Shortest-path Interdiction with Dynamic Attacks
Jorge A. Sefair, University of Florida, 303 Weil Hall, Gainesville, FL, 32608, United States of America, j.sefair@ufl.edu, J. Cole Smith

We study a shortest-path interdiction problem in which two agents (user and an interdictor) interact in a network. The user travels the network intending to reach a destination node at the minimum cost, while the interdictor attacks some arcs to increase the traversing cost. To maximize the user's shortest path, the interdictor can attack while the interdictor travels the network, i.e., the interdictor can initially attack a subset of arcs and, after observing the user's reaction, attack again.

3 - On a General Framework for Three-stage Interdiction Problems with Fortification
Leonardo Lozano Sanchez, PhD Student, University of Florida, 303 Weil Hall, Gainesville, FL, 32698, United States of America, llozano@ufl.edu, J. Cole Smith

Interdiction problems with fortification involve two players who compete in a sequential game where a defender fortifies his system in anticipation to an optimal attack. We present a solution framework that is build upon the intuition of sampling the third-stage problem to obtain upper bounds while adding cuts to the first-stage problem. We conducted computational experiments on the shortest path problem achieving compelling results over large instances with up to 53,658 nodes and 192,084 arcs.

4 - Effectively Handling Indicator Constraints in IBM-Cplex
Andrea Lodi, Professor, University of Bologna, DEIS, Viale Risorgimento 2, Bologna, 40136, Italy, andrea.lodi@unibo.it, Pierre Bonami

Mixed Integer Linear Programming (MILP) models are commonly used to model indicator constraints, which either hold or are relaxed depending on the value of a binary variable. However, classical bigM formulations are notoriously weak and MILP solvers have serious difficulties to deal with them. Motivated by a class of Classification problems with Ramp Loss functions on which Mixed Integer Nonlinear Programming models with nonconvex constraints are solved better than the equivalent MILP formulations, we describe an entirely new and effective implementation of the way IBM-Cplex handles indicator constraints. The implementation is based on the iterative strengthening of the constraints at the nodes through local cutting planes. (Joint work with Pierre Bonami.)

Chair: Muhong Zhang, Arizona State University, 5910 W Park Ave., Chandler, United States of America, muhong.zhang@asu.edu

1 - Integration of Progressive Hedging and Dual Decomposition for Stochastic Integer Programs
Ge Guo, PhD Student, Iowa State University, 610 Squaw Creek Drive, Unit 13, Ames, IA, 50010, United States of America, geguo@iastate.edu, Sarah M. Ryan

We present a method for integrating the Progressive Hedging Algorithm (PHA) and the Dual Decomposition (DD) method for stochastic mixed-integer programs using PySP and DDSIP. A method to transform non-anticipativity weights from PHA to Lagrange multipliers in DD is found. Fast progress in early iterations of PHA speeds up convergence of DD to an exact solution. We report computational results on stochastic server location and unit commitment instances.

2 - Reserve Response Sets for Unit Commitment under Wind Uncertainty
Joshua Lyon, PhD Candidate, Arizona State University, P.O. Box 875706, Tempe, United States of America, jdlyon@asu.edu, Muhong Zhang, Kory Hedman

Uncertainty from renewable resources is a growing concern for power system schedulers. Deterministic models remain in favor due to their computational tractability, but they may overlook solutions that respond well to forecast deviations. One problem is that deterministic policies rarely consider the cost of dispatching reserves. In this research, we propose a decomposition algorithm that determines reserve requirements based on cost criteria as well as reserve deliverability.

3 - Strong Formulation for Unit Commitment Problems
Kai Pan, PhD Student, University of Florida, Weil Hall 411, Gainesville, FL, 32611, United States of America, kpan@ufl.edu, Jean-Paul Watson, Yongpei Guan, Qianfan Wang

We propose a strong formulation for unit commitment problem. The computational experiments verify its effectiveness in solving the unit commitment problem efficiently.

4 - Mathematical Determination of Reserve Requirements in Unit Commitment Problem
Chao Li, PhD Student, Arizona State University, 2343 W Main Street, Apt 2097, Mesa, AZ, 85201, United States of America, Chao.Li.cidse@asu.edu, Muhong Zhang

System reliability is critical in power system operation. Stochastic programming and robust optimization have been proposed to model uncertainties. However, both are limited in applications due to computational challenges. Reserve requirements are adopted by system operators. In this work, reserve requirement policies are determined systematically based on polyhedron structures. A case study will be presented to compare the performance of the proposed methods versus rule-of-thumb rules.

Chair: Kresimir Mihic, Oracle Labs, 501 Island Parkway #3102, Belmont, CA, 94002, United States of America, kresimir.mihic@oracle.com

1 - Generalized Decomposition for Non-linear Problems
Kresimir Mihic, Oracle Labs, 501 Island Parkway #3102, Belmont, CA, 94002, United States of America, kresimir.mihic@oracle.com, Alan Wood

We present Randomized Decomposition (RD), a method for solving non-linear, non-convex mathematical programs. RD is similar to Bender's Decomposition but does not require any knowledge of the problem structure. Instead, the problem is partitioned into random subsets of decision variables, each of the sub-problems represented by the random subsets are optimized, and the process is repeated. Sub-optimal solutions are permitted at certain points in the solution process to help escape local optima.

2 - The Paired Assignment Problem
Vardges Melkonian, Ohio University, 1 Ohio University, Athens, OH, 45701, United States of America, melkonia@ohio.edu

We consider a variation of the maximum bipartite matching problem where each completed task must have at least two agents assigned to it. We prove that the basic solutions of LP-relaxation are half-integral. It is shown that a fractional basic solution can be further processed to obtain an optimal solution.

3 - Formulating a Realistic Mixed Model Assembly Line Balancing Problem
Anas Alghazi, PhD Candidate, Clemson University, Freeman Hall, Clemson, SC, 29634, United States of America, aalghaz@clemson.edu, Mary Elizabeth Kurz

We investigate the formulation of the mixed model line balancing problem that captures realistic characteristics such as zoning constraints and parallel stations. Since the problem is NP-Hard, making use of the structure of the problem is important in order to be able to solve reasonably sized problems to optimality. Different exact solution procedures and formulation techniques are studied to achieve this goal.

4 - Computational Complexity of the Deterministic Annealing Algorithm
Pratik Mayur Parekh, Graduate Student, University of Illinois, Urbana-Champaign, Coordinated Science Laboratory, 1308 West Main St., Urbana, IL, 61801, United States of America, pparekh2@illinois.edu, Carolyn Beck

The deterministic annealing approach to clustering is derived on the basis of the principle of maximum entropy and produces natural hierarchical clustering solutions through a sequence of phase transitions. In this article, the computational complexity for the classic DA algorithm is analyzed through analytical derivation and simulation study. We have also applied smoothing analysis to study the variation in complexity for small perturbations of input data.

Network Optimization and Routing Problems

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Qie He, Department of Industrial and Systems Engineering, University of Minnesota, 111 Church St, SE, Minneapolis, MN, 55455, United States of America, qhe@umn.edu

1 - Algorithms in Traveling Salesman Problem with Continuous Arc Cost Distribution
Zhouchun Huang, University of Central Florida, 4000 Central Florida Blvd., University of Central Florida, Orlando, FL, 32816, United States of America, zhouchun.huang@knights.ucf.edu, Qipeng Zheng

The formulation of Traveling Salesman Problem that incorporates risk managements with conditional value-at-risk is proposed. As a commonly occurring continuous probability distribution, Gaussian distribution is applied to describe the uncertain arc costs. several algorithms including a new cutting plane method are developed to solve the problem in both small-sized or large-sized networks.

2 - Branch-and-Cut-(and-Price) for the Chance-Constrained Vehicle Routing Problem
Thai Dinh, Graduate Student/Research Assistant, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, tndinh@wisc.edu, Ricardo Fukasawa, James Luedtke

We study algorithms for the chance-constrained vehicle routing problem, in which a limit is imposed on the probability that truck capacity is exceeded. We present a branch-and-cut algorithm that requires minimal assumptions on the random demands, and also a branch-and-cut-and-price algorithm for the case when demands are independent normal. Computational results will be presented.

3 - Inventory Routing Problem for a Single Perishable Product with Stochastic Demands
Mahmood Rezaei, Researcher, University of Liege, Rue Louvrex 14, Liege, 4000, Belgium, m.rezaei@ulg.ac.be, Yves Crama, Tom Van Woensel, Martin Savelsbergh

We consider an inventory routing problem where perishable products are dispatched from a central depot to a set of geographically dispersed stores. Demands to each store are stochastic. The objective is to maximize the total profit of the network (the total revenue minus the total transportation costs) during an infinite planning horizon. We develop 4 different approaches to model and solve the problem. The solution methods are compared by simulation and managerial insights are drawn.

4 - Minimum Concave Cost Flows in Capacitated Grid Networks
Qie He, Department of Industrial and Systems Engineering, University of Minnesota, 111 Church St, SE, Minneapolis, MN, 55455, United States of America, qhe@umn.edu, Shabbir Ahmed, Shi Li, George Nemhauser

We study the minimum concave cost flow problem over a two-dimensional grid network (CFG), where one dimension represents time and the other represents echelons. We give a characterization of the computational complexity of CFG based on the grid size, the distribution of sources and sinks over the grid, and arc capacity values. Our algorithms and hardness results generalize complexity results for many variants of the lot-sizing problem, and answer several open questions on serial supply chains.

Chair: Yaping Wang, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ypwang@neo.tamu.edu

1 - Lung Cancer: New information from Old Data
Katia Camacho-Caceres, Graduate Student, 10 Ramirez Silva, Mayaguez, 00680, Puerto Rico, katia.camacho@upr.edu

This work re-examines lung cancer microarray data with a multiple criteria optimization-based strategy. This strategy does not require any adjustment of parameters by the user and is capable to converge consistently to important genes potential biomarkers even in the presence of multiple and incommensurate units across microarrays. Groups with distinct smoking habits and gender are contrasted to elicit a set of highly differentially expressed genes, several of which are associated to lung cancer

2 - A Rigid Point Set Registration Approach for Aligning Two Metrology Data with Different Resolution
Yaping Wang, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ypwang@neo.tamu.edu, Erick Moreno-Centeno, Yu Ding

Given two misaligned metrology datasets with different cardinality and resolution from the same manufacturing part surface, a crucial step to get better prediction of the underlying true surface is to find correspondences between the two datasets. We combine down sampling, solving downsized problem to optimality, partial solution propagation, and iterative local search to obtain solutions with much higher quality than other commonly used approaches within reasonable amount of time limit.

3 - Deploying OPL Optimization Models on Client-server Architectures
Vincent Beraudier, OPL Program Manager - CPLEX Optimization Studio, IBM, Porte Neuve, Bat A, 4 Av Alphonse MorelL, Grasse, 06130, France, vincent.beraudier@fr.ibm.com

CPLEX Optimization Studio enables you to take advantage of all your computing resources locally or remotely. Using the OPL modeling language and its dedicated UIs, we will demonstrate how to take advantage of all your computing resources in minutes to create, debug and deploy optimization models. We will take you through all the steps of implementing optimization projects, including formulating the optimization model, integrating it with user data, and deploying the project on a server.

4 - Semidefinite and Copositive Relaxation of Polynomial Optimization by Using Symmetric Tensors
Xiaolong Kuang, Student, Lehigh University, 425 Montclair Avenue, Bethlehem, PA, 18015, United States of America, kuangxiaolong0731@gmail.com, Luis Zuluaga

We study relaxation of general polynomial optimization problem over the cones of positive semidefinite and completely positive tensors, which are natural extensions of the cones of positive semidefinite and copositive matrices. Then we characterize the relationship between Lagrangian bounds, semidefinite bounds and copositive bounds of polynomial optimization.

Optimization Society Prizes

Sponsor: Optimization

Sponsored Session

Chair: Sanjay Mehrotra, Professor, Northwestern University, Evanston, IL, United States of America, mehrotra@iems.northwestern.edu

1 - Optimization Society Student Paper Prize

Santanu Dey, Georgia Tech, 765 Ferst Drive, NW, Atlanta, United States of America, santanu.dey@isye.gatech.edu

The INFORMS Optimization Society Student Paper Prize was established in 2006 and is awarded annually at the INFORMS Fall National Meeting to one or more student(s) for an outstanding paper in optimization that is submitted to and received or published in a refereed professional journal during the three calendar years preceding the year of the award. The prize serves as an esteemed recognition of promising students who are looking for an academic or industrial career.

2 - The INFORMS Optimization Society Prize for Young Researchers

Andrzej Ruszczynski, Distinguished Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08550, United States of America, rusz@business.rutgers.edu

The INFORMS Optimization Society Prize for Young Researchers was established in 1998 and is awarded annually to one or more young researcher(s) for an outstanding paper in optimization that was accepted, or published in a refereed professional journal within the last four years. All authors must have been awarded their terminal degree within the last eight years. The prize serves as an esteemed recognition of promising colleagues who are at the beginning of their career.

3 - The Farkas Prize of the INFORMS Optimization Society

Yinyu Ye, Professor, Stanford University, Huang 308, Stanford, CA, 94025, United States of America, yyye@stanford.edu

The Farkas Prize of the INFORMS Optimization Society was established in 2006 and is awarded annually at the INFORMS Fall National Meeting to a mid-career researcher for outstanding contributions to the field of optimization, over the course of their career. Such contributions could include papers (published or submitted and accepted), books, monographs, and software. The awardee will be within 25 years of their terminal degree as of January 1 of the year of the award. The prize serves as an esteemed recognition of colleagues in the middle of their career.

4 - The Khachiyan Prize for Lifetime Accomplishments in Optimization

Tamas Terlaky, Professor, Lehigh University, 200 W. Packer Ave, Bethlehem, PA, United States of America, terlaky@lehigh.edu

The Khachiyan Prize of the INFORMS Optimization Society was established in 2010 and is awarded annually at the INFORMS Fall National Meeting to an individual or a team for life-time achievements in the area of optimization. The award recognizes a sustained career of scholarship from nominees who are still active at the year of the nomination. The prize serves as an esteemed recognition of innovativeness and impact in the area of optimization, including theory and applications.

Optimization, Convex

Contributed Session

Chair: Cun Mu, PhD Student, IEOR, Columbia University, 500 West 120th Street, Rm. 315, Columbia University, New York, NY, 10027, United States of America, cm3052@columbia.edu

1 - Subgradient Optimization for Parametric Nonlinear Programming

Jonathon Leverenz, Clemson University, Clemson University, Clemson, SC, 29634, United States of America, jlevere@clemson.edu, Margaret Wiecek

Parametric Programming is used to address uncertainty in optimization problems. Solutions are functions of the parameter and are typically obtained using approximations of the primal problem. Subgradient optimization has not previously been applied in this setting but can improve the quality of these solutions when used to solve the dual problem. An algorithm is presented along with a basic convergence result and illustrative examples.

2 - A Semi-definite Programming Approach for Optimal Selection in Tree Breeding

Makoto Yamashita, Tokyo Institute of Technology, 2-12-1-W8-29, Oookayama, Meguro-ku, Tokyo, Se, 152-8552, Japan, Makoto.Yamashita@is.titech.ac.jp, Tim Mullin

In tree breeding, we wish to optimize parent-genotype contributions in grafted seed orchards, achieving the greatest genetic value in the orchard seed while maintaining essential genetic diversity. We represent this optimization problem as a semi-definite program, and we combine the SDPA solver into open-source optimal selection software, OPSEL. This approach has considerable flexibility, and we found from numerical results that the semi-definite program provides a valuable solution.

3 - Linear Inverse Problems for Multi-structured Signals – With Application in Low-rank Tensor Recover

Cun Mu, PhD Student, IEOR, Columbia University, 500 West 120th Street, Rm. 315, Columbia University, New York, NY, 10027, United States of America, cm3052@columbia.edu, Bo Huang, John Wright, Donald Goldfarb

Recovering a multi-structured signal from incomplete information is a recurring problem in signal processing and machine learning. In this talk, we first give a negative result on the common approach of minimizing the sum of individual sparsity inducing norms (e.g. \ell_1, nuclear norm). Then we demonstrate that, for the low-rank tensor recovery problem, it is possible to design a better model by exploiting those structures jointly.

4 - Largest Inscribed Rectangles In Geometric Convex Sets

Mehdi Behroozi, PhD Student, University of Minnesota, 111 Church St. SE, Minneapolis, MN, 55455, United States of America, behro040@umn.edu, John Carlsson, Shuzhong Zhnag

We consider the problem of finding maximum area inscribed box inside a compact and solid convex set, representable in finite number of inequalities. For the traditional 2-dimensional n-gon problem, we present optimization based exact and approximation algorithms, which find the largest inscribed axis-aligned rectangle for any given direction of axes in $\mathcal{O}(n)$ time and compute $(1-\epsilon)$-approximation to the largest inscribed rectangle in $\mathcal{O}(\frac{n}{\epsilon})$ time.

5 - An Efficient Algorithm for the Nested Resource Allocation Problem

Thibaut Vidal, LIDS — Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 32-D566, Cambridge, MA, 02139, United States of America, vidalt@mit.edu, Nelson Maculan, Patrick Jaillet

We propose an exact polynomial algorithm for a nested resource allocation problem with convex costs and constraints on partial sums of resource consumptions, in the presence of either continuous or integer variables. This resource allocation problem appears prominently in a variety of applications related to production and resource planning, scheduling, ship speed optimization and vehicle routing.

Finance, Portfolio Analysis 1

Contributed Session

Chair: Jinming Xie, The Chinese University of Hong Kong, Dept. of Syst. Eng. & Eng. Manag., Shatin, Hong Kong - PRC, jmxie@se.cuhk.edu.hk

1 - Are Markets Efficient? An Exercise in Predicting Exchange Rates

Arnav Sheth, Assistant Professor, Saint Mary's College of California, 380 Moraga Rd, Moraga, CA, 94556, United States of America, aas3@stmarys-ca.edu, Adam Duncan

Institutional traders trade foreign equities through the foreign exchange market at a benchmark rate called the WM/Reuters Fixing Rate, or the WM Fix. This indicates that a strong relationship between the WM Fix and equity indices exists. We test the predictability of the WM Fix, and exchange rates in general, using stepwise regression techniques and we find that such a relationship does indeed exist. This puts into question the hypothesis of informational efficiency in financial markets.

2 - Empirical Pricing Kernels: A Revisit

Jinming Xie, The Chinese University of Hong Kong, Dept. of Syst. Eng. & Eng. Manag., Shatin, Hong Kong - PRC, jmxie@se.cuhk.edu.hk, Duan Li

In this research, we revisit the empirical pricing kernels estimated by the option prices and the underlying asset prices. We estimate a time series of empirical pricing kernels non-parametrically and find that they consistently have oscillating shapes. Similar phenomenon are found in both the US and Hong Kong market. Besides, these oscillating shapes provide support to the Friedman and Savage utility function theory based on real market data.

3 - Financial Risk in Multifractal Asset Returns
Woojin Chang, Associate Professor, Seoul National University, 1 Gwanak-ro Gwanak-gu, Seoul, Korea, Republic of, changw@snu.ac.kr, Ho Jin Lee

Multifractal Processes provide long memory in volatility, fat-tail distribution behavior, and the moment scaling. We applied the Multifractal Model of Asset Returns, which was introduced by Calvet, Fisher, and Mendelbrot in 1997, to financial risk models such as Value at Risk and Expected shortfall. Both simulations and empirical studies are conducted to confirm the validity of our application.

4 - Set-valued Shortfall Risk Measures for Multi-asset Markets with Frictions
Cagin Ararat, PhD Candidate, Princeton University, 1 Charlton Street, Sherrerd Hall, Princeton, NJ, 08540, United States of America, cararat@princeton.edu, Birgit Rudloff, Andreas H. Hamel

In a multi-asset market with frictions, existence of individual utility functions for assets is assumed and the corresponding utility-based set-valued shortfall risk measures are studied. Their values are defined as the solutions of certain convex set optimization problems. Using a recent set-Lagrange duality, dual problems are obtained and they give rise to multi-objective versions of optimized certainty equivalents. Examples include the entropic risk measure and average value at risk.

5 - Enhancing Rebalancing Gains through Randomization and the use of Portfolio Tactics
Maximilian Goer, PhD Candidate, Princeton University, 12 Lawrence Dr, Apt 501, Princeton, NJ, 08540, United States of America, mgoer@princeton.edu, Woo Chang Kim, John Mulvey

It is well established that rebalancing gains or 'volatility pumping' can enhance the risk-reward characteristics of a portfolio. Due to increasing correlations between the major asset classes, these gains are hard to capture in practice. We show that rebalancing gains can be achieved by using portfolio tactics and selective randomization to decide which tactics are invested at any given time. Special attention will be given to the commodities space.

Co-Chair: Bo Zhang, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, United States of America, bozhang@gatech.edu

1 - Large Dimensional Factor Models Based on High-frequency Observations
Markus Pelger, University of California, Berkeley, Department of Economics, 508-1 Evans Hall, Berkeley, CA, 94720, United States of America, markus.pelger@berkeley.edu

This paper develops an inferential theory for factor models of large dimensions based on high-frequency observations. I estimate the number of factors and derive consistent and asymptotically normal estimators of the loadings and factors for very general stochastic processes in continuous time. The estimation approach can separate factors for systematic large sudden movements, so-called jumps factors, from continuous factors. I apply the approach to the U.S. equity market.

2 - Optimal Importance Sampling of Default Losses
Alexander Shkolnik, UC Berkeley, Berkeley, CA, United States of America, ads2@stanford.edu, Kay Giesecke

We develop an importance sampling estimator of large-loss probabilities in reduced-form models of name-by-name default timing. Such default timing models are widely used to measure portfolio credit risk and to analyze securities exposed to correlated default risk. In contrast with classical methods, our approach does not require knowledge of the loss transform and is implementable for virtually any model. We discuss the technical conditions guaranteeing asymptotic optimality of the estimator.

3 - Systemic Risk with Central Counterparty Clearing
Hamed Amini, EPFL, Extranef 249, Lausanne, 1015, Switzerland, hamed.amini@epfl.ch

We study a financial network in a stochastic framework. We measure systemic risk in terms of a coherent valuation principle. The framework allows us to examine the effects on systemic risk and price contagion of multilateral clearing via a central clearing counterparty (CCP). This is based on joint work with Damir Filipovic and Andreea Minca.

4 - Static Models of Central Counterparty Risk
Samim Ghamami, Economist, Federal Reserve Board, 20th Street and Constitution Ave NW, Washington, DC, 20551, United States of America, samim.ghamami@frb.gov

International standard setting bodies have outlined a set of principles for central counterparty (CCP) risk management; they have also devised CCP risk capital requirements on banks for their CCP exposures. There is still no consensus on how CCP risk should be measured coherently in practice. Based on novel applications of well-known mathematical models in finance, we introduce a coherent CCP risk measurement framework that gives a risk sensitive definition of the CCP risk capital.

Stochastic MINLP With Endogenous Uncertainty

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Ban Kawas, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, NY, 10598, United States of America, bkawas@us.ibm.com

1 - Transit Network Design Problem with Uncertain Demands
Chungmok Lee, Research Staff Member, IBM Research Ireland, Damastown Industrial Estate, Mulhuddart, Dublin, 15, Ireland, chungmok@ie.ibm.com, Rahul Nair

We consider a transit network design problem (TNDP) with uncertain demands. Typically the transit networks are very large and the formulation of the problem often requires nonlinear constraints making solving of the problem difficult. We present a decomposition approach enabling us to exploit the special structure of problem, which naturally localizes the uncertain demands only to user-behavior modeling sub problems. We then apply robust optimization to warrant solutions over uncertain demands.

2 - Distribution Shaping and Scenario Bundling for Stochastic Programs with Endogenous Uncertainty
Ban Kawas, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, NY, 10598, United States of America, bkawas@us.ibm.com, Marco Laumanns, Steve D. Prestwich

Stochastic programs are usually formulated with probability distributions that are exogenously given. Handling endogenous uncertainty still remains a largely unresolved challenge. We develop a new approach to handle decision-dependent probabilities based on the idea of distribution shaping. We demonstrate on a pre-disaster planning problem and solve a recently considered instance of the Istanbul highway network to optimality within seconds, for which only approximate solutions had been known.

Software Demonstrations

Cluster: Software Demonstrations

Invited Session

1 - Syncopation Software - Decisions Large and Small, Made Faster and Better with DPL
Chris Dalton, CEO, Syncopation Software

This demonstration will explore the full range of DPL products. With DPL 8's convenient Excel add-in interface, performing a quick analysis on a spreadsheet takes just a few clicks, all right in Excel's ribbon. Moving beyond the basics, DPL's influence diagrams, decision trees and fault trees make quick work of a broad range of problems, from business valuation to tough security analyses. Need to make that decision 100 times? DPL's Portfolio version has you covered, including a new turnkey system for portfolio data management.

2 - FICO - Optimization on the FICO® Analytic Cloud
Oliver Bastert, FICO, Maximilianstr. 35a, Munich, Germany, OliverBastert@fico.com

This demo will show you how to turn an optimization model into a full optimization application, using FICO® Xpress Optimization Suite. We will also demonstrate how to deploy this application on the FICO® Analytic Cloud, with just a few clicks. Through the FICO Decision Management Platform, FICO's new cloud-based tools platform, you can build, implement and scale complex solutions combining predictive analytics, rules and optimization.

1 - Embed Decision Making in Middle School Mathematics

Kenneth Chelst, Wayne State University, 4815 Fourth St. MEB, Detroit, MI, 48201, United States of America, kchelst@wayne.edu, Asli Salhi-Koca, Thomas Edwards

Almost all middle school mathematics is simply descriptive and does not ask the student to use the information to make a quantitative based decision. Ratios, rates and percentages are critical skills developed in middle school mathematics. A standard example is: the ratio of boys to girls in a class is 3:2. If the class has 30 students how many are girls? We will demonstrate how to transform this and other standard textbook examples into practical decision making contexts.

2 - SAS Analytics Certificate Programs for Universities

Mike Speed, Analytical Consultant, SAS Institute, 9312 Lake Forest Ct S, College Station, TX, 77845, United States of America, mike.speed@sas.com, Jerry Oglesby, Curt Hinrichs

Over three dozen universities have partnered with SAS to offer certificate programs that provide their graduates with recognition for sought-after skills in the job market. Certificate programs vary by institution with some being more specialized in specific areas such as data mining while others being more general such as analytics. The talk will provide an overview of the programs, benefits and requirements for interested faculty and universities.

3 - MIT BLOSSOMS: A Gentle Introduction to OR for High School Classes

Richard Larson, Professor, MIT, E40-233, Cambridge, MA, 02139, United States of America, rclarson@mit.edu, Elizabeth Murray

The MIT BLOSSOMS program presents a freely available repository of interactive video lessons for high school STEM classes, STEM = Science, Technology, Engineering and Math. In its 7th year, we review BLOSSOMS, its "Teaching Duet" pedagogical model, its use in teacher Professional Development, its eight country partners, and its gentle introduction to OR concepts depicted in many BLOSSOMS lessons. Examples: applied probability, LP, social networks and graph theory.

Production and Scheduling 3

Contributed Session

Chair: Jian Chen, The University of Hong Kong, LG108, Composite Building, HKU, Hong Kong, Hong Kong - PRC, justinchenjian@gmail.com

1 - Stochastic Lot Sizing Problem with Controllable Processing Times

Esra Koca, Bilkent University, Department of Industrial Engineering, Bilkent, Ankara, 06800, Turkey, ekoca@bilkent.edu.tr, M. Selim Akturk, Hande Yaman Paternotte

We consider the stochastic lot sizing problem with controllable processing times. We assume that the compression cost function is a convex function as it may reflect increasing marginal costs of larger reductions and may be more appropriate when the resource life, energy consumption or carbon emission are also taken into consideration. We formulate the problem as a second order cone program (SOCP), use the recent advances in SOCP to strengthen it and then solve by a commercial solver.

2 - Rich Project Scheduling Based on Decomposition

Mehmet Gulsen, Asst. Professor, Baskent University, Baglica Kampus, Etimesgut, Ankara, 06810, Turkey, mgulsen@baskent.edu.tr, Huseyin Guden, Arda Turkgenci

We consider the rich project scheduling problem with multi-projects, multi-modes, resource constraints, divisible and indivisible tasks, and cost-time trade off which is motivated by an actual instance. Since the proposed model needs too much time and memory for solving large instances a heuristic method, based on the decomposition, is proposed for such instances. Critical path method and another model are used to reduce the size of the model. The method was tested in the actual instance.

3 - Robust Design and Operation of Red Blood Cell Production in a Parallelized Hollow Fibre Bioreactor

Ruth Misener, Royal Academy of Engineering Research Fellow, Imperial College London, South Kensington Campus, London, United Kingdom, r.misener@imperial.ac.uk, Nicki Panoskaltsis, Maria Fuentes Gari, Eirini Velliou, Stratos Pistikopoulos, Athanasios Mantalaris

Recent work developed a novel, biomimetic, cost-effective three-dimensional hollow fiber bioreactor for growing healthy red blood cells ex vivo. Experiments to empirically improve the bioreactor are cost- and labor-intensive, so we propose robust superstructure optimization for bioreactor design. We discuss the potential of our superstructure design strategy not only on this individual bioreactor but also more generally on bioprocess optimisation.

4 - Synchronization of Production Scheduling and Shipment in an Assembly Flowshop

Jian Chen, The University of Hong Kong, LG108, Composite Building, HKU, Hong Kong, Hong Kong - PRC, justinchenjian@gmail.com, George Q. Huang, Hao Luo, Jun Qiang Wang

We study a synchronized scheduling problem of production simultaneity and shipment punctuality in a two-stage assembly flowshop. Simultaneity seeks that all products belonging to a same customer order are simultaneously completed. Punctuality attempts to meet orders' individual due dates. Two performance measures is presented. We develop a scheduling model by balancing the two criteria. Genetic algorithm is used for solving the model. Numerical studies reach several significant findings.

Sponsor: Women in OR/MS

Sponsored Session

Chair: Güzin Bayraksan, Associate Professor, Ohio State University, 1971 Neil Ave., Columbus, OH, 43210, United States of America, bayraksan.1@osu.edu

1 - How Near-Miss Events Amplify or Attenuate Risky Decision Making

Robin Dillon-Merrill, Georgetown University, 517 Hariri, McDonough School of Business, Washington, DC, 20057, United States of America, rld9@georgetown.edu

Exposure to near-misses alters responses to future risky events, and the results of exposure are not always the same. We differentiate two types of near-miss events: vulnerable, in which the events are viewed as disasters that almost happened, and resilient, in which the events are understood as disasters that did not occur. We show that vulnerable near-misses reduce future risk-taking behavior whereas resilient near-misses do not. We also offer recommendations for communicating risk.

2 - Optimization with Multivariate Conditional Value-at-Risk Constraints

Nilay Noyan, Associate Professor, Sabanci University, Sabanci University, Istanbul, 34956, Turkey, nnoyan@sabanciuniv.edu, Gabor Rudolf

For many decision making problems under uncertainty, it is crucial to specify decision makers' risk preferences based on multiple stochastic performance measures. We introduce a multivariate risk-averse preference rule based on CVaR and develop optimization models with multivariate CVaR constraints. For finite probability spaces we develop a cut generation algorithm, where each cut is obtained by solving a MIP. We show that our results can be extended to a wider class of coherent risk measures.

3 - Learning Consumer Tastes through Dynamic Assortments

Canan Ulu, Georgetown University, McDonough School of Business, Georgetown University, Washington, DC, 20057, United States of America, cu50@georgetown.edu, Dorothee Honhon, Aydin Alptekinoglu

We model this problem as a discrete time dynamic program where each period the firm chooses an assortment based on the prior distribution over consumer tastes. The consumers then choose a product that maximizes their own utility and the firm observes sales. We order assortments based on their information content and show that the optimal assortment cannot have lower information content than the myopically optimal assortment.

Inventory Management II

Contributed Session

Chair: Burcu Keskin, Associate Professor, University of Alabama, 300 Alston Hall, Tuscaloosa, Al, 35487, United States of America, bkeskin@cba.ua.edu

1 - Managing Disruption Risks: Aligning Inventory, Dual Sourcing and Agility Capacity Decisions

Florian Lücker, École Polytechnique Fédérale de Lausanne, EPFL - TOM Odyssea 4.16, Station 5, Lausanne, Switzerland, florian.luecker@epfl.ch, Ralf W. Seifert

In this talk we investigate the relationship between the three operational risk mitigation measures safety inventory, dual sourcing, and agility capacity by modeling a manufacturing firm. We quantify the decrease in inventory levels in the presence of dual sourcing and agility capacity. Furthermore, we show how to determine optimal inventory and dual sourcing decisions holistically. Within our modeling framework we introduce an operational metric that quantifies supply chain resilience.

2 - Sparsity-constrained Inventory Positioning in Online Retailing

Annie Chen, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, anniecia@mit.edu, Stephen Graves

Many online retailers operate with a large network of fulfillment centers. To reduce their operational overhead, the retailer will limit the number of fulfillment centers that hold each item. We formulate an optimization problem to position the inventory in their network, and propose a computationally efficient algorithm for solving it.

3 - Base-stock Policies for Lost Sales Models: Aggregation and Asymptotics

Joachim Arts, Eindhoven University of Technology, Postbus 513, Eindhoven, 5600MB, Netherlands, j.j.arts@tue.nl, Retsef Levi, Bert Zwart, Geert-Jan Van Houtum

We consider the optimization of base-stock policies for periodic review lost sales inventory models. We take an unconventional view of the state space that allows for aggregation. We derive asymptotic results for approximations within this aggregations. The rate of convergence of these asymptotics is independent of the lead time. Numerical results show that these approximations lead to optimality gaps of 0.01% on average.

4 - An Integrated Supplier Selection and Inventory Problem with Lateral Transshipments

Burcu Keskin, Associate Professor, University of Alabama, 300 Alston Hall, Tuscaloosa, Al, 35487, United States of America, bkeskin@cba.ua.edu, Mohammad Firouz, Sharif Melouk

We study the supplier selection problem of a firm operating multiple warehouses that face stationary stochastic demands, allowing multi-sourcing from suppliers and lateral transshipments among warehouses to mitigate the risks that arise from supplier quality, capacity, and disruptions. We use simulation-optimization approach to solve the problem and show the inherent trade-off between multi-sourcing and single sourcing under different disruption scenarios.

1 - Evaluating Basing Options for Optimizing Accessibility for Global Response Force

Jeremy Eckhause, Operations Researcher, RAND Corporation, 1200 S. Hayes St., Arlington, VA, 22202, United States of America, eckhause@rand.org, Christopher Pernin, Michael Schwille, Katharina Best

For a global response force to achieve its mandate, rapid access to almost any point on the globe is essential. Since the long-term presence of the US is difficult to predict, using of a set of intermediate bases may be required for establishing fast and sustainable access to large numbers of contingency locations. We present an approach for identifying a robust set of intermediate bases for ensuring global access and a methodology for identifying new bases as infrastructure requirements change.

2 - How Deployments Affect the Capacity and Utilization of Army Military Treatment Facilities

Adam Resnick, RAND Military Applications, United States of America, adam_resnick@rand.org

The Army wished to understand whether the Army's Force Generation cycle, designed to make the generation of deployable units more predictable, created ebbs and flows in the ability of military treatment facilities to provide care and respond to changing family needs as soldiers and care providers deploy and return home. This study examines how the cycle affects capability and soldier health care utilization at Army military treatment facilities and how it affects family health care utilization.

1 - Hydrodynamic Limit of Order Book Dynamics

Xuefeng Gao, Assistant Professor, The Chinese University of Hong Kong, William M. W. Mong Engineering Building, Shatin, Hong Kong - PRC, xfgao@se.cuhk.edu.hk, Jim Dai, Ton Dieker, Shijie Deng

We study the temporal evolution of limit order book shape on the macroscopic time scale, motivated by a desire to better understand the interplay among order flows, order book shape and price impact. Our main result states that in the scaling regime where time goes to infinity and price tick size goes to zero, a pair of measure-valued processes representing the sell-side shape and buy-side shape of an order book converges weakly to a pair of deterministic measure-valued processes.

2 - A Model for Queue Position Valuation

Kai Yuan, Columbia University, 3022 Broadway, 4J, Uris Hall, New York, NY, 10027, United States of America, KYuan17@gsb.columbia.edu, Ciamac Moallemi

We develop a model for valuing limit orders based on their relative queue position by identifying two important components of positional value: a static component that relates to the tradeoff at an instant of trade execution between earning a spread and incurring adverse selection costs; a dynamic component, which captures the optionality associated with the future value that accrues by locking in given queue position. Moreover, the model can be empirically calibrated.

3 - High Frequency Trading in Limit Order Markets: Stochastic Modeling and Asymptotic Analysis

Rama Cont, Imperial College, London, SW7 2AZ, United Kingdom, r.cont@imperial.ac.uk

We propose a stochastic model for a limit order market which captures the coexistence of high and low frequency and examine the consequences of HFT on price dynamics, volatility and liquidity. A detailed study of empirical HF data points to a multi-scale heavy traffic regime in which the limit order book may be described as a measure-valued Markov process, solution of a stochastic free boundary problem whose properties give some insight into how HFT affects price and order book dynamics.

4 - Scaling Limit of a Limit Order Book Model via the Regenerative Characterization of Lévy Trees

Peter Lakner, NYU Stern School of Business, New York, NY, United States of America, plakner@stern.nyu.edu, Josh Reed

We consider a one-sided limit order book model in a high frequency regime. Our main result shows that in the case where the mean displacement from the current best bid at which a new order is placed is positive, the measure-valued process describing the whole limit order book converges to a simple functional of reflected Brownian motion. A cornerstone of our approach is the regenerative characterization of Lévy trees proved by Weill.

Application of Game-Theoretical Methods in Supply Chain, Reliability and Inventory

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Maryam Hamidi, Session Chair, University of Arizona, 1127 E. James E. Rogers Way, Room 111, P.O. Box 210020, Tucson, AZ, 85721, United States of America, mhamidi@email.arizona.edu

1 - Mining Leasing Contracts through Games Theory: Chilean Mine Case Study

Diego Carrasco, Pontificia Universidad Catölica de Chile, vicuña mackena 4860, Santiago, RM, 7820436, Chile, dncarras@uc.cl, Maryam Hamidi, Haitao Liao, Rodrigo Pascual

The objective of this article is to present a methodology to assess mining leasing contracts decisions. The modeling of the problem considers a fleet composed of multicomponent equipment, each having different increasing failure rates. This failure rate is affected by the usage intensity given by the lessee to the equipment, and the quality of maintenance given by the lessor. The problem formulation is through games theory. It is tested on a haul trucks fleet operating in a mine in Chile.

2 - Revenue Sharing Contracts When Retailers can be Dishonest

Eda Kemahlioglu-Ziya, Assistant Professor, Poole College of Management at the University of North Carolina, Raleigh, NC United States of America, ekemahl@ncsu.edu, Seb Heese

To investigate the impact of dishonest information transfer, we consider a single-supplier single-retailer supply chain that operates under a contract with a revenue sharing clause, providing the retailer incentive to underreport sales revenues. We study the impact of cheating on the different supply chain constituents. We show that when the retailer can exert sales effort, a supplier might benefit from the retailer's dishonesty.

3 - Impact of Collaborative Incentive on Supply Chain Member Performance

Liyan Wang, Tongji University, Shanghai, China, ker820416@163.com, Minghai Ye

The objective of this paper is to uncover the nature of supply chain collaboration and explore its impact on supply chain member performance based on collaborative incentive. A three level model including a manufacture, a retailer and a salesperson is established based on game theory. The key propositions of the paper are listed as follows: both the manufacturer and the salesperson are beneficiaries of the collaborative incentive, while the retailer benefits or not is uncertain.

4 - Application of Game Theory on Inventory Level Decision Making

Masoud Vaziri, University of Rhode Island, University of Rhode Island, Kingston, RI, 02881, United States of America, masoudvaziri@my.uri.edu, manbir sodhi

Spare parts can be very profitable for corporations. This paper studies spare parts inventory games as N-person non-zero-sum single-shot games involving the OEM and the market in a non-cooperative setup. The OEM decides on its pricing strategy as well as the order-up-to stock level and resulting in a mixed strategy solution.

Sponsored Session

Chair: David A. Goldberg, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, dgoldberg9@isye.gatech.edu

1 - State Space Collapse for Critical Multistage Epidemics

Florian Simatos, Researcher, Inria, 23 avenue d'Italie, Paris, 75013, France, florian.simatos@inria.fr

We study a multistage epidemic model generalizing the SIR model, where individuals go through K stages of the epidemic before being removed. Infected individuals infect susceptible ones, who directly go to the same stage of the epidemic; or they go to the next stage of the epidemic. For this model, we identify the critical regime in which we establish diffusion approximations. Surprisingly, the limiting diffusion exhibits an unusual form of state space collapse which we analyze in detail.

2 - Scheduling using Interactive Oracles

Jinwoo Shin, Assistant Professor, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, jinwoos@kaist.ac.kr, TongHoon Suk

Since Tassiulas and Ephremides proposed the maximum weight scheduling algorithm in 1992, extensive research efforts have been made for resolving its high complexity issue. In this paper, we resolve the issue by developing a generic framework for designing throughput-optimal and low-complexity scheduling algorithms in constrained queueing networks via establishing a rigorous connection between iterative optimization methods and low-complexity scheduling algorithms.

3 - High-dimensional Estimation with Geometric Constraints
Elena Yudovina, University of Michigan Dept of Statistics, 439 West Hall, 1085 S University Ave, Ann Arbor, MI, 48109, United States of America, yudovina@umich.edu, Yaniv Plan, Roman Vershynin

Consider measuring an (unobserved) vector x in R^n through inner product with some (observed, possibly random) measurement vectors a_1, ..., a_m. The measurements may be nonlinear, e.g. because of clipping; they can even be one-bit, giving only the sign of the inner product. We give a simple procedure for recovering x, which is completely agnostic with respect to the nature of the nonlinearity, and gives essentially the best possible error bounds in several natural models.

4 - A Sensitivity Approach to Model Uncertainty
Henry Lam, Boston University, 111 Cummington Mall, Boston, MA, United States of America, khlam@bu.edu

Virtually any type of performance analysis of stochastic systems builds on model assumptions that, to various extents, deviate from the truth. I will demonstrate an optimization-based methodology to assess the impact of this model error, using Kullback-Leibler divergence as a model discrepancy measurement. Our contribution is a new infinitesimal approximation that reduces the typically difficult optimization problems into tractable simulation problems for suitably defined sensitivity quantities.

Joint Session ENRE/JFIG: Analysis of Biomass/Biofuel Production: Economic and Environmental Impacts

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment & Junior Faculty Interest Group

Sponsored Session

Chair: Halil Cobuloglu, PhD Candidate, Wichita State University, 1845 Fairmount St, Wichita, KS, United States of America, halil.cobuloglu@gmail.com

1 - Supply Chain Design and Management for Biocrude Production via Waste from Pulp & Paper Plants
Mohammad Marufuzzaman, Mississippi State University, Industrial & Systems Engineering, PO Box 9542, Starkville, MS, 39762, United States of America, maruf237@gmail.com, Sushil Poudel, Sandra D. Eksioglu

The objective of this research is to develop an optimization model to design and manage a biocrude supply chain network using waste generated from pulp & paper facilities. We propose a two-phase Analytic Center Cutting Plane algorithm to solve this challenging NP-hard problem. We tested the performance of the algorithm on a case study which we develop using data from the southeast region of U.S. Furthermore, we employ ArcGIS to visualize and validate the results from the optimization model.

2 - Sequential Location-Allocation Optimization of Fast Pyrolysis Facilities
Yihua Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, yihuali@iastate.edu, Guiping Hu, Wright Mark

A mixed integer linear programming (MILP) model is formulated to perform sequential expansion planning of biofuel production system with fast pyrolysis, hydroprocessing and refining technology. A case study in Iowa shows a sequential spatial construction under different levels of processing goal and the potential of drop-in fuels production in Iowa.

3 - Food vs Biofuel: An Optimization Approach to Analyze Land-use Competition and Environmental Impacts
Halil Cobuloglu, PhD Candidate, Wichita State University, 1845 Fairmount St, Wichita, KS, United States of America, halil.cobuloglu@gmail.com, Esra Buyuktahtakin

In this study, we develop a multi-objective mixed-integer optimization model to investigate trade-offs and competition between biomass and food production. The model maximizes total benefits and provides optimal decisions at the farm level while considering economic and environmental impacts such as soil erosion, GHG emission, nitrogen pollution, biodiversity, and food sustainability. Results are demonstrated with an application in Kansas by considering switchgrass and corn production.

4 - Bioenergy Supply Chain Network Design Model to Enhance Biomass Quality Characteristics
Krystel Castillo, Assistant Professor, The University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, krystel.castillo@utsa.edu, Erin Webb

This paper has two main contributions. First, a biomass supply chain network design model including quality uncertainties as well as operational costs is presented in order to capture the impact of the prevention or pretreatment activities to improve the moisture and ash content and reduce the energy consumption in the drying process and ash disposal at the conversion facility. Second, a metaheuristic method is proposed to solve this problem.

Sustainability I

Contributed Session

Chair: Raja Jayaraman, Assistant Professor, Khalifa University, Department of Industrial & Systems Engin, Abu Dhabi, United Arab Emirates, raja.jayaraman@kustar.ac.ae

1 - A Case Study for Analyzing Air Pollution Impact Factors
Vahid Hosseini, Assistant Professor, Sharif University of Technology, Department of Mechanical Engineering, Tehran, Iran, vhosseini@sharif.edu, Hossein Shahbazi, Masoud Hamedi

Tehran is the capital city of Iran and one of the largest cities in western Asia, ranked 19th in the world with a population of 8.5 million. Air pollution is a major problem in Tehran, and has been influenced by several factors during recent years including rapid population growth, increasing personal car ownership, low technology level of produced vehicles and use of old vehicles with high fuel consumption. This study aims to investigate the impact of such parameters on Tehran air quality.

2 - Application of Green Supply Chain Management Strategies in Various Industries
Suna Cinar, PhD Student, Wichita State Unniversity, Wichita State University, Industrial Eng, 1845 Fairmount, Wichita, KS, 67260-0035, United States of America, sxcinar@wichita.edu, M Bayram Yildirim

Due to increasing environmental awareness, companies around the world want to become environmental friendly by reducing the amount of waste produced, amount of energy used, and by meeting the current environmental regulations. Green supply chain management is one of effective practices that can help industries including manufacturer, supplier to collaborate and create a green supply chain in their organization.

3 - Using Priming to Design Features that Influence Sustainable Purchases
Erin MacDonald, Assistant Professor, Iowa State University, 2020 Black Engineering Building, Ames, IA, 50011, United States of America, erinmacd@stanford.edu, Jinjuan She

This research strives to communicate a product's sustainability to the consumer through product features that trigger the consumer to value and seek further sustainability information during purchase. A novel design technique uses psychological priming to help designers create such features. We found that priming successfully enhances designers' skills. As tested with realistic prototypes, the features created affect consumers' thoughts of sustainability during product evaluation and purchase.

4 - Wal-Mart's Dilemma: Sales Growth vs. Inventory Growth
Seungjae Shin, Mississippi State Unveristy, Meridian, 2212 5th Street, Meridian, MS, 39301, United States of America, sjshin1204@gmail.com

Wal-Mart's business target is making a higher sales growth rate than inventory growth rate. Comparing with financial ratios of its competitors, Wal-Mart has significantly better ratios for day-in-inventory and cash-conversion-cycle. Regression analysis reveals that day-in-inventory, cash-conversion-cycle, and per employee cost-efficiency have similar effect on both sales growth rate and inventory growth rate. Supply chain ratio has more effect on inventory growth rate than sales growth rate.

5 - Sustainability and Firm Performance: The Mediating Role of Innovation
Paulo Gomes, Visiting Assistant Professor, Babson College, Babson Park, Wellesley, MA, United States of America, pgomes@babson.edu, Graça Silva

Do you need to innovate in order to profit from being green? This study investigates the mediating role of innovation on the relationship between sustainability practices and firm performance based on statistical analysis of data from manufacturing firms in Europe. We distinguish between three types of practices inbound, outbound and production. Results show that product innovation mediates the relationship between sustainability practices and sustainable performance.

Pricing and Computation in Package Auctions

Cluster: Auctions

Invited Session

Chair: Ben Lubin, Assistant Professor, Boston University, 595 Commonwealth Ave, Room 621A, Boston, MA, 02215, United States of America, blubin@bu.edu

1 - Computational Techniques for Incentive Auctions

David Bergman, School of Business, University of Connecticut, One University Place, Stamford, CT, United States of America, david.bergman@business.uconn.edu, Andre Cire, Robert Day

The Federal Communications Commission is creating rules for and planning to run a voluntary incentive auction for broadcast TV spectra. In this talk we discuss how to model the problem of assigning stations to channels in the final repacking stage of the auction, and discuss various computational techniques that can be applied to solve for a valid repacking, including recently introduced binary decision diagram-based optimization.

2 - Informative Pricing in Package Auctions

Sebastien Lahaie, Researcher, Microsoft Research, 641 Avenue of the Americas, New York, NY, 10011, United States of America, slahaie@microsoft.com

The notion of informative prices is important in package auctions and motivates design choices such as linear prices, but the concept remains informal in the literature. Prices are informative if they give good estimates of the final cost of bundles, and drive the auction to convergence in a small number of rounds. We formalize the concept and derive implications using ideas from online and statistical learning.

3 - A Bayes-Nash Equilibrium Analysis of Payment Rules for Core-Selecting Combinatorial Auctions

Ben Lubin, Assistant Professor, Boston University, 595 Commonwealth Ave, Room 621A, Boston, MA, 02215, United States of America, blubin@bu.edu, Benedikt Bunz, Sven Seuken

In this paper, we use computational methods to study approximate Bayes-Nash equilibria of payment rules for core-selecting combinatorial auctions. Within these equilibria, we study the incentives, fairness, and efficiency of a wide range of existing and novel payment rules.

Energy III

Contributed Session

Chair: Wei Yuan, PhD candidate, IMSE,USF, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, weiyuan@mail.usf.edu

1 - Reinforcement Learning for Energy Consumption Prediction of Converter Steelmaking Process

Yanyan Zhang, Northeastern University, 3-11 Wenhua Road, Heping District, Shenyang, China, zhangyanyan@ise.neu.edu.cn, Lixin Tang

The energy consumption prediction aims at estimating the amount of energy resources to be used. The problem is challenging owing to the coupling of energy consumption, regeneration, conversion, and the time-varying characteristic of production environment. This paper develops SVM based Q-learning method to deal with the energy prediction problem. Experimental results show that RL method is stable and with no less than 95% prediction accuracy.

2 - Cost-effective Power Grid Defending with Transmission Line Switching

Wei Yuan, PhD candidate, IMSE,USF, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, weiyuan@mail.usf.edu, Bo Zeng

Optimal power grid protection through defender-attacker-defender (DAD) model is a state-of-art approach for power system defending problem. In this research, we introduce transmission line switching as a cost-effective post-contingency mitigation operation into the DAD model. Exact algorithm is designed and numerical studies validate the effectiveness of transmission switching.

3 - Dynamic Allocation of Mobile Plants to Monetize Associated or Stranded Natural Gas under Uncertainty

Siah Hong Tan, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, tansh@mit.edu, Paul Barton

Associated or stranded gas presents a challenge to monetize due to its low volume and lack of supporting infrastructure. Mobile plants which produce GTL fuel or LNG on a small scale have been identified as attractive but yet unproven routes to gas monetization. We examine a multi-stage optimization framework which allocates mobile plants in a field under uncertainty of prices, supply and demand and perform a case study of monetizing associated gas in the Bakken shale play.

4 - Some Polyhedral Results for DCOPF Problem with Switching

Burak Kocuk, Georgia Institute of Technology, 765 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, burak.kocuk@gatech.edu, Santanu Dey, Andy Sun

Transmission line switching in power networks has become increasingly important in practice. However, underlying theory of this problem is not well-studied. In this work, we first prove some hardness results. Then, we propose a new formulation based on cycles, which is used to find valid inequalities and polyhedral results. Furthermore, we consider the problem with cardinality constraint. Finally, numerical results are provided.

5 - A Two-stage Price-based Unit Commitment Model for GENCOs with Wind Penetration

Yidong Peng, North Dakota State University, Industrial & Manufacturing Engineering, 1410 14th Avenue North Room 202 CIE, Fargo, ND, 58102, United States of America, yidong.peng@ndsu.edu, Jing Shi

In this study, we propose a two-stage stochastic programming model to solve Price-Based Unit Commitment problem (PBUC) for GENCOs with wind penetration. The proposed model considers both day-ahead and real-time electricity markets. The first stage deals with GENCOs' bidding strategies in day-ahead market, as well as the day-ahead PBUC, while the second stage considers GENCOs' real time actions in corresponding to the electricity price in the real-time market and volatility of wind power output.

■ TC73

Parc- Mission I

Storage and Demand Side Resources in Power Systems

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Yongpei Guan, University of Florida, Weil 413, Gainesville, FL, 32611, United States of America, guan@ise.ufl.edu

1 - Optimal Control of Plug-In Hybrid Electric Vehicles with Market Impact and Risk Attitude

Lai Wei, PhD Candidate, University of Florida, 387 Maguire Village, Apt 2, Gainesville, FL, 32603, United States of America, laiwei@ufl.edu, Yongpei Guan

We develop optimal electricity storage control policies for plug-in hybrid electric vehicles for the benefit of an energy market participant. We explore the cases for aggregators to participate only in a real-time market and in both the real-time and day-ahead markets. For each developed model, we analyze the properties of the value function and explore the corresponding optimal policy structure. Finally, through numerical study, we discuss the insights.

2 - Determining the Marginal Cost for Pumped-storage Plants for use in the Real-time Market

Goran Vojvodic, PhD Student, George Washington University, Department of Decision Sciences, School of Business, Washington, DC, 20052, United States of America, goranv@gwu.edu, David Morton, Ahmad Jarrah

In the energy sector, there is a huge interest in grid-level storage and efficiency in terms of resource usage. We deal with both topics and argue that a precise estimation of the marginal cost for pumped-storage units is needed. We introduce the concept of forward-looking thresholds and provide a stochastic optimization-based approach in order to estimate the thresholds. We demonstrate the stability and quality of our methodology and its superiority compared to an expected value based approach.

3 - Large Scale Optimization in Energy Systems

Mona Asudegi, University of Maryland, 9348 Cherryhill Road, Apt 811, College Park, MD, 20740, United States of America, asudegi@umd.edu, Ali Haghani

Developing an advanced system which can accommodate green energy and technologies such as solar, wind energy, and many more in the electric power grid and also applying an appropriate demand management system are fundamental keys toward resolving some of the energy concerns in the world. This study is focused on developing a demand response model and also an efficient heuristic algorithm for solving the model for the electric grid system.

4 - Value of Pumped Storage Hydropower in Ancillary Service Markets

Zhi Zhou, Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL, 60439, United States of America, zzhou@anl.gov, Thomas Veselka, Vladimir Koritarov, Matthew Mahalik, Todd Levin

Energy storage facilities are becoming increasingly important in integrating variable generation into the power grid. Besides energy price arbitrage, a pumped storage plant can provide various ancillary services. We model the optimal operation strategy of a pumped storage system in a two-settlement electricity market and the associated ancillary service market. The value of pumped storage is analyzed for different levels of variable renewable generation in the system.

■ TC74

Parc- Mission II

Stochastic Programming in Energy

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Canan Uckun, Argonne National Laboratory, 9700 S. Cass Avenue, Lemont, IL, 60439, United States of America, cuckun@anl.gov

1 - Capacity Adequacy and Revenue Sufficiency in Electricity Markets with Wind Power

Todd Levin, Computational Engineer, Argonne National Laboratory, 9700 S. Cass Ave., Bldg. 221, Argonne, IL, United States of America, tlevin@anl.gov, Audun Botterud

We present a computationally efficient stochastic MIP that determines optimal generator expansion decisions, as well as periodic unit commitment and dispatch. The model is applied to analyze the impact of increasing wind power capacity on the optimal generation mix and the profitability of thermal generators. We find that increasing wind penetration reduces energy prices while the prices for operating reserves increase. Additionally, no thermal units are profitable without scarcity pricing.

2 - Optimizing a Battery Storage for the Regulation Service using Approximate Dynamic Programming

Bolong Cheng, Princeton University, Olden Street Engineering Quadrangle, Electrical Engineering, Princeton, NJ, 08544, United States of America, bcheng@princeton.edu, Warren Powell

There is growing interest in the use of battery storage to provide ancillary services to the electricity grid. We focus on the frequency regulation market of the PJM grid, where the storage unit needs to react to a control signal every two seconds. In addition, we also want to minimize the energy consumption during the optimization horizon and control the degradation from frequent charge/discharge cycles. We develop an approximate dynamic programming algorithm that optimizes the use of battery.

3 - Stochastic Optimization for Unit Commitment – A Review

Qipeng Zheng, Assistant Professor, University of Central Florida, Industrial Engineering & Management Sys, Orlando, FL, 32817, United States of America, Qipeng.Zheng@ucf.edu, Jianhui Wang, Andrew Liu

With the high penetration of renewables, increasing deregulation of the electricity industry and growing demands on system reliability, recent research has been focusing on transition from traditional deterministic approaches to stochastic optimization for unit commitment. Related literature has grown rapidly in the past several years, this talk is to review the works that have contributed to the modeling and computational aspects of stochastic optimization based UC, and discuss future research.

4 - An Improved Stochastic Unit Commitment Formulation to Accommodate Wind Power

Canan Uckun, Argonne National Laboratory, 9700 S. Cass Avenue, Lemont, IL, 60439, United States of America, cuckun@anl.gov, Audun Botterud, John Birge

The expansion of renewable resources, especially weather-based resources such as wind, creates more uncertainty and variability in the operation of the power grid. In this work, we propose an improved stochastic programming formulation to address these challenges. The proposed formulation improves the standard two-stage stochastic unit commitment problem by producing dynamic unit commitment decisions over time rather than fixing them in the first stage.

Parc- Mission III

Reliability I

Contributed Session

Chair: Arda Vanli, Assistant Professor, Industrial and Manufacturing Engineering Department. Florida State University, 2525 Pottsdamer St., Tallahassee, FL, 32310, United States of America, avanli@fsu.edu

1 - Condition Monitoring of Composites with Guided-wave Sensors

Arda Vanli, Assistant Professor, Industrial and Manufacturing Engineering Department. Florida State University, 2525 Pottsdamer St., Tallahassee, FL, 32310, United States of America, avanli@fsu.edu, Spandan Mishra

This study proposes a new statistical approach for damage identification and degradation monitoring of composites with guided-wave sensors. The features of Lamb-wave sensor signal that are sensitive to through-thickness cracks and delaminations are first identified using principle component analysis. An updating strategy is developed for Bayesian posterior distribution of the features with new condition data to make continuous assessment of the condition of the structure.

2 - Optimal Allocation of Resources in Reliability Growth Testing

MohammadHossein Heydari, University of Arkansas, Department of Industrial Engineering, 4129 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, mhheydar@uark.edu, Kelly Sullivan, Edward Pohl

Reliability growth testing seeks to identify and remove failure modes in order to improve the reliability of a product entering the market. We seek to deploy limited testing resources across a series-parallel system (i.e., at the system, subsystem, and component levels) in effort to maximize the reliability of a product upon entering the market, considering cost-benefit tradeoffs in testing at each level. We present a simulated annealing heuristic and analyze results for a set of experiments.

3 - A Synthesis of Feedback and Feedforward Control for Stationary and Nonstationary Disturbance Models

Lihui Shi, data scientist, eBay, 523 122nd PL Apt 3, Bellevue, WA, 98005, United States of America, shilihui@uw.edu, Kailash Kapur

Process adjustment strategy is an important part of the process improvement methods. For continuous improvement and proactive strategies, we propose the periodic shift disturbance models, and investigate the feedforward control application from a new disturbance decomposition framework. We combine feedforward control with feedback control for maintaining the stability of the process and delivering products at target values.

4 - Design Decision Process and Sensitivity Analysis for Multi-state Systems with Multi-state Components

Carlos Solorio, CETYS University, Calzada CETYS S/N, Mexicali, Mexico, carlos.solorio@cetys.mx

The level of complexity in the process of designing real life systems has grown tremendously. Highly reliable systems are needed, considering this high level of complexity. The analysis should consider the way components affect the whole system reliability. The performance measures developed are used for comparing two or more systems at a point in time and over a time horizon, and they also consider the disutility function, which help in selecting the best system.

5 - Random Field Modeling with Insufficient Snapshots for Probability Analysis and Design

Zhimin Xi, Assistant Professor, University of Michigan - Dearborn, 4901 Evergreen Rd, Dearborn, MI, 48128, United States of America

This paper proposes a new random field modeling method using a Bayesian Copula. The proposed method is composed of three key ideas: (i) determining the marginal distributions of random field variables, (ii) determining optimal Copulas to model the bivariate distributions of the random field variables, and (iii) modeling a joint probability density function of the random field variables. Two case studies were employed for the purpose of demonstrating.

Practical & Tactical Pricing Decision Support Approaches

Sponsor: The Practice Track

Sponsored Session

Chair: Jim Mullin, VP, Planning Analytics, Veritec Solutions, 824 Miramar Terrace, Belmont, CA, 94002, United States of America, Jim@veritecsolutions.com

1 - Practical Tactical Pricing Decision Systems - Industry Examples
Jim Mullin, VP, Planning Analytics, Veritec Solutions, 824 Miramar Terrace, Belmont, CA, 94002, United States of America, Jim@veritecsolutions.com

This talk will provide an overview of practical decision support systems used for helping companies make more efficient and profitable pricing decisions. Examples of applications in several industries will be discussed.

2 - Using OR Analytics in Social Media Advertising
Brad Smallwood, VP, Advertising, Facebook, bsmallwood@fb.com

This talk will cover practical quantitative methods employed by social media companies to support tactical decision-making in advertising pricing and targeting. Specific emphasis will be given to real world examples over the last few years as the industry has grown rapidly and analytic techniques have evolved.

3 - Effective Pricing Decisions and Process for the Self-Storage Industry
Kevin Bowman, Director, Pricing & Revenue Management, kevin.bowman@storage-mart.com

This talk provides some background on the history and evolution of the self-storage industry, with a focus on how prices are set. In the last 3-4 years, substantial progress has been made in the use of data analytics to support a more formal pricing process. The result is that the industry leaders have moved towards a proactive, data-driven approach that is enabling them to separate their performance from slower-movers.

Parc- Market Street

Joint Session Analytics/HAS: Clinical Analytics, Informatics and Clinical Decision Making

Sponsor: Analytics & Healthcare Applications

Sponsored Session

Chair: John Zaleski, Chief Informatics Officer, Nuvon, Inc., 4801 S. Broad Street, Suite 120, Philadelphia, PA, 19112, United States of America, jzaleski@nuvon.com

1 - Early Warning Notifications Developed Using Medical Device Data
John Zaleski, Chief Informatics Officer, Nuvon, Inc., 4801 S. Broad Street, Suite 120, Philadelphia, PA, 19112, United States of America, jzaleski@nuvon.com

While much of the automatically collected medical device data in inpatient wards is obtained for the purpose of charting and documentation, collecting such data can offer greater clinical benefit. This presentation will survey some of the protocol- and guideline-based patient care management directives and detail how commonly-collected and automated medical device data can facilitate rapid decision making.

2 - Critical Medical Decisions
Adam Seiver, Senior Director and Chief, Medical Affairs, Philips Healthcare, Therapeutic Care, 27869 Saddle Court, Los Altos Hills, CA, 94022, United States of America, adam.seiver@philips.com

Despite massive investment, the electronic medical record disappoints when helping critical care clinicians make and execute high-quality decisions. This talk will: 1. Present three scenarios that highlight features of critical care decision-making. 2. Propose a decision-analytic (DA) framework for analyzing critical care decisions 3. Storyboard a DA-based computer system under development intended to help the critical care team make and execute high-quality critical care decisions.

3 - Modular Multi-parameter Clinical Decision Support on an EMR-independent Platform
Jim Fackler, Associate Professor, Johns Hopkins Univ. Sch. of Medicine, 318 Overhill Road, Baltimore, MD, 21210, United States of America, jim@jhmi.edu

Bridging data and decisions in an intensive care unit can be, quite literally, life and death. 300 data streams of varied data density and fidelity come from one patient. Although time-series analyses of single parameters adds value (e.g. heart rate variability), decisions will best be supported with multi-parameter "chunking" of data for analytics. This talk will discuss the role of 1) a modular clinical decision support system and 2) an EMR-independent architecture for its implementation.

Decision Analysis 4

Contributed Session

Chair: Jing Chen, Associate Professor, Dalhousie University, 6100 University Avenue, Halifax, NS, B3H 4R2, Canada, jchen@dal.ca

1 - Customer Returns, Pricing, and Personalization in an Online-Retail Dual Channel
Jing Chen, Associate Professor, Dalhousie University, 6100 University Avenue, Halifax, NS, B3H 4R2, Canada, jchen@dal.ca, Bintong Chen

The retailing industry today increasingly distributes product through both retail and online channels. Advances in data collection and analytics technology make it possible to implement personalized pricing in an online channel. An online channel, however, usually incurs significantly higher rates of customer returns. We examine how customer returns and personalized pricing affect a retailer's decision on whether to add an online channel in addition to a retail channel.

2 - Analysis of Supplier Performance using MAUT and Simulation
Hardik Bora, Iowa State University, Ames, IA, United States of America, hdbora@iastate.edu, Anuj Mittal, Pratik Pingle, Caroline Krejci

The analysis of supplier performance and identification of suppliers for improvement is essential to ensure product quality and to allocate organizational resources rationally. We describe a methodology that combines multi-attribute utility theory and Monte Carlo simulation to analyze various supplier performance metrics and rank suppliers accordingly, using case study data.

3 - The Effect of Educational Programs on Individual Protective Behaviors Toward Seasonal Influenza
Elnaz Karimi, Concordia University, 3440 Durocher, Apt.1405, Montreal, H2X2E2, Canada, karimi.lnz@gmail.com, Ketra Schmitt, Ali Akgunduz

A Health Belief Model (HBM)-based questionnaire was administered to two groups of undergraduate students to determine the predictors of seasonal influenza interventions. While the control group received only the questionnaires, the treatment group was subjected to an educational program about flu. The behavioral predictors in both groups were assessed based on a multivariate regression analysis.

4 - Bargainers Negotiating Attributes with Strict Tradeoffs
Michael Menasco, Emeritus, at University, San Bernardino, 9132 Hoopa Drive, Kelseyville, CA, 95451, United States of America, menasco_sr@mchsi.com, Abhik Roy

We construct necessary conditions for two bargainers negotiating over n attributes in a lexicographic order of attributes. We show negotiated outcomes are equivalent in both preference (utility) and attribute spaces. We begin with the basic case, whereby, there is constant rate of substitution between two attributes x and y (Keeney and Raiffa, 1976)and apply these results to three attributes (x, y, z).

5 - A Hierarchical Model for Making General Search Decisions
Matthew Oster, Pacific Northwest National Laboratory, 902 Battelle Blvd, Richland, WA, United States of America, matthewoster@gmail.com, Dale Henderson, Samrat Chatterjee

Searching for a lost plane at sea or a buried nuclear warhead requires careful planning and resources. Decisions related to choice of strategies, tactics, and resources are often made at different administrative levels. We propose a hierarchical structuring of this decision space in which many search policies may be shaped.

Joint Session DAS/SPPSN: Decision Analysis in Policy Applications

Sponsor: Decision Analysis & Public Programs, Service and Needs
Sponsored Session

Chair: Karen Jenni, Insight Decisions, 2200 Quitman St, Denver, CO, 80212, United States of America, kjenni@insightdecisions.com

1 - Decision Analysis without Decision Makers
Karen Jenni, Insight Decisions, 2200 Quitman St, Denver, CO, 80212, United States of America, kjenni@insightdecisions.com

For a recent systematic multi-attribute based evaluation of alternative nuclear fuel cycles, current decision-makers specified only the factors that should be considered. Instead of further guidance on value functions, we were directed to consider multiple policy perspectives. We will describe several innovative techniques used to assure that an appropriately broad set of value perspectives could be considered, and the benefits of those approaches to the study sponsors.

2 - Turning Water into Wine: Decision Analysis Applied to Water Issues in the Heart of Napa Valley
Timothy Nieman, President, Decision Applications, 1390 Grove Court, Saint Helena, Ca, 94574, United States of America, tnieman@decisionapplications.com

Application of rigorous decision analysis framing and modeling methods can be very useful to small municipal government decision making, yet these applications face unique challenges. We discuss an application to water management issues in Napa Valley using Monte Carlo based climate modeling as a foundation for policy decisions, illustrating both the challenges and rewards of institutionalizing better decision methodologies at this level of government.

3 - Choosing Cleanup Strategy for Canada's Faro Mine – Challenges for Environmental Decision Analysis
Lee Merkhofer, Lee Merkhofer Consulting, 22706 Medina Court, Cupertino, CA, 95014, United States of America, lmerkhofer@prioritysystem.com

A description of a collaborative decision analysis, wherein members of Canada's Federal government, Yukon government, Indian tribes, and local citizens worked together to see if they could reach agreement on what to do about the abandoned Faro mine, a "toxic nightmare" that was once the largest lead and zinc mine in the world. Challenges and limitations of DA for resolving controversial environmental policy problems are well illustrated.

4 - Decision Analytical Applications in Ecosystem Recovery Planning
Bill Labiosa, Regional Science Coordinator, U.S. Geological Survey, Northwest Region, 909 1st Ave, 8th Floor, Seattle, WA, 98104, United States of America, blabiosa@usgs.gov

Within the context of the ecosystem recovery planning processes of the lead State agency in Puget Sound, WA, I will focus on two examples of the use of decision analytical framing and tools: 1) multi-attribute models to prioritize ecosystem recovery strategies involving multiple agencies and diverse stakeholders and 2) probability models to assess and represent uncertainty within a large model-based expert assessment used to rank "ecosystem threats" at watershed and coastal ecosystem scales.

Recent Advances in Utility Theory

Sponsor: Decision Analysis
Sponsored Session

Chair: Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu

1 - Multiattribute Utility Functions Satisfying Mutual Preferential Independence
Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu, Zhengwe Sun

We discuss the general form of multiattribute utility functions that satisfy the ordinal condition of mutual preferential independence, and present methods for their assessments.

2 - Expected Utility, Parameter Uncertainty and Narrow Framing
Manel Baucells, USC Center for Social and Economic Research, 12025 Waterfront Drive, Playa Vista, Ca, 90094, United States of America, mbaucells@gmail.com, Rakesh Sarin

Can decisions made in isolation be optimal for the grand problem? For monetary decisions, we offer a simple proof that only logarithmic utility permits narrow framing in the presence of learning. Under parameter uncertainty, we show that narrow framing, learning, and ambiguity aversion cannot coexist. With no learning, aversion to parameter uncertainty reduces the optimal amount invested, and we provide a heuristic support for partial Kelly strategies based on such aversion.

3 - Multiattribute Ordinal Utility Functions
David Bell, Harvard Business School, Boston MA, United States of America, dbell@hbs.edu, Ali Abbas

We discuss desirable conditions that allow practical assessment of multiattribute ordinal utility functions.

4 - Revisiting Even Swaps
Debarun Bhattacharjya, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Route 134, Yorktown Heights, NY, 10598, United States of America, debarunb@us.ibm.com, Jeffrey Kephart

Even swaps (Hammond et al. 1998, 1999) is an interactive method that solves deterministic multi-attribute decision problems by iteratively removing columns and rows from the consequence table representation of the problem. We revisit the even swaps method, presenting (i) new properties such as the conditions under which an even swap is feasible; (ii) heuristics including a Bayesian method that learns preferences while guiding the user; and (iii) results from extensive experiments.

Social Media and Network Analysis in Data Mining

Sponsor: Data Mining
Sponsored Session

Chair: Onur Seref, Assistant Professor, Virginia Tech, Pamplin 1007, Blacksburg, VA, 24061, United States of America, seref@vt.edu

1 - Successful Delivery in Vehicle Routing
Fahrettin Cakir, University of Iowa, Department of Management Sciences, Iowa City, 52242, United States of America, fahrettin-cakir@uiowa.edu

Recent trend in businesses is to explore big data to discover facts they did not know before. Researchers resort to data-mining to increase business knowledge. However, there has been relatively little attention paid to the vehicle routing problem. Specifically, we focus on the problem of making successful delivery to locations. We study the correlation between the probability of successful delivery between locations and show why this information is valuable for logistics companies.

2 - Influence-Guided Community Detection in Social Networks
Wenjun Wang, PhD Student, The University of Iowa, S283 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, wenjun-wang@uiowa.edu, Nick Street

Using a new influence cascade model, we proposed an effective algorithm (IGSK) for community detection in binary networks. In this paper, we extend it to weighted networks to incorporate the weights on edges. Moreover, we present a novel influence-guided label propagation algorithm (IG-LPA) to uncover the hierarchical community structure in social networks. Tests on real-world networks and synthetic benchmarks demonstrates its excellent performance in terms of both accuracy and efficiency.

3 - Corporate Competitive Actions on Social Media: An Empirical Analysis
Alan G. Wang, Virginia Tech, Blacksburg, United States of America, alanwang@vt.edu, Yuhong Li, Weiguo Fan

An increasing number of firms have adopted social media for various business purposes. We focus on two dominant social media platforms, Facebook and Twitter, and empirically examine corporate competitive actions (CA) in social media. We aim to reveal the types of competitive actions undertaken by corporates on social media, the differences in competitive actions between social media and traditional media, and the effect of social media competitive actions on corporate performances.

4 - A Computational Rhetoric Framework for Mining Online Stock Commentaries

Onur Seref, Assistant Professor, Virginia Tech, Pamplin 1007, Blacksburg, VA, 24061, United States of America, seref@vt.edu, Michelle Seref, Alan Abrahams

We develop a computational rhetoric methodology that combines data mining, machine learning, and natural language processing to analyze rhetorical moves in online stock pitch arguments of players from an online investment game. We derive predictive models to determine a player's stock prediction accuracy and their influence in their online community. We compare our framework to conventional text mining methods to highlight the contribution of our computational rhetoric approach.

MCDM & Service Science: Theory and Applications

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Adiel T. de Almeida Filho, Assistant Professor, Universidade Federal de Pernambuco, Caixa Postal 7471, Recife, PE, 50630-971, Brazil, adieltaf@googlemail.com

1 - Tackling Uncertainty in Complex MCDA and MAUT Problems

Lisa Scholten, Eawag, Swiss Federal Institute of Aquatic Science and Technology, Ueberlandstrasse 133, P.O. Box 611, Duebendorf, ZH, 8600, Switzerland, lisa.scholten@eawag.ch, Nele Schuwirth, Peter Reichert, Judit Lienert

We present a new approach for tackling uncertainties in preference elicitation and predictive modeling of complex MCDA/MAUT problems and apply it to water infrastructure planning in Switzerland. A two-step procedure for preference elicitation is combined with uncertainty and global sensitivity analyses (UA, GSA). We will show the usefulness of UA and GSA to explore the importance and contribution of often ignored uncertainties and to focus on those crucial for discriminating alternatives.

2 - Integrating Stakeholders in an MCDA-process for Sustainable Water Infrastructure Planning

Judit Lienert, Dr., Eawag, Swiss Federal Institute of Aquatic Science and Technology, Ueberlandstrasse 133, P.O. Box 611, Duebendorf, ZH, 8600, Switzerland, judit.lienert@eawag.ch, Jun Zheng, Lisa Scholten

We focus our talk on stakeholder participation in an exemplary MCDA for sustainable water infrastructure planning. We combined a stakeholder with a social network analysis to identify main actors and their objectives. These were confirmed in a group workshop, in which we also generated alternatives for water infrastructures, and socio-economic future scenarios. Preference elicitation for the MCDA was done online and in interviews. We present main results of the case study and of lessons learnt.

3 - Examining Customer Service Features on Retail Websites

Kaveepan Lertwachara, Professor, California Polytechnic State University, 1 Grand Avenue, San Luis Obispo, CA, 93407-0304, United States of America, klertwac@calpoly.edu, Anteneh Ayanso

This research examines customer service functionalities implemented on top online retail sites in the U.S. Our study aims to determine the relationship between retailers' customer service performances, website traffic, and online sales. Our analysis is based on the Customer Service Life Cycle (CSLC) theory which includes four customer service stages: Requirements, Acquisition, Ownership, and Retirement.

4 - Service Design & Optimization in a Multi-channel Customer Support Environment

Ehud Rattner, University College Dublin, School of Business, Belfield, Dublin 4, Ireland, ehud.rattner@ucdconnect.ie, Vincent Hargaden, Paula Carroll

We develop a framework for service design and delivery in a multi-channel customer support environment. Using a linear programming approach, we optimize agent allocation, where the objective function is a weighted abandon rate. Hard constraints include agent availability and business metrics, time for agent training is a soft constraint.

Optimization Models and Algorithms for Data Mining with Uncertainties

Sponsor: Data Mining

Sponsored Session

Chair: Neng Fan, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, nfan@email.arizona.edu

1 - Support Vector Machine Classification with Robust Chance Constraints

Ximing Wang, University of Florida, Gainesville, FL, 32611, United States of America, x.wang@ufl.edu, Panos Pardalos

In this talk, we explored approximation schemes for robust chance constraints in support vector machine classification assuming the moment information of the uncertain data are given. With an exact approximation and solving algorithm, the problem can be solved efficiently.

2 - Data-driven Support Vector Machines with Uncertainties

Neng Fan, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, nfan@email.arizona.edu, Elham Sadeghi

In this talk, we discuss data-drive support vector machines with uncertainties by robust optimization, chance-constrained optimization models and algorithms.

3 - Smartly Sharing your Information against User Account Linkage across Multiple Online Social Networks

Yilin Shen, benoit.shen@gmail.com, Hongxia Jin

Users are posting their personal status without being aware of how their information is shared across multiple OSNs. We first identify a practical and easy-to-conduct attack model to accurately link user accounts across OSNs, in which only very few public user information is needed. In order to defend against this attack, we develop the first countermeasure which keeps as much as user's information visible and meanwhile prevents users' accounts from being linked on various OSNs via k-anonymity.

Search Theory

Sponsor: Military Applications Society

Sponsored Session

Chair: Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - Graph Search with Delayed, Out-of-Sequence, and Incomplete Observations

David Casbeer, Air Force Research Laboratory, 2210 8th St, R300, WPAFB, OH, United States of America, david.casbeer@us.af.mil

A UAV is searching for a ground vehicle on a road network that is out-fitted with unattended ground sensors (UGSs). The UGSs are communication constrained and can only relay observations when the UAV visits them. The UAV lacks the ability to detect and identify the evader and must visit the UGSs to learn the evader's location. This scenario leads the UAV's control actions to depend on delayed, out-of-order, and incomplete observations. UAV control policies for guaranteed capture are discussed.

2 - When to Believe an Informant: A Model for Human Intelligence

Michael Atkinson, Naval Postgraduate School, 1411 Cunningham Road, Monterey, CA, United States of America, mpatkins@nps.edu, Moshe Kress

A searcher desires to find a target hiding in one of n cells. The searcher receives a stream of intelligence tips about the location of the target from an imperfect informant. At any time the searcher can engage the cell he thinks contains the target. There is urgency for the searcher to engage the cell quickly before the target executes an attack. If the target executes his attack, the searcher incurs some cost. If the searcher engages the wrong cell, additional collateral damage occurs.

3 - Dynamic Search Time Allocation Problem in a Complete Graph
Yan Xia, University at Buffalo, 342 Bell Hall, Buffalo, NY, 14260-2050, United States of America, yanxia@buffalo.edu, Rajan Batta, Rakesh Nagi

Decentralized method of routing a fleet of vehicles rarely considers workload sharing under stochastic environment. In this paper, we investigate the benefit of workload sharing for a decentralized, stochastic routing and time-allocation problem motivated by reconnaissance applications of unmanned aerial vehicles (UAVs). We develop two tractable routing methods with sharing for any given routing method with no sharing. One of the methods is guaranteed to be better the no-sharing method.

4 - CADSIM: A Tool for Analyzing Multiparty Strategic Interactions
Paul Scerri, Carnegie Mellon University, Robotics Institute, Pittsburgh PA, United States of America, pscerri@cs.cmu.edu, Joe Mola, Elan Freedy, Amos Freedy

Military analysts must often try to understand complex strategic interactions involving multiple parties with a mixture of cooperative and adversarial relationships. We present CADSIM, a tool that uses MDPs to explore a strategy space. The tool builds on an algorithm called TREMOR that manages a very large state space by focusing on interactions between actors, but otherwise computing policies independently. Graphical tool support empowers analysts to work with complex models.

Technology Entrepreneurship in China

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Yanbo Wang, Assistant Professor, Boston University, 595 Commonwealth Avenue, Boston, MA, United States of America, wyanbo@bu.edu

Co-Chair: Chuck Eesley, Assistant Professor, Stanford Univ., Huang Engineering Center Room 355, 475 Via Ortega, Stanford, 94305, United States of America, cee@stanford.edu

1 - Firm Performance & State Innovation Funding: Evidence from China's Innofund Program
Yanbo Wang, Assistant Professor, Boston University, 595 Commonwealth Avenue, Boston, MA, United States of America, wyanbo@bu.edu

Leading industrial economies have historically employed innovation subsidies with the aim of overcoming the market failures associated with financing tech-oriented small firms. Although our understanding of these policies' impact is mixed, industrializing economics have begun to embrace similar policies. Using a regression discontinuity design, this project investigates how a major innovation subsidy program in China impact firm performance, including survival, patenting, and refinancing.

2 - Innovation Paradox of Returnees: Evidence from China's High Technology Industries
Haiyang Li, Rice University, Houston, TX, United States of America haiyang@rice.edu, Jiangyong Lu, Seong-Jin Choi, Xiaohui Liu

We investigate why technology ventures led by returnees who in general enjoy technology advantage underperform the ventures led by their local counterparts. With a sample of technology ventures in China's high technology industries, we found that while returnee ventures have a higher level of innovation input, their innovation efficiency is lower than their local counterparts. Our results also show that innovation efficiency mediates the negative effect of returnees on venture performance.

3 - Political Hazards and Firms' Geographic Focus
Nan Jia, Assistant Professor, Marshall School of Business, University of Southern California, BRI 306, 3670 Trousdale Pkwy, Los Angeles, CA, 90089, United States of America, Nan.Jia@marshall.usc.edu, Kyle Mayer

We examine the relationship between the geographic focus of a firm's sales and the firm's vulnerability to expropriation hazards in the form of unauthorized levies. Although expanding outside the home location can initially increase a firm's exposure to government expropriation, we find that this effect reverses when a firm's sales outside its home location reach the point at which the firm pose a credible threat to exit the market in which it is being targeted.

4 - Does Institutional Change in Universities Influence High-Tech Entrepreneurship? Evidence from China
Chuck Eesley, Assistant Professor, Stanford Univ., Huang Engineering Center Room 355, 475 Via Ortega, Stanford, CA, 94305, United States of America, cee@stanford.edu, Delin Yang, Jamber Li

We examine how policies that attempt to change educational institutions to be more innovative affect the beliefs and behaviors of alumni entrepreneurs as well as the performance of firms they start. We address this question by studying how China's Project 985, an educational reform that attempted to foster innovation within a subset of Chinese universities, impacted entrepreneurs' beliefs regarding innovation.

Economics of Online Services

Sponsor: eBusiness

Sponsored Session

Chair: Mingdi Xin, Assistant Professor, University of California at Irvine, United States of America, mingdi.xin@uci.edu

1 - Optimal Timing of Sequential Distribution: Day-and-Date Strategy in the Movie Industry
Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Terrence August

We present a model of consumer choice that examines trade-offs between substitutable products (theatrical and video forms), the possibility of purchasing both alternatives, and a congestion externality affecting consumption at theaters. We characterize the market conditions under which a studio should pursue direct-to-video, day-and-date, and delayed video release strategies.

2 - Cardinality Bundling with Constrained Prices
Jianqing Wu, Purdue University, 403 W. State Street, West Lafayette, In, 47906, United States of America, wu35@purdue.edu, Mohit Tawarmalani, Karthik Kannan

Cardinality bundling (CB) is a kind of bundling strategies where firms set prices that depend only on the size of the bundle. The existing analytical framework of CB lacks sub-additivity constraints on bundle pricing, which limits its application in reality. In this study, we solve the CB problem with additional constraints on bundle prices: marginal decreasing prices; unit decreasing prices; and the general sub-additive prices. In addition, we provide gap analysis between different CB models.

3 - Spreading Goodwill through Social Media: Gratitude, Network Distance, and Charitable Giving
Dobin Yim, Fordham University, 113 West 60th Street, New York, NY, 10023, United States of America, dyim@fordham.edu

We explore how expression of gratitude affects charitable giving behavior, conditional on the distance the message travels over social networks. We extract message patterns from an online charitable giving campaign on Twitter and show that gratitude is positively associated with donation behavior. However, this positive effect dissipates over network distance. We discuss the implications of our findings and future direction of the study.

Pharmaceutical and Healthcare Supply Chains

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Hui Zhao, Penn State University, Smeal College of Business, University Park, United States of America, huz10@psu.edu

1 - Recruitment Stocking Processes
Anh Ninh, RUTCOR, Rutgers Center for Operations Research, 100 Rockafeller Rd, Piscataway, NJ, 08954, United States of America, ninhtuananh@gmail.com, Yao Zhao, Benjamin Melamed

We define a general class of inventory control problems - recruitment stocking problems (RSP), where one needs to recruit a target number of subjects through multiple locations. RSP can be found in clinical trials, marketing research as well as recruitment of employees and military forces. We provide a mathematical characterisation of RSP and its performance metrics both exactly and approximately.

2 - Gatekeeper or Roadblock: Tradeoffing Evidence Generation and Access to New Drug

Hui Zhao, Penn State University, Smeal College of Business, University Park, United States of America, huz10@psu.edu, Leon Xu

The rocketing R&D cost and the flat number of new drugs approved over decades imply an unprecedented crisis in drug innovation productivity and post questions to the current drug innovation regulation. We consider alternatives to tradeoff access and evidence generation. Based on detailed modeling, we propose remedies for the accelerated approval pathway instituted in 1992 to speed up the development of new drugs but failed its original purpose.

3 - Coordination of the Influenza Vaccine Supply Chain in the Presence of Costly Demand Effort

Xinghao Yan, Ivey Business School - Western University, 1255 Western Road, London, ON, N6G 0N1, Canada, xyan@ivey.uwo.ca, Greg Zaric

We study influenza vaccination supply chain consisting of a government, a vaccine manufacturer, and population. We show that the optimal order quantity is never less than the critical vaccination demand, defined as the demand without vaccine shortages. The optimal critical vaccination demand may not lead to herd immunity. We provide sufficient and necessary conditions for the existence of coordinating contracts in different contract families, defined according to which decisions are verifiable.

4 - Designing Health Care Supply Chain for Cardiovascular Diseases: A Predictive Analytic Application

Kingshuk Sinha, Professor, Mosaic Company Professor of Corporate Responsibility, Carlson School of Management, University of Minnesota, Minneapolis, MN, United States of America, ksinha@umn.edu, Bhupinder Juneja, Ujjal Mukherjee

We report the results of an empirical study where socio-economic considerations are accounted for in designing a health care supply chain for cardiovascular diseases. A "big" data set on cardiovascular diseases is analyzed using predictive analytic techniques to develop a risk model for the population level disease condition.

Retail Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Dorothee Honhon, Assistant Professor, University of Texas at Dallas, Naveen Jindal School of Management, Dallas, TX, 75080, United States of America, Dorothee.Honhon@utdallas.edu

Co-Chair: Amy Xiajun Pan, Assistant Professor, University of Florida, Department of ISOM, Warrington College of Business Administr, Gainesville, FL, 32611, United States of America, amy.pan@ufl.edu

1 - Econometric Analysis of Customer Conversion in eRetail

Nikolay Osadchiy, Assistant Professor, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30309, United States of America, nikolay.osadchiy@emory.edu, Vishal Gaur

We model the process of customer acquisition and conversion in retail. Using the data from an online specialty retailer, we estimate parameters of the customer conversion process and discuss implications for advertising and promotion planning.

2 - Optimal Pricing and Ordering Policy for Perishable Products

Amy Xiajun Pan, Assistant Professor, University of Florida, Department of ISOM, Warrington College of Business Administr, Gainesville, FL, 32611, United States of America, amy.pan@ufl.edu, Zumbul Atan, Dorothee Honhon

We consider the problem of a retailer managing fresh and perishable/old products. Depending on the shelf display, consumers have different purchase behavior. We provide the optimal discounting policy for the old products and ordering policy for the fresh products, and propose effective heuristics.

3 - Dynamic Assortments in Online Retailing

Bharadwaj Kadiyala, PhD Student, University of Texas at Dallas, 800 West Campbell Road, Richardson, TX, 75080, United States of America, bxk121930@utdallas.edu, Dorothee Honhon, Canan Ulu

Online retailing offers a unique opportunity to gather information about customer preferences. The extent to which this information is censored depends largely on the framework in which websites operate i.e., where and how much information about products is displayed to customer during their browsing process. Using a Bayesian framework, we study assortment decisions with information obtained from online sales and customer clicks, with the aim of maximizing profits.

4 - Selling to Nanostores

Jiwen Ge, PhD Candidate, Eindhoven University of Technology, De Lismortel 38, Eindhoven, 5612AR, Netherlands, J.Ge@tue.nl, Dorothee Honhon, Jan C. Fransoo, Lei Zhao

Nanostores are small retail stores which are prevalent in mega-cities. Consumer Packaged Goods manufacturers frequently send salespersons to visit nanostores and generate sales. We build MDP models to optimize a manufacturer's sales effort strategy while considering the suboptimal behavior of the nanostores. Optimal polices and parametric results are derived.

Hilton- Continental 3

Disruption Risk Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Nitin Bakshi, Assistant Professor, London Business School, NW1 4SA, London, United Kingdom, nbakshi@london.edu

1 - Inducing Suppliers to Improve Reliability with Contracts and Delegation

Woonam Hwang, PhD Candidate, London Business School, Regent's park, London, NW14SA, United Kingdom, whwang@london.edu, Nitin Bakshi, Victor DeMiguel

Suppliers can mitigate supply risk by improving their processes or overproducing, but their mitigating actions are often not directly contractible. We investigate how buyers can use contracts and delegation to induce the suppliers to improve reliability. We find that, although suboptimal, simple contracts can often generate high efficiency. Also, delegating the production quantity decision to the supplier can mitigate the problem of incentive alignment, resulting in higher efficiency.

2 - Increasing Supply Chain Robustness through Process Flexibility and Strategic Inventory

Yehua Wei, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, yehua.wei@duke.edu, He Wang, David Simchi-Levi

In this talk, we consider a combination of process flexibility and strategic inventory as an effective disruption mitigation strategy. For a manufacturer with multiple plants, we analyze K-chain flexibility designs in which each plant is capable of producing exactly K products. We find that while 2-chain can be very effective in disruption mitigation, 3-chain is significantly more robust than 2-chain when there is demand uncertainty.

3 - Responsible Sourcing in Supply Chains

Robert Swinney, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27516, United States of America, robert.swinney@duke.edu, Hau Lee, Ruixue Guo

We analyze the sourcing decision of a buyer choosing between two supplier types: responsible suppliers are costly while risky suppliers are less expensive but may experience responsibility violations. Some consumers are socially conscious, willing to pay for a responsibly sourced product and willing to punish (by exiting) if there is a responsibility violation. We find the buyer's optimal sourcing strategy and determine how market and supply chain characteristics drive incentives to source responsibly.

INFORMS Analytics Maturity Model

Cluster: INFORMS Communities

Invited Session

Chair: Barry List, Director of Commuications, INFORMS, 5521 Research Park Dr., Catonsville, MD, 21228, United States of America, barry.list@informs.org

1 - Launching INFORMS Analytics Maturity Model 2.0

Norm Reitter, Director, Analytics, CANA Advisors, 7371 Atlas Walk Way, Gainesville, VA, 21055, United States of America

The IAMM has been developed over two years to provide organizations with a probing way to do self-assessment and plan for the future. The IAMM committee chair explains how it has gone from beta version to launch date at the INFORMS Annual Meeting.

2 - How Business, Government and Consultants Can Use the New INFORMS Maturity Model
Aaron Burciaga, Senior Manager, North America Inventory Analytics Lead, Accenture, 4305 Majestic Lane, Fairfax, VA, 22033, United States of America, adburciaga@gmail.com

The IAMM is a diagnostic and planning tool that can be used not only by business, but also by government agencies and consultants working with a variety of organizations. Aaron Burciaga, a key participant in the model's development, demonstrates how it can be used to full advantage.

3 - What Every Academic Needs to Know About the Maturity Model
Barry List, Director of Commuications, INFORMS, 5521 Research Park Dr., Catonsville, MD, 21228, United States of America, barry.list@informs.org

Academics can gain advantage from the IAMM by acting as advisors to industry. INFORMS Communications Director Barry List reviews the academic/industry connection.

Supply Chain Design

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Nico Vandaele, Professor Dr., KU Leuven, Naamsestraat 69, Leuven, 3000, Belgium, Nico.Vandaele@kuleuven.be

1 - A Stakeholder Perspective as a Basis for Sustainable Supply Chain Design
Catherine Decouttere, Senior researcher, KU Leuven, Naamsestraat 69 Box 3555, Leuven, 3000, Belgium, catherine.decouttere@kuleuven.be, Nico Vandaele, Stef Lemmens

A 5-step framework is presented which embeds sustainability in supply chain modelling: stakeholder analysis, key performance setup, model and scenario building, scenario ranking and final choice. We focus on the first and second step: the stakeholder analysis reveals the number, type and interrelationships between the stakeholders; here from a concise set of key performance indicators is derived. We include technical, economical and value based KPI's based on real-life industrial evidence.

2 - Integrated Supply Chain Network Design for Vaccines: A Literature Review
Stef Lemmens, PhD-researcher, KU Leuven, Naamsestraat 69 Box 3555, Leuven, 3000, Belgium, stef.lemmens@kuleuven.be, Nico Vandaele, Catherine Decouttere

Companies all over the world are confronted with designing the supply chain of their businesses. The aim of this literature review is twofold. We provide an updated overview on integrated supply chain network design and we study the concepts for a peculiar pharmaceutical product: vaccines. This presentation provides an overview of different supply chain network characteristics, supply chain performance measures and show how uncertainty is incorporated in the design of a supply chain network.

3 - Horizontal Collaboration and Fairness
Philippe Chevalier, Professor, UCLouvain, Voie du Roman Pays 34, L1.03.01, Louvain-la-Neuve, 1348, Belgium, philippe.chevalier@uclouvain.be, Alejandro Lamas

We model participants to the supply chain as a capacitated lot sizing problem and study how fairness can be implemented to foster fair and efficient horizontal collaboration in a supply chain.

4 - Designing Supply Chain Interfaces under Asymmetric Information
Per Agrell, Université Catholique de Louvain, 34 Voie du Roman Pays, L1.03.01, Louvain-la-Neuve, 1348, Belgium, per.agrell@uclouvain.be, Peter Bogetoft

Delegation of upstream supplier coordination to contract manufacturers is found in practice, but disputed. We study the organizational and contractual choice of a coordinator to either control or delegate the investment decision of some shared resource to a CM or to an upstream supplier in a three-stage supply chain. The analysis derives closed-form results for the economic performance for different delegation schemes under asymmetric information on investment cost.

MSOM Fellows Session

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Gal Raz, Associate Professor, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, razg@darden.virginia.edu

1 - Multidimensional Approximation Algorithms for Capacity-expansion Problems
Robin Roundy, Brigham Young University, Provo, UT, 84602, United States of America, robin@mathematics.byu.edu, Van-Anh Truong

We develop high-dimensional approximation algorithms to compute provably near-optimal capacity-expansion policies. Our approach is computationally efficient and produces a policy with expected cost of no more than twice that of an optimal policy. We overcome the curse of dimensionality using cost-separation schemes. This is the first approximation technique for multimachine, multiproduct systems with stochastic, nonstationary, correlated demands.

2 - Operations Management and the Discounting-Risk Neutrality Conundrum
Matthew J. Sobel, Case Western Reserve University, Weatherhead School of Management, Cleveland, OH, 44106, United States of America, Matthew.sobel@case.edu

The following result from preference theory does not square with empirical reality: if a decision-maker's preferences are consistent with time discounting, then they are consistent with risk neutrality. In my experience, operations managers are sensitive to both timing and risk. This talk sketches the conundrum, outlines a possible solution, and describes some consequences for research in operations management.

3 - The Service and Information Economy: Research Opportunities
Uday Karmarkar, UCLA, 110 Westwood Plaza, Gold Hall, Suite B-512, Los Angeles, CA, 90066, United States of America, uday.karmarkar@anderson.ucla.edu

The US economy is already dominated by services and information. These trends are also present in all large economies in the world. I discuss opportunities for research in Operations and Technology Management related to these substantial economic shifts.

Hilton- Continental 9

Emerging Issues in Sustainable Operations

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Isil Alev, Doctoral Student, Georgia Tech School of Industrial and Systems Engineering, isilalev@gatech.edu

1 - The Implications of Extended Warranties on a Closed-Loop Supply Chain
Wayne Fu, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, United States of America, Wayne.Fu@scheller.gatech.edu, Atalay Atasu

Extended warranties can improve the product value perceived by customers. But they also expand the obligation of manufacturers. In this study, we establish a stylized model that accounts for the effects of warranties, endogenizes the allocation decisions, and demonstrates the impact of extended warranties on product-line choices, and overall profitability. We also highlight the relationship between extended warranties offering and product-line choices.

2 - Strategic Allocation of Medical Surplus
Wee Meng Yeo, YeoWee.Meng@scheller.gatech.edu

To bridge the gap between medical surplus and needs, the Medical Surplus Recovery Organization (MSRO) allows recipients to pick items under full information visibility. Each recipient can either order or wait. We characterize the equilibrium strategies that are Pareto-optimal threshold. We investigate an alternative strategy where MSRO dictates the choice of its recipient and shipment. We develop novel insights and frameworks guiding the operational strategies for a medical-surplus supply chain.

3 - Effect of Government Subsidies on the Adoption of Energy Efficient Products
Haoying Sun, Assistant Professor, Texas A & M University, 301K Wehner, 4217 TAMU, College Station, TX, 77845, hsun@mays.tamu.edu, Steve Gilbert

We use the durable goods framework to study how the timing of the government subsidy program on energy efficient products affects the manufacturer's production and investment decisions and how this in turn affects the energy consumption.

4 - Impact of E-Waste Regulations on the Sale and Lease Strategies
Ni Fang, HEC Paris, 1, Rue de la Libération, Jouy en Josas, 78350, France, ni.fang@hec.edu, Andrea Masini

While e-waste regulation is becoming increasingly popular to minimize the environmental impact, its actual effects remain unclear. In this paper, we study impact of e-waste legislations on the regulated manufacturer's distribution channel strategies amid manufacturer's free choice of dealing with off-lease units in monopoly environment.

Hilton- Exec. Boardroom

Revenue/Yield Management I

Contributed Session

Chair: Pawan Chowdhary, IBM Research Center, 650 Harry Rd, San Jose, CA, 95120, United States of America, chowdhar@us.ibm.com

1 - Differentiated B2B Pricing Strategy for Service Configurations
Pawan Chowdhary, IBM Research Center, 650 Harry Rd, San Jose, CA, 95120, United States of America, chowdhar@us.ibm.com, Zhengliang Xue, Markus Ettl

We study a method to price personalized service configurations. A seller has to deal with request-for-quotes of fully customized packages. A top-down and bottom-up approach is applied to estimate buyer's purchase probability for any configuration based on historical data. In a B2B setting, client relationship is considered in pricing decision, which is incorporated into a utility model assessing market value of configuration and impact of relationship. The business impact is justified by data.

2 - Immediate vs. Past-Purchase Based Retail Price Discounts
Michael Pangburn, University of Oregon, 1208 University of Oregon, Eugene, OR, 97405, United States of America, pangburn@uoregon.edu, Monire Jalili

Retailers commonly offer an immediate discount percentage off regular price. In contrast, some retailers apply a credit toward a future purchase, based on the customer's prior purchase. We contrast the efficacy of these two discounting strategies to better understand conditions under which prior-purchase based discounts may outperform immediate discounts.

3 - Optimal Keyword Bidding in Search Based Advertising
Baris Selcuk, Assoc.Professor, Bahçesehir University, Ciragan cad., Ciragan cad., Istanbul, 34353, Turkey, bariselcuk@gmail.com, Ozgur Ozluk

In search-based advertising, advertisers bid on keywords to have an impact on their ad's placement. An advertiser must bid correctly for each keyword in order to maximize the expected revenue while keeping the daily costs in mind. We construct an optimization model that maximizes total expected advertising revenue while keeping the total costs below a given advertising budget where the stochastic relationship between the bid prices and the click-through-rates is considered.

New Applications of Pricing and Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Georgia Perakis, William F. Pounds Professor, Massachusetts Institute of Technology, Sloan School of Management, Cambridge, MA, 02142, United States of America, georgiap@mit.edu

1 - Optimization Models and Insights for Promotion Planning
Maxime Cohen, PhD Candidate, MIT, maxcohen@mit.edu, Georgia Perakis, Kiran Panchamgam

We study the Promotion Optimization Problem, i.e., deciding which items to promote, at what time and at what price. Our formulation includes several business rules that arise in practice. We build demand models from data in order to capture the stockpiling behavior as well as cross items effects. This gives rise to a hard problem. We then propose efficient LP based methods, show theoretical performance guarantees and validate our results using real data.

2 - Scheduling with Testing
Yaron Shaposhnik, MIT, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, United States of America, shap@mit.edu, Retsef Levi, Thomas Magnanti

We study a new class of scheduling problems that captures a common tradeoff between using resources for processing jobs, and investing resources to 'test' jobs and learn more about their uncertain attributes. This can inform future decisions, but also delay service. We derive intuitive structural properties of the optimal policies, and use a new cost-accounting scheme to devise a surprisingly low dimensional dynamic programming formulation, which ultimately leads to an FPTAS.

3 - Data-driven Bundle Pricing with Dynamic Product Valuation and Substitution Effects
Wei Sun, Researcher, IBM T J Watson Research Center, 1101 Kitchawan Road, 05-034D, Yorktown Heights, NY, 10598, United States of America, sunw@us.ibm.com, Anshul Sheopuri, Dashun Wang

We study bundle pricing for technology products and services (e.g., handset with plans, console with games), where dynamic product valuations (willingness to pay) and substitution effect within a product group are prominent. We propose a data-driven method that fits a copula model over the joint valuations with sales data. A case study on a telecom company demonstrates the importance of incorporating dynamic valuation, product substitution and correlations in the joint distribution.

4 - Data-driven Newsvendor with a Mixture Distribution
Chongli Daniel Chen, Operations Research Center, MIT, 77 Mass Ave, Bldg E40-130, Cambridge, MA, 02139, United States of America, dcchen@mit.edu, Retsef Levi, Georgia Perakis

We consider a newsvendor facing demand that is a mixture of known finite distributions, but with unknown weights. Given a small sample of the true distribution, we formulate the problem as a robust optimization problem using a mixture distance to define the uncertainty set. This results in a tractable linear program, and we prove convergence properties. Preliminary simulations show good performance for small sample sizes. This approach is general and can be adapted for different cost functions.

Empirical Studies in Healthcare Operations Management

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Nan Liu, Assistant Professor, Columbia University, 600 W. 168th St., 6th floor, New York, NY, 10032, United States of America, nl2320@columbia.edu

Co-Chair: Pengyi Shi, Assistant Professor of Operations Management, Purdue University, Krannert School of Management, West Lafayette, IN, United States of America, shi178@purdue.edu

1 - A Comprehensive Probabilistic Framework for Prediction of Patients' Readmission to Medical Centers

Adel Alaeddini, University of Texas at San Antonio, One UTSA Circle, San Antonio, United States of America, Adel.Alaeddini@utsa.edu, Jon Stauffer, Kurt Bretthauer, Jonathan Helm

The problem of readmission to medical centers after getting discharged often causes serious problems to both patients and medical centers. In this study we develop a comprehensive probabilistic framework based on integration of survival models, and local regression analysis to provide an accurate real-time estimate of readmission, personalized for each patient. We also design a comprehensive optimization model to find the optimal parameters of the proposed framework.

2 - Consequences of Delays in Patient Transfers Out of the Mass General Hospital ICU

David Scheinker, dscheink@gmail.com, Sara Dolcetti, Benjamin Christensen, Retsef Levi, Ulrich Schmidt, Tara Tehan, Bethany Daily, Peter Dunn

More expert guidelines exist to prevent transfer delay to an Intensive Care Unit than transfer delay from an ICU. We test the assumption that a patient delayed in the ICU is no worse off than she would be in a general care unit. In particular, we examine the impact of transfer delays from the ICU on total patient length of stay. We find that ICU transfer delays extend total patient hospital length of stay. This finding allows us to more accurately quantify the financial impact of such delays.

3 - The Effect of Health Plan Type on the Utilization of Advanced Diagnostic Imaging

Xin Zheng, Boston University, 595 Commonwealth Ave, Boston, United States of America, xinzheng@bu.edu, Rona Doncaster, Amy McLaughlin, Justin Ren, Anita Tucker, Jonathan Beebe

Using 2010 Thomson-Reuters MarketScan commercial claims and encounters database, we found that HMO beneficiaries overall uses about 339 millions less and HDHP beneficiaries uses around 392 millions less imaging studies than PPO beneficiaries given all the control variables in these plans the same. These differences could be the potential source for unwanted health care usage. Understanding this can help us reduce health care waste from the costly imaging studies.

4 - An Analysis of Patient Preferences and Choice Behavior in Outpatient Appointment Scheduling

Nan Liu, Assistant Professor, Columbia University, 600 W. 168th St., 6th floor, New York, NY, 10032, United States of America, nl2320@columbia.edu, Stacey Finkelstein, Beena Jani, David Rosenthal, Margaret Kruk

Patient choice of an outpatient appointment depends on her preferences over a variety of attributes associated with the appointment and how she makes trade-off among them. By conducting discrete choice experiments on different populations, we investigate a comprehensive set of "operational" attributes that can affect patient choice. We also explore heterogeneity in patient preferences and explain this heterogeneity by identifying individual characteristics that can modify patient preferences.

Customer Choices, Upgrades and Prices

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Metin Cakanyildirim, University of Texas at Dallas, Campbell Road, Richardson, United States of America, metin@utdallas.edu

1 - Dynamic Pricing and Replenishment with Customer Upgrades

Oben Ceryan, Assistant Professor, Department of Decision Sciences, LeBow College of Business, Drexel University, 3220 Market St., Philadelphia, PA, 19104, United States of America, oc43@drexel.edu, Ozge Sahin, Izak Duenyas

We study the impact of product upgrades on a firm's pricing and replenishment policies by considering a multiple period, two-stage model where the firm first sets prices and replenishment levels, and after observing the demand, it decides whether to upgrade any customers to a higher quality product. We characterize the structure of the optimal upgrade, pricing, and replenishment policies and find that offering upgrades assists in preserving the vertical price differentiation of the products.

2 - Revenue Management under Customer Choice Behavior with Cancellations and Overbooking

Dirk Sierag, CWI, Science Park 123, Amsterdam, Netherlands, D.D.Sierag@cwi.nl, Jean-Pierre van der Rest, Bert Zwart, Rob van der Mei, Ger Koole

In many application areas such as airlines and hotels a large number of bookings are cancelled. We propose a revenue management model that takes cancellations into account in addition to customer choice behaviour. Numerical results show that the model without cancellations can lead to a revenue loss of up to 20%. The combination of the model, tractable and well-performing solution methods, and an accurate parameter estimation method ensures that the model can efficiently be applied in practice.

3 - National and Store Brand Advertising and Pricing Strategies

Stanko Dimitrov, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca, Jen-Yi Chen

In this presentation we discuss different pricing and advertising decisions competing national and store brands can take. We consider three cases, when both advertising and pricing decisions are made at the same time, and when one decision is fixed and the other must be made. We find that the allowing both pricing and advertising decisions to be made in unison leads to boundary solutions. We conclude with interpretations of our results and future research directions.

4 - WTP-Choice Model

Metin Cakanyildirim, University of Texas at Dallas, Campbell Road, Richardson, United States of America, metin@utdallas.edu, Varun Gupta

We propose a WTP (Willingness To Pay)-choice model and use it to compare equilibrium prices, demands and profits of several contexts: without considering inventory and with stockouts - lost sales and backorders. One of the interesting results with independent WTPs is the loose coupling of retailers; equilibrium prices are not coupled but profits are. Dependent WTPs can cause price cycles. Empirical comparisons with (mixed) Logit are also presented.

Pricing and New Product Development in Supply Chains

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Chia-Wei Kuo, National Taiwan University, 1, Sec. 4 Roosevelt Road, Taipei, 106, Taiwan - ROC, cwkuo@ntu.edu.tw

1 - Simultaneous vs. Sequential Crowdsourcing Contests

Lu Wang, Rotman School of Management, 105 St. George Street, Toronto, Canada, Lu.Wang12@Rotman.Utoronto.Ca, Ming Hu

In a crowdsourcing contest, innovation is outsourced by an innovating firm to an open crowd whose members compete in generating best solutions. We consider two mechanisms when innovation demands expertise in multiple attributes. One is to run a simultaneous contest, where a single solution is simultaneously submitted by each contestant. The other is to run multiple sequential sub-contests, with each dedicated to one attribute. Which mechanism should the firm choose?

2 - Dynamic Pricing with Gain-Seeking Reference Price Effects
Zhenyu Hu, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, hu48@illinois.edu, Peng Hu, Xin Chen

We study a dynamic pricing problem of a monopolist facing an aggregate demand with gain-seeking reference price effects. We show that even the myopic pricing strategy leads to complex dynamics over time. We then consider a special case, in which consumers only remember the price in the last period and the demand is mainly driven by promotions. Our results suggest that a skimming cyclic pricing strategy is optimal. Conditions are derived to guarantee the optimality of high-low pricing strategies.

3 - Contract Design for Cloud Computing Service with Service Level Consideration
Kwei-Long Huang, Assistant Professor, National Taiwan University, No. 1, Sec. 4, Roosevelt Rd., Taipei, 106, Taiwan - ROC, craighuang@ntu.edu.tw, Carol Hsu, Chia-Wei Kuo, Chao-Lung Yang

Design of contracts for cloud computing service with resource guarantee is considered. A service provider determines pricing and resource allocation by offering two types of contracts with different service levels. Each contract specifies price and associated penalty if the provider cannot fulfill the requested resource. Optimal pricing and resource allocation decisions as well as the equilibrium contracts of the service provider are analyzed based on the dynamics of the model characteristics.

Facility Logistics IV

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Suzanne Marcotte, Associated professor, ESG-UQAM, Dept Management and technology, P.O. Box 8888, Downtown Station, Montreal, Qc, H3C3P8, Canada, Suzanne.Marcotte@cirrelt.ca

1 - A GPU Accelerated Sub-gradient Lagrangian Search for the Quadratic Assignment Problem
Rakesh Nagi, Professor and Department Head, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, nagi@illinois.edu, Ketan Date

The Quadratic Assignment Problem (QAP) is the fundamental problem in facilities layout. It is strongly NP-hard. In this work, we study a linearization model for the QAP and parallelize the sub-gradient Lagrangian search algorithm using graphics processing unit (GPU). We show this method can be used to obtain quick and strong lower bounds on the large instances of the QAP.

2 - Models for Unit Load Storage System Design
Pratik Mital, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, pmital3@gatech.edu

Unit load storage systems are by far the most common storage system architectures. Different objectives and hardware implementations have yielded a large variety of models. Characteristics of the various models and a hierarchy of the models will be presented.

3 - Designing a Rotated Aisle Layout for Improved Facility Performance
Dean Marinchek, Ohio University, 270 Stocker Center, Athens, OH, 45701, United States of America, dm089112@ohio.edu, Dale Masel

Traditionally, aisles in a manufacturing facility are designed to run parallel to the walls of the facility, which means that travel can't follow the shortest distance between two points. To allow more direct travel between departments, this work uses a layout in which main aisles running across the facility divide it into bays. The departments are arranged with the main aisles parallel to the walls of the facility and then the main aisles are rotated to reduce the overall travel distance.

4 - Evaluation of Dynamic Deployment of Production, Storage and Handling Resources in a Modular Facility
Suzanne Marcotte, Associated Professor, ESG-UQAM, Dept Management and technology, P.O. Box 8888, Downtown Station, Montreal, Qc, H3C3P8, Canada, Suzanne.Marcotte@cirrelt.ca, Ben Montreuil

We previously proposed a design methodology for a dynamic deployment of production, storage and handling resources in a modular facility design. Indeed, facilities can be modeled as a grid on which generic modules can be located. Resources such as production, storage and handling resources are to be assigned to these modules to minimize the total cost trough time. We provide empirical results and insights in this paper through a case study of a computer refurbishing and recycling facility.

Innovative Solutions for Congestion Mitigation III

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Siriphong (Toi) Lawphongpanich, University of Florida, Industrial and Systems Engineering, Gainesville, FL, 32611, United States of America, Lawphong@ise.ufl.edu

Co-Chair: Yafeng Yin, University of Florida, Gainesville, FL, United States of America, yafeng@ce.ufl.edu

1 - Maintenances & Repair Planning Model Based on Day-to-Day Dynamic Traffic Assignment
Terry Friesz, Penn State, 305 Leonhard Building, University Park, PA, 16802, United States of America, tfriesz@psu.edu, Terry Friesz, Ke Han, Yuqi Sun

We propose a maintenance & repair planning model based on day-to-day dynamic traffic assignment. This model captures both transient congestion caused by M&R activities in progress and post-project effects as a result of improved road quality and capacity. An optimal M&R planning strategy, which accounts for both maintenance and congestion costs, is solved with heuristics.

2 - Speed Harmonization for A Bottleneck Based on Vehicle-to-Infrastructure Communications
Hao Yang, Postdoctoral Associate, Virginia Tech Transportation Institute, 3500 Transportation Research Plaza, Blacksburg, VA, 24061, United States of America, yhharolduci@gmail.com, Hesham Rakha

Capacity drop at bottlenecks is one major cause of congestion and road instability. This study proposes a speed harmonization strategy with vehicle-to-infrastructure (V2I) communications to solve this problem. The strategy provides variable speed limits, which force probe vehicles travel with smaller speed and constrain inflow rates to bottlenecks, based on a feedback control system. Experiments show that the strategy significantly mitigates congestion when capacity drop happens at a bottleneck.

Emergency Response Capability Modeling

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Halit Uster, Southern Methodist University, Lyle School of Eng., Dallas, TX, 75275, United States of America, uster@smu.edu

1 - Assessing the Responsiveness of a Healthcare Network to Sudden Surge Demand
Mercedeh TariVerdi, mercedeh.t@gmail.com, Elise Miller-Hooks, Yanshuo Sun, Eirini Kastrouni

An urban disaster event can lead to sudden surge demand for urgent healthcare. To a community, efficient response by the healthcare system is as vital as the performance of each individual facility. A queueing system conceptualization of a network of hospitals in NYC is taken in assessing system performance.

2 - A Heuristic Method for Relevant Performance Measures in a Dynamic Ambulance Management Model
Thije van Barneveld, Centrum Wiskunde en Informatica, Science Park 123, Amsterdam, 1098 XG, Netherlands, t.c.van.barneveld@cwi.nl, Sandjai Bhulai, Rob van der Mei

In serious life-threatening emergency situations, the ability of ambulance service providers to arrive at the emergency location within a few minutes to provide medical aid makes the difference between survival or death. In this talk, we focus on Dynamic Ambulance Management: how to redeploy the available ambulances if an ambulance becomes busy? We present a DAM-model and we propose a heuristic for making ambulance redeployments in this presentation.

3 - Equity Modeling and Resource Management for Hospital Evacuations
Esra Agca, Kadir Has University, Istanbul, Turkey, esra.agca@khas.edu.tr, Douglas Bish

We present a hospital evacuation transportation model for multiple evacuating hospitals, which may be managed by different hospital groups, sharing available evacuation resources in the same region. The proposed model is an IP with a system-level utilitarian objective of minimizing the average evacuation risk. We discuss equity issues that arise with resource sharing employing an equity modeling framework based on the social welfare function of risk-based utilities for each hospital and each patient.

4 - Emergency Response Network Design Integrating Supply and Demand Sides under Data Uncertainty
Jyotirmoy Dalal, Ph D candidate, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, jyotirmoy.dalal@gmail.com, Halit Uster

We consider an emergency response network design problem focusing on both cost-effective relief distribution (supply side) and fast evacuation (demand side). We explore the effects of uncertainties of demand, supply, various cost components, and available infrastructure. We present computational results and analysis based on data from a network serving coastal Texas.

Joint Inventory and Location Models

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Jianing (Jenny) Zhi, The University of Alabama, 300 Alston Hall, Box 870226, Tuscaloosa, AL, 35404, United States of America, jzhi@crimson.ua.edu

1 - An Inventory Modulated Capacitated Facility Location Model with Correlated Demands
Kayse Maass, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, leekayse@umich.edu, Mark Daskin, Siqian Shen

While current capacitated fixed charge location problems use inflexible capacities, in reality, facility managers have many operational tools to extend capacity or to allow the facility to accept demands in excess of the capacity constraint for short periods of time. Our model begins to capture these operational extensions and has the potential to reveal operating policies that take advantage of spatial and temporal correlations in demand that would not be evident in current models.

2 - Dynamic Inventory Rebalancing of Vehicle Sharing Systems under Nonstationary Demand
Cathy Xia, Associate Professor, Ohio State University, Columbus, OH, United States of America, xia.52@osu.edu

We present a decentralized approach to dynamically manage the inventory of vehicles at different locations in a sharing system. Our approach is robust and adaptive to arbitrary nonstationary demand patterns and provides long-term guarantees on achieving a given service availability target.

3 - Production Planning with Price-Dependent Supply Capacity
Z. Melis Teksan, University of Florida, ISE Dept. 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States of America, zmteksan@gmail.com, Joseph Geunes

We consider a producer who procures input for production, where the available supply of the input depends on the price offered to suppliers. The producer seeks a production and supply-pricing plan that minimizes the cost incurred while meeting a set of demands over a finite number of discrete time periods. The most general version of the problem is NP-Hard. We provide polynomial-time algorithms for practical special cases, and a new and efficient algorithm for convex-cost lot sizing problems.

4 - An Integrated Location and Inventory Problem with Multiple Newsvendors
Jianing (Jenny) Zhi, The University of Alabama, 300 Alston Hall, Box 870226, Tuscaloosa, AL, 35404, United States of America, jzhi@crimson.ua.edu, Burcu Keskin

In a newsvendor setting, we compare a direct shipment option from a supplier to multiple retailers with a consolidated shipment from a supplier to a DC and then to retailers. While the direct shipment considers only inventory decisions, the consolidated shipment problem is an integrated location-inventory problem where the location of the DC is on a continuous plane. For various transportation costs, we identify the conditions that impact the expected profits.

Optimal Sensor Locations in Traffic Networks

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Kuilin Zhang, Assistant Professor, Michigan Technological University, 1400 Townsend Drive, 870 Dow Environmental Sciences, Houghton, MI, 49931, United States of America, klzhang@mtu.edu

Co-Chair: Dengfeng Yang, Sr. R&D Engineer, Infor US Inc., 8777 N. Stemmons Freeway, Dallas, TX, United States of America, dengfeng.yang@infor.com

1 - The Influence of Sampling Procedures in Freight Tour Synthesis
Carlos Gonzalez-Calderon, Postdoctoral Research Associate, Rensselaer Polytechnic Institute, 110 8th St, JEC 4037, Troy, NY, 12180, United States of America, gonzac8@rpi.edu, Xuegang (Jeff) Ban, Jose Holguin-Veras

This paper introduces an entropy-maximization model to estimate the flows of delivery tours on the basis of traffic counts, and develops heuristic approaches to identify the location of the traffic counts that should support the estimation process. Three heuristics are defined and implemented. The performing of the formulation and the heuristics are tested in the Sioux Falls network.

2 - Reliable Mobile Sensor Network Design through Optimizing Packets Transmissions in VANETs
Dengfeng Yang, Sr. R&D Engineer, Infor US Inc., 8777 N. Stemmons Freeway, Dallas, TX, United States of America, dengfeng.yang@infor.com, Kuilin Zhang

A vehicular ad hoc sensor network (VANET) uses cars as mobile nodes to create a mobile sensor network. Packets transmission paths in the VANET are likely disrupted due to weak radio strength of vehicle moving dynamics and environment changes. We formulate a mixed-integer linear programming model to determine optimal packets scheduling and routing in the VANET to enhance a reliable mobile sensor network connectivity. Customized branch-price-cut and heuristic algorithms are proposed.

3 - Enhancing Observability of Dynamic Traffic Systems: A Stochastic Linear Programming Approach
Kuilin Zhang, Assistant Professor, Michigan Technological University, 1400 Townsend Drive, 870 Dow Environmental Sciences, Houghton, MI, 49931, United States of America, klzhang@mtu.edu, Xuesong Zhou

Measuring observability for static traffic state variables such as OD, path and link flow, has received increasing attention recently. We present a holistic approach to model the observability for practically important performance measures, such as corridor-level travel time dynamics and reliability, under various sensor network design plans. A novel two-stage stochastic linear programming framework is developed to quantify and optimize the value of information from heterogeneous sensors.

Hilton- Union Sq 5

Transportation Planning II

Contributed Session

Chair: Haihong Xiao, HEC Paris, 1, Rue de la Libération, PhD Office, Jouy en Josas, 78351, France, haihong.xiao@hec.edu

1 - Long-haul Freight Selection for Last-mile Cost Reduction
Arturo Pérez Rivera, PhD Student, University of Twente, P.O. Box 217, Enschede, 7500 AE, Netherlands, a.e.perezrivera@utwente.nl, Martijn Mes

We consider the planning problem a company faces when it must transport multiple freights from a single origin to different, and far away, destinations on a regular basis (e.g., daily trips). In each trip, freights are consolidated for the long-haul and transported to their destinations in the last-mile. Last-mile costs depend on the combination of freights transported in each trip. We study how these costs can be reduced, over time, by using look-ahead consolidation polices for the long-haul.

2 - GreenYourRoute Platform for Environmentally Friendly Vehicle Routing
Erotokritos Skordilis, University of Thessaly, Ogl 39, Volos, Greece, erskordi@gmail.com, George Saharidis, George Kolomvos, George Liberopoulos

The objective of the proposed research is to develop a Decision Support System (DSS) for a web based platform which will help individuals and companies move commodities in the most environmental friendly way, minimizing environmental externalities (e.g. CO2 emissions) and transportation costs. The developed platform which is the final outcome of an FP7 European research project, referred to as GreenRoute project.

3 - Truck-Trailer Routing Problem with Intermediate Inventory Facilities for Industrial Gas Distribution
Haihong Xiao, HEC Paris, 1, Rue de la Libération, PhD Office, Jouy en Josas, 78351, France, haihong.xiao@hec.edu, Laoucine Kerbache, Soumia Ichoua, Nicoleta Neagu

The truck and trailer routing problem with intermediate inventory facilities(TTRPIIF) is a variant of the well known vehicle routing problem (VRP). Different from the VRP, in the TTRPIIF, customers are serviced by a fleet of trucks and trailers, Due to some characters, each type of industrial gas can only be carried on by a particular type of trucks, the truck can execute one or two "trips" on one route.

4 - Highway Improvement Project Selection by Multi-Objectives
Peter Kelle, Professor, Louisiana State University, ISDS Department, BEC 2213, Baton Rouge, LA, 70803, United States of America, qmkell@lsu.edu, Helmut Schneider

In highway improvement project selection several objectives must be considered; some of them are based on perceptions, some others are costly and difficult to measure. We use available crash data as proxy measures and for hazard perception in a multi-criteria selection under budget constraint. In the application case we analyze four years of accident data at 23 thousand of potential locations.

Chair: Cagatay Iris, PhD st., Technical University of Denmark, Bygningstorvet 116B, Building 115, room, DTU, Copenhagen, 2800, Denmark, cagai@transport.dtu.dk

1 - Port-Hinterland Container Dwell Time Analysis: The Shippers Effect
Panagiotis Ypsilantis, PhD Student, Rotterdam School of Management, PO Box 1738, Rotterdam, Netherlands, pypsilantis@rsm.nl, Rob Zuidwijk

Container dwell times are considered a crucial performance indicator of container terminals affecting both their capacity as much as their attractiveness to shippers that usually face long lead times. We analyze data derived from an intermodal carrier, in the Netherlands, and assess the main determinants of container dwell times. Our results demonstrate that next to other factors, the shippers and their strategies have a very significant effect on the development of dwell times.

2 - Stowage Planning Models in Cargo Composition Analysis
Dario Pacino, Technical University of Denmark, Bygningstovet 115, Kgs. Lyngby, 2800, Denmark, darpa@transport.dtu.dk, Alberto Delgado Ortegon, Rune Möller Jensen

The last decade has seen a growing interest on automated stowage planning solutions from both the industry and academia. Recently, stowage planning models have proven to scale to industrial level application. Operational stowage planning is, however, not the sole application. In this presentation, we show how stowage planning models can also be used at the tactical level. In particular, we show how revenue and vessel utilization can be analyzed by our models in terms of cargo composition.

3 - Container Relocation Problem under Truck Appointment System in Container Terminals
Dusan Ku, PhD Stu., University of Auckland, Level 4 (ISOM), 12 Grafton Road, Auckland, 1010, New Zealand, d.ku@auckland.ac.nz, Tiru Arthanari, Tava Olsen

We study the container relocation problem with truck appointment system (TAS). Though mainly purposed to reduce the number of trucks during peak hours and improve their turn-time, the TAS can also lend itself to minimising yard reshuffling for pickups. To this end, a stochastic dynamic programming model is formulated and a B&B method with the abstraction heuristics computes the expected number of reshufflings. A heuristic is proposed and its performance is compared with that of the B&B method.

Optimization for Rail Planning

Sponsor: Railway Applications

Sponsored Session

Chair: Mingzhou Jin, The University of Tennessee, 525D John D. Tickle Buidling, Knoxville, TN, 37996, United States of America, jin@utk.edu

1 - Classification Track Assignment in Railway Hump Yards
Mingzhou Jin, The University of Tennessee, 525D John D. Tickle Buidling, Knoxville, TN, 37996, United States of America, jin@utk.edu, Haodong Li

The classification track assignment in a hump yard determines tracks for all blocks following predetermined hump and assemble times. This paper proposes an integer program to minimize dirty tracks and pullback operations subject to classification tracks capacity constraints and track number constraints for outbound trains. A Lagrangean relaxation-based algorithm is proposed. The application of the model and the efficiency of the solution approach are demonstrated by a real-world hump yard.

2 - Integrated Modeling of Strategic Train Operation Planning on a Shared-Use Corridor
Bo Zou, University of Illinois at Chicago, 2073 Engineering Research Facility, 842 West Taylor Street, Chicago, IL, 60607, United States of America, bzou@uic.edu, Ahmadreza Talebian

We develop a hypergraph based approach to model strategic operation planning on shared use rail corridors. Given the passenger train scheduling priority, passenger and freight side costs are sequentially minimized. We propose a solution approach which takes advantage of the problem structure and leads to efficient solution time. The impact of speed heterogeneity and delay tolerance on corridor performance is examined. We also demonstrate the model applicability to a real case study in the US.

3 - Strategies to Control a Shortest Path Based Railroad Blocking Network
Erick Wikum, Principal Scientist, Tata Consultancy Services, Seven Hills Park, 1000 Summit Drive, Milford, OH, 45150, United States of America, erick.wikum@tcs.com

With "algorithmic blocking," routes for rail movements are generated by solving shortest path problems. We describe algorithmic blocking, motivate the need for corresponding control mechanisms, and explain the main control mechanisms behind algorithmic blocking. Then, we present strategies to ensure the routes returned by algorithmic blocking are those desired by railroad experts. In the process, we present a new approach to the calibration of the block costs used to compute shortest paths.

4 - Optimization-based Train Dispatching Systems in Operation in Europe
Leonardo Lamorgese, Researcher, SINTEF ICT Optimization, Trondheimsveien 17, Oslo, Os, 0560, Norway, leonardo.lamorgese@sintef.no, Carlo Mannino

Train dispatching is the process of directing train movements on a railway. When delays or disturbances occur, dispatchers take decisions to minimize deviations. We show that this optimization problem can be tackled effectively by integer programming using suitable exact and approximate decomposition techniques, so improving train punctuality. Dispatching systems based on our algorithms for main line and large stations are in operation in Italy, Norway and Latvia.

Control of Airport Operations for Congestion Mitigation

Sponsor: Aviation Applications

Sponsored Session

Chair: Alexandre Jacquillat, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-246, Cambridge, MA, 02139, United States of America, alexjacq@mit.edu

1 - Speed Control
Michael Levin, The University of Texas at Austin, ECJ 6.2, Austin, TX, 78712, United States of America, michaellevin@utexas.edu, Travis Waller, David Rey

Sector and airport capacity oversaturation is often resolved through human-assigned radar vectors, which may strongly affect en-route delay and fuel consumption, and are seldom fair with regards to airlines operations costs. Therefore, speed control based models provide an attractive framework to coordinate and separate aircraft. We use these controls in a combined sector and airport model that integrates equity. Results are analyzed by a simulation of air traffic between several major airports.

2 - Managing Capacity Uncertainty in Ground Delay Programs through En Route Speed Control
James Jones, University of Maryland, College Park, MD, 20742, United States of America, jonesjc1@umd.edu, David Lovell, Michael Ball

Capacity uncertainty at airports during inclement weather creates challenges in scheduling flights during Ground Delay Programs. We present a stochastic programming model to manage this uncertainty using both speed control and ground delays. The model demonstrates strong potential to reduce the amount of airborne holding and ground delay particularly in the event of an early weather pattern clearance.

3 - Modeling the Airport Runway Configuration Selection Process
Jacob Avery, Massachusetts Institute of Technology, Cambridge, MA, United States of America, avery2@mit.edu, Hamsa Balakrishnan

An airport's runway configuration refers to the combination of runways being used to serve arrivals and departures. Air traffic controllers choose runway configuration by considering factors such as wind speed and direction, visibility, demand, coordination with surrounding airports, and noise mitigation. We present a maximum likelihood discrete-choice model of the decision process for runway selection. We demonstrate our approach using data from Newark, LaGuardia, and San Francisco airports.

4 - Airline-Driven Ground Delay Programs: Motivation, Models and Benefit Assessment
Chiwei Yan, PhD Student, Operations Research Center, MIT, 77 Massachusetts Avenue, E40-130, Cambridge, MA, 02139, United States of America, chiwei@mit.edu, Michael Ball, Prem Swaroop, Cynthia Barnhart, Vikrant Vaze

We develop an airline-driven ground delay program (GDP) planning framework to inform the design of GDP parameters. Contrary to existing optimal planning methods, ours takes into account private preferences and business objectives of airlines. We develop a novel voting mechanism to facilitate the framework, which is also applicable to other multi-player context where decision space is continuous. Benefit assessment based on both simulated and realistic environment suggests promising results.

Operations Management/Manufacturing

Contributed Session

Chair: Deanna Kennedy, Assistant Professor, University of Washington Bothell, 18115 Campus Way NE, Bothell, WA, 98011, United States of America, kennedy.deanna@gmail.com

1 - The Effects of Disruptions to Lean Operations: How Responding Means Waste Creation
Deanna Kennedy, Assistant Professor, University of Washington Bothell, 18115 Campus Way NE, Bothell, WA, 98011, United States of America, kennedy.deanna@gmail.com, Anthony Stillman, Ashley Thayer, Jiansheng Xu, M. Travis Maynard, Amy Sommer

Lean organizations strive to remove all excess waste from processes. However, they may be forced to create waste when disruptions happen. We examine disruptions by lean manufacturers and service providers in healthcare and compare their responses. Insights about how learning and complexity contribute to the responses are discussed.

2 - Process Parameters under Multiple Objectives
Amit Mitra, Professor, Auburn University, Harbert College of Business, 419 Lowder Hall, Auburn, AL, 36849-5266, United States of America, mitraam@auburn.edu

Product manufacturing often requires multiple operations with subsequent operations being influenced by those preceding it. It is of interest to determine process parameter values, such as mean and standard deviation associated with corresponding operations. Such determination may be under multiple objectives, some of which may be conflicting to each other.

3 - Mapping Product Characteristics onto Optimal EOL Strategies
Daniel Steeneck, Virginia Tech, 250 Durham Hall, Blacksburg, VA, 24061, United States of America, steeneck@vt.edu, Subhash C Sarin

Recently, much attention has been devoted to research in reverse supply chain (RSC) management. This has been motivated both by academic interest and by the significant impact that the RSC activities, including remanufacturing, have on a nation's economy and the environment. In this presentation, we will discuss how a product's characteristics influence a manufacturer's decision regarding the appropriate value-recovery strategy and product design to employ.

4 - Design of a Production and Distribution System with Production Disruptions
Louis Luangkesorn, Research Assistant Professor, University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara St., Pittsburgh, PA, 15261, United States of America, lol11@pitt.edu, Jue Gong, Bopaya Bidanda

Production capacity decisions can be in a setting where severe production disruptions can occur. One area is prison industries, where prison inmates are employed to provided needed goods such as food for other state institutions. This system would be subject to unplanned disruptions for administrative, safety, and security reasons. We use Bayesian data analysis to justify assumptions for the production and distribution with disruptions model, then provide analytical results.

Operations Management/Marketing Interface I

Contributed Session

Chair: Régis Chenavaz, Assistant Professor, Kedge Business School, Domaine de Luminy, Marseille, France, r.chenavaz@gmail.com

1 - Control Theory Application in a Traditional Budget Spending Problem for a Small to Medium Size Firm
Gurkan Akalin, Assistant Professor, Eastern Illinois University, 4008 Lumpkin Hall, Charleston, IL, 61920, United States of America, gurkanakalin@hotmail.com

In this paper, a mathematical model is developed based on the control theory in order to find an optimum budget spending for advertising and quality improvements in small to medium size firms when there is additional word of mouth pressure. Further managerial insights are presented.

2 - Dynamic Lot Sizing and Product Diffusion Model for New Products
Xiang Wu, Huazhong University of Science and Technology, School of Management, 1037 Luoyu Road, Wuhan, China, hsiangstevenwu@gmail.com, Haoxuan Xu, Jinlong Zhang, Yeming Gong

This paper considers dynamic lot sizing and pricing policies for new products, where the retailer faces a time-varying demand. We incorporate product diffusion into dynamic lot sizing model with price effects, and explain how to combine ordering and pricing policies to maximize the revenue.

3 - Group Buying: Retail Stores' Performance and Implications
Qijun Qiu, The University of Hong Kong, RM 723, 7/F, K.K.Leung Building, The University of Hong Kong,Pokfulam RD., Hong Kong, Hong Kong - PRC, angieq@hku.hk, Benjamin Yen

We study a new promotion strategy, Group Buying (GB), in which consumers enjoy a price discount by forming a group. We build monopoly and competition models to examine if and how store offers GB in a sustainable manner. We find that store's decision depends on the market pattern and its regular pricing policy, while it still can manage to secure a reasonable profit. Further, store competition affects the equilibrium in a quite dramatic way. All these explain the prevalence of GB worldwide.

4 - Consideration of Options Demand Forecasting in the Design of Option Bundles
Radu Constantin Popa, Technische Universitat Munchen, Arcisstr. 21, Munich, 80333, Germany, radu.c.popa@tum.de, Martin Grunow, Thomas Stablein

Option bundling is the sale of several options as a package, which can improve forecasts. However, no existing bundle design method focuses on the accuracy of options demand forecasting. Instead, revenue maximization is used as standard objective. Since the resulting bundles do not level options demand enough to lead to better forecasts, we developed a clustering method integrating the improvement of forecasting with revenue maximization. We tested the method on data from the automotive sector.

Sponsored Session

Chair: Olga Perdikaki, Texas A&M University, MS 4217 TAMU, College Station, United States of America, operdikaki@mays.tamu.edu

1 - Analyzing Big-box Retailer in an Emerging Market
Aditya Jain, Assistant Professor, Indian School of Business, Gachibowli, Hyderabad, India, Aditya_Jain@isb.edu, Mehmet Gumus, Saibal Ray

We consider the impact of the entry of a big-box retailer in a market dominated by small retailers. The small retailers are characterized by local coverage of the market, whereas the big-box retailer provides services valued by customers. Since both types of retailers obtain supplies from a common manufacturer, big-box retailer's entry affects the supply conditions. Our work thus highlights roles of direct competition as well as indirect supply side effect on small retailers and customers.

2 - The Effectiveness of Targeted Return Management in Retailing
Mehmet Sekip Altug, Assistant Professor, George Washington University, School of Business, Washington, DC, 20052, United States of America, maltug@gwu.edu

As retailers offer more lenient return policies, customer abuse and fraudulent returns are also on the rise. In order to combat that situation, instead of changing the return policies for everyone, retailers started to implement a tool that identifies those "bad" customers. In a newsvendor framework, I study a monopolist retailer's first-period inventory, price and return policy decisions where the retailer selectively changes its second-period return policy and discuss its impact on profit.

3 - Getting a Second Opinion: Category Advisors
Alper Nakkas, Associate Professor, Nova School of Business and Economics, Campus de Campolide, Lisbon, 1099-032, Portugal, nakkas@skku.edu

Category captainship, which is a common category management implementation in the retailing industry, can have a tremendous impact on the retailer's bottom line performance. In order to better align the incentives of the category captains, retailers often seek advice from other non-captain manufacturers as well, manufacturers who often referred to as category advisors. Our research investigates the consequences of using a category advisor on the category captainship implementations.

4 - An Integrated Approach for Retail Budget Allocations across Store Labor and Marketing Activities
Olga Perdikaki, Texas A&M University, MS 4217 TAMU, College Station, United States of America, operdikaki@mays.tamu.edu, Subodha Kumar, Chelliah Sriskandarajah

We establish the relationship between weekly sales of a retail store with respect to weekly store traffic, weekly store labor hours, and intra-day traffic variability within a week. We develop an optimization model that allocates store budget across store labor, advertising, and arrival variability reduction efforts to maximize store sales. We present a framework that incorporates the output of the budget allocation model to support salesforce scheduling and discuss managerial implications.

1 - Contracting Service Outsourcing with Objective and Subjective Performance Metrics
Zhi Ouyang, School of Management, Xiían Jiaotong University, No. 28 at Xianning West Road of Xiían, Xi'an, China, ouyangzhi1987@stu.xjtu.edu.cn, Qin Su

As to the poor service quality in outsourcing practice, we introduce subjective performance metrics into traditional outsourcing contacting. Based on the contract theory, we analyze the optimal performance for service outsourcing and investigate the reward and punishment mechanism for performance changes. We suggest the situation where the subjective requirements are needed and show optimal objective incentive factor needs to be modified with subjective requirement for higher outsourcing results

2 - Staffing Call Centers After Learning
Xiaowei Zhang, HKUST, Hong Kong, China, xiaowiez@ust.hk, Bangxian Wu

Queueing-theoretic methods have been widely used for designing appropriate call center staffing rules. However, the assumptions of many queueing models are often violated due to the heterogeneity and sophistication of real systems. It is conceivable that the queueing-theoretic staffing rules may not be accurate. In this talk, we will present a framework that attempts to learn the modeling error from data so that necessary adjustment can be made to make the staffing rules more reliable.

3 - Typology-based Analysis of New Service Development
Thomas Meiren, Fraunhofer IAO, Nobelstr. 12, Stuttgart, Germany, thomas.meiren@iao.fraunhofer.de, Ilyas Khan

Based on empirical data from 200 service companies a typology of services was derived and used for the analysis of their service development activities. Depending on the type of service the study shows clear differences concerning strategy, customer integration, development process and methods. The presentation discusses the main findings and provides recommendations for practitioners.

4 - The Three Laws of Service
Robin Qiu, Penn State, 30 E. Swedesford Road, Malvern, PA, 19355, United States of America, robinqiu@psu.edu

By rethinking service encounters, we introduce the new three laws of service. Based on the three laws of service for service encounters, we can view the systems behavior of a service organization as the dynamics of cocreation-oriented service networks. Examples will be used to elucidate the corresponding concepts and principles.

Health Care Modeling Optimization III

Contributed Session

Chair: Daniel Gartner, Carnegie Mellon University, The H. John Heinz III College, Pittsburgh, PA, 15213, United States of America, dgartner@andrew.cmu.edu

1 - An Implementation of Operating Room Scheduling System in Aichi Medical University Hospital
Mari Ito, Graduate School of Mathematical Sciences and Information Engineering, Nanzan University, d13mm002@nanzan-u.ac.jp, mari.1211.ito@gmail.com, Seto, 489-0863, Japan, d13mm002@nanzan-u.ac.jp, Atsuo Suzuki, Yoshihiro Fujiwara

We develop a support system for generating schedules of operations in Aichi Medical University Hospital. At the result, the schedule obtained has the high efficiency of utilization of operating rooms. We estimate the processing time of operations, than assign the operations to the available time slot operating rooms by integer programming method.

2 - Elective Surgery Scheduling to Improve Patient Safety
Joonyup Eun, PhD Student of Industrial Engineering, Purdue University, 315 N. Grant Steet, West Lafayette, IN, 47907, United States of America, eunj@purdue.edu, Sang-Phil Kim, PhD, Yuehwern Yih, PhD

Surgery scheduling without considering patient health condition exposes patients to be at risk of sentinel events or decreases patient safety. This research describes an operating room planning problem in which patients with different health conditions are scheduled for elective surgery. The problem deals with diseases which not only exacerbate patient health condition with the lapse of waiting time, but also have different severity when they are diagnosed.

3 - Delay Modeling and Analysis Approach for Surgical Scheduling
Maryam Khatami, PhD Student, Wayne State University, 4815 Fourth Street, Detroit, MI, United States of America, maryam.khatami@wayne.edu, Alper Murat

We model the delay propagation in surgical operations to improve elective case scheduling practices. Given the extent of resource sharing, effectiveness of a schedule greatly depends on how delays with different sources and duration could be eliminated via resource de-coupling and absorbed with slack time allocation. Using data from a Detroit hospital with 30 ORs, we construct delay propagation networks and present analysis results from employing delay elimination and reduction strategies.

4 - On Coordinating Anesthesiology and Internal Medicine in a Patient-Centered Surgical Home
Douglas Morrice, Professor, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, Douglas.Morrice@mccombs.utexas.edu, Luci Leykum, Susan Noorily, Dongyang Ester Wang, Kumar Muthuraman, Jonathan Bard

In this paper, we consider different levels of coordination of Anesthesia and Internal Medicine services through patient scheduling in a Patient-Centered Surgical Home. Our work is motivated by a study conducted at the University of Texas Health Sciences Center, San Antonio and its affiliated teaching hospital.

5 - Flexible Hospital-wide Scheduling of Elective Patients
Daniel Gartner, Carnegie Mellon University, The H. John Heinz III College, Pittsburgh, PA, 15213, United States of America, dgartner@andrew.cmu.edu, Rainer Kolisch, Rema Padman

We evaluate three model extensions of Gartner and Kolisch (2014) in which elective patients are scheduled hospital-wide to maximize contribution margin given clinical pathways and scarce resources: First, we decide whether or not a patient is admitted. Second, we decide on the assignment of a patient to one out of several wards (e.g. for multi-morbid patients). Third, we allow for overtime of human resources. In an experimental study, we evaluate these extensions based on real-world data.

Transport Risk Management

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Vedat Verter, Professor, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, vedat.verter@mcgill.ca

1 - A Time-Dependent Road Ban Design Problem In Hazmat Transportation Network

Tolou Esfandeh, PhD Student, University at Buffalo (SUNY), Industrial and Systems Engineering, Buffalo, NY, 14260, United States of America, tolouesf@buffalo.edu, Rajan Batta, Changhyun Kwon

In this talk, we develop and analyze a time dependent road-ban policy to mitigate the risk of hazardous material (hazmat) transportation. By closing roads at particular times, we aim to route hazmat trucks in paths that are dissimilar as far as possible in order to reduce the likelihood of accidents involving hazmat and simultaneously reducing road congestion.

2 - Regulating Intermodal Transportation of Hazardous Materials

Manish Verma, Associate Professor, McMaster University, 1280 Main Street W, Hamilton, ON, L8S 4M4, Canada, mverma@mcmaster.ca, Ginger Ke, Ghazal Assadipour

This research suggests two distinct bi-level programming driven optimization frameworks to assist the government in regulating the usage of intermodal terminals for hazardous material transportation. In the first policy, the government closes certain intermodal terminals; while in the second one, the government deters the carrier from using certain terminals by imposing tolls. Distinct hybrid particle-swarm optimization based solution methodology is also proposed to solve the resulting models.

3 - A Bi-objective Model for the Used Oil Location-routing Problem

Jiahong Zhao, School of Transportation & Logistics, Southwest Jiaotong University, 111 Erhuanlu Beiyiduan,Chengdu,Sichuan, Chengdu, 610031, China, zhao.jiahong@mail.mcgill.ca, Vedat Verter

We present a bi-objective model for the used oil location-routing problem to minimize the total cost and environmental risk. Focusing on hazardous materials contained in used oils that are airborne on release,we propose an environmental risk measure by incorporating the Gaussian plume model in the box model. To solve the problem,we used a modified weighted goal programming approach. The application of the proposed approach in Chongqing of Southwest China provided interesting managerial insights.

4 - Regulating Hazmat Transportation by Game Theory

Stefano Giordani, University of Rome, "Tor Vergata", Via del Politecnico 1, Rome, Italy, stefano.giordani@uniroma2.it, Massimiliano Caramia, Lucio Bianco, Veronica Piccialli

We study a toll setting policy to regulate hazmat transportation, where the regulator aims at minimizing the network total risk and achieving risk equity by minimizing the maximum link total risk. The idea is discouraging hazmat carriers from using links with high risk concentration, assuming that the toll paid by a carrier on a link depends on the link total risk, i.e., by all the carriers' route choices. The model is a bilevel problem where the inner problem is a Nash game among the carriers.

Sponsored Session

Chair: Robin Dillon-Merrill, Georgetown University, 517 Hariri, McDonough School of Business, Washington, DC, 20057, United States of America, rld9@georgetown.edu

1 - Perceived Risk, Fear and Avoidance Behavior: The Economic Value of Risk Communication

William Burns, Professor, Decision Research, 1201 Oak St Suite 200, Eugene, OR, 97401, United States of America, william_burns@sbcglobal.net

Respondents nationwide participated in a risk communication experiment in which they were exposed to risk communication messaging and then several days later a simulated terrorist attack on an airline. Those receiving a risk message that informed them that DHS could respond effectively to possible attacks reported less fear and intention to cancel planned air travel. Economic modeling of these mitigating results, show significant reductions in loss to the airline industry and U.S. economy.

2 - Your Money or Your Privacy: Eliciting Trade-offs for Cyber Security

Heather Rosoff, Research Assistant Professor, University of Southern California, 3710 McClintock Avenue, RTH 314, Los Angeles, CA, 90089, United States of America, rosoff@usc.edu, Kenneth Nguyen, Richard John

In the cyber world, individuals must decide how to protect their privacy from threats ranging from individual hackers to larger organizations (marketers, government). In doing so, they are forced to assess what values they are willing to trade-off to protect their privacy. In this presentation, we evaluate individuals' smartphone purchase preferences based on trade-off assessments between privacy, cost, processing speed, available apps for download, ease of interface, and server quality.

3 - An Experimental Study of Response to a Near Miss Loss of Coolant Accident (LOCA)

Richard John, Associate Professor, University of Southern California, RTH 310, University Park, Los Angeles, CA, 90089, United States of America, richardj@usc.edu, Jinshu Cui, Heather Rosoff

Public response to a near miss LOCA was using a video scenario simulation of an unfolding crisis at a local nuclear power plant. Over 900 respondents were randomly assigned to one of 18 conditions, using a 3 (cause of LOCA) by 3 (attribution for near miss) by 2 (resolution) between-groups factorial design. Affect, risk perceptions, and behavioral intentions at 3 separate time points were included in an SEM constructed to account for all 3 manipulated variables and demographic variables.

4 - Near-Misses and the Challenges for Cyber Security Decision Making

Robin Dillon-Merrill, Georgetown University, 517 Hariri, McDonough School of Business, Washington, DC, 20057, United States of America, rld9@georgetown.edu

Much about cybersecurity technologies and practices is known but not put into practice. We believe one understudied factor is the impact of prior near-miss events. A near-miss may occur but if there are no salient cues of a possible bad outcome, people appear to mistake such good fortune as an indicator of system resiliency. In several studies, we study people's reaction to near-miss events in the cyber-context. We discuss the implications of our studies for risk communication.

Chair: Zhuoxin Allen Li, PhD Student, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78703, United States of America, zhuoxin.li@phd.mccombs.utexas.edu

1 - IT and Productivity Paradox: A Firm-level Empirical Research with Dynamic DEA Methods

Jiawen Liu, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, China, jiawen_liu@hust.edu.cn, Yeming Gong

While some researches argue that IT can improve the enterprise productivity, others maintain the impact of IT is negative. Using 67 samples from enterprises in Asia, Europe and US, we develop a dynamic two-stage DEA model, allowing intertemporal effects in efficiency measuring, to study IT productivity paradox.

2 - Dynamic Backing Behaviors in Online Crowdfunding with Network Externalities

Zhuoxin Allen Li, PhD Student, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78703, United States of America, zhuoxin.li@phd.mccombs.utexas.edu

Online crowdfunding enables entrepreneurs to fund their project by soliciting small investments from a large number of potential investors over the Internet. In addition to the static project information provided by the entrepreneur, investors also assess a project's prospect based on other investors' backing decisions. We develop a dynamic structural model that captures investors' backing behaviors and estimate the model using data collected from a major crowdfunding platform.

3 - Budget Allocation over Cybersecurity Investment Categories through a Portfolio Approach

Yueran Zhuo, PhD Candidate, University of Massachusetts Amherst, 121 Presidents Drive, 226, Amherst, MA, 01003, United States of America, yzhuo@som.umass.edu, Senay Solak

Cybersecurity is an indispensable component of business success. The deterioration of cyber environment has increased the need for efficient planning of cybersecurity investments. We develop a generic framework to optimize budget allocation over cybersecurity investment categories to achieve the maximum protection against cyber-attacks under multiple industry background settings. Numerical and analytical analyses are conducted to conclude managerial insights separately for different industries.

4 - TamagoCar – Using a Simulation App to Explore Demand Response to Energy Tariffs

Ksenia Koroleva, Rotterdam School of Management, Burgmeester Oudlaan 50, Rotterdam, Netherlands, koroleva@rsm.nl, Micha Kahlen, Wolf Ketter

We propose to study the behavior of electric vehicle (EV) users with a specifically designed application, TamagoCar, which combines real world driving behavior with a simulated EV environment. The uncertainty about the future price, range anxiety and uncertainty about future travel are hypothesized to reduce price sensitivity of demand for electricity. Participants adjust their behavior in response to real-time price changes and smooth out the demand peaks, thus favorably impacting the grid.

5 - Disease Co-Contingencies and Impact on Test Alert Closure Times in E-Patient Portals

Yazan Alnsour, PhD Student, Business School, University of Colorado Denver, 1475 Lawrence St., Denver, Co, 80202, United States of America, yazan.alnsour@ucdenver.edu, Jiban Khuntia, Todd Trautman

Comorbidity and contiguous disease lead to multiple alerts in e-portals. This study explores how concerns with comorbidity leads to a better result in closing alerts. Using e-Portal datasets for diabetes patients, our analysis provides evidence that comorbidity conditions lead to early closure of alerts, and complement each click and view of the alerts; in comparison to contiguous disease. We compare and contrast these results with patients with renal insufficiency as focal diseases.

Big Data 1

Contributed Session

Chair: Samik Raychaudhuri, 24/7 Customer Pvt. Ltd., EGL Business Park, Off Intermediate Ring Road, Bangalore, 560071, India, samikr@gmail.com

1 - Machine Learning to Recognize Customer Intent in Big Data

Samik Raychaudhuri, 24/7 Customer Pvt. Ltd., EGL Business Park, Off Intermediate Ring Road, Bangalore, 560071, India, samikr@gmail.com, Ravi Vijayaraghavan

In this presentation, we will discuss some of the ML models that we use in various channels to ferret out customer intent from the voluminous "big data" - which are collected through our interaction with the customers at various touchpoints.

2 - Leveraging Big Data to Enhance user Engagement

Wesley Gifford, IBM T.J. Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, wmgifford@us.ibm.com, Yi-Min Chee, Ashish Jagmohan, Anshul Sheopuri

Many businesses devote considerable effort to maintaining user engagement. In this work we study the problem of identifying users who would be most suited for engagement actions, the best content to recommend to them based on a variety of novel mechanisms, and the appropriate time to engage such users. Models are developed which capture relevant user dynamics and performance results are given based on experiments using real-world data.

3 - Group Sparse Optimization via Nonconvex Regularization

Yaohua Hu, Zhejiang University, 38 Zheda Road, Hangzhou, ZJ, 310027, China, hyh19840428@163.com

In this paper, we investigate the theoretical properties and design an efficient numerical algorithm for the group sparse optimization. We introduce the group restricted eigenvalue condition, and apply it to establish the oracle result and recovery bound for the $\ell_{p,q}$ regularization problem. We also apply the proximal gradient method to solve the $\ell_{p,q}$ regularization problem and present some numerical results on both simulated data and real data in gene transcriptional regulation.

4 - Streaming Analytics for High Velocity Big Data IoT Platforms

Michiel Van Herwegen, Ghent University, Tweekerkenstraat 2, Gent, 9000, Belgium, michiel.vanherwegen@ugent.be, Dirk Van den Poel

Using an actual IoT application deployed on a lambda architecture cloud platform, this study covers the challenges of streaming analytics when the high velocity aspect must be met in an IoT context that also has to scale to millions of simultaneous devices. In order to achieve highly scalable algorithms that can cope with incomplete information, we reworked batch ensemble algorithms for streaming data to cope with common IoT data issues while retaining the core properties of the algorithm.

5 - The Fundamentals of Responsive Processes: Exploiting Context in an Entropy-Based Analytic Framework

Andy Bruntsch, PhD Cand., The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, abruntsch@ust.hk

In an era of pervasive customer focus a processes' capability to dynamically respond to escalating process requirements in the most efficient, yet feasible and still compliant way is no longer optional. A novel analytical approach is presented based on an analogy. It establishes entropy for quantifying dynamic change in the context of a process and for modeling its translation into dynamic process behavior. Application to an extensive dataset of a patenting process shows the practical relevance.

Health Care Modeling Optimization IV

Contributed Session

Chair: Guohua Wan, Professor, Shanghai Jiao Tong University, 535 Fahuazhen Road, Shanghai, 200052, China, ghwan@sjtu.edu.cn

1 - An Optimization Framework to Improve Patient Safety in Radiation Therapy Care Delivery Process

Pegah Pooya, North Carolina State University, 111 Lampe Dr, Campus Box 7906, Raleigh, NC, United States of America, ppooya@ncsu.edu, Prithima Mosaly, Julie Ivy, Lukasz Mazur, Katharin Deschesne

We develop an optimization framework to improve the process reliability and patient safety of radiation therapy care delivery process for cancer patients. The use Safety Barriers (SB) in radiation oncology is a widely recognized method for detecting potential errors before they reach the patient. In this study, a Dynamic Programming model is developed to optimize the location and elements of Safety Barriers (SB).

2 - Multi-level HIV Prevention Funds Allocation Process – Asymmatric Information

Monali Malvankar, University of Western Ontario, Schulich School of Medicine & Dentistry, London, ON, Canada, mmalvan@uwo.ca, Greg Zaric, Xinghao Yan

HIV prevention funds often traverse several levels of decision-making. We model the process of allocation of prevention funds in which an upper-level decision maker allocates funds to multiple lower-level decision makers as a dynamic programing model. The upper-level decision maker attempts to improve outcomes through use of a priori information.

3 - A Mixed Integer Programming Approach to Surgery Scheduling with Simultaneous Decision Making

Halil Ibrahim Guenduez, Assistant Professor, RWTH Aachen University, Kackerstr. 7, Aachen, 52072, Germany, guenduez@or.rwth-aachen.de, Martin Baumung

Our work covers a real case of surgeon and elective surgery scheduling for a small clinic department in University Hospital Aachen, Germany, and aims at improving the scheduling in order to reduce costs related to the operating room time while considering different resources simultaneously. For this purpose, we developed a mixed integer linear programming model, which aims at minimizing the costs for the operating room time required to perform all of the surgeries.

4 - Scheduling Surgical Operations in a Large Chinese Hospital

Guohua Wan, Professor, Shanghai Jiao Tong University, 535 Fahuazhen Road, Shanghai, 200052, China, ghwan@sjtu.edu.cn, Liwei Zhong, Guochun Tang

We study the surgical operations scheduling problem in a large Chinese hospital. We first model the problem as a deterministic multimachine scheduling problem to determine the assignment of the jobs to operating rooms and the sequence of the jobs in each operating room. Then, given the job sequence and assuming random processing times, we determine the job starting times by an appointment scheduling model. These models and algorithms are built in a real scheduling system running in the hospital.

5 - Scheduling of Operating Room Activities with a Balanced Distiribution of Surgical Services

Bülent Cekiç, Dr., Hacettepe University, Hacettepe University Beytepe Campus, Department of Business Administration, Ankara, 06800, Turkey, bulentc@hacettepe.edu.tr

This study aims to find an optimal solution to the balanced distribution of surgical services to operating rooms. For that matter, a mixed integer programming model is developed. The objective function of the model aims to minimize setup costs and provides a weekly balanced distribution of operating rooms to surgical services. The results shows that the alternative scenarios exhibit more balanced operation distributions and a flexible operating room usage with less time and setup costs.

Kidney Exchange Models

Sponsor: Health Applications

Sponsored Session

Chair: Yichuan Ding, Assistant Professor, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Daniel.Ding@sauder.ubc.ca

1 - Optimizing over Pure Stationary Equilibria in Consensus Stopping Games

Amin Dehghanian, University of Pittsburgh, 1061 Benedum Hall, 3700 O'Hara St,, Pittsburgh, PA, 15261, United States of America, amd120@pitt.edu, Murat Kurt, Andrew Schaefer

We consider consensus stopping games, a class of stochastic games that requires the consent of all players to terminate the game. We show that each consensus stopping game may have many pure stationary equilibria, which in turn raises the question of equilibrium selection. We develop an efficient algorithm to find a best pure stationary equilibrium of a consensus stopping game. We discuss an application of this class of games in the context of kidney exchanges.

2 - Current Challenges in Kidney Exchange

Itai Ashlagi, MIT, 100 Main St., Cambridge, MA, United States of America, iashlagi@mit.edu

Different practices will be explored followed by models that explain some of the achievements of some kidney exchange clearinghouses. I will further empirical findings that shed light on the kidney exchange marketplace.

3 - Experiences from a Large Kidney Exchange, and New Results on Dynamic, Failure-aware, Fair Matching

Tuomas Sandholm, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America, sandholm@cs.cmu.edu, John Dickerson

Modern kidney exchanges conduct complex matching with 2-cycles, 3-cycles, and altruistic-donor-triggered chains that extend potentially infinitely. I will share learnings from running the optimization side of the UNOS kidney exchange since its inception in 2010. It now includes 59% of the US transplant centers. I will present new experiments on advanced kidney exchange matching that combines dynamic matching via potentials, matching that is cognizant of pre-surgery edge failures, and fairness.

4 - Rationing Non-Directed Donors in Kidney Exchange

Chris Ryan, The University of Chicago Booth School of Business, Chicago, IL, United States of America, christopher.ryan@chicagobooth.edu, Yichuan Ding, Dongdong Ge, Simai He

Historically, non-directed donors (NDDs) have been allocated to the decreased-donor waitlist. Recently, use of NDDs in exchanges has increased the number of transplants but reduced prospects for patients without donors. We take a non-asymptotic approach to quantify the marginal benefit of NDDs to the exchange pool. When the pool size is not moderately large and the proportion of low sensitized patients is above a threshold, the marginal benefit of NDDs diminishes quickly.

Dynamic Programming in Health Care

Sponsor: Health Applications

Sponsored Session

Chair: Steven Shechter, Associate Professor, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T-1Z2, Canada, steven.shechter@sauder.ubc.ca

1 - Managing Healthcare Systems: Speedup versus Admission Control

Galit Yom-Tov, Technion-Israel Institute of Technology, Haifa, Israel gality@techunix.technion.ac.il, Carri Chan

Waiting, admission control and speedup of service rates have been used to manage congestion in Service Systems. We examine a multi-server queueing system which allows for admission control and speedup. We characterize properties of the optimal control, and do performance evaluation of a queueing system with a two-threshold policy. We use the approximation analysis to characterize the region of the optimal solution, and develop a greedy heuristic to derive a near-to-optimal solution.

2 - Issuing Policies for Hospital Blood Inventory

Alireza Sabouri, University of British Columbia, Vancouver, BC, V6T 1Z2, Canada, alireza.sabouri@sauder.ubc.ca, Tim Huh, Steven Shechter

We propose a model for allocating red blood cells for transfusion to patients, which is motivated by recent evidence suggesting that transfusing older blood is associated with increased mortality rate. We study the properties of blood issuance policies that balance the trade-off between "quality" measured in average age of blood transfused and "efficiency" measured in the amount of shortage. Based on our analysis, we design efficient issuance policies and evaluate their performance.

3 - Dynamic New Patient Consult Scheduling for Medical Oncology

Antoine Sauré, Post-Doctoral Fellow, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T 1Z2, Canada, antoine.saure@sauder.ubc.ca

Motivated by an increasing demand for cancer care and long waits for new patient consults, we undertook a study of medical oncology scheduling practices at a regional cancer center. As a result, we formulated and approximately solved a discounted infinite-horizon MDP model that seeks to identify good policies for allocating oncologist consultation time to incoming new patients, while reducing waits in a cost-effective manner. The benefits from the proposed method are evaluated using simulation.

Health Care, Strategy and Policy 2

Contributed Session

Chair: George Miller, Altarum Institute, 3520 Green Court, Suite 300, Ann Arbor, MI, 48105, United States of America, george.miller@altarum.org

1 - Measuring the Efficiency of Home Health Agencies

Mehmet Kilinc, University of Arkansas, Bell Engineering, Fayetteville, AR, 72701, United States of America, mkilinc@uark.edu, Ashlea Milburn

The objectives of this study are to analyze the efficiency of home health agencies by Data Envelopment Analysis (DEA) and to investigate differences in efficiency across a study area. Some of the research questions that this study aims to address are: How much variation is there in efficiency in home healthcare industry? What are the driving factors determining efficiency of agencies? What are the best practices? What are the possible policy interventions to improve inefficient agencies?

2 - Assessing the Benefits and Costs of Prevention from Multiple Stakeholder Perspectives

George Miller, Altarum Institute, 3520 Green Court, Suite 300, Ann Arbor, MI, 48105, United States of America, george.miller@altarum.org, Charles Roehrig

We describe a new analysis tool for characterizing the value of an investment in nonclinical primary prevention from the multiple perspectives of organizations that can influence the investment. Applications to smoking and obesity interventions illustrate how stakeholder-specific value is affected by (1) the time horizon and costs of interest, (2) the costs associated with increased longevity caused by an intervention, and (3) the impact of improved treatment on the benefits of prevention.

3 - Capacity Planning for Cancer Prevention
Aaron Ratcliffe, University of North Carolina Greensboro, 438 Bryan Building, PO Box 26170, Greensboro, NC, 27402-6170, United States of America, aaron.ratcliffe@uncg.edu, Ann Marucheck, Wendell Gilland

We analyze a queuing network to study the relationship between screening guidelines and capacity planning for colorectal cancer. The screen provider chooses its capacity to balance the cost of cancer detection delay with the cost of additional capacity. Patients spend a random time at home before scheduling a repeat screen. We consider the impact of other provider interventions such as price changes and education efforts about screening guidelines.

4 - Risk Assessment of Occupational Injuries Using Accident Severity Grade
Nasibeh Azadeh-Fard, PhD Student, Virginia Tech, 250 Durham Hall, Blacksburg, VA, 24060, United States of America, nasibeh@vt.edu, Anna Schuh, Jaime Camelio

To identify workplace hazards, safety surveillance techniques have been used, including official accident severity metric. However, the definition of severity used by these tools does not consider important employee and workplace factors with potential significant impacts on accident severity. A new severity scoring and risk assessment system is introduced which considers multiple influential factors that improves risk assessment and the estimation of accident severity.

5 - Cigarette Packet Pictorial Warning: Is There Any Impact on New, Old, and Non-Smokers
Siddhartha Rastogi, Assistant Professor, IIM Indore, Rau-Pithampur Road, IIM Indore, Indore, 453331, India, srastogi@iimidr.ac.in, Rajhans Mishra

India made pictorial warning on cigarette packets mandatory following most industrial nations. However, it is not ascertained in case of India if this warning has had any desirable impact. We seek to assess this impact on three different groups of adults, namely - smokers, initiators, and non-smokers. We use survey method with purposive sampling and triangulate our results with those of international studies. The study hopes to contribute with marketing and policy insights.

Joint Session HAS/Analytics: Big Data Analytics in Healthcare

Sponsor: Health Applications & Analytics Section

Sponsored Session

Chair: Hao Zhang, University of Maryland School of Medicine, 22 S Greene St, Baltimore, MD, 21201, United States of America, hzhan001@umaryland.edu

1 - Applying Advanced Analytics to Generate Value from Big Data in Health
Juergen Klenk, Principal Scientist, Exponent, Inc., 1800 Diagonal Road, Suite 500, Alexandria, VA, 22314, United States of America, jklenk@exponent.com

Fueled by legislative catalysts (e.g., HITECH, ACA) and remarkable discoveries that demonstrate the actual value of data driven decision making in organizations (e.g., Erik Brynjolfsson, MIT), the Healthcare Industry is now rushing to generate value from Big Data. We will review key components of a Big Data Analytics strategy, demonstrate how it can be successfully implemented to benefit your organization, and discuss specific examples related to Personalized Medicine and Wellness.

2 - Parallel Predictive Modeling Platform for Healthcare Analytic Research using EHR
Jimeng Sun, Associate Professor, School of Computational Science and Engineering, Georgia Tech, 266 Ferst Drive, Atlanta, GE, 30363, United States of America, jsun@cc.gatech.edu

Healthcare analytics research increasingly involves the construction of predictive models for disease targets across varying patient cohorts using electronic health records (EHRs). We implemented this platform using Map-Reduce to enable independent tasks to run in parallel in a cluster computing environment.

3 - Electronic Health Records for Decision Support - Meaningful Use of Complex Medical Data
Eva Lee, Professor & Director, Georgia Institute of Technology, Ctr for OR in Medicine & Healthcare, Atlanta, GA, 30332, United States of America, eva.lee@gatech.edu

This work is joint with Grady Memorial Hospital and the Children's Healthcare of Atlanta. We focus on identifying reasons behind the recurrence of patient admissions, and designing classification models to predict potential readmissions. Large scale data analysis and results will be presented. This is critical given the Affordable Care Act is beginning to implement readmission penalties. The algorithmic approach could detect readmission triggers without human monitoring.

4 - Understanding Temporal Patterns in Drug Therapy
Margrét Bjarnadóttir, University of Maryland, 4324 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu

Non-adherence to drug therapy can lead to worsening of conditions and health decline. Summary statistics are often used to describe adherence, but they do not adequately capture patients' different adherence patterns, which vary widely. In this study we propose a methodology to understand drug adherence in large scale populations through clustering and Eventflow, a novel interactive visualization tool, summarizing prescription patterns of large patient cohorts.

Data-driven Service Systems

Sponsor: Computing Society

Sponsored Session

Chair: Omid Nohadani, Associate Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, nohadani@northwestern.edu

Co-Chair: Jocelyn Dunn, Visiting Pre-Doctoral Fellow, Northwestern University, Industrial Eng. and Management Sciences, Evanston, IL, 60208, United States of America, jocelyn.dunn@northwestern.edu

1 - Data-driven Approaches for Planning Equipment Maintenance
Ying Tat Leung, IBM Research - Almaden, 650 Harry Road, San Jose, CA, 95120, United States of America, ytl@us.ibm.com, Hyung-il Ahn, Axel Hochstein

With increasing availability of data, quantitative approaches for planning equipment maintenance have evolved beyond the classic statistical approach in the last two decades. We present an example of how straightforward historical data reporting, the traditional time-based maintenance model, a more equipment-specific condition-based one, and a most assertive predictive maintenance approach are used simultaneously to provide different types of information to aid the maintenance planner.

2 - Robust Data-Driven Categorization for Service System Usage
Omid Nohadani, Associate Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, nohadani@northwestern.edu, Jocelyn Dunn, Gerhard Klimeck

When defining categories of service system usage, typically, dissension among multiple criteria is observable. These criteria measure different aspects of data and have unknown importance in categorization. With uncertain weights on these multiple criteria, a robust data-driven approach is developed and applied to nanoHUB usage data to deduce, validate, and optimize categories of usage. The proposed method is generic and free of assumptions enabling targeted improvement of diverse systems.

3 - CityScan: Urban Predictive Analytics
Mallory Nobles, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, mallory.nobles@gmail.com, Seth Flaxman, Daniel Neill

We present CityScan, a novel approach to urban predictive analytics. CityScan applies state-of-the-art detection methods to identify emerging clusters of various leading indicators, and uses these clusters to predict when and where an event of interest is likely to occur. It has been deployed in Chicago to predict emerging events relevant to city operations, including hot-spots of violent crime and rodent infestations, and achieves high accuracy at fine-grained spatial and temporal resolutions.

Social Media Consumer Analytics

Sponsor: Information Systems

Sponsored Session

Chair: Ramesh Shankar, Associate Professor, University of Connecticut, 2100 Hillside Road, Unit 1041, Storrs, CT, 06269, United States of America, Ramesh.Sankaranarayanan@business.uconn.edu

1 - Firm's Social Media Efforts, Consumer Behavior, and Firm Performance: Evidence from Facebook

Sunghun Chung, Postdoctoral Fellow, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A1G5, Canada, sunghun.chung@mcgill.ca, Animesh Animesh, Kunsoo Han, Alain Pinsonneault

This study theorizes and empirically examines how firm's social media efforts influence consumer behavior and firm performance. Using detailed data collected from Facebook pages, we find that richness and responsiveness of a firm's social media efforts are significantly associated with the firm's market performance, captured by abnormal return and Tobin's q. Interestingly, the intensity of firm's social media effort is not significantly associated with firm performance.

2 - WOM, Cast and Fans: Movie Demand Prediction using Derived Networks

Yang Wang, University of Utah, David Eccles School of Business, 1655 East Campus Center Drive, Salt Lake City, UT, 84112, United States of America, yang.wang@business.utah.edu, Olivia Sheng, William Moore, Vandana Ramachandran

WOM and movie sales can be correlated according to past studies. Can future movie demand prediction using WOM be enhanced by linkage between movies established via common casts, crews or fans? Using data from the most popular Chinese movie review platform, douban.com, we improve demand forecasts for foreign movies shortly after their premiere outside China via Hierarchical Bayesian Modeling and the aforementioned linkage amongst movies.

3 - Factors Driving Customer Engagement in Location-Based Social Media

Ram Gopal, Professor, Department Head, University of Connecticut, 2100 Hillside Road Unit 1041, Storrs, CT, 06269, United States of America, ram.gopal@business.uconn.edu, Ramesh Shankar, Lei Wang, Joseph Pancras

Retailers are increasingly utilizing location-based services via mobile devices to enhance customer engagement. We develop a two stage model of location-based customer engagement in Foursquare to seek how business characteristics, geographic proximity and demographic similarity together affect customer engagement. We find a persistent spatial interdependence, a spatial phenomenon that we term 'social congregation' effect, and a temporal agglomeration effect in the restaurant industry.

4 - Linguistic Features and Peer-to-Peer Loan Quality: A Machine-learning Approach

Mingfeng Lin, University of Arizona, 1130 E. Helen St, Tucson, AZ, 85721, United States of America, mingfeng@email.arizona.edu, Qiang Gao

We study the information value of linguistic features in predicting loan qualities in online peer-to-peer lending, using transactions data from a leading platform. Using both explanatory and predictive models, we find that linguistic features, or how borrowers write their loan request descriptions, can differentiate good and bad loans. Interestingly, investors are not always able to interpret such information, suggesting that our machine learning approach can help improve market efficiency.

Quality and Inventory Issues in Behavioral Operations

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Elena Katok, Ashbel Smith Professor, University of Texas at Dallas, 800 W. Campbell Drive, Dallas, TX, 75080, United States of America, ekatok@utdallas.edu

1 - The Effect of Social Influence on Consumers' Switching Behavior under Quality Competition

Dayoung Kim, Cornell University, 301K Sage Hall, Ithaca, NY, 14850, United States of America, dk668@cornell.edu, Andrew Davis, Vishal Gaur

We conduct a laboratory experiment to investigate the effect of social influence on consumers' choices between firms competing on service quality. First, we examine how consumers choose between two firms differing in service quality, absent social influence, and how this behavior impacts market share and uncertainty in demand. We then explore how the presence of social influence affects these same performance metrics, and provide managerial implications for both high and low quality firms.

2 - Cry Wolf or Equivocate? Credible Forecast Guidance in a Cost-loss Game

Elena Katok, Ashbel Smith Professor, University of Texas at Dallas, 800 W. Campbell Drive, Dallas, TX, 75080, United States of America, ekatok@utdallas.edu, Gary Bolton

What is the most credible way to convey forecast uncertainty to the users of expert models? We test two ways - give end users uncertainty information, or give them specific recommendations. We find that the effectiveness of both methods is hampered by a cry wolf effect, but substantially more so for recommendations. People are particular sensitive to the cry-wolf effect when the optimal decision is to take a counter-intuitive action.

3 - How Supplier Scorecards Affect Quality: A Behavioral Study

Elena Katok, Ashbel Smith Professor, University of Texas at Dallas, 800 W. Campbell Drive, Dallas, TX, 75080, United States of America, ekatok@utdallas.edu, Zhixi Wan

Supplier scorecards are used to evaluate existing suppliers and motivate them to deliver high quality, by linking current performance with future contracts. We present an analytical model of supplier behavior with scorecards, and investigate it in the laboratory.

4 - The Bright and Dark Sides of Perception Biases in Inventory Decisions

Yaozhong Wu, National University of Singapore, Singapore, 119245, Singapore, yaozhong.wu@nus.edu.sg

We study the impact of perception biases in competing inventory decisions. We analyze how a manager's perception bias affects each other's inventory decisions and performances in strategic interactions, and more importantly who benefits from these biases in the short and long runs. We show that a perception bias can serve as a competitive advantage in the sense that a biased manager can achieve a higher profit than an unbiased competitor.

Dynamic Combinatorial Optimization under Uncertainty

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Alejandro Toriello, Assistant Professor, Georgia Tech ISyE, 765 Ferst Dr NW, Atlanta, GA, 30332, United States of America, atoriello3@isye.gatech.edu

1 - Randomized Minmax Regret for Combinatorial Optimization under Uncertainty

Andrew Mastin, MIT, EECS & LIDS, Cambridge, United States of America, mastin@mit.edu, Sang Chin, Patrick Jaillet

We consider a randomized model for minmax regret combinatorial optimization under uncertainty, where an optimizing player selects a probability distribution over solutions and an adversary selects costs with knowledge of the player's distribution. While the deterministic minmax regret versions of most polynomial solvable problems are NP-hard, we show that under this randomized model, the minmax regret version of any polynomial solvable combinatorial problem becomes polynomial solvable.

2 - New Efficient Algorithms for the Time Cost Tradeoff Problem in Project Management

Dorit Hochbaum, Professor, University of California, Berkeley, IEOR Department, Etcheverry Hall, Berkeley, CA, 94720, United States of America, hochbaum@ieor.berkeley.edu

The time-cost trade-off problem (TCT) is to determine the extent of expediting, or crashing, of activities in a project so as to benefit most from early completion incentives. We describe two polynomial time algorithms that provide a new interpretation of old algorithms: one solving the primal and the other solving the dual.

3 - Semi-Infinite Relaxations for the Dynamic Knapsack Problem with Stochastic Item Sizes

Alejandro Toriello, Assistant Professor, Georgia Tech ISyE, 765 Ferst Dr NW, Atlanta, GA, 30332, United States of America, atoriello3@isye.gatech.edu

We consider a knapsack problem in which item sizes are stochastic and realized after an attempted insertion, and the decision maker chooses an item to insert dynamically based on remaining capacity. We derive relaxations of polynomial and pseudo-polynomial size based on different approximations of the value function, relate them to previous work and compare them.

4 - A MIP Model and Solution Approach for Supply Chain Planning with Time-Aggregated Quantity Discounts

Aly Megahed, Research Staff Member, IBM Research - Almaden, 650 Harry Road - Office D3-428, San Jose, CA, 95120, United States of America, aly.megahed@us.ibm.com, Pratik Mital

We present a supply chain planning problem with time-aggregated quantity discounts. Such discounts are given on aggregated order quantities (e.g. total annual orders that were placed on a monthly basis). A MIP-based local search algorithm is developed as a solution approach. Numerical results that show the efficiency of that algorithm are shared.

Hilton- Mason A

Information, Networks and Big Data

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Eugene Perevalov, Lehigh University, IS&E Department, Bethlehem, PA, 18015, United States of America, eup2@lehigh.edu

1 - Predicting Long-Term Product Ratings in Business-to-Consumer Online Systems

Alexander Nikolaev, University at Buffalo (SUNY), 312 Bell Hall, Buffalo, NY, 14260, United States of America, anikolae@buffalo.edu, Sushant Khopkar

Online users often rely on observed product ratings. However, when an average product rating is based on a small number of ratings, they may not feel confident about the product, even if the average is high. This paper presents a new Bayesian Network (BN) method for predicting the long-term average product rating. Compared to Running Average and Linear Regression predictors, the BN method works particularly well around the time of product introduction when prediction accuracy is most valuable.

2 - Education Supply Chains and Network Science – A Preliminary Investigation

Soundar Kumara, Allen E. Pearce/Allen M. Pearce Professor, The Pennsylvania State University, 222 Leonhard Building, Industrial Engineering, University Park, PA, 16802, United States of America, skumara@psu.edu, Gerhard Klimeck, Yi-Shan Sung, Cheng-Bang Chen, Jim Slopsema, Lynn Zentner, Mike Zentner

On-line education can be equated with supply chains, where different educational modules and tools can be considered as products; students, researchers and others can be considered as customers. In this talk we deal with longitudinal data from nanohub on-line learning and research resource usage (from Purdue University) to investigate product mix, and capacity requirements by using statistical and Graph analytics.

3 - On the Theory of Information Extraction

Xing Wang, Student, Lehigh University, 205 Summit Street, Bethlehem, PA, 18015, United States of America, xiw313@lehigh.edu, Eugene Perevalov

The classical Information Theory provides tools for optimizing information transmission by virtue of properly describing information quantity. On the other hand, in order to optimize information acquisition from sources, a general quantitative description of information accuracy and, respectively, of the structure of the sources' knowledge is needed. We describe the basics of a general theory of information accuracy that naturally extends the classical information theory in this direction.

Optimization, Robust 1

Contributed Session

Chair: Mohammad Javad Feizollahi, Phd Candidate, Georgia Institute of Technology, 765 Ferst Drive NW, Suite 439 (main building), Atlanta, GA, 30332-0205, United States of America, feizollahi@gatech.edu

1 - A Method for Robust Parameter Design with a Categorical Response

Gonca Karabulut, Production Engineer, Unilever, Camalti Sitesi A2 Blok No:13 Atasehir, Istanbul, Turkey, goncabacanli@gmail.com, Gülser Köksal

A relatively simple and effective method called Logistic Regression Model Optimization (LRMO) is studied for analysis of categorical response data for product design. Its performance is compared with those of four other design optimization methods for an ordered categorical response: Accumulation Analysis (AA), Weighted Signal-to-noise Ratio (WSNR), Scoring Scheme (SS), Weighted Probability Scoring Scheme (WPSS).

2 - Uncertainty Quantification for Robust Optimization and Extended Relational Algebra of Polytopes

Abhilasha Aswal, International Institute of Information Technology, Bangalore, 26/C Electronics City, Bangalore, KA, 560100, India, abhilasha.aswal@iiitb.ac.in, Anushka Chandrababu, GNS Prasanna

Our robust polyhedral representation of uncertainty allows a simple quantification of amount of information driving the optimization. We can establish info equivalences and create new constraint sets, equal in info to an old constraint set. An extended relational algebra of polytopes enables a qualitative visualization of the relations among alternative constraint sets. We show that our approach is computationally simpler than stochastic alternatives and more expressive than robust alternatives.

3 - The Robust Deviation Quadratic Assignment Problem

Mohammad Javad Feizollahi, Phd Candidate, Georgia Institute of Technology, 765 Ferst Drive NW, Suite 439 (main building), Atlanta, GA, 30332-0205, United States of America, feizollahi@gatech.edu, Igor Averbakh

We consider a generalization of the classical quadratic assignment problem, where material flows are uncertain, and only upper and lower bounds are known for each flow. The objective is to find a minmax regret solution. We present an exact Benders decomposition algorithm, a tabu search based heuristic, and a hybrid approach that allows us to combine the speed of heuristics with the rigor and precision of the exact method. We discuss the results of extensive computational experiments.

4 - A Robust Optimization Inventory Model with Uncertain Demand and Lead Time

Mohammad Rahdar, Iowa State University, Iowa State University, Ames, IA, 50011, United States of America, rahdar@iastate.edu, Guiping Hu, Lizhi Wang

A robust optimization model is proposed to explicitly address the uncertain demand and lead time in an inventory model. The model has a tri-level structure. The top level makes ordering decision in the current period, the middle level identifies the worst scenario for all the future periods, and the bottom level is a deterministic inventory model for the remaining periods of the planning horizon. We propose an exact algorithm for the tri-level programming model and report the numerical results.

5 - Robust Vehicle Routing Problem with Time Windows

Da Lu, PhD Student, University of Waterloo, 200 University Ave West, Waterloo, ON, N2L 3G1, Canada, d4lu@uwaterloo.ca, Fatma Gzara

This paper proposes a robust model for the vehicle routing problem with time windows where customer demands are uncertain. The uncertainty is defined as a set of cardinality constrained supports. We propose a branch-and-price-and-cut algorithm to solve the problem. The subproblem is a robust counterpart of shortest path problem with resource constraints(SPPRC) that is solved by solving a series of SPPRC. A new separation strategy tailored for the robust case is developed to find violated cuts.

Combinatorial Optimization and Social Network Analysis

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Cynthia Wood, Rice University, 6100 Main St. - MS 134, Houston, TX, 77005, United States of America, ciw2@rice.edu

1 - Upper Bound on the Clique Number of a Graph

Chitra Balasubramaniam, Texas A&M University, 3131 TAMU, College Station, 77843, United States of America, bcvaidyanath@neo.tamu.edu, Sergiy Butenko

The Maximum Clique Problem has many practical applications that include social network analysis, fault tolerance, and protein interaction networks among others, but it is intractable. We develop a good upper bound for this problem using clique relaxations and compare the results with the bounds from literature.

2 - A Branch-decomposition Algorithm for the p-Median Problem

Caleb Fast, Rice University, 6100 Main St. - MS 134, Houston, TX, 77005, United States of America, ccf5@rice.edu, Illya Hicks

This talk presents results from using a dynamic programming algorithm on branch decompositions of linear relaxations to approximate optimal solutions of p-Median problems. This problem is NP-hard, making an approximation algorithm attractive. This talk compares the branch decomposition algorithm with a standard integer program solver and heuristics for the problem.

3 - Community Detection in Dynamic Social Networks

Aaron Schecter, Northwestern University, 1424 Main St, Evanston, IL, 60202, United States of America, aschec@gmail.com, Noshir Contractor

Research on the identification of communities has focused on their detection in static networks. With the increased availability of time-stamped digital trace data it is now possible to model the dynamics of communities where ties appear, disappear, or change in intensity. We utilize a hierarchical clustering algorithm and a fuzzy clustering algorithm to identify dynamic communities based on cohesion and structural equivalence respectively. We use simulations to validate our methods.

4 - Finding the Maximum Weighted Co-2-Plex in a {Claw, Bull}-Free Graph

Cynthia Wood, Rice University, 6100 Main St. - MS 134, Houston, TX, 77005, United States of America, ciw2@rice.edu

The maximum weighted co-2-plex problem determines a subset of vertices of maximum total weight of a given graph, in which each vertex has degree at most one. This talk presents two polynomial time algorithms for solving MWC2P problem in {claw, bull}-free graphs.

Optimization, Metaheuristics 1

Contributed Session

Chair: Rym M'Hallah, Associate Professor, Kuwait University, PO Box 5969, Safat, Kuwait, 13060, Kuwait, rymmha@yahoo.com

1 - An Iterated Local Search Variable Neighborhood Descent for the m-Machine Flowshop

Rym M'Hallah, Associate Professor, Kuwait University, PO Box 5969, Safat, Kuwait, 13060, Kuwait, rymmha@yahoo.com

This paper considers the minimal earliness tardiness -machine permutation flow shop scheduling problem with distinct due dates and no inserted idle time when a job is waiting. It presents a mixed integer program, and approximately solves it using V, a fast iterated local search variable neighborhood descent. The results prove the good performance of V, which matches 20.02 % existing upper bounds and tightens 70.54% ones with a 0.07% average deviation.

2 - Transmission Expansion Planning using Multivariate Interpolation

Ebrahim Mortaz, Auburn University, Auburn, AL 36849, Auburn, United States of America, emortaz@auburn.edu, Jorge Valenzuela

The total cost of the Transmission Expansion Planning (TEP) problem consists of investment and operation costs. In this research, we propose a multivariate interpolation method to compute the operation cost for the TEP problem in which the demand changes from hour to hour and the fuel price from day to day. A binary particle swarm optimization is also proposed to solve the problem. We compare our method with traditional methods based on the total cost of the obtained expansion plans.

3 - Mitigating Irreducible Complexity in Evolutionary Algorithms via Initial Population Seeding

Matthew Hoffman, Sandia National Laboratories, P.O. Box 5800, MS 1188, Albuquerque, NM, 87185-1188, United States of America, mjhoffm@sandia.gov, Jack Gauthier, Geoffry Pankretz

Logical constraints confound evolutionary operations in combinatorial optimization problems, leading to "Irreducible Complexity" - the existence of viable (possibly optimal) solutions that cannot be discovered by traditional evolutionary means. We discuss one avenue for mitigating this issue: seeding the initial population with solutions that satisfy the logical constraints least likely to be satisfied by chance. We will demonstrate efficacy of such seeding by comparing results vs. status quo.

4 - A Comparative Study of Algorithms to the Social Team Formation Problem

Victor Cavalcante, Researcher, IBM Research, Rodovia Jornalista Fco. Aguirre Proença, Km 09 - Chacaras Assay, Hortol,ndia, SP, 13186-525, Brazil, victorfc@br.ibm.com, Steven Tsukamoto, Ana Paula Appel, Thiago Rosario, Vagner Santana

Team members' ability to work together is paramount in collaborative tasks. Thus, assembling effective teams to perform collaborative tasks requires considering not only skills, capabilities or availabilities, but also contemplating social links among potential team members. This Social Team Formation Problem is the subject of the current work, where an implementation of a GRASP meta-heuristic is depicted and experimental results are reported and compared with other optimization approaches.

5 - Many Heuristics are Better than One: A Data-driven Approach to Solving MAX-CUT

John Silberholz, PhD Candidate, MIT, 77 Massachusetts Ave, E40-149, Cambridge, MA, 02139, United States of America, josilber@mit.edu, Swati Gupta, Iain Dunning

Can graph properties predict the performance of heuristics on NP-hard problems? Can multiple heuristics be combined into a method that outperforms any single one of them? What is the value added of a new heuristic? We address these questions by constructing a large test bed of instances and implementing 40 published heuristics for MAX-CUT. We show that a hybrid method outperforms any single heuristic and discuss how large-scale test beds and code repositories can improve heuristic evaluation.

Data Mining in Medical and Engineering Domain

Sponsor: Data Mining

Sponsored Session

Chair: Cao (Danica) Xiao, PhD Student, University of Washington, Seattle, 3900 Northeast Stevens Way, Mechanical Engineering Building, Room G6, Seattle, WA, 98195, United States of America, danicaxiao@gmail.com

1 - Mining the Structure of Aggregate Energy Demand for Large Consumer Populations

Adrian Albert, Senior Scientist, C3 Energy, 1300 Seaport Blvd, Redwood City, CA, 94062, United States of America, adrian.albert@c3energy.com, Ram Rajagopal

We study the structure in consumption variability of large groups of residential consumers. Variability in aggregate demand is of particular importance for utilities, since they have to make advance decisions on bids into day-ahead and spot markets. We develop a method to form portfolios of individual consumers for which the aggregate is predictable in some sense. For this we design an algorithm to estimate the covariance structure between users that uses past history and exogenous covariates.

2 - Support Vector Data Description-Based Clustering Validity Index

Young-Seon Jeong, Chonnam National University, Dept. of Industrial Engineering, Gwangju, Korea, Republic of, young.jeong@jnu.ac.kr, Soo-Hyun Lee, Jae-Yun Kim, Myong-Kee Jeong

This talk presents a novel clustering validity index (CVI) based on a support vector data description (SVDD) based compactness. Unlike the existing CVIs, which are sensitive to arbitrary shapes of a clustering, the proposed CVI can accurately evaluate a clustering compactness in kernel space. The preliminary results show that the proposed CVI can achieve the accurate compactness for arbitrary shapes of a clustering such as a lengthy stick shape.

3 - A Markov Model to Predict the Future Diabetes Burden in the U.S.
Ji Lin, Centers for Disease Control and Prevention, 4770 Buford Highway, Building 107, MS F-73, Atlanta, GA, 30341, United States of America, xhi6@cdc.gov, Theodore Thompson, Yiling Cheng, Xiaohui Zhuo, Ping Zhang, Edward Gregg, Deborah Rolka

Forecasting of future diabetes prevalence is helpful for formulating health policy and allocating resources. A Markov model is developed to predict prevalence of diabetes for demographic cohorts. Future prevalence depends on current prevalence, incidence, mortality, and migration. Transition probabilities are estimated by statistical modeling on U.S. Census projections and National Health Interview Survey. The system is represented in difference equations and solved by Monte Carlo Simulation.

4 - Decomposed K Nearest Neighbors
Cao (Danica) Xiao, PhD Student, University of Washington, Seattle, 3900 Northeast Stevens Way, Mechanical Engineering Building, room G6, Seattle, WA, 98195, United States of America, danicaxiao@gmail.com, W. Art Chaovalitwongse

DKNN is a variant of KNN that considers the distance to the class prototypes of nearest neighbors as the classification rule, as opposed to the majority votes. Our DKNN also has a training process to learn the distance metric that minimizes classification errors and maximize the margin of decision boundary. Furthermore, DKNN introduces a regularization term (Frobenius or L1) to increase robustness and improve prediction accuracy.

Chair: Qingwei Jin, Associate Professor, Zhejiang University, Department of Management Science and Eng, Hangzhou, Zh, 310058, China, qingweijin@gmail.com

1 - Graphic Method for n-variable Linear Programming with Two Constraints
Youkang Fang, Professor, Beihai College of Beihang University, 88 Yintan Street, Beihai, 536002, China, fykfyk2004@163.com

In this paper, we show that any linear programming with n variables and two constraints can be solved by using two dimensional graphic method at most twice, and the the degeneracy problem in the simplex method is no more a problem in our method.

2 - Evolutionary Multi Point Search In CPLEX Studio's Constraint Programming Solver Engine
Renaud Dumeur, Principal Architect, Constraint Programming Product Development, IBM, 9 Rue de Verdun, Gentilly, 94250, France, renaud.dumeur@fr.ibm.com, Paul Shaw

In this talk, we present the Multi Point search used in CP Optimizer, the Constraint Programming solver of IBM ILOG CPLEX Studio. After a short introduction to both Constraint Programming and Evolutionary Computation, we will present how the later is hybridized with the former to implement MultiPoint search, as well as information about its usage, parameterization and performance on a large sets of integer and scheduling problem instances.

3 - Semidefinite Relaxation Based Branch and Bound Algorithm for Nonconvex QCQP
Qingwei Jin, Associate Professor, Zhejiang University, Department of Management Science and Eng, Hangzhou, Zh, 310058, China, qingweijin@gmail.com, Cheng Lu

To globally solve convex quadratically constrained quadratic programming problems with nonconvex objective functions, we design a semidefinite relaxation based branch and bound algorithm. We add valid nonconvex constraints, use their convex relaxation and design a branch and bound algorithm to tighten the relaxations, which enforces the nonconvex constraints being satisfied gradually. Numerical experimental results show that the proposed algorithm is very effective.

4 - Optimal Solutions to a Root Minimization Problem over a Polynomial Family with Affine Constraints
Mert Gurbuzbalaban, Postdoctoral Researcher, Massachusetts Institute of Technology, MIT/Lab for Information and Decision Sys, 32 Vassar St., Building 32-D614, Cambridge, MA, 02139, United States of America, mert@cims.nyu.edu, Michael Overton, Julie Eaton, Sara Grundel

We consider the problem of minimizing the root radius and abscissa over the space of monic polynomials of degree n subject to k affine constraints on their coefficients, motivated by some challenging optimal design problems in control. This is a difficult optimization problem due to the nonsmoothness and nonconvexity of the objective function. We prove that there exists an optimizer with at least n-k+1 active roots and present numerical experiments.

5 - A New Globally Convergent Incremental Newton Method
Mert Gurbuzbalaban, Postdoctoral Researcher, Massachusetts Institute of Technology, MIT/Lab for Information and Decision Sys, 32 Vassar St., Building 32-D614, Cambridge, MA, 02139, United States of America, mert@cims.nyu.edu, Asuman Ozdaglar

We develop and analyze a new globally convergent incremental Newton method for minimizing the sum of strongly convex functions, motivated by machine learning problems over large data sets and distributed optimization over networks. We discuss its convergence rate and prove its linear convergence under some assumptions.

Finance, Portfolio Analysis 2

Contributed Session

Chair: Mehmet Benturk, Student, Lincoln University, 401 15th St, Oakland, CA, 94612, United States of America, mbenturk@yahoo.com

1 - The Effect of Taste Change on Optimal Portfolio Selection when Assets Exhibit Varied Liquidity
Mehmet Benturk, Student, Lincoln University, 401 15th St, Oakland, CA, 94612, United States of America, mbenturk@yahoo.com, Aharon Hibshoosh

We analyze optimal portfolio selection where some assets are illiquid and are leveraged with different interest rates and different collateral value limits. We assume a taste change when the market changes from bear to bull. We decompose the effect of taste change on asset selection into a substitution effect and income effect. In a portfolio with risky investments and with leverage we derive and characterize the efficient frontier under alternative assumptions on leverage determination.

2 - Portfolio Optimization using Gini-based Risk Measures
Ran Ji, PhD, George Washington University, 2201 G St, NW, Funger Hall 415, Washington, DC, 20052, United States of America, jiran@gwmail.gwu.edu, Srinivas Y. Prasad, Miguel Lejeune

We formulate portfolio optimization models that employ the Gini Mean Difference (GMD) risk measure. We introduce the Mean-Gini Ratio metric that jointly accounts for the expected return and GMD criteria, and show that it is SSD consistent and LP solvable. Computational and cross-validation results as well as comparisons with other risk measures will be presented. Practical insights about the influence of the risk aversion coefficient will be illustrated.

3 - A Black Litterman Model for CVaR Optimization
Cagatay Karan, PhD Student, North Carolina State University, 2152 Burlington Labs, 2500 Stinson Drive, Raleigh, NC, 27695, United States of America, ckaran@ncsu.edu, Tao Pang

The Black Litterman Model (BLM) has contributed to modern portfolio theory a new perspective where the investor views and market equilibrium expected excess returns are combined in a Bayesian manner to get the optimal portfolio weights. Bertsimas, Gupta and Paschalidis(2012) have showed that one can get BLM type results by using inverse optimization. We will show our algorithms and numerical results for the BLM type optimization problems under CVaR risk measure.

4 - Computing near-optimal Value-at-Risk portfolios using Integer Programming techniques
Onur Babat, Lehigh University, 217 West Packer Avenue Apt:106, Bethlehem, PA, 18015, United States of America, onur.babat@lehigh.edu, Luis Zuluaga, Juan C. Vera

We consider the Value-at-Risk (VaR) portfolio optimization problem, which is an extension of Markowitz model in which VaR is used instead of variance as the risk measure. The VaR model can be formulated as an integer programming (IP) problem, and the formulation can be solved for small to mid-size instances in a reasonable amount of time. We exploit the IP formulation to develop an efficient algorithm to solve larger scale instances of the VaR model. Relevant numerical experiments will be given.

5 - A Model Selection Method for Option Pricing
Berk Orbay, Bogazici University, Suna sok. 34 Etiler, Istanbul, Turkey, berk.orbay@boun.edu.tr, Refik Güllü, Wolfgang Hörmann

Empirical evidence on comparison of option pricing models shows that there is no consensus on a single dominating model for all contract parameters and over different time periods. We propose a clustering method to find the relevant regions of contract parameters for model selection. Then, we use a decision rule to select the most suitable model over these regions. Finally, we provide out-of-sample testing results using different assets and option pricing methods over different time periods.

Optimal Stopping with Applications to Finance and Economics

Sponsor: Financial Services Section

Sponsored Session

Chair: Dharma Kwon, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 South Sixth Street, Champaign, United States of America, dhkwon@illinois.edu

1 - A Dynamic Analysis of Short Time Work Arrangements

Kuno Huisman, Tilburg University, Post Office Box 90153, Tilburg, Netherlands, K.J.M.Huisman@uvt.nl

This paper analyses the temporary unemployment regulations that were introduced during the recent recession. We view these measures as a collection of real options that governments provide to ?rms and value these options. The e?ect of such measures on the liquidation decision of the ?rm is studied and in addition the e?ect of government limitations on the duration of the program. Temporary unemployment measures delay a ?rm's liquidation. However, the programme is not necessarily good for welfare

2 - Detection with Post-Change Drift Uncertainty

Heng Yang, Graduate Center, CUNY, 365 fifth avenue, New York, NY, 10016, United States of America, hyang@gc.cuny.edu, Olympia Hadjiliadis, Mike Ludkovski

We consider the problem of quickest detection of an abrupt change when there is uncertainty about the post-change distribution. The objective is to find a decision rule to minimize a measure of worst detection delay of the min-max type subject to a frequency of false alarm constraint. In this effort, we discuss two different rules: the first rule is a delayed version of CUSUM algorithm, and the second rule is an online composite CUSUM-based stopping time.

3 - Optimal Mean Reversion Trading with Transaction Cost and Stop-Loss Exit

Tim Leung, Columbia University, 500 West 120th Street MC4704, New York, United States of America, tl2497@columbia.edu, Xin Li

Motivated by the industry practice of pairs trading, we study the optimal timing strategies for trading a mean-reverting price spread. An optimal double stopping problem is formulated to analyze the timing to start and subsequently liquidate the position subject to transaction costs. We apply a probabilistic methodology and derive the optimal price intervals for entry and exit. We also incorporate a stop-loss constraint and investigate its impact on the optimal timing strategies.

4 - Sequential Replacement under Uncertainty in the Population Distribution

Dharma Kwon, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 South Sixth Street, Champaign, United States of America, dhkwon@illinois.edu, Steven Lippman

We study the impact of uncertainty in the problem of sequential replacement of projects with unknown quality and unknown population distribution of quality. The decision-maker can operate one project at a time, observe the performance, update his belief on the quality and the population distribution, and replace it with another project from the population. Our novel result: the real option value is decreasing in the uncertainty in the population distribution.

Integer Nonlinear Programming and Applications – 2

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Monique Guignard, Professor, University of Pennsylvania, OPIM Dept., the Wharton School, 3730 Walnut Street, Philadelphia, PA, 19104-6340, United States of America, guignard_monique@yahoo.fr

1 - Using MINLP in Real Time Crossdock Optimization

Heng Zhang, University of Pennsylvania, 200 S 33rd St., Philadelphia, PA, 19104, United States of America, hengzhang24@gmail.com, Monique Guignard, Peter Hahn

The Crossdock Door Assignment Problem (CDAP) determines door assignments once for the entire planning period, thus possibly sacrificing operational efficiency. We propose a dynamic approach that repeatedly solves the CDAP when information needs updating in response to events during the planning period. We use for that our fast Convex Hull MatHeuristic CHH, designed for general MINLPs with linear constraints. Simulation demonstrates the superiority of the dynamic approach over the static one.

2 - Combined Multiproduct Maritime Inventory Routing & Blend Scheduling: Approaches to Large-Scale MINLP

Nicolas Sawaya, ExxonMobil, 800 Bell Street, Houston, United States of America, nicolas.sawaya@exxonmobil.com, Ahmet Keha, Jin-Hwa Song, Kevin Furman, Myun-Seok Cheon

We introduce a very large-scale problem for simultaneous optimization of ship routing, inventory management and tank blending of multiple bulk products. Nonlinearities arise due to the blending of products in on-shore tanks in order to meet demand specifications as well as achieve value uplift. We examine multiple modeling and solution approaches to solve this MINLP problem.

3 - Using SDP-based Convexification for Quadratic MIP Problems

Monique Guignard, Professor, University of Pennsylvania, OPIM Dept., the Wharton School, 3730 Walnut Street, Philadelphia, PA, 19104-6340, United States of America, guignard_monique@yahoo.fr, Lucas Letocart, Michael Bussieck

We review SDP-based methods for convexifying the quadratic objective function of MINLP problems with linear constraints. We describe how they can be used in conjunction with commercial MINLP optimization software, and discuss implementation issues. We report on numerical experiments with quadratic knapsack problems, generalized assignment problems and crossdock door assignment problems.

Scheduling I

Contributed Session

Chair: Yu "Washington" Zhang, UNC Chapel Hill, 101 Misty Woods Circle Apt R, Chapel Hill, NC, 27514, United States of America, yuzhang@email.unc.edu

1 - ATM Replenishment Scheduling

Yu "Washington" Zhang, UNC Chapel Hill, 101 Misty Woods Circle Apt R, Chapel Hill, NC, 27514, United States of America, yuzhang@email.unc.edu

We consider an ATM replenishment problem where the bank operates multiple ATMs in the same area. If a customer finds an ATM without any cash available, certain cost will be incurred. The replenishment cost is non-linear in the sense that the bank will pay more money for replenishing multiple ATMs by sending out one truck for each ATM than filling them up altogether. We present structures of the optimal strategy and study a heuristic policy which is easy to implement.

2 - A Collaborative Scheduling Method for Quay Crane Dual Cycling in Container Terminals

Yujiao Sun, Dalian University of Technology, No.2 Linggong Road, Ganjingzi District, Dalian, China, sunyujiao@mail.dlut.edu.cn, Xiangpei Hu

Dual cycling is a rising Quay Crane scheduling method that has proved to be of high economical and environmental advantages. However, yard reshuffles and the integration of loading and unloading operations make it a complex problem. We propose a collaborative scheduling strategy, which coordinates the operational sequence of containers on Yard Cranes, Yard Trucks, and Quay Cranes. Based on this strategy, we formulate a mixed integer programming model and solve it by a hybrid genetic algorithm.

3 - Enhancing HPC Scheduling through Predictive Analytics

Sarah Powers, Oak Ridge National Labs, One Bethel Valley Rd., Oak Ridge, TN, United States of America, powersss@ornl.gov

Foreknowledge of job arrivals to a High Performance Computing (HPC) system provides valuable information to the job scheduler. Optimizing the utility earned by the system is key for both users and administrators. This talk will discuss the use of predictive modeling, data mining and simulation to enable better scheduling criteria in a heterogeneous computing environment.

4 - Stochastic Scheduling of Patients to Maximize Number of On-time Appointments

Esmaeil Bahalkeh, Ohio University, 1602 apt,15 S.Shafer st,, university commons, Athens, OH, 45701, United States of America, eb867213@ohio.edu, Gursel A. Suer

In this study, we have proposed a stochastic math model to schedule the patients. The model determines the patients' appointment times considering a certain level of risk. The objective is to generate a sequence where the number of patients who can be seen by their appointment time is maximized. Other patients are given higher priority in the next period.

5 - Scheduling Learning Dependent Jobs in Assembly Lines Considering Ergonomic Factors

Flavio S. Fogliatto, Federal University of Rio Grande do Sul, IE Department, Porto Alegre RS, Brazil, ffogliatto@gmail.com, Michel Anzanello, Marcia Echeveste, Ana Rita Facchini

We propose a method to select clustering variables aimed at grouping customized product models into families. Two groups of clustering variables are considered: those generated by expert assessment on product features, and those representing workers' learning rate, obtained through learning curve modeling. The method integrates the "leave one variable out at a time" elimination procedure with a k-means clustering technique.

Inventory Management III

Contributed Session

Chair: Min Wang, Drexel University, 3141 Chestnut Street, Philadelphia, United States of America, mw638@drexel.edu

1 - Critical Level Rationing in Inventory Systems With Continuous Demand

Pablo Escalona, Universidad Técnica Federico Santa Marìa, Avenida España 1680, Valparaìso, Chile, pablo.escalona@usm.cl, Fernando Ordonez

This paper analyzes the use of a critical level policy for an inventory system that provides differentiated service-levels for two demand classes (high and low priority). We considering an inventory system with continuous review (Q,r) policy and demand classes that are modeled through continuous distributions. We look for closed form optimal solution under mild assumptions. We separate our analysis in two cases, when demand follows a distribution with positive support and a normal distribution.

2 - Last Time Buy and Re-use of Parts

Sina Behfard, University of Twente, Ravelijn building, Hallenweg 17, Enschede, 7522 NH, Netherlands, s.behfard@utwente.nl, Matthieu van der Heijden, Ahmad Al Hanbali, Henk Zijm

Spare part availability is essential for capital goods with a long service period. Sourcing decisions are hard once production of spares ceases while the remaining service period is long. We develop a decision support model to optimize the mix of supply sources (a last order before production stops, repair of failed parts, and recovery of useable parts from phased-out systems). We show that repairs and asset recovery are attractive, even when expensive, because of the postponement effect.

3 - Stabilizing Costs in a Continuous Review Inventory System: A Bi-Objective Approach

Gonca Yildirim, Assistant Professor, Cankaya University, Industrial Engineering Department, Ankara, Turkey, goncayildirim@cankaya.edu.tr, Dincer Konur

Focusing on cost minimization in a continuous review inventory system can result in cost variability between replenishment cycles due to stochastic nature of the demand. This cost fluctuation may be undesirable for planning purposes in practice. This study adopts a bi-objective approach that minimizes total costs and its range. A numerical study is conducted to demonstrate how costs can be stabilized using our approach.

4 - Optimizing Inventory's Contribution to Profitability in a Regulated Utility

Linda Li, Student, the University of Alabama, 1105 17th Street Tuscaloosa, Apt 5102A, Tuscaloosa, 35401, United States of America, lczy1985@163.com, Chuck Schmidt, David Miller

Through DEA model, we first investigates a group of electric utilities when the resource is inventory which implies these firms procure a significant extra amount in inventory (materials and supplies). Then we construct an analytical model of the inventory policy controlling the extra buying of material that will be inventoried and added to the firm's rate base.

5 - Decision Rules for Emergency Replenishments in an Inventory System

Sven Axsater, Professor, Lund University, Box 118, Lund, Sweden, sven.axsater@iml.lth.se

This paper provides a new decision rule for emergency replenishments in an inventory system. The decision rule is a generalization of a previous decision rule suggested and evaluated in Axs‰ter (2003, 2007). An improvement step is added to this rule. The decisions are based on complete information about the system state. It is possible to handle batch ordering, compound Poisson demand and emergency replenishments that take time. Emergency replenishments will always lead to lower expected costs.

1 - Automated Commercial Imagery Adjudication

Freeman Marvin, Executive Principal, Innovative Decisions, Inc., 8230 Old Courthouse Road, Suite 460, Vienna, VA, 22182, United States of America, ffmarvin@innovativedecisions.com

The National System for Geospatial Intelligence (NSG) expects to increase reliance upon commercial sensors in coming years, to decrease costs and increase capacity. Due to technological advances, modern commercial imagers are now able to address a wide range of intelligence questions. Unfortunately, the process by which analysts can task commercial imagery is inefficient. This paper examines economic and decision analytic methods to improve the value of commercial imagery to national security.

2 - Combining Technology and Soft Skills in the Bayesia Expert Knowledge Elicitation Environment (BEKEE)

Joe Tatman, Innovative Decisions, Inc., 8230 Old Courthouse Road, Suite 460, Vienna, VA, 22182, United States of America, jatatman@innovativedecisions.com, Amanda Hepler, Gary Smith, Sean Tatman, Bill Patchak, Suzanne Mahoney, Dennis Buede

US Army CECOM Equipment Diagnostic Analysis Tool (CEDAT) project requires building of Bayesian networks using subject matter experts anywhere in the world. The technology of BayesiaLab BEKEE was combined with IDI experience in the soft skills of expert elicitation to develop a process for CEDAT enabling online experts to contribute effectively to all phases of Bayesian network model building. The process is being transferred to the CEDAT model builders and initial applications are underway.

3 - Program Objectives Memorandum (POM): Alternative Decision Analytic (DA) Approaches

Terry Bresnick, Innovative Decisions Inc., 3132 NW 63rd St, Boca Raton, FL, United States of America, bresnick@ix.netcom.com

DoD and the IC all prepare POMs, but there is little consistency in approach. We review 3 approaches spanning the spectrum of applications. USMC uses a balance beam approach to produce an order-of-buy. An IC agency built the POM around a MODA framework aimed at information needs. Several DoD/IC organizations use incremental benefit/cost analysis to produce a Pareto-optimal efficient frontier. Pros and cons of each will be discussed along with "social" aspects of implementation.

4 - Development of the Bayesian Enterprise Analysis Model

Mark Gallagher, Technical Director, HQ USAF A9, 1570 Air Force Pentagon, Washington, DC, 20330, United States of America, Mark.Gallagher@pentagon.af.mil, Justin Sorice, David Blum

The Bayesian Enterprise Analysis Model (BEAM) is a military enterprise analysis tool to evaluate force structure and strategies across the US Department of Defense in multiple scenarios. BEAM will evaluate alternative force structures including future systems against an adaptive adversary that varies allocations in response to observations. The presentation will highlight current development achievements, lessons learned and future research goals.

Social Media Sentiment

Cluster: Social Media Analytics

Invited Session

Chair: Les Servi, The MITRE Corporation, 202 Burlington Road, Bedford, MA, 01730, United States of America, lservi@mitre.org

1 - Network Contagion in Social Media

Chaitanya Kaligotla, PhD Student, INSEAD, Boulevard de Constance,, Fontainebleau, 77300, France, Chaitanya.kaligotla@insead.edu

This research studies the diffusion of inaccurate information versus that of competing accurate information, within the same network over time. This talk investigates how the dynamics of influence spreads over networks is effected by network structure. The project involves a mix of theoretical analysis and empirical analysis from mined Social Network data.

2 - What Social Media Sentiment Can (And Cannot) Tell Us About Public Opinion

Clay Fink, John Hopkins, Applied Physics Lab, 11100 Johns Hopkins Rd, Laurel, MD, 20723, United States of America, finkcr1@jhuapl.edu

We contrast sentiment expressed on Twitter in Nigeria toward president Goodluck Jonathan. We find that Twitter sentiment is more negative but correlates with surveys by region and over time. These results hold after reweighting survey results by factors associated with Twitter use.

3 - Heuristics for Secretary Pool Problems

Donald Gaver, Distinguished Professor of Operations Research, Naval Postgraduate Schoo, Monterey, CA, 93943, United States of America, DGaver@nps.edu, Patricia A. Jacobs

Classical single-secretary optimum selection (examine field for 1/e opportunities; pick 1st > max therein in remaining time) is generalized to cover the s >= 1 selection problem. Various alternative formulations are proposed and explored. Selection of superior organization teams from a candidate universe is a Social Media objective.

4 - Non-linear Dynamics of Human Emotions Expressed by Twitter Data and its Implication

Les Servi, The MITRE Corporation, 202 Burlington Road, Bedford, MA, 01730, United States of America, lservi@mitre.org, Waldemar Karwowski, Nabin Sapkota, Tareq Ahram, Dylan Schmorrow

Exploration of the extent that human emotions, expressed in Twitter data, have chaotic and non-linear dynamics has profound implications in forecasting a population's mood. This study examined such dynamics found in 7320 data points, collected from hourly data representing over 380,000 Twitter messages.

Hilton- Plaza B

Behavioral OR and Applications of Cognitive Analytics

Cluster: Cognitive Analytics

Invited Session

Chair: Horst Samulowitz, IBM Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, samulowitz@us.ibm.com

1 - Text Analytics and Sentiment Analysis: Past, Present and Future

Richard Socher, Stanford, Serra Mall, Stanford, United States of America, richard@socher.org

Sentiment analysis is both linguistically interesting and crucial to business intelligence. In this talk, I will first describe overly simple methods for sentiment analysis that have been used in the past. Next, I will describe current methods of sentiment analysis and demo an easy to use tool for text and sentiment classification: etcml.com. In the third part, I will introduce more sophisticated models based on recursive deep learning which may supersede currently used algorithms.

2 - Analytics Integrated into Cognitive Algorithms Environment
Ali Koc, IBM TJ Watson Research Center, 1101 Kitchawan Rd,, Yorktown Heights, United States of America, akoc@us.ibm.com, Chandra Reddy, Meinolf Sellmann, Horst Samulowitz

We study analytic techniques and algorithms that integrate into cognitive computing and algorithms environment. The techniques have to be efficient and flexible enough to facilitate interactivity with the user and visualization. We present the work on a pre-disaster planning problem that strengthens a rural area transportation network, and on a fire evacuation planning problem. The specific applications solve extreme linear resource constraints with non-linear/stochastic objective functions.

3 - On the Importance of Behavioural OR
Raimo Hamalainen, Professor, Aalto University, Espoo, Espoo, 00076, Finland, raimo.hamalainen@aalto.fi

The new research area of Behavioural Operational Research(BOR) studies the behavioural aspects in OR based problem solving and decision support as well as the use of OR methods in the analysis of human behaviour. BOR aims to improve the practice of OR and to advance the use of OR models of social systems. Behavioural research exists in some areas of OR (e.g.decision analysis, behavioural operations ,system dynamics, game theory) but more studies are needed across the full spectrum of OR.

Rare Events, Sensitivity, and Exact Simulation

Sponsor: Applied Probability Society

Sponsored Session

Chair: Jose Blanchet, Associate Professor, Columbia University, Rm. 323, School of Engineering, 500 West 120th Street, New York, NY, 10027, United States of America, jose.blanchet@columbia.edu

1 - Sensitivity Analysis for Markov Chains
Chang-han Rhee, Georgia Tech, North Ave NW, Atlanta, GA, 30332, United States of America, rhee@gatech.edu, Peter Glynn

We introduce a general theory that provides sufficient conditions for differentiability of various types of performance measures including ones associated with random horizon expectations and stationary expectations, which are known to be notoriously difficult to deal with. The new theory is easy to apply on the basis of the model building blocks and requires weaker conditions than the ones provided by the existing literature. It also provides expressions useful for computation via simulation.

2 - Interplay of Insurance and Financial Risks
Qihe Tang, The University of Iowa, Iowa City, IA, United States of America, qihe-tang@uiowa.edu

Consider an insurance company exposed to a stochastic economic environment that contains two kinds of risks. The first kind is the insurance risk caused by traditional insurance claims, and the second kind is the financial risk resulting from investments. In this talk I will study the interplay of the two risks on the ruin probability for heavy-tailed cases.

3 - Rare-event Analysis for the Extreme Eigenvalues of the Beta-Laguerre Ensemble
Gongjun Xu, University of Minnesota, xuxxx360@umn.edu

We consider the tail behavior of the extreme eigenvalues coming from the Beta-Laguerre ensemble, which is a generalization of the Wishart matrix and plays an important role in multivariate analysis. We provide asymptotic approximations and bounds for the tail probabilities of the extreme eigenvalues. Moreover, we construct efficient Monte Carlo simulation algorithms to compute the tail probabilities. This is a joint work with Kevin Leder and Tiefeng Jiang.

4 - Exact Simulation of Multidimensional Reflected Brownian Motion
Karthyek Rajhaa Annaswamy Murthy, PhD Student, Tata Institute of Fundamental Research, Homi Bhabha Road,, Navy Nagar, Colaba, Mumbai, 400005, India, kamurthy@mailhost.tifr.res.in, Jose Blanchet

Using the recently developed tolerance enforced simulation techniques, we present the first exact simulation method for multidimensional reflected Brownian motion (RBM). The problem of obtaining samples from reflected diffusions is challenging because of the presence of correlated local-time-like terms in their definition. We obtain samples of RBM by first obtaining a piecewise linear approximation to the RBM, and then by applying a novel acceptance/rejection procedure to eliminate the error.

Stochastic Control Applications

Sponsor: Applied Probability Society

Sponsored Session

Chair: Bora Keskin, The University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, bora.keskin@chicagobooth.edu

1 - Moment Conditions for Multi-Server Queues with Integral Load
Alan Scheller-Wolf, Professor, Carnegie Mellon University, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, awolf@andrew.cmu.edu, Michele Dufalla, Rein Vesilo

We provide a partial answer to the open question concerning the performance of multi-server queues with integral load. We do so by finding tighter necessary conditions for finite expected delay moments for these queues under power-law (i.e. Pareto) service times, using domain of attraction theory. This reduces, but does not close, the gap between necessary and sufficient conditions for these queues.

2 - Investment Timing with Incomplete Information and Multiple Means of Learning
Nur Sunar, University of North Carolina at Chapel Hill, Nur_Sunar@kenan-flagler.unc.edu, Michael Harrison

We consider a firm that can use one of several costly learning modes to dynamically reduce uncertainty about the unknown value of a project in a continuous-time setting. In addition to dynamic decisions about its learning mode, the firm must decide when to stop learning and either invest or abandon the project. We solve both the discounted and undiscounted versions of this problem, and extend our analysis to consider a firm that can choose multiple learning modes simultaneously.

3 - Queuing System Topologies with Limited Flexibility
Kuang Xu, MIT, 77 Massachusetts Ave., Cambridge, United States of America, kuangxu@mit.edu, John Tsitsiklis

We study a multi-server model where n flexible servers are connected to rn queues through a fixed connectivity graph, with average degree d. We show that as n tends to infinity, both a diminishing delay and a large capacity region are jointly achievable, even under limited flexibility (d << n): a family of random graphs are shown to stabilize all bounded admissible arrival rates, while simultaneously ensuring a diminishing queueing delay under a new class of matching-based scheduling algorithms.

4 - Server-Side Scheduling for Video Service: Earliest Progressive Deadline First
Kristen Gardner, Carnegie Mellon University, Computer Science Department, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America, ksgardne@cs.cmu.edu, Sem Borst, Mor Harchol-Balter

Video servers must deliver content to clients on time. Each byte has a deadline by which it must be received by the client. We introduce a new server-side scheduling policy, Earliest Progressive Deadline First (EPDF), and prove that EPDF maximizes the fraction of bytes delivered on time. Like most server-side scheduling policies, EPDF is difficult to analyze exactly; we provide several bounds and approximations. Empirical results show that other policies, like GPS, perform similarly to EPDF.

Data Fusion for Prognostics

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, United States of America, kliu8@wisc.edu

1 - Scalable Predictive Analytics for Multi-sensor Condition Monitoring Applications
Xiaolei Fang, Georgia Institute of Technology, 1207 Noble Creek Dr NW, Atlanta, GA, 30327, United States of America, xfang33@mail.gatech.edu, Kamran Paynabar, Nagi Gabraeel

We develop a multi-sensor prognostic model that utilizes multistream signals to predict residual lifetimes of partially degraded systems. We first fuse the multistream degradation signals via Multivariate Functional Principal Components Analysis (MFPCA). Next, the fused features are used for prognostics via adaptive functional regression. To address some of the Big Data challenges, a randomized low-rank matrix approximation technique is incorporated to speed up the MFPCA matrix decomposition.

2 - Reliability Analysis of a Surveillance System with Multifunctional Sensors

Yiwen Xu, United States of America, yiwen.xu6@gmail.com, Haitao Liao

In this paper, we study the reliability of a surveillance system with multifunctional sensors. Such multifunctional components provide another degree of flexibility for functional redundancy within the system. The analytic formulation of system reliability is provided and a redundancy allocation problem is formulated and solved through a heuristic-enhanced genetic algorithm.

3 - Iterative System Optimization Based on Condition Monitoring Data and Bayesian Updating

David Coit, Rutgers university, 96 Frelinghuysen Rd., Piscataway, NJ, 08854, United States of America, coit@rutgers.edu, Nida Chatwattansiri

This paper proposes a method to update model parameters of condition monitoring system with generalized series-parallel structure using Weibull distributions. We analyze actual system usages in future scenarios that take various uncertainties into consideration. In particular, our method uses Bayesian approach to update model parameters of the system reliability. The technique is illustrated by numerical examples of independent Weibull component lifetimes with scale parameters.

4 - Integration of Data Fusion Methodology and Degradation Modeling Process to Improve Prognostics

Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, United States of America, kliu8@wisc.edu, Shuai Huang

This talk develops a systematic data-level fusion methodology that combines the degradation-based signals from multiple sensors to construct a health index for better characterizing the condition of a unit. The novelty of this methodology lies in integrating the fusion procedure and the degradation modeling in a unified manner. The methodology was tested and validated by using the degradation-based signals of aircraft gas turbine engine that was generated by C-MAPSS.

Data Driven Scientific Discovery

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Chiwoo Park, Florida State University, 2525 Pottsdamer St., Tallahassee, Fl, 32310, United States of America, cpark5@fsu.edu

1 - Ensemble Data Assimilation: Combining Geophysical Models with Observational Data

Jeffrey Anderson, Senior Scientist, National Center for Atmospheric Research, P.O. Box 3000, Boulder, CO, 80307-3000, United States of America, jla@ucar.edu

Data assimilation (DA), originally developed for weather prediction, combines computer forecasts and observations to produce initial conditions for subsequent forecasts. Ensemble DA uses sample statistics from sets of forecasts to estimate the impact of observations on model state variables. This talk presents an introduction to state-of-the-art ensemble DA algorithms that use millions of observations per day, models with 100 million variables, and O(100) ensemble members.

2 - Scalability of Scientific Image Analysis

Daniela Ushizima, Research Scientist, Lawrence Berkeley National Lab., 1 Cyclotron, Berkeley, CA, 94720, United States of America, dushizima@lbl.gov

Research laboratories store images as part of experimental records. Limitations in scientific image analysis hamper ability to understand the acquired data. This talk will overview current research on fundamental and domain-specific pattern recognition methods that exploits mathematical and statistical image analysis techniques to bring knowledge about known structures as constraints, apply priors to find scientifically relevant constructs and allow fast software for use in everyday analysis.

3 - Robust Nanoparticles Detection by Fusing the Complementary Image Information

Yanjun Qian, Research Assistant, Texas A&M University, 1501 Holleman Dr, Apartment 82#, College Station, TX, 77840, United States of America, qianyanjun09@gmail.com, Xiaodong Li, Yu Ding, Jianhua Huang

This paper studies the problem of detecting nanoparticles in noisy transmission electron microscopic (TEM) images. In order to achieve robustness while handling low contrast and high noise, we propose an approach to fuse two kinds of complementary image information: the region information and the edge information. We apply our method to a set of TEM images taken under different resolutions and noise levels. It can process a TEM in a few minutes, and the processed outcomes appear rather robust.

4 - Data-Driven Study of Nanoparticle Growth

Chiwoo Park, Florida State University, 2525 Pottsdamer St., Tallahassee, Fl, 32310, United States of America, cpark5@fsu.edu, Nigel Browning, Taylor Woehl, James Evans

We present a data-driven approach for studying nanoparticle growth in a solution. Individual nanoparticles in a solution typically grow through a series of single atom attachments, but more importantly, when they reach to a critical size they can aggregate with other particles to form bigger particles. We exploit the realtime microscopic images of the growth process and our image sequence data analysis method for previously unexplained findings on aggregation-based particle growth.

Emerging Topics in Simulation Analysis & Optimization

Sponsor: Simulation

Sponsored Session

Chair: Jie Xu, Assistant Professor, George Mason University, 4400 University Dr., MS 4A6, Fairfax, VA, 22030, United States of America, jxu13@gmu.edu

1 - Efficient Multi-fidelity Simulation Optimization

Jie Xu, Assistant Professor, George Mason University, 4400 University Dr., MS 4A6, Fairfax, VA, 22030, United States of America, jxu13@gmu.edu, Loo Hay Lee, Edward Huang, Nurcin Celik, Si Zhang, Chun-Hung Chen

There are often simulation models of different levels of fidelity for evaluating alternative solutions of a complex system, offering a trade-off between accuracy and speed. We propose a Multi-fidelity Optimization with Ordinal Transformation and Optimal Sampling framework to exploit the benefits of high- and low-fidelity simulation models to perform optimization efficiently. Through preliminary analysis and numerical experiments, we demonstrate the promising performance of the proposed method.

2 - Simulation Swarm Optimization

Lee Schruben, Berkeley University, Berkeley, CA, United States of America, lees@berkeley.edu, Raunak Bhinge, Eike Ebel

A swarm of simulation models can explore multi-dimensional feasible regions. The simulations can change their configurations (locations) as they run, guiding each other toward optimal solutions. The basic notion is akin to Particle Swarm Optimization where the particles are stochastic discrete-event simulation models running in parallel. The models can replicate themselves as they approach stochastic constraints or promising positions to balance exploration, exploitation, and estimation.

3 - Agent-Based Simulation of Financial Markets: Multifractal Analysis of Positive-Intelligence Models

James Thompson, Research Analyst, NC State University, Fitts Dept Indust & Sys Engr, Raleigh, NC, 27695-7906, United States of America, j7sthompson@gmail.com, James Wilson

To analyze the impact of intelligent traders on agent-based simulations of financial markets, we enhance the classic zero-intelligence model of financial markets with positive-intelligence agents using the MASON modeling framework. Exploiting multifractal detrended fluctuation analysis, we analyze the series of stock prices generated by the positive-intelligence simulation. We study the changes in this output process when altering the mix of agents with competing market philosophies.

4 - Simulation-based Continuous Optimization with Stochastic Constraints

Liujia Hu, Georgia Institute of Technology, 765 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, lhu9@gatech.edu, Sigrun Andradottir

We consider simulation optimization problems with stochastic constraints. We propose an Adaptive Search with Discarding and Penalization (ASDP) method for solving this problem. ASDP utilizes the penalty function approach to convert the original problem into a series of simulation optimization problems without stochastic constraints. We present conditions under which the ASDP algorithm converges almost surely, and conduct numerical studies aimed at assessing its efficiency.

Carbon-Considerate Operations Management

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Tarkan Tan, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, T.Tan@tue.nl

1 - Managerial Implications of Considering CO2 Emissions on Vehicle Routing Problems

Josue Velazquez-Martinez, Instituto Tecnológico y de Estudios Superiores de Monterrey, Campus Santa Fe, Mexico City, Mexico, josue.velazquez@itesm.mx, Jose Cohen, Jan C. Fransoo

We present a new model for the VRP that minimizes CO2 emissions. Our model is formulated based on the NTM methodology. Extensive numerical experiments show that substantial CO2 savings can be achieved when truck utilization increases or truck capacity is large. We present conditions in which minimizing distance is equivalent to minimizing CO2 emissions.

2 - Carbon Leakage: The Impact of Asymmetric Emission Regulations on Technology and Capacity Investments

Beril Toktay, Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, beril.toktay@scheller.gatech.edu, Ximin (Natalie) Huang, Tarkan Tan, Kristel Hoen

We study the decisions for an energy-intensive good producer to choose between (1) investing in cleaner technology in an area where emissions are regulated and/or (2) expanding capacity in the unregulated area, under the uncertainty of future emission price. We also compare the impacts of different mitigation options of the policy maker numerically: grandfathering is preferable by companies while border tax is more effective in inducing lower total emission when the emission price is moderate.

3 - The Impact of Coordination on the Retail Chain Emissions

Yann Bouchery, Ecole de Management de Normandie, 30, Rue de Richelieu, Le Havre, 76087, France, y.bouchery@tue.nl, Zied Jemai, Tarkan Tan, Asma Ghaffari

This paper analyzes the impact of coordination on the retail chain emissions besides a cost analysis. We show that the supply chain carbon emissions can be greater under pure cost driven coordination. We also show how this effect could be mitigated. We argue that the objective of coordination needs to be clearly defined to ensure cost and carbon emissions reduction. Accordingly, we use multiobjective optimization to identify the solutions achievable when coordinating the supply chain.

4 - Where to Exert Abatement Effort for Sustainable Operations Considering Supply Chain Interactions?

Tarkan Tan, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, T.Tan@tue.nl, Astrid Koomen

We consider the problem of how firms can take the dynamics of supply chain interactions into account when "greenifying" their operations. We introduce a framework which firms can use in defining the right optimization problem and boundaries when they want to exert abatement effort. Our framework, which is applied at a chemical company, can help firms in determining which impact certain decisions have on other firms' emissions in the supply chain and the resulting total footprint of the product.

The Economics of Auction Markets

Cluster: Auctions

Invited Session

Chair: Brian Baisa, bhbaisa@gmail.com

1 - Reference-Dependent Bidding in Dynamic Auctions

Marion Ott, Lehrstuhl für Volkswirtschaftslehre, Templergraben, Germany, marion.ott@vwl1.rwth-aachen.de, Karl-Martin Ehrhart

Loss-averse bidders (a la K̂szegi and Rabin, 2006) with independent private values face different sensations as the price clock proceeds in English (EA) or Dutch auctions (DA). We solve for personal equilibrium profiles (PEP), which contain each bidder's best response given the others' strategies and the reference point induced by the strategies. If PEP exist in both auctions, the revenue in the DA exceeds that from the EA, mainly due to the aversion to losing the item in the DA.

2 - Revealed Preference in Bidding: Empirical Evidence from Recent Spectrum Auctions

Oleg Baranov, Colorado Technical University, CO, United States of America, Oleg.Baranov@Colorado.edu, Lawrence Ausubel

Activity rules are among the key innovations underlying modern dynamic multi-item auctions. In recent work, Ausubel and Baranov (2013, 2014) have advocated that the traditional activity rules may be both too weak and too strong, and instead have advocated activity rules based upon the Generalized Axiom of Revealed Preference (GARP). Detailed bidding data from two recent spectrum auctions provide unique opportunity to examine whether GARP-based activity rules are too restrictive to be viable.

3 - The Role of a Market Maker in Networked Cournot Competition

Subhonmesh Bose, California Institute of Technology, 1200 E. California Blvd, Pasadena, United States of America, boses@caltech.edu, Adam Wierman, Desmond Cai

We study the role of a market operator in a transmission constrained electricity market. We model the market as a one-shot networked Cournot competition. This mimics the operation of a spot market in a deregulated market structure. We focus on possible mechanisms employed by the market operator to balance demand and supply. We the characterize existence of Generalized Nash Equilibrium and show that market outcomes at equilibrium can be very different under different market operator mechanisms.

4 - Bid Behavior in the Uniform Price and Vickrey Auctions on a General Preference Domain

Brian Baisa, bhbaisa@gmail.com

I compare the Vickrey auction and the uniform-price auction in a setting where bidders have private values and multiunit demands. I remove the standard quasilinearity restriction and assume only that bidders have weakly positive wealth effects. I show that truth-telling is not a dominant strategy in the Vickrey auction and both auctions are generally inefficient. When the auction is large, both give approximately equal allocations and revenues, and both are approximately ex-post efficient.

Energy IV

Contributed Session

Chair: Nikolaos Gatsis, Assistant Professor, The University of Texas at San Antonio, One UTSA Circle, BSE 1.500, San Antonio, TX, 78249, United States of America, nikolaos.gatsis@utsa.edu

1 - Nodal Pricing Applied to Feed-in RES in a Hybrid Pricing Context

Hong Cai, PhD Student, Norwegian School of Economics, Room 108, Helleveien 124, Bergen, -, 5043, Norway, hong.cai@nhh.no, Mette Björndal, Evangelos Panos, Endre Björndal

Using a large scale network, we mainly study in a joint market, whether nodal pricing (location marginal pricing) helps one pricing area (zone) to reduce the volatility within the grid caused by the increased share of feed-in wind generated power in other pricing areas where zonal pricing is applied.

2 - Peer Effects vs. Competitive Effects under Alternative Regulatory Regimes

Eun-Hee Kim, Assistant Professor, George Washington University, Funger Hall 615D, 2201 G Street, NW, Washington, DC, 20052, United States of America, eunheek@gwu.edu

This paper studies drivers of operating efficiency in the power sector under alternative regulatory regimes by making use of a unique dataset from the U.S. electric power industry. The dataset matches confidential tested data and publicly available observed data on power plant efficiency and is used to construct a disaggregated measure of efficiency based on self-benchmarking.

3 - Capacity Mechanisms and Generation Investments in Electricity Markets

Yuto Takano, Tokyo University of Science, 2641 Yamazaki Noda-shi, Chiba, Japan, 7414617@ed.tus.ac.jp, Ryuta Takashima

Recently a capacity mechanism has been introduced in various countries in order to recover an investment cost. It is necessary to discuss the design of the capacity mechanism due to the penetration of the renewable energy. In this paper we analyze an effect of the capacity market on investments under uncertainties by means of stochastic programming. Especially, we compare the outcome with that for energy-only market in order to extract the effect of the capacity market.

4 - Optimization of Energy Management in Large Scale Smart Grid Systems

Sunil Vuppala, IIITB, Electronics City, Bangalore, India, sunil.vuppala@iiitb.ac.in, GNS Prasanna

We present optimization techniques for near real time control in smart grids handling objectives of consumers and utility with price uncertainty in a rolling horizon approach. Our MILP handles fine grain constraints till the level of individually controllable appliances. Our results are compared with an ALL-OR-NONE heuristic that is scalable up to 100,000's of consumers. The results indicate 5-15% of energy bill reduction by using optimization methods, compared to heuristics, on area wide grids.

5 - Stochastic Programming Models for Power Flow Optimization in Electricity Distribution Networks

Nikolaos Gatsis, Assistant Professor, The University of Texas at San Antonio, One UTSA Circle, BSE 1.500, San Antonio, TX, 78249, United States of America, nikolaos.gatsis@utsa.edu, Mohammadhafez Bazrafshan

Stochastic programming models for real and reactive power management in distribution networks are introduced. Decisions include real power consumption from programmable loads, and reactive power consumption or generation from photovoltaic generation units, which is adaptive to the uncertain (random) generated solar power. The aim is to minimize expected thermal losses or maximize the user sum-utility, under risk-constrained voltage regulation. Decentralized solution algorithms are presented.

Energy Planning and Uncertainty

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Soheil Shayegh, Georgia Institute of Technology, North Ave NW, Atlanta, GA, 30332, United States of America, soheilsh@gatech.edu

1 - Impact of Forecast Errors on Expansion Planning of Power Systems with a Renewables Target

Salvador Pineda, University of Copenhagen, Universitetsparken 5, Copenhagen, Denmark, spinedamorente@gmail.com, Juan Miguel Morales, Trine Krogh Boomsma

We present a model to determine the expansion plan that minimizes investment and operating costs, while ensuring a given share of renewable generation. This model includes both a day-ahead and a balancing market to capture the impact of both production forecasts and the associated prediction errors. Within this framework, we compare two paradigmatic market designs that differ in whether the day-ahead generation schedule and the subsequent balancing re-dispatch are co-optimized or not.

2 - Optimal Bidding Policies in the Electricity Market using Approximate Dynamic Programming

Daniel Jiang, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08540, United States of America, drjiang@princeton.edu, Warren Powell

There is growing interest in the use of grid-level storage to smooth variations in supply that are likely to arise with increased use of wind and solar energy. Battery arbitrage is becoming an important way of paying for these expensive investments. The problem of optimal bidding in the presence of storage is complicated by the fact that bids need to be placed either day or hour-ahead. We propose the use of approximate dynamic programming (ADP) techniques to find profitable bidding policies.

3 - Quantitatively Exploring the Future of RPS in the Korean Electricity Sector via an Energy Model

Dong Gu Choi, Senior Researcher, Korea Institute of Energy Research, 152 Gajeong-ro Yuseong-gu, Daejeon, 305-343, Korea, Republic of, doonggus@gmail.com, Sang Yong Park, Jong Chul Hong

We investigate the Korean renewable portfolio standard (RPS) mechanism and develop a multi-regional bottom-up model (via TIMES model) to implement how the mechanism will work. Based on scenario-based analysis with model, we predict the possible future results of the mechanism under a national basic plan on electricity demand and supply. We indicate the disharmony between the plan and mechanism. In addition, we address some insights and suggestions on its continued application.

4 - Fuel Hedging Strategy for Electric Power Utilities

Jo Min, Associate Professor, Iowa State University, 3004 Black Engineering, Ames, 50011, United States of America, jomin@iastate.edu, Chung-Hsiao Wang

Electric power utility companies have used contracts to hedge against fuel price volatility for their coal generation units. With the recent popularity of natural gas combined cycle generation units, the fuel hedging strategy now needs to consider natural gas as well. As coal-based and natural gas-based generation units are competing for economic dispatch, for a utility owning both types of generation units, we show how fuel hedging strategy can be developed and analyzed.

Parc- Mission II

Stochastic Programming for Planning Electricity Supply

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Sarah M. Ryan, Professor, Iowa State University, 3004 Black Engineering Bldg., Ames, United States of America, smryan@iastate.edu

1 - Capacity Planning in Power Systems with High Solar Energy Penetration using Stochastic Programming

Cesar Silva-Monroy, Senior Member of Technical Staff, Sandia National Laboratories, PO Box 5800, Albuquerque, NM, 87185-1140, United States of America, casilv@sandia.gov, Jean-Paul Watson, Andrew Mills, Richard Li-Yang Chen, Ali Pinar, Francisco Munoz

Uncertainty such as fuel prices and load growth exists when selecting new generators. At current low penetration, the amount of solar energy available during high load periods (i.e., capacity value) is treated as deterministic. However, at levels set by renewable portfolio standard the above approach can result in suboptimal expansion plans. We present a stochastic programming formulation of this problem that includes treatment of solar capacity value as one of several sources of uncertainty.

2 - Solution Sensitivity Based Scenario Reduction for Stochastic Unit Commitment

Yonghan Feng, Iowa State University, 0076 Black Engineering Bldg, Ames, IA, 50010, United States of America, yhfeng@iastate.edu, Sarah M. Ryan

A two-stage stochastic program is formulated for day-ahead commitment of thermal units to minimize the total expected cost when uncertain load and variable generation resources are considered. A heuristic scenario reduction method that selects scenarios based on their cost and reliability impacts helps to alleviate the computational burden. In instances derived from a US system operator, the proposed method maintains solution quality even when the reduction is substantial.

3 - Economic Assessment of Energy Storage in Integration of High Levels of Renewable Generation

Nan Li, PhD Student, Arizona State University, 1151 South Forest Avenue, Tempe, AZ, 85287, United States of America, nan.li24@asu.edu, Audun Botterud, John Birge, Canan Uckun, Kory Hedman

The fast-growing expansion of renewable energy increases the complexities in balancing generation and demand in the power systems. The energy-shifting and fast-ramping capability of energy storage technologies has led to increasing interest in energy storage for grid integration of renewable energy. We present a stochastic programming framework to evaluate and investigate the potential value of energy storage in power systems with high renewable penetration levels.

4 - Robust Optimization or Stochastic Programming for Unit Commitment?

Sarah M. Ryan, Professor, Iowa State University, 3004 Black Engineering Bldg., Ames, United States of America, smryan@iastate.edu, Narges Kazemzadeh

We study stochastic programming and robust optimization in the unit commitment problem for a multi-bus power system under net load uncertainty. The stochastic programming model aims to minimize a combination of expected value and CVaR of the costs, while the robust model objective reflects the commitment cost and the worst case dispatch cost. We compare the performance of these approaches in different aspects including economic efficiency as well as the risk associated with the decisions.

Parc- Mission III

Reliability II

Contributed Session

Chair: Wei Xie, Adjunct Assistant Professor, University of Arizona, 1127 E. James E. Rogers Way, Tucson, AZ, 85721, United States of America, shallwe123@gmail.com

1 - Multi-phase Spare Parts Provisioning for Warranty Service Demand
Wei Xie, Adjunct Assistant Professor, University of Arizona, 1127 E. James E. Rogers Way, Tucson, AZ, 85721, United States of America, shallwe123@gmail.com

In this paper, we study spare parts inventory control for warranty repairs. This study is focused on a new product covered by a non-renewable free-replacement warranty policy. We consider time-varying warranty demand rate based on stochastic sales and out-of-service units. Specifically, a multi-phase inventory model is developed to provide an effective support for the warranty service.

2 - A Condition-Based Maintenance Policy for a Multi-Unit System with Aperiodic Inspections
Minou Olde Keizer, University of Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands, m.c.a.olde.keizer@rug.nl, Ruud Teunter

In condition-based maintenance (CBM) a certain condition, e.g., vibration, is monitored to estimate the moment of failure. Maintenance is then performed right before that moment. We consider an advanced, existing, CBM optimization approach in which the aperiodic inspection moments and condition thresholds are jointly optimized for a two-unit series system. We analyze an adapted version of the system where two units operate in parallel, and provide new insights on CBM for systems with redundancy.

3 - Multi-stage Reliability Growth Planning Using Dynamic Programming
Zhaojun Li, Assistant Professor, Western New England University, 1215 Wilbraham Rd, Springfield, MA, 01119, United States of America, zhaojun.li@wne.edu

This research formulates the multi-stage reliability growth planning using dynamic programming. Product development usually experiences multiple stages and optimal resources allocation including testing time and units for each stage can lead to higher projected reliability. One stage's reliability growth depends on previous stages' reliability growth, which forms a sequential decision process. The approach for reliability growth planning is demonstrated through an engine development example.

Revenue Management Applications for Non-Travel Industries

Sponsor: The Practice Track

Sponsored Session

Chair: Bruce Patty, Vice President, Veritec Solutions, 75 Lochinvar Road, San Rafael, Ca, 94901, United States of America, BPatty@veritecsolutions.com

1 - Revenue Management in the Self Storage Industry
Bruce Patty, Vice President, Veritec Solutions, 75 Lochinvar Road, San Rafael, Ca, 94901, United States of America, BPatty@veritecsolutions.com

The Self Storage industry presents several problems of interest from setting starting rates to making rate changes for existing customers. In this presentation, an overview of the decisions to be made will be provided as well as a detailed look into the existing customer rate change decision.

2 - Price and Revenue Optimization in the Rental Industry
Hossam Zaki, Vice President of Pricing Science, Zilliant, hossam_zaki@yahoo.com

This presentation will provide insights into and comparisons between two Price and Revenue Optimization (PRO) problems in the rental vertical. The first is PRO for the B2C One-Way Truck Rental industry. The second is PRO for the B2B Equipment Rental industry. We will contrast between the B2C aspects of the first and the B2B aspects of the second and how these aspects affect the solution design.

Sponsored Session

Chair: Natalie Scala, Assistant Professor, Towson University, Dept. of e-Business and Technology Manag, 8000 York Road, Towson, MD, 21252, United States of America, nscala@towson.edu

1 - Making the Case for Case Management: Identifying High Risk Diabetes Patients
David Anderson, Assistant Professor, Baruch College, Zicklin School of Business, 1 Bernard Baruch Way, New York, NY, 10010, United States of America, david.anderson@baruch.cuny.edu, Margrét Bjarnadöttir

In this paper we show that insurance claims data can be used to identify diabetes patients who are relatively healthy and low cost, but are at risk of having high costs in the following year. Using a mix of regression analysis and other data mining techniques, we are able to identify a patient cohort that has low costs in the observation year, but have high costs the next year. We identify a group of patients who go from an average cost of under $5,500 to over $12,000 in the following year.

2 - Simulating Carrier Strike Group Manning
Hoda Parvin, Research Analyst, CNA, 4825 Mark Center Dr, Alexandria, VA, 22311, United States of America, Parvinh@cna.org, Edward Schmitz, David Rodney

We present a discrete event simulation model to study the impact of enhanced carrier strike group (CSG) presence on Navy's personnel. We develop several manning policies to assess how enhancing CSG presence affect various aspects of Navy manpower. The model informs policy makers on optimal points of CSG manning without degrading other sea billets. We show the impact of changing manning priorities over the deployment cycle and produce both immediate and long-term estimates of the impacts.

3 - Fortification of Network Components against Intentional Disruptions
Gokhan Karakose, University of Missouri, Columbia, MO, United States of America, gkz7c@mail.missouri.edu, Ronald McGarvey, Mustafa Y. Sir

In this paper, a methodology to protect a transportation network components against interdictors (i.e. attacks) is proposed to minimize the economic impact of network disruption. Here, the cost of network disruption is defined as the number of users who are unable to reach their destinations because of the cut in the network. This cost is integrated to maintenance optimization models which are developed in a game theoretic perspective.

Decision Analysis 5

Contributed Session

Chair: Vijitashwa Pandey, Assistant Professor, Oakland University, 2200 N Squirrel Rd, Rochester, MI, 48309, United States of America, pandey2@oakland.edu

1 - Collaborative Decision Analysis for Stakeholder Agency Engagement in Resource Management
Matthew Wood, Research Psychologist, US Army Engineer Research & Development Center, USACE New England District, 696 Virginia Road, Concord, MA, 01742, United States of America, matthew.d.wood@usace.army.mil, Keith Rudie, Mandy Michalsen, Leah Wickstrom, Matthew Bates, Igor Linkov

Decision making in resource management contexts requires the coordinated effort of a variety of organizations tasked with different regulatory missions. We describe an effort using multi-criteria decision analysis to structure discussion and promote collaboration between these groups, and facilitate development of conceptual design alternatives for improving the Green River in Kent, WA to effectively balance concerns (e.g. flood risk, ecology) shared across these organizations.

2 - Heterogeneity Based Grading
Deokkyo Oh, Researach fellow, Korea Corporate Governance Service, 76 yeouinaru-ro, youngdeungpo-gu, Seoul, 150977, Korea, Republic of, deokkyo.oh@gmail.com

Conventional grading models generally follow the percentile rule but sometimes make a problem in interpreting the grading result as each grade is not so identically explanary. Therfore, in this research, heterogeneity based grading model will be developed with the cluster analysis. The number of grade suitalbe to data set will be found first and more specifically, two-stage cluster analysis shall be adopted in this research to identify the "good" and "bad" groups first and detailed grades.

3 - Experiment Design for Multiple Attribute Selection Problems
Dennis Leber, NIST, 100 Bureau Drive, Gaithersburg, MD, 20899, United States of America, dennis.leber@nist.gov, Jeffrey Herrmann

When collecting data to support a selection decision, the decision-maker must decide which data to collect. Ranking and Selection methods provide guidance on such experiment designs with focus on allocating data collection across the alternatives. We present work on allocating a fixed data collection budget across multiple attributes. We developed several allocation rules and tested their performance. The better allocation rules considerably increased the probability of correct selection.

4 - Antibiotic Stewardship: A Decision Analytic Approach
Vijitashwa Pandey, Assistant Professor, Oakland University, 2200 N Squirrel Rd, Rochester, MI, 48309, United States of America, pandey2@oakland.edu, Vipul Shukla

Antibiotic stewardship, a sequential decision-making process used to delineate and assess antibiotic treatment regimens, is an essential tool utilized in health-care. Evolving antibiotic resistance mechanisms and profiles of pathogenic microorganisms require alteration of treatment regimens. This presentation will discuss a decision theoretic framework for optimizing antibiotic stewardship.

Forecasts and Judgments

Sponsor: Decision Analysis

Sponsored Session

Chair: Asa Palley, Duke University, The Fuqua School of Business, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, asa.palley@duke.edu

1 - The Benefits of Eliciting, Evaluating, and Aggregating Forecasters' Quantiles
Casey Lichtendahl, University of Virginia, 100 Darden Blvd, Charlottesville, United States of America, LichtendahlC@darden.virginia.edu, Yael Grushka-Cockayne, Robert Winkler

We present the benefits of eliciting, evaluating, and aggregating forecasters' quantiles, rather than their probabilities. We characterize the class of proper scoring rules for multiple quantiles. By applying the idea of bracketing to quantiles, we propose new measures for evaluating the quality of a crowd's forecasts. In aggregating quantiles, we show that averaging quantiles can be consistent with a Bayesian updating process.

2 - Measuring Advice Taking
Jack Soll, Associate Professor, Duke University: Fuqua School of Business, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, jsoll@duke.edu, Min Bang, Asa Palley, Christina Rader

We introduce a new measure of advice taking, IOA (influence of advice). IOA more completely measures influence compared to extant alternatives, because it applies to entire probability distributions and not just point estimates. We discuss the properties of IOA, and the new insights it reveals about behavior.

3 - Eliciting and Aggregating Forecasts when Information is Shared
Asa Palley, Duke University, The Fuqua School of Business, 100 Fuqua Drive, Box 90120, Durham, NC, 27708, United States of America, asa.palley@duke.edu, Jack Soll

Dependence in forecast errors greatly limits the ability of the wisdom of crowds to recover the truth. This dependence often emerges because information is shared: forecasters may draw on the same data when formulating their responses. We present an elicitation procedure in which forecasters also guess how others will respond. An assessor can aggregate these responses through a technique called pivoting. We discuss the results of several studies examining the accuracy of the aggregate forecasts.

Graphical Models in Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Wenhao Liu, PhD Candidate, Stanford University, 475 Via Ortega, Stanford, Ca, 94305, United States of America, owenliu@stanford.edu

1 - Facilitating the Construction of Bayesian Networks from the Literature
Lea Deleris, IBM, Dublin Research Lab, Dublin, Ireland lea.deleris@ie.ibm.com, Stephane Deparis, Bogdan Sacaleanu, Charles Jochim

We have built information extraction and aggregation algorithms to facilitate the construction of Bayesian networks (BNs) from information contained in the literature. Specifically, we extract probabilities and dependence/independence statements from a set of specified academic papers, aggregate the statements into a BN structure and make use of the probabilities to determine the parameters of the conditional probability tables. We illustrate our approach with papers related to breast cancer.

2 - Inference in Hybrid Influence Diagrams with Deterministic Conditionals
Prakash P. Shenoy, Ronald G. Harper Distinguished Professor of Artificial Intelligence, Univ. of Kansas Business School, 1300 Sunnyside Ave, Summerfield Hall, Lawrence, KS, 66045-7601, United States of America, pshenoy@ku.edu

We discuss some challenges associated with making inferences in hybrid influence diagrams with deterministic conditionals. For problems that can be solved without arc-reversals, these challenges can be overcome by approximating conditionals probability density and utility functions by mixtures of polynomials. A framework for making inferences is described and illustrated with examples.

3 - Extending Influence Diagram Graphics
Jim Matheson, Chairman, SmartOrg, Inc., 855 Oak Grove Ave, Ste 202, Menlo Park, CA, 94025, United States of America, jmatheson@smartorg.com

The original conceptualization of influence diagrams had only Decision and Chance Nodes (sometimes deterministic), and values were thought to be in another third dimension. Then explicit Value Nodes allowed automatic generation of complete decision models. An extension is to add "data analytic" nodes, which usually point into a chance node to be further evaluated and interpreted by human assessments. Human interpretation gives a view of where you are going: a "windshield" above the "dashboard.

4 - Efficient Observation Set Selection for Bayesian Networks, with Application in Petroleum Prospecting
Marie Lilleborge, PhD Student, Norwegian Computing Center, P.O. Box 114 Blindern, Oslo, NO-0314, Norway, lilleborge@nr.no

We try to speed up observation set selection for BNs, while still ensuring optimality of the information gathering. Probability updates must be calculated many times, so it is crucial to use fast routines such as the Junction Tree Algorithm even for small BNs. For larger BNs, we use upper and lower bounds inspired by JTA.

5 - Complexity of the Exact Solution to the Test Sequencing Problem
Wenhao Liu, PhD Candidate, Stanford University, 475 Via Ortega, Stanford, Ca, 94305, United States of America, owenliu@stanford.edu, Ross Shachter

We analyze the complexity of decision tree and influence diagram solutions to the test sequencing problem. We develop an MDP influence diagram formulation that scales better, and show how a decision circuit formulation improves on the decision tree solution through recursive coalescence. We prove that this decision circuit formulation achieves the lower bound complexity for the general test sequencing problem and renders this problem tractable for more tests than has been possible to date.

Sponsored Session

Chair: Mustafa Gökce Baydogan, Assistant Professor, Department of Industrial Engineering, Bogaziçi University, Bebek, Istanbul, 34342, Turkey, mustafa.baydogan@boun.edu.tr

1 - Regularization Methods for Virtual Metrology Modeling

Seoung Bum Kim, Associate Professor, Korea University, Anam-Dong, Seongbuk-Gu, Seoul 136-713, Seoul, Korea, Republic of, sbkim1@korea.ac.kr, Chan Hee Park

In this study, we present various regularization algorithms for virtual metrology modeling in semiconductor manufacturing processes. Advantages and disadvantages of each method are discussed.

2 - Clustering of Short Time-Course Gene Expression Data with Dissimilar Replicates

Cem Iyigün, Assistant Professor, Middle East Technical University, Endustri Muhendisligi, ODTU, ANKARA, 06800, Turkey, iyigun@metu.edu.tr, Ozlem Ilk Dag, Ozan Cinar

In this study, we propose a clustering method where every gene is considered as a collection of short time-series of replications by using a distance measure coupling the Euclidean distance and slope changes. The numerical experiments showed that the proposed approach can find the clusters very fast with a low percentage of misclassification. Furthermore, various criteria are proposed for finding the number of clusters.

3 - Ensemble Learning Strategies for Large-scale Time Series Analysis and Data Mining

Mustafa Gökçe Baydogan, Assistant Professor, Department of Industrial Engineering, Bogaziçi University, Bebek, Istanbul, 34342, Turkey, mustafa.baydogan@boun.edu.tr

We introduce a novel time series (TS) representation based on a tree-based ensemble learning strategy. Earlier, many high-level representations have been proposed for TS data mining but they require many parameters and have problems with generalizability. Our proposed approach is scalable, imposes no constraints and has only one parameter. Benefits of our approach are illustrated on 45 TS classification problems. The approach has promising extensions to clustering, anomaly detection etc.

Building MCDM Models: Practical and Methodological Issues

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Danielle Morais, daniellemorais@yahoo.com.br

Co-Chair: Adiel Teixeira Almeida, Professor, Universidade Federal de Pernambuco, Recife, PE, Brazil, almeidaatd@gmail.com

1 - Resolving Evaluation of Criteria Weights by Interactive Flexible Elicitation

Adiel Teixeira Almeida, Professor, Universidade Federal de Pernambuco, Recife, PE, Brazil, almeidaatd@gmail.com, Ana Paula Costa, Adiel T. de Almeida Filho, Jonatas Almeida

The paper deals with the elicitation of weights of multicriteria additive models, which is one of the most relevant issues in additive models. The tradeoff elicitation procedure is one of the approaches with strongest theoretical foundation. This paper presents a method based on flexible elicitation for the tradeoff procedure so as to reduce the DM effort in the process. The use of the DSS is illustrated by an application.

2 - Selecting Suppliers with an Additive-veto Multicriteria Model

Luciana Hazin, UFPE, Av. Académico Hélio Ramos, Recife, Brazil, alencarlh@gmail.com, Adiel Teixeira Almeida

Organizations have taken an increasing interest in analyzing outsourcing, particularly with regard to selecting suppliers. Thus, this study puts forward a multicriteria decision aid model to assist companies to select suppliers, using an additive-veto model. An application for selecting contractors for a building site using this model is presented.

3 - A Multi Criteria Failure Mode Effects and Criticality Analysis Approach

Adiel T. de Almeida-Filho, Assistant Professor, Universidade Federal de Pernambuco, Caixa Postal 7471,cordeiro, Recife, PE, 50630971, Brazil, atalmeidafilho@yahoo.com.br, Marcelo Alencar, Adiel Teixeira Almeida

This work presents a multi criteria failure mode effects and criticality analysis (FMECA) approach. FMECA provides a critical and systematic evaluation of potential failure modes and its causes with respect to an industrial plant or a specific equipment by considering a risk priority number (RPN). The approach proposed can be used to rank potential causes from FMECA providing managerial information for resources allocation amongst failure prevention, inspections and preventive maintenance.

4 - A Multi-criteria Decision Model for Technology Readiness Assessment

Danielle Morais, Federal University of Pernambuco, Production Engineering Department, Brazil, daniellemorais@yahoo.com.br, Adiel Teixeira Almeida, Ceres Cavalcanti

The Brazilian energy production is traditionally generated by hydroelectricity. However, the actual challenge of the sector is to identify new technologies for supply energy for the country. This study deals with a multicriteria decision model for Technology Readiness Assessment in order to improve the decision making in this sector.

Advances in Business Data Analytics

Sponsor: Data Mining

Sponsored Session

Chair: Nick Street, Professor and Departmental Executive Officer, The University of Iowa, S210 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, nick-street@uiowa.edu

1 - The Effect of Diversity in Dynamic Class Prediction

Senay Yasar Saglam, Graduate Student, University of Iowa, S210 John Pappajohn Business Building, Iowa City, IA, 52242, United States of America, senay-yasarsaglam@uiowa.edu, Nick Street

Dynamic class prediction has taken great attention for the last couple of decades. Accuracy and prediction confidence are used to evaluate ensemble performance. In this study, we analyze the effect of diversity in three experimental settings. For each new point, we choose ensembles via: random assignment, heuristic search process, and a two-phase framework using probability-based distance measure. After accounting for certain features of the ensembles, we find that diversity remains useful.

2 - On Over-Specialization and Popularity Biases of Recommender Systems

Panagiotis Adamopoulos, PhD Candidate, New York University, 4 4 W 4th Street, New York, NY, 10012, United States of America, padamopo@stern.nyu.edu, Alexander Tuzhilin

Focusing on the problems of over-specialization and concentration bias in recommender systems, we propose a novel probabilistic method in the neighborhood-based collaborative filtering framework. We conduct an empirical study showing that the proposed method increases the diversity, dispersion, and mobility of recommendations by selecting diverse sets of neighbors. This performance improvement is in accordance with ensemble learning theory and the phenomenon of "hubness" in recommender systems.

3 - Building Interpretable Descriptive Patterns for Discrete Linear Classification

Tong Wang, Student, MIT, 70 Pacific St Apt 242a, Cambridge, Ma, 02139, United States of America, tongwang@mit.edu, Cynthia Rudin

Descriptive Pattern (DP) sets are a collection of rules used to characterize groups of objects in data. We present a MIP model to create accurate and interpretable DP sets. Our model penalizes the lengths of the rules, the number of features per rule, and the total number of features to create collections of rules that are more understandable to human experts. We show how DP rules can be used for classification, and introduce extensions to improve the predictive accuracy of these models.

Mathematical Modeling and Operations Research in Military Decision Making II

Sponsor: Military Applications Society

Sponsored Session

Chair: William Fox, Professor, Naval Postgraduate School, Department of Defense Analysis, Monterey, CA, 93943, United States of America, wpfox@nps.edu

1 - Military Capital Budgeting with Risk and Effectiveness

Mike Teter, PhD Candidate, Colorado School of Mines, 1500 Illinois St, Golden, CO, 80401, United States of America, mteter@mymail.mines.edu

We consider a new approach to modeling military capital budgeting with minimum risk while meeting an acceptable effectiveness level. We build a framework for computational methods, e.g., decision analysis and mathematical programming, used in deriving risk and effectiveness. We apply the corresponding framework to plan future procurement purchases of the US Army. We employ visualization techniques to demonstrate the results to senior-level planners.

2 - using Mathematical Models in Decision Making Methodologies to Find Node Influences in the Noordin Dark Network

William Fox, Professor, Naval Postgraduate School, Department of Defense Analysis, Monterey, CA, 93943, United States of America, wpfox@nps.edu

In dark network analysis, we use SNA measures and metrics. We use these in decision making concerning disrupting or deceiving a given network. We explore methods to identify the key nodes such as an average ranking scheme, AHP, and TOPSIS. We compare these methods using the Noordin Dark Network with seventy nine nodes.

3 - Sense Making of Narratives: Informing a Rapid Fielding Process

Michael Jaye, Associate professor, Naval Postgraduate School, Dept of Defense Analysis, Monterey, CA, United States of America, mjjaye@nps.edu

The Warfighter Technology Tradespace Methodolgy applies a construct that relies on technical, logistics, and user factors. The intent is to maximize the likelihood of technology acceptance upon fielding. To inform that process as feedback, we gathered and analyzed narratives from soldier end users. We present the narrative collection process and results. The intent is to highlight user dispositions as well as those factors influencing acceptance or rejection of the newly fielded equipment.

4 - The Value of a Whisper in Changing the Attitudes and Opinions of a Population

COL (R) Robert Burks, Department of Defense Analysis, NPS, 5125 Ocean Bluff Court, Seaside, 93955, United States of America, reburks@nps.edu

This research seeks to develop a planning aid to facilitate the disruption of a dark network by triggering a cascade of influence in a competing environment by which individuals accept and spread a negative message to other individuals in the network as fast and efficient as possible. Presented is the progress and efforts to identify the key individuals in a network to ensure the dissemination of a rumor reaches and triggers a cascade eroding confidence and trust in the dark network.

The Economic and Social Impacts of Mobile Apps

Sponsor: eBusiness

Sponsored Session

Chair: Sang Pil Han, Assistant Professor, Arizona State University, W.P. Carey School of Business, Tempe, AZ, United States of America, sangpil78@gmail.com

1 - Do App Descriptions Matter? Evidence from a Mobile App Store Market

Gunwoong Lee, Doctoral Candidate, Arizona State University, W.P. Carey School of Business, Tempe, AZ, 85287-4606, United States of America, gunwoong.lee@asu.edu, Raghu Santanam, Sungho Park

Mobile App markets enable developers to deliver an array of App-related attributes and/or marketing messages through the head of product descriptions. We evaluate whether extrinsic and intrinsic cues in App descriptions significantly impact App sales and whether they can complement the cues offered from a product page. Our results suggest that extrinsic cues are strongly related to App rankings, and substantiate the complementarities between extrinsic cues in App description and market formats.

2 - The Impact of the Freemium Strategy on the Adoption of Mobile Apps in Google Play Market

Charles Liu, Associate Professor, University of Texas at San Antonio, 1 UTSA Circle, College of Business, UTSA, San Antonio, TX, 78249, United States of America, Charles.Liu@utsa.edu, Yoris Au

This study empirically examines the impact of offering free mobile apps on the adoption of their paid version in Google Play mobile app market. By analyzing a large panel dataset consisting of 1922 free and paid mobile apps, we found that the adoption of a paid mobile app is significantly accelerated when a high quality free mobile app is offered, and the lifecycle of a paid version of a mobile app is highly associated with the lifecycle of its free version. However, the effect of the freemium strategy is significantly reduced when free apps are prevalent in the same app category or when there is high quality differentiation between the free and paid versions of an app (e.g., limited time or limited functionality of the free version). Moreover, we found that such quality differentiation also has a significant impact on the revenue from the paid apps.

3 - Nature or Nurture? An Analysis of Rational Addiction to Mobile Platform Apps

Hyeokkoo Eric Kwon, Doctoral Candidate, KAIST School of Business, Korea Advanced Institute of Science, Cheongnyangni-dong, Dongdaemun-gu, Seoul, 130-722, Korea, Republic of, hkkwon7@business.kaist.ac.kr, Hyunji So, Sang Pil Han, Wonseok Oh

We extend the rational addiction model of Becker and Murphy (1988) to three types of mobile social apps (e.g., SNS, Social Game (SG), and Instant Messaging Service (IMS)) that are offered at a free of charge. Furthermore, using unique panel data set, we investigate their rational addictiveness. The initial findings suggest that all three apps are addictive. However, only users of SG are found to be rational, while such rational behaviors are not evident among users of SNS and those of IMS.

4 - An Empirical Analysis of Mobile App Time Use: Are Facebook and YouTube App Use Complements?

Sang Pil Han, Assistant Professor, Arizona State University, W.P. Carey School of Business, Tempe, AZ, United States of America, sangpil78@gmail.com, Sungho Park, Wonseok Oh

In this study, we use a unique panel data set detailing individual-level mobile app time-use and build a utility theory-based model for multiple discrete/continuous choice of app use. We quantify the baseline utility and satiation levels of different mobile app categories and examine how these vary with user demographics. To allow for category (dis)similarity in unobserved attributes, we employ a factor analytic structure in our multiple discrete/continuous model.

Entrepreneurial/Innovative Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Onesun Steve Yoo, Assistant Professor, University College London, Gower Street, London, United Kingdom, o.yoo@ucl.ac.uk

1 - Optimal Learning and Development Strategy for Entrepreneurial Product Launch

Onesun Steve Yoo, Assistant Professor, University College London, Gower Street, London, United Kingdom, o.yoo@ucl.ac.uk, Tingliang Huang, Kenan Arifoglu

We examine the setting of an entrepreneurial firm engaged in an early product development process. We adopt a Bayesian approach and present a formal model of learning and development in the entrepreneurial firm's product development process. We examine whether or not such frequent developing and learning cycles are beneficial for the entrepreneur, and if so, when.

2 - Dynamic or Persistent? How to Spend on R&D

Christophe Pennetier, Student, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Christophe.Pennetier@insead.edu, Karan Girotra, Jurgen Mihm

We study the impact of R&D spend variability on the R&D performance of publicly traded US firms. Using a novel dataset that combines Compustat data with patent outcomes, we find that controlling for the level of total R&D spend, firms that employ more year-to-year variation get significantly lower R&D outcomes (patent+citation counts). Further dissecting the results, we identify their root causes. A steady hand approach in R&D spend is most productive, while responsiveness can hurt the firm.

3 - Supervising Major Projects You Do Not Fully understand

Svenja Sommer, HEC Paris, 1 Rue de la Libération, Jouy en Josas, France, sommers@hec.fr, Magnus Mahring, Christoph Loch

This study addresses the challenges facing senior executives who serve on supervising bodies of large and strategically important initiatives. They ultimately bear responsibility, but cannot understand all the details of what is going on. In this situation, how can executives provide the necessary guidance and supervision? Based on interviews with senior managers, we discover strategies on how to set targets, evaluate progress, respond to surprises and evaluate the people.

4 - When is Necessity the Mother of Invention?

Stelios Kavadias, Margaret Thatcher Professor Innovation and Growth, Cambridge Judge Business School, Trumpington Street, Cambridge, UK, CB2 1AG, United Kingdom, s.kavadias@jbs.cam.ac.uk, Sezer Ulkü

Many claim that "necessity if the mother of invention" and that adverse conditions induce creative thinking (e.g., Jugaad innovation). Yet, the unknowns of every innovation context, point to the need for unbounded, and thus unconstrained, search and exploration; constraints should(?) make it difficult for the firm to change direction in response to new information, resulting in inferior solutions. We explore how different types of constraints affect the performance of entrepreneurial efforts.

Hilton- Continental 2

Supply Chain Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Elodie Adida, University of California at Riverside, School of Business Administration, Riverside, United States of America, elodie.goodman@ucr.edu

1 - When Dynamic Pricing Meets Graph Theory

Georgia Perakis, William F. Pounds Professor, Massachusetts Institute of Technology, Sloan School of Management, Cambridge, MA, 02142, United States of America, georgiap@mit.edu, Swati Gupta, Maxime Cohen

We introduce a class of dynamic programs for multi-period pricing problems based on an equivalent graphical reformulation. Our formulation can handle several business rules that arise in practice and considers demand models that capture the stockpiling behavior of consumers through dependence on past prices. For fixed memory, we propose a polynomial time algorithm but also illustrate that when the memory is large the problem is NP hard. We introduce approximation schemes for solving the problem.

2 - Advance Demand Information in a Multi-Product System

Fernando Bernstein, Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, fernando.bernstein@duke.edu, Greg DeCroix

We examine the impact of different types of advance demand information on firm profit and on the benefits of resource flexibility. The firm receives information revealing either the total volume of demand across products or the mix of demand between products. We examine two scenarios: a setting with dedicated resources and one with a common resource. Mix and volume information are complements in systems with dedicated resources, but they are substitutes in a system with a common resource.

3 - Competition and Coordination in a Two-channel Supply Chain

Elodie Adida, University of California at Riverside, School of Business Administration, Riverside, United States of America, elodie.goodman@ucr.edu, Amy David

We study competition and coordination in a supply chain in which a single supplier both operates a direct channel and sells its product through multiple retailers competing in quantities. We find that the two-channel supply chain may be subject to inefficiencies not present in the traditional supply chain, and study its coordination both with symmetric and asymmetric retailers.

Data-Driven Methods in Inventory Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Alp Akcay, Assistant Professor, Bilkent University, Ankara, 06800, Turkey, alp.akcay@bilkent.edu.tr

1 - Demand Fulfillment Probability under Parameter Uncertainty

Canan Gunes Corlu, Boston University, 808 Commonwealth Avenue, Boston, United States of America, canan@bu.edu, Bahar Biller, Sridhar Tayur

In a budget-constrained multi-item inventory system, we consider the case of unknown demand parameters estimated from historical data. The objective is to identify the inventory targets that maximize the demand fulfillment probability subject to a budget constraint on the total inventory investment. We show that the inventory targets accounting for parameter uncertainty achieve an increase of up to 6% in the expectation and a reduction of up to 86% in the variance of the fulfillment probability.

2 - Partner Evaluation in Continuous Replenishment Programs

Manuel Rossetti, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, rossetti@uark.edu, Shengfan Zhang, Payam Parsa, Edward Pohl

A continuous replenishment program (CRP) is a supply chain initiative in which the manufacturer manages the replenishment process using shared demand information provided by the customer. This paper is focused on quantifying the partner selection process from the perspective of the manufacturer, who faces a set of customers. Several factors such as volume, customer location, requested product mix and desired service level are considered as inputs for this selection process.

3 - The Newsvendor under Demand Ambiguity: Combining Data with Moment and Tail Information

Soroush Saghafian, Arizona State University, Tempe AZ, United States of America, Soroush.Saghafian@asu.edu, Brian Tomlin

Data-driven approaches typically assume that the planner has no information beyond the evolving history of demand observations. The planner may, however, have partial information about the demand distribution in addition to demand observations. We propose a non-parametric, maximum-entropy based technique, termed SOBME (Second Order Belief Maximum Entropy), which allows the planner to effectively combine demand observations with partial distributional information.

4 - A Novel Aggregation Method for Assemble-to-Order Systems

Emre Nadar, Assistant Professor, Bilkent University, Bilkent University, Ankara, Turkey, emre.nadar@bilkent.edu.tr, Mustafa Akan, Alan Scheller-Wolf, Alp Akcay

We present an approximate dynamic programming method to the inventory control of large assemble-to-order (ATO) systems, under Markovian assumptions on production and demand. We approximate the optimal cost function by reducing the state space of the original problem via a novel aggregation technique. We show the optimality of a lattice-dependent base-stock and rationing policy for the aggregate problem. We establish error bounds for this approximation and provide computational results.

Hilton- Continental 4

Supply Chain Management I

Contributed Session

Chair: Susan A. Slotnick, Professor, Cleveland State University, Monte Ahuja College of Business, 1860 E. 18th Street, Cleveland, OH, 44115, United States of America, s.slotnick@csuohio.edu

1 - A Supply Chain with Third-party Reverse Logistics for Product Returns

Yertai Tanai, Kent State University, P.O. Box 5190, Department of Management and Information, Kent, OH, 44242, United States of America, ytanai@kent.edu, Butje Eddy Patuwo, Alfred L Guiffrida

We consider a two-echelon supply chain with reverse logistics. It consists of a supplier, a retailer and a 3PL provider that processes the product returns independently. The product flow is initiated by the supplier that directly supplies the retailer, which services the customers. Based on Markov processes and queuing network, we seek to find a base-stock level that minimizes the expected total cost for the retailer and a capacity that minimizes the total expected cost for the 3PL.

2 - The Value of Information Sharing in Supply Chains Facing Seasonal Demand

Vladimir Kovtun, Sy Syms School of Business, 500 W 185th Street, New York, NY, 10033, United States of America, vladimir.kovtun@yu.edu, Avi Giloni, Clifford Hurvich

We study the value of information sharing in a two player supply chain where the most downstream player (retailer) observes external demand that is generated by one of several seasonal autoregressive processes. We find that information sharing is valuable only in the presence of strong seasonality in the demand observed by the retailer. Furthermore there is never value in information sharing when the retailer and its supplier observe peak and low seasons at the same time.

3 - Practice of Supply Chain Management in Small- and Medium-sized Enterprise

Mi-Ae Kim, Ph.D. Candidate, Kyungpook National University, 80 Daehak-ro, Buk-gu, Daegu, 702-701, Korea, Republic of, olive5263@naver.com, Chang-Kyo Suh

The purpose of this study is to determine the underlying dimensions of supply chain management(SCM) practice in small- and medium sized enterprise(SEM). The study identifies current trends and adoption of SEM's SCM in South Korea. The results reveal the perceived benefits and major barriers of SCM to SEMs. The study provides thoughts on how SMEs can improve SCM within their own organizations and supply chain.

4 - Reverse Supply Chain for Remanufacturing with Uncertain Demand and Return Product Yield

Samar Mukhopadhyay, SKK University GSB, 53 Myungryun-dong 3-ga, Jongno gu, Seoul, Se, 110-745, Korea, Republic of, samar@skku.edu, Huafan Ma

Remanufacturing as a means of sustainability is increasingly resorted to. But it brings in the problem of uncertain yield, unlike new parts. We design a supply chain contract that also takes into account short and long manufacturing lead times. We consider two popular types of contracts, a push or a pull contract. We obtain optimal supply chain contracts for these contract types, and a random yield rate and demand. We compare the results of different scenarios and develop managerial insights.

5 - Supply Chain Transparency and Ethical Sourcing

Susan A. Slotnick, Professor, Cleveland State University, Monte Ahuja College of Business, 1860 E. 18th Street, Cleveland, OH, 44115, United States of America, s.slotnick@csuohio.edu, Jen-Yi Chen

Two firms produce the same product. One sources ethically and the second does not, and market share is affected by the nature of their sources and whether or not they disclose them. Costs include procurement, disclosure and discovery. We investigate the tradeoffs involved and the incentives for a firm to disclose the nature of its sourcing in response to its cost and market structure, as well as the characteristics of its competitors.

Military Application 1

Contributed Session

Chair: Timothy Chung, Assistant Professor, Naval Postgraduate School, 777 Dyer Road, BU-218, Monterey, CA, 93943, United States of America, thchung@nps.edu

1 - Modeling of Probabilistic Search with Uncertain Prior Information

Timothy Chung, Assistant Professor, Naval Postgraduate School, 777 Dyer Road, BU-218, Monterey, CA, 93943, United States of America, thchung@nps.edu

This work investigates the impact of variability in the prior information in the probabilistic Bayesian search for a target. This analysis offers insights into the search process, and provides enhanced guidance to improve search performance. We present heuristics that inform the initialization and execution of the search process that address the uncertainty present in the initial probability values, and demonstrate the efficacy of the proposed search strategies through simulation studies.

2 - Inventory Optimization for the United States Navy Destroyer Fleet

Andrew Johnson, PhD Candidate, Rutgers Business School, 1 Washington Road, Newark, NJ, United States of America, andrew.johnson@rutgers.edu, Yao Zhao

A general problem that the US Navy has encountered is the need to optimize a set of mission critical parts, which make up the Ballistic Missile Defense System. Because of the low demand nature, the part(s) may not be readily available and can render the vessel non-operational. Also, an additional issue that leadership is having is quantifying the cost of not having a vessel at a designated location or region of responsibility because of the missing part(s).

3 - Analytical Models for Sea-Based Logistics Operations

Jennifer Pazour, University of Central Florida, 4000 Central Florida Blvd, Building 91 R, Orlando, Fl, 32816, United States of America, Jennifer.Pazour@ucf.edu

Sea Basing is a concept of the United States Navy that allows the Joint Forces to be supported from the sea. From a logistics perspective, sea-basing will require ship-to-objective locations, selective offloading, and transfer of cargo between ships. We develop models to quantify and evaluate sea-based logistic system design and to aid in analyzing the trade-offs associated with operating in a complex and uncertain environment where decisions must be made in the face of imperfect information.

4 - Advancing the State of the Art in Applying Network Science to Command and Control (C2)

Herman Monsuur, Netherlands Defence Academy, Faculty of Military Sciences, Enys House, Het Nieuwe Diep 8, Den Helder, 1781 AC, Netherlands, H.Monsuur@nlda.nl, Rene Janssen, Tim Grant

Modern C2 systems link tens of thousands of computers and their users. Network science provides the mathematical techniques for representing and analyzing networks with millions of nodes. C2 has been making a transformation from top-down, directive command to Network Enabled Capability (NEC), self-synchronization, and agility. Therefore C2 systems are regarded as networks, rather than a hierarchy. It is appropriate to view these processes and systems through the lens of network science.

5 - Risk-averse Stochastic Network Interdiction

Churlzu Lim, Associate Professor, University of North Carolina at Charlotte, 9201 University City Blvd., Charlotte, NC, 28269, United States of America, clim2@uncc.edu

We consider a stochastic network interdiction problem, where the leader interdicts arcs assuming the follower solves an optimization problem having stochastic parameters. In order to make a risk-averse interdiction, we propose to use CVaR, a popular financial risk measure, as the objective function. The efficacy of the risk-averse interdiction using CVaR will be discussed via numerical examples.

■ WA09

Hilton- Continental 6

Applications of Cognitive Analytics

Cluster: Cognitive Analytics

Invited Session

Chair: Horst Samulowitz, IBM Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, samulowitz@us.ibm.com

1 - Medical Sieve: A Multimodal Cognitive Assistant for Radiologists and Cardiologists

Tanveer Syeda-Mahmood, Chief Scientist & Research Manager, IBM Research, 650 Harry Road, San Jose, CA, 95120, United States of America, stf@us.ibm.com

Medical Sieve is a new cognitive assistant system that filters the essential clinical information from patient records for diagnosis and treatment planning. It uses sophisticated medical text and image processing, pattern recognition and machine learning techniques guided by advanced clinical knowledge to process clinical data about the patient to extract meaningful summaries indicating the anomalies, and comparisons to similar patients.

2 - Measuring and Predicting Personal Traits and Behavior from Social Media

Eben Haber, Research Staff Member, IBM Almaden Research Center, 650 Harry Road, San Jose, CA, 95120, United States of America, ehaber@us.ibm.com

Psycholinguistic research has shown that traits such as personality affect a person's language, and that it is possible to infer those traits from samples of a person's writing. Social media makes millions of writing samples available, this has huge implications in areas from marketing to enterprise team building. We present the results of several studies in this area, showing what we can learn about people through social media and how we can use that information to better engage with them.

3 - FoodSIS: A Text Mining System to Improve the State of Food Safety in Singapore

Jayant Kalagnanam, Chief Scientist, IBM Research, Yorktown Heights, NY, 10598, United States of America, jayant@us.ibm.com, Sneha Chaudhari, Andy Prapanca, Kiran Kate

FoodSIS improves efficiency of such focused information gathering process with the use of machine learning techniques to identify and rank relevant content. We discuss the challenges in building such a system and describe how thoughtful system design and recent advances in machine learning provide a framework that synthesizes interactive learning with classification to provide a system that is used in daily operations.

Operations/Sustainability 1

Contributed Session

Chair: Eylem Koca, Assistant Professor, Fairleigh Dickinson University, 1000 River Road, H-DH2-06, Teaneck, NJ, 07666, United States of America, koca@fdu.edu

1 - A Factorial Design for Factory Demand Response with Onsite Wind and Solar Energy

Victor Santana-Viera, Student, Texas State University - San Marcos, 601 University Drive, San Marcos, TX, 78666, United States of America, vas41@txstate.edu, Jesus Jimenez, Jose Espiritu, Tongdan Jin

We implement a demand response program for large industry consumers to meet the uncertain load curtailment requirement using onsite renewables generation as power backup. Instead of shutting down machines, onsite wind-solar generation allows the manufacturers to meet the curtailment goal while maintaining the normal production. We use design-of-experiment methodology to size the wind and solar generators such that the DR benefit is maximized under uncertain wind speed and weather condition.

2 - A New Modeling Approach to Waste Management

Mariapaola Testa, Research Assistant, Massachusetts Institute of Technology - Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, mptesta@mit.edu, Stephen Graves, Timothy Gutowski

Waste treatment facilities receive municipal solid waste as input and separate it according to its recyclable and non-recyclable components, facing the challenge of operating with high variable inputs in a commodity market. So far, only a few studies have tried to optimize the waste separation process. In our work, we propose a network-flow modeling approach to increase the plant efficiency and the recovery of valuable recyclable material.

3 - Operations Strategy under Environmental Uncertainty

Baris Yalabik, University of Bath, School of Management, Claverton Down, Bath, BA2 7AY, United Kingdom, by212@management.bath.ac.uk, Gulsun Nakiboglu, Michael Lewis

Carbon price scenarios are used to investigate the likely impact of a range of operations strategies. We develop a simulation model (based initially on the characteristics of the iron and steel industry) to examine process improvement strategies in response to the uncertain nature of carbon prices and the trajectory of best available technology over time. The results compare and contrast two types of strategies: environmental investment strategies and production reduction strategies.

4 - How Green Policy Affect Market Share? An Empirical Study of European Automobile Industry

Kejia Hu, Northwestern University, 2001 Sheridan RD, Evanston, United States of America, kejia.hu@northwestern.edu, Yuche Chen

We investigate the lead-lag effect of a company's implementation of green policy on its market share in auto industry. From a dataset composed of 14-years real-world vehicle emission records in Europe, we extract two time series of emission indexes and market share for each car model. Then we examine the lead-lag effect by Spearman Rank Correlation and change point detection methods. The results show that implementation of green policy has effects on the market share in the auto industry.

5 - The Role of Ecolabels in Consumer Markets

Eylem Koca, Assistant Professor, Fairleigh Dickinson University, 1000 River Road, H-DH2-06, Teaneck, NJ, 07666, United States of America, koca@fdu.edu, Gil Souza

The proliferation of legitimate and false ecolabels has been reported to cause confusion as to the effectiveness of ecolabels in signaling and bolstering sustainability. Using an analytical model built on recent empirical findings, we investigate why and how firms adopt ecolabels, how consumers react to ecolabels and information provided, and the implications of ecolabels from a supply chain management perspective.

Hilton- Continental 8

Supply Chain, Risk Management I

Contributed Session

Chair: Shyam Mohan, London Business School, NW1 4SA, London, London, United Kingdom, smohan@london.edu

1 - using Influence Diagrams to Effectively Manage Supply Chain Risks

Xiaojuan Wang, Tsinghua University, Department of Industrial Engineering, Room 530, Shunde Building, Beijing, 100084, China, wxj13@mails.tsinghua.edu.cn, Wancheng Feng, Jeffrey David Tew, Wanshan Zhu

Supply chain risks have a very significant impact on a firm's vulnerability which can adversely affect its financial performance. This research attempts to reduce supply chain vulnerability via a coordinated holistic approach, involving all supply chain stakeholders. Specifically, we utilize the method of Influence Diagrams to build a decision support tool which identifies and analyzes the possible risks associated with each particular supplier in a given supply chain.

2 - On Cascading Disruptions in Interconnected Supply-chain Networks

Shyam Mohan, London Business School, NW1 4SA, London, London, United Kingdom, smohan@london.edu, Nitin Bakshi

Nearly 40% of all supply chain disruptions are said to originate in tier 2 and beyond. We propose an analytical framework to study the cascading of disruptions in supply-chain networks. We formalise the notion of supply-chain resilience as a measure of how quickly firms in a supply chain recover from a disruption. We also provide a comparative metric termed relative vulnerability to identify firms which are expected to suffer greater downtimes and consequently more losses due to disruptions.

3 - Credit-constrained Suppliers, Bankruptcy and the Use of Reverse Factoring

Ram Bala, Professor, Santa Clara University, 500 El Camino Real, Santa Clara, CA, United States of America, rbala@scu.edu, Sripad Devalkar

Trade credit is a commonly observed form of financing in many supply chains. However, many big retailers source their products from small suppliers in developing countries who are significantly credit constrained and have a high probability of bankruptcy. In such cases, buyers have begun to provide 'reverse-factoring' programs to help their small suppliers get access to capital. We study the efficacy of such reverse factoring programs.

4 - Contracting for Continuity of Mission Critical Services
Marc Jansen, PhD Candidate, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, mcj32@cam.ac.uk, Nektarios Oraiopoulos, Daniel Ralph

Major interruptions to outsourced IT services are high-profile and costly, with costs increasing in frequency and duration of outages. This paper examines how contract decisions between an IT vendor and client across a sales and after-sales phase can mitigate downtime costs through appropriate system design and response capacity investments.

Hilton- Continental 9

Sustainable Operations in Electric Vehicle and Electricity Generation Systems

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Yangfang Zhou, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, helenzhou@smu.edu.sg

1 - To Sell and to Provide? The Implications of the Auto Manufacturer's Involvement in Car Sharing
Ioannis Bellos, Assistant Professor, George Mason University, 4400 University Drive, MS 5F4, Fairfax, VA, 22030, United States of America, ibellos@gmu.edu, Beril Toktay, Mark Ferguson

We study the auto manufacturer's choice regarding whether to offer a car sharing business model in conjunction with the traditional sales channel. We explicitly model the consumer's choice of transportation mode as well as vehicle usage decisions and we characterize the environmental and economic implications of the auto manufacturer's strategy.

2 - A Framework for the Analysis of Probabilistic Demand Response Schemes
Mayank Sharma, IBM, mxsharma@us.ibm.com, Pavithra Harsha, Soumyadip Ghosh, Ramesh Natarajan

We describe the class of probabilistic demand response (PDR) schemes that are particularly suited for dynamic load management in the residential sector. Our main contribution is a new method for implementing and analyzing these schemes based on an operational objective that balances the total cost and revenue of meeting demand. We evaluate the suitability of various PDR schemes and illustrate the effectiveness of the method for a collection of thermostatically controlled loads with simulations.

3 - Service Region Design for Urban Electric Vehicle Sharing Systems
Long He, PhD Candidate, University of California, Berkeley, 1117 Etcheverry Hall, Berkeley, CA, 94720, United States of America, longhe@berkeley.edu, Ho-Yin Mak, Ying Rong, Zuo-Jun Max Shen

We consider a service area design problem of an electric car sharing business model that is subject to uncertain driver usage behavior, for which only limited knowledge may be inferred from survey data. With partial distributional information, we obtain a robust formulation as a mixed integer second-order cone program. Using data from California Household Travel Survey, we demonstrate the impacts of factors such as fleet size, battery capacity and charging time on the expansion of service area.

Education 1

Contributed Session

Chair: Walter A Garrett, Jr, Instructor of Decision Sciences, Saint Louis University, 221 N Grand Blvd, Saint Louis, MO, 63103, United States of America, wgarrett@slu.edu

1 - Meta-Analysis in Online Engineering Education
Ling Zu, Clemson University, 2517 Moorcroft Ln, duluth, GA, 30096, United States of America, lzu@g.clemson.edu, Mary Elizabeth Kurz, Wennian Li

There is limited meta-analysis of online engineering education research especially focused in two-year colleges. This study considers online engineering education papers since 1998 and conducts meta-analysis to explore possible factors that could affect students' preferences in choosing e-learning instead of traditional education. As a result, demographic factors such as social status including ethnicity, race, gender, financial status are considered as well as the effectiveness of education.

2 - The Appointment Scheduling Game
Antoine Sauré, Post-Doctoral Fellow, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T 1Z2, Canada, antoine.saure@sauder.ubc.ca, Martin Puterman, Charles Ko, Drew Paulin

We describe the Appointment Scheduling Game (ASG), an easy to use teaching tool that reveals the main challenges in managing advance patient scheduling systems and provides an introduction to simulation and decision analysis. The ASG simulates a system with limited service capacity in which daily appointment requests, characterized by their urgency, arrive randomly. Students assume the role of a scheduling clerk who must assign appointment dates to these requests without knowing future demand.

3 - An Innovative Approach to Teaching Operations Management through Experiential & Online Learning
Kristen Sosulski, Assistant Professor, NYU Stern, 40 West 4th Street, Suite 509, New York, NY, 10012, United States of America, ksosulsk@stern.nyu.edu, Harry Chernoff

The authors present an experiential approach to teaching operations management through the study of business processes in situ. There is no classroom; instead a flipped-classroom model is employed where students learn new topics through faculty-led online videos and exercises. Class meeting time is used to observe a company's operations process in practice. Results suggest that students better synthesize their knowledge of operations through the study of processes in a real business setting.

4 - Incorporating Content Balancing with Ant Colony Optimization for a Balanced Incomplete Block Design Exam
Pei-Hua Chen, National Chiao Tung University, 1001 University Rd, Dept. of Management Science, Hsin-Chu, 300, Taiwan - ROC, peihuamail@gmail.com, Shu-Wei Huang, Wan-Yu Tsai, Pei-Ru Hong

We proposed three content balancing methods and incorporated them with the Ant Colony Optimization approach to construct balanced incomplete block design forms. 13 blocks with 65 items were constructed from a 292-item bank. Three proposed methods will be evaluated in terms of their computation time and measurement precision.

5 - A Systemic Model of Public School Failure
Walter A Garrett, Jr, Instructor of Decision Sciences, Saint Louis University, 221 N Grand Blvd, Saint Louis, MO, 63103, United States of America, wgarrett@slu.edu

The identification of at-risk schools is a desirable public-policy objective; early intervention may reduce the consequences and costs of school failure. This paper presents a general-systems model of public school performance, in which failure" is one of several output states. Various economic, social, political, financial, and achievement variables are used as inputs to an Ordered Logistic Regression to build a prescriptive model. The model is tested using data from Missouri school districts.

Revenue/Yield Management II

Contributed Session

Chair: Wei Zhang, University of California, Los Angeles, 110 Westwood Plaza, B501, Los Angeles, CA, 90095, United States of America, zhangw.03@gmail.com

1 - Influencing Adoption Patterns via Contract Structures in Hi-Tech Supply Chains
Wei Zhang, University of California, Los Angeles, 110 Westwood Plaza, B501, Los Angeles, CA, 90095, United States of America, zhangw.03@gmail.com, Reza Ahmadi, Sriram Dasu

An OEM who adopts a new product may bring various externalities to other OEMs and incentivize them to make similar adoption decisions. Positive correlation of adoptions can be harmful for the seller and OEMs, as it can lead to adoption rush or delay, which results in demand-supply mismatch and may undermine the seller's ability to reinvest in R&D. We propose that sellers can influence buyer behavior through the structure of contract.

2 - Dynamic Pricing and Capacity Management for Stochastic Rental System with Advance Demand Information
Wen Jiao, The Hong Kong Polytechnic University, Dept. of Logistics & Maritime Studies, Kowloon, Hong Kong - PRC, wendy.j@connect.polyu.hk, Hong Yan

This paper examines the pricing and capacity management problem for a car rental company facing advance demand information (ADI) and walk-in customers. ADI customers request a booking by paying the booking fee in advance and enjoy a discounted price at demand realization, while walk-in customers require immediate service. At each period, the company decides the booking limit for ADI customers and current unit price. We characterized the structure of the optimal pricing and booking limit policy.

3 - Competitor-Risk Optimized Price Matching in an Omni-Channel Environment
Shiva Subramanian, IBM Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, subshiva@us.ibm.com, Markus Ettl, Joline Uichanco, Pavithra Harsha

Consumers browse products and prices across multiple channels and retailers to finalize purchases today. To remain competitive, retailers have adopted either a risk-averse price strategy of matching competitor prices, or a high-risk strategy that focuses on profit margin. In our work, we use real data from a retailer to demonstrate the business impact of a novel prediction-optimization based price-matching approach that profitably manages a retailer's value-at-risk due to competition.

4 - A New Predictive Model Application in Social Networking Revenue Management
Yingying Kang, Principal Operations Research Consultant, Sabre Holdings Inc., 3150 Sabre Drive, Southlake, TX, 76092, United States of America, Yingying.Kang@sabre.com

Accurately predicting the customer behavior and CTR is a key factor for maximizing the revenue of a social network. The classic models like logistic regression model rely on the accurate estimation of significant factors and their coefficients. And it relies on the accuracy of historical data. We propose a Bayesian Inference based predictive model to estimate parameters of network attractiveness distribution based on the observed CTR distribution. It is proven effective under highly uncertainty.

Returns Management at the Operations-Marketing Interface

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Tolga Aydinliyim, Assistant Professor, Baruch College, CUNY, Zicklin School of Business, Box B9-240, New York, NY, 10010, United States of America, tolga.aydinliyim@baruch.cuny.edu

1 - Savvy Consumers, Lenient Return Policies: Mitigating Strategic Waiting in Online Retailing
Tolga Aydinliyim, Assistant Professor, Baruch College, CUNY, Zicklin School of Business, Box B9-240, New York, NY, 10010, United States of America, tolga.aydinliyim@baruch.cuny.edu, Mehmet Sekip Altug

In an online retailing context, we study return management decisions when consumers are discount seeking and sensitive to stock-outs. We find that allowing returns enhances profit if the retailer can salvage with a mild discount, and the ability to do so is a strategic advantage in case of competing retailers.

2 - Optimal Pricing and Return Policies for Loss Averse Customers
Wenjing Shen, Drexel University, 3200 Market Street, 735, Philadelphia, PA, 19104, United States of America, ws84@drexel.edu, Gulay Samantli, Ben Lev

Customer return policies reduce product misfit uncertainty and improve customer satisfaction. Previous studies on customer return have assumed loss neutral customers. In this paper, we study the impact of customer loss aversion on the optimal price, inventory, and return policies.

3 - An Empirical Analysis of Product Return Episodes
Paul Messinger, University of Alberta, Edmonton, AB, Canada paulm@ualberta.ca, Michele Samorani, Aydin Alptekinoglu

A product return episode is a sequence of transactions composed of the purchase of a product, a return of that product, a repurchase of a similar product, etc., concluding with a final purchase or return. We empirically study return episodes using data from a national consumer electronics retailer.

4 - Intertemporal Pricing and Return Policies for Strategic Consumers
Wenbo (Selina) Cai, Assistant Professor, New Jersey Institute of Technology, MEC 308, University Heights, Newark, NJ, 07102, United States of America, cai@njit.edu, Ying-Ju Chen

We develop a model that takes into account both consumer valuation uncertainty and strategic consumer behavior, and derive the optimal pricing and return policy for a retailer. We find that a generous return policy encourages high-valued consumers to purchase early, but lessens the capacity rationing effect in the latter period and consequently may induce some consumers to wait.

Managing Queues in Service Systems

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Philipp Aféche, Rotman School of Management; University of Toronto, 105 St.George Street, Toronto, Canada, Philipp.Afeche@Rotman.Utoronto.Ca

1 - Robust Capacity Planning under Service Constraints
Hussein Naseraldin, Professor, Ort Braude College, Snunit St, Karmiel, 21982, Israel, nhussein1@braude.ac.il, Opher Baron

Capacity decisions are strategic in nature and are determined at the beginning of the horizon. Then it constrains the possible capacity in any single period. Data uncertainty plays a key role in such decisions. We propose optimal robust capacity decisions subject to service requirements. We adopt a Robust Optimization approach in which one searches for a feasible solution that is at least as good as all other feasible solutions for most data realizations.

2 - Information Sharing in the Presence of Loss Averse Customers
Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Pengfei Guo

We study the impact of information sharing in the presence of loss averse customers in a service system.

3 - Allocation Policies in Blood Transfusion
Vahid Sarhangian, Rotman School of Management; University of Toronto, 105 St.George Street, Toronto, ON, Canada, vahid.sarhangian11@rotman.utoronto.ca, Hossein Abouee Mehrizi, Opher Baron, Oded Berman

Recent studies suggest an increased risk of adverse clinical outcomes in patients receiving transfusions of older" blood. We analyze a stylized queueing model of a hospital blood bank and investigate the potential of a family of allocation policies in reducing the age of transfused blood without significantly affecting its availability. We evaluate the outcome of the policies and investigate when they are more likely to be effective as an alternative to reducing the shelf-life.

4 - Designing, Scheduling, and Pricing Differentiated Services under Quality-Speed Tradeoffs
Sherwin Doroudi, Tepper School of Business; Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, sdoroudi@andrew.cmu.edu, Philipp AfÉche, Mustafa Akan, Mor Harchol-Balter

Quality-speed tradeoffs are inherent in designing and providing various products and services: longer processing increases quality and allows customization, but also increases utilization and waiting times. We consider a queueing model with utility-maximizing, time-sensitive customers whose service valuations are increasing in processing time. We study the problem of optimally designing, scheduling, and pricing the set of differentiated services, both under welfare- and revenue-maximization.

Data-driven Revenue Management Studies

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, serguei.netessine@insead.edu

1 - Cost Efficient Cloud Resource Virtualization
Andrew Li, MIT, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, aali@mit.edu, Devavrat Shah, Muhammad J. Amjad, Vivek Farias

The Cloud has become synonymous with virtual computing, and users now face the challenging problem of choosing from a vast array of compute resources differing in price and quality. In this work, we present policies for efficient use of cloud resources by dynamically maintaining a portfolio of resources. Experiments on Amazon's EC2 cloud platform show that this achieves significant cost savings with negligible loss in quality.

2 - The Value of Clickstream Data in the Competitive Analysis: Evidence from Hotel Bookings
Sergei Koulayev, Economist, CFPB, 1700 G st NW, Washington, DC, 20002, United States of America, sergei.koulayev@gmail.com, Serguei Netessine, Jun Li

Today, half of hotel bookings are originated in the online channel. A major role in the online distribution is played by OTAs: two-sided platforms that connect travelers and hotel properties. Consumer activity on such platforms leaves a trace of clickstream data, combined with displays of hotel options presented to the user. We show that such data provides an insight into the structure of hotel's competition set, in addition to traditional datasets of prices and sales volumes.

3 - Two Sided Platforms: Case of Service Level Tradeoff
Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Ashish.KABRA@insead.edu, Karan Girotra, Elena Belavina

Recently there has been a rapid rise of online intermediaries that match offline supply and demand in transportation, delivery and hospitality (such as Uber, Beauty Bureau). In these system "service level" to one side of the platform comes at the expense of "service level" to other side. Using data from a Taxi demand-supply matching app we estimate how past experience of the supply and demand predict their future usage of the platform. We use these estimates to improve system design.

4 - The Impact of Returning Customers at an Internet Fashion Retailer
Ngai-Hang Leung, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-14, Boston, MA, 02139, United States of America, zacleung@mit.edu, Georgia Perakis, Pavithra Harsha

Our analysis of clickstream data collected from an online fashion retailer shows that a significant number of sales are due to returning customers. We propose a demand model where customers may not buy the item on their initial visit, but may return and purchase the item in a subsequent visit. We propose and analyze a markdown optimization pricing model with returning customers. We estimate our demand model and quantify the benefit of applying our pricing model.

Innovative Applications in Pricing and Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Pelin Pekgun, Assistant Professor, University of South Carolina, 1014 Greene Street, Moore School of Business, Columbia, SC, 29208, United States of America, pelin.pekgun@moore.sc.edu

1 - Taking it to a Higher Level: Integrated Revenue Management from Vision to Reality
Jon Higbie, Managing Partner & Chief Scientist, Revenue Analytics, Inc., 3100 Cumberland Blvd., Suite 1000, Atlanta, GA, 30339, United States of America, jhigbie@revenueanalytics.com, Vedat Akgun

Revenue management began as a specialized function buried deep in the organization. Through case studies we will describe how revenue management has elevated its game to a higher level and is evolving into the analytics center of excellence for organizations who are seeking a unified view of their business data, one version of the truth, and prescriptive capabilities that serve strategic planning, finance, sales, marketing, and distribution.

2 - Notes on the Journey Towards Total Hotel Revenue Management
Tudor Bodea, InterContinental Hotels Group, 3 Ravinia Drive, Atlanta, GA, 30346, United States of America, tudor.bodea@ihg.com, Alex Kao, Dev Koushik, Christy Zhao, Darlene Fenix, Quentin Taylor, Clint Nall, Ying Song

Organizations in industries as diverse as airline, hospitality or television broadcasting use revenue management (RM) tactics to maximize their revenue growth. In the hospitality industry, hotel companies have long implemented RM decision support systems that optimize the availability and prices of their retail transient products. In this work, we offer opinions on what hotel companies that consider moving towards a Total Hotel RM framework may witness along the way.

3 - Hotel Standby Upgrades - How and When Do They Work?
Ovunc Yilmaz, PhD Student, University of South Carolina, 1705 College Street, Columbia, SC, 29201, United States of America, oyilmaz@email.sc.edu, Mark Ferguson, Pelin Pekgun

Inspired by e-standby upgrades" in the hotel industry, this study examines how and when these upgrades can provide additional revenue for a hotel. We develop optimal pricing strategies under both myopic and strategic customer behavior through an analytical model. Using data from a major hotel chain, we also provide some empirical findings.

4 - Customer Choice Modeling in Revenue Management Systems
Shadi Sharif Azadeh, Polytechnique Montreal, Apt 108, 50 Willowdale, Montreal, Canada, shadi.sharifazadeh@polymtl.ca, Gilles Savard, Patrice Marcotte

One of the main challenges in Revenue Management systems is to estimate demand of each product at a given time when some products in the choice set are not available (censored demand). Most of choice-based RM researches assume that choice parameters are known a priori. However, in reality, the only information at hand is the registered transactions. In this research, we estimate product utilities for different customer segments as well as daily potential demand using registered bookings.

5 - An Empirical Study of Price Movements of Airlines Industry in Indian Market
Goutam Dutta, Professor, Indian Institute of Management, Ahmedabad, Wing 3, Room No 3H, PMQ Area, Ahmedabad, 380015, India, goutam@iimahd.ernet.in, Sumitro Santra

We analyze the movement of airline prices of Indian domestic sector. We first conduct a detailed econometric analysis of five domestic routes. Next we develop the power divergence statistic (PDS) for each route and built a direct comparison study on average PDS and average prices. Our research suggests that the competition and price dispersion steps up as departure date comes closer. It also shows that route characteristics affect price movement as well as price dispersion in different routes.

Analytics for the Tactical Edge: Better Business through Operations Research in the DoD

Sponsor: Military Applications Society

Sponsored Session

Chair: Aaron Burciaga, Senior Manager, North America Inventory Analytics Lead, Accenture, 4305 Majestic Lane, Fairfax, VA, 22033, United States of America, adburciaga@gmail.com

1 - The Influence of Cognition on Decision Making & Decision-Making Support Methods
Rafael Matos, President, Military Operations Research Society, 2111 Wilson Boulevard, Suite 700, Arlington, VA, 22201, United States of America, president@mors.org

Continued advances in decision analysis and decision making support systems, with rigorous mathematical approaches, are very important. It is also important to create consciousness on the cognitive elements that affect the individual and collective decision-making process. This lecture explores the way we think and some of the most common heuristics and biases that affect our problem solving and decision-making activities, and how they can affect the results of rigorous quantitative methods.

2 - The Marine Corps Way: using Maneuver Warfare to Lead Analytics
Aaron Burciaga, Senior Manager, North America Inventory Analytics Lead, Accenture, 4305 Majestic Lane, Fairfax, VA, 22033, United States of America, adburciaga@gmail.com

Over its storied 238-year history the Marine Corps has built a powerful brand ñ one that connotes leadership, discipline, training, and management. We present how proven battlefield practices empower success in analytics where "fog of war" and "asymmetric threats" also characterize business opportunities, data, and adoption.

3 - Ready, Fire, Aim – Executing Before Planning
Josh Janes, Consultant, Accenture, 1936 North Clark Street, Apt. 516, Chicago, IL, 60614, United States of America, janesj@gmail.com

Organizations often execute actions before completing a plan. Once actions are executed, the team responsible for the project's success must determine how to overcome the hasty start. Case studies impacting the DoD are presented comparing courses of action to mitigate the rash decisions which diminish mission or project success. Courses of action are rated on a cost, timeline, and customer confidence scale.

Maritime Logistics and Operation

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Deniz Ozdemir, Yasar University, Universite Caddesi, No:35-37, Agacli Yol, Bornova, Izmir, 35100, Turkey, deniz.ozdemir@yasar.edu.tr

1 - Vessel Crew Scheduling: Formulations and Heuristics

Kerem Akartunali, Lecturer, Department of Management Science, University of Strathclyde, 40 George Street, Glasgow, G1 1QE, United Kingdom, kerem.akartunali@strath.ac.uk, Alex Leggate, Seda Sucu, Robert Van Der Meer

Crew scheduling is a well-studied area of research, in particular for airlines, but very little attention has been given to companies operating fleets of vessels. The maritime setting presents its own challenges such as long duty times and weather uncertainties. In this talk, we discuss different formulations and solution methods (including customized heuristics and approximate formulations) for solving these problems. We will conclude with preliminary computational results and a case study.

2 - Yard Assignment in Bulk Material Terminals

Ceyda Oguz, Koc University, College of Engineering, Istanbul, Turkey, coguz@ku.edu.tr, Isil Koyuncu

We developed a mathematical model for the yard assignment of bulk materials, such as coal, to determine the location of loading and unloading vessels while minimizing the total distance traveled in ports. The model also determines the dimensions of the bulks given that the area of each bulk is fixed.

3 - Heterogeneous Bulk Service Queuing Models with Applications to Transportation Systems

Nishant Mishra, Assistant Professor, Erasmus University Rotterdam, Rotterdam School of Management (RSM) Erasmus University Rotterdam, Burgemeester Oudlaan 50, 3062 PA, Rotterdam, Netherlands, nmishra@rsm.nl, Niek Baer, Debjit Roy, J an-Kees van Ommeren

We study multi-server queuing models with heterogeneous servers, and specifically, show that the steady state waiting time in a queuing system with two types of servers has a phase-type distribution. We then present approximations for heterogeneous bulk service queues for a semi-open queuing network with batch-size dependent service time, and finally, conclude by discussing an application of the model for a container transportation system at the Port of Rotterdam.

4 - Stochastic Berth Allocation and Quay Crane Assignment for Quayside Operations

Deniz Ozdemir, Yasar University, Universite Caddesi, No:35-37, Agacli Yol, Bornova, Izmir, 35100, Turkey, deniz.ozdemir@yasar.edu.tr, Gokberk Ozsakalli, Huseyin Gencer

Traditional planning of quayside operations cause unnecessary waiting of vessels and inefficient utilization of resources. Moreover, most of the integrated approaches consider deterministic vessel arrivals and quay crane handling time which is actually not realistic in practice. To this end, an integrated stochastic multi objective model has been developed to minimize the vessel service time and quay crane movement. The mixed integer model was solved by using stochastic programming and applied at Izmir Container Terminal based on the historical data. It has shown promising results.

Sponsored Session

Chair: Emily Block, Assistant Professor of Management, University of Notre Dame, Notre Dame IN 46556, United States of America, esblock@gmail.com

1 - The Impact of Community and MFI Logics in Shaping KIVA Loan Framing

Todd Moss, Emily Block

The purpose of this paper is to consider the relative strength of institutions in directing the activities of organizations in a field. We seek to understand the conditions under which one institution is likely to dominate the behavior of organizations over another. Specifically, we consider the relative impact of professional and national institutions on hybrid microfinance organizations. We suggest that temporal, organizational and field characteristics are likely to influence the power of professional and national institutions on not only the activities that microfinance organizations engage and the language that they use to describe themselves, but also the timing of their responses to external events. We hypothesize the effect of organizational form, ownership structure, timing of founding, peer effects, strength of national institutions and governance and community characteristics.

2 - Implications of Chinese Investment in Africa on Social, Environmental and Economic Vulnerability

Emily Block, Assistant Professor of Management, University of Notre Dame, Notre Dame IN 46556, United States of America, esblock@gmail.com, Viva Bartkus, Taylor Boyd, Jessica Helmann, Kerri Martin, Todd Moss

Despite its late entry into the market, China has become the largest trading partner with sub-Saharan African countries. In fact, China pumped over $210 million into Africa last year. The consequence of this recent trend, for both African countries and MNCs looking to invest there, has been widely debated and speculated. This paper empirically investigates the economic, development, and environmental consequences of Chinese investment in a full population of sub-Saharan African countries. We discuss implications for Base of the Pyramid and strategy research, seeking to understand the conditions under which different foreign investments are likely to be profitable.

3 - Organizational Responses to Public and Private Politics: An Analysis of Climate Change Activists and U.S. Oil & Gas Firms

Sustainable Logistics: Models and Applications

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: M. Ali Ulku, Associate Professor, Rowe School of Business, Dalhousie University, Halifax, NS, Canada, ulku@dal.ca

1 - Carbon Allocation in Traveling Salesman Problems

Josue Velazquez-Martinez, Instituto Tecnológico y de Estudios Superiores de Monterrey, Campus Santa Fe, Mexico City, Mexico, josue.velazquez@itesm.mx, Jan C. Fransoo, Bart Leenders

We develop a methodology to allocate carbon to multiple clients that are being served on a single route. We demonstrate analytically a number of desirable properties of the allocation mechanism, and apply the mechanism in a European retail distribution setting.

2 - Carbon Emissions Considerations in Joint Replenishment Problems: Direct vs. Indirect Grouping

Dincer Konur, Assistant Professor, Missouri University of Science and Technology, Engineering Mgmt. & Systems Engineering, Rolla, MO, 65406, United States of America, konurd@mst.edu, Brian Schaefer

In this study, we model and solve a bi-objective joint replenishment problem with cost and carbon emissions minimization for each of the two common grouping strategies: direct and indirect. An evolutionary heuristic method is discussed for each strategy. A set of numerical studies demonstrates that a retailer's preference for a specific grouping strategy depends on not only economical but also environmental objectives.

3 - Carbon Emissions Comparison of Third Party Last Mile Delivery Versus Customer Pickup

Jay R. Brown, Assistant Professor, Loyola University Maryland, Sellinger School of Business and Mgmt., Baltimore, MD, 21210, United States of America, jbrown11@loyola.edu, Alfred L Guiffrida

Carbon emissions resulting from conventional shopping involving customer pickup with trip chaining is compared to e-commerce-based online retailing involving third party last mile delivery to customers' homes. The break-even number of customers for carbon emissions equivalence is approximated and analyzed for feasibility. A methodology for calculating the difference in expected carbon emissions is formulated and demonstrated.

4 - Supply Chain Management of a Modular Product with Returns

M. Ali Ulku, Associate Professor, Rowe School of Business, Dalhousie University, Halifax, NS, Canada, ulku@dal.ca, Juliana Hsuan, Dennis Yu

Modularity and returns relate to sustainability. In a retailer-manufacturer setting and when the demand for a returnable product depends on both price and modularity level, we develop a profit-maximizing stochastic model. The solution includes optimal expressions for the price, and the order quantity. We derive managerial insights from our structural and numerical results relating to the management of such a perishable product and its implications on sustainable supply chain management.

Challenges in Dynamic Ride-sharing

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Niels Agatz, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3000DR, Netherlands, nagatz@rsm.nl

1 - A Matching Model and Solution Approach for Ride-sharing with Meeting Points

Mitja Stiglic, Faculty of Economics, University of Ljubljana, Kardeljeva ploöcad 17, Ljubljana, 1000, Slovenia, mitja.stiglic@ef.uni-lj.si, Niels Agatz, Mirko Gradisar

We consider a ridesharing system that uses meeting points to allow more flexibility in the rider's pickup and drop-off locations. Riders can either be picked up from home or from a meeting point that is within a certain acceptable walking distance. We develop a model and devise an exact and a heuristic optimization approach to match drivers and riders and determine their routes.

2 - Finding Optimal Stable Ride Matches for Dynamic Ride-sharing Systems

Xing Wang, GE Global Research, 1 Research Circle, Schenectady, NY, 12309, United States of America, xwstella@gmail.com, Niels Agatz, Alan Erera

Automated ride-share systems provide most convenience to the individual users and provide most potential for vehicle miles savings to the system. However, system optimal matches may not provide the maximum costs savings for each individual. We introduce the notion of stability for ride-share matches and present mathematical programming methods to establish stable matching.

3 - Dynamic Ridesharing: How to Get Started?

Martin Savelsbergh, Professor, University of Newcastle, Callaghan, Newcastle, NSW2308, Australia, martin.savelsbergh@newcastle.edu.au, Alan Lee

Dynamic ridesharing services have now been successfully introduced in several countries. Their ultimate success critically depends on (initial) participation rates. We investigate different ways in which a service provider can attract participants during the start up phase.

4 - Structure of Routes as a Function of Incentives for Ridesharing

Xiaoqing Wang, University of Southern California, 3715 McClintock Ave, OHE 235A, Los Angeles, CA, 90089, United States of America, xiaoqinw@usc.edu, Maged Dessouky, Fernando Ordonez

We consider varying passenger travel time under congestion and load dependent toll cost in a pickup and delivery problem with time windows. The objective is to study how optimal routes change if a cost reduction and time savings are available for ridesharing. Both 0-1 integer programming model and heuristics are developed to solve the problem. A set of computational experiments are performed to explore how the ridesharing are affected by the different time savings on HOV lanes and toll savings.

Transportation Planning III

Contributed Session

Chair: Milad Keshvari Fard, ESSEC Business School, HB 314-ALEGESSEC- 60 Avenue du Hazay, Cergy, 95000, France, milad.keshvarifard@essec.edu

1 - The Hub Location Problem with Discrete Cost functions

Milad Keshvari Fard, ESSEC Business School, HB 314-ALEGESSEC- 60 Avenue du Hazay, Cergy, 95000, France, milad.keshvarifard@essec.edu, Laurent Alfandari

We propose a new formulation for the Hub Location Problem by considering the cost as a discrete function of the number of vehicles used for transportation. We observe that the difference between the continuous and discrete cost function is too high to be ignored. Moreover, for cost reduction benefits, we study advantages of using direct shipments as well as using simultaneous intermodal transportation. Finally we design a hybrid metaheuristic algorithm to solve large scale problems.

2 - The Identification of Transport Bundling Opportunities in a Horizontal Supply Chain

Gert Woumans, PhD Student, IESEG School of Management, 3, Rue de la Digue, Lille, 59000, France, g.woumans@ieseg.fr, Jeroen Belien, Stefan Creemers, Robert Boute

Horizontal cooperation is a powerful concept to increase supply chain efficiency: by bundling transports and by reducing empty backhauling, efficiency is increased through improved load factors and increased frequency of deliveries. Finding suitable collaboration partners is challenging. We present an algorithm that uses a clever sorting and filtering technique to detect potential partners, based on the geographical compatibility of transports. The algorithm is being used by 4PL TRI-VISOR.

3 - Multiclass O-D Estimation using Probit-Based Stochastic User Equilibrium and Multiple Data Types

Qing Zhao, Cornell University, 220 Hollister Hall, Ithaca, NY, 14850, United States of America, qz74@cornell.edu, Mark Turnquist

This paper proposes a bi-level optimization model and corresponding solution method for static multiclass O-D estimation using various data types. The upper level optimization derives O-D entries by minimizing the sum of squared differences between observations from different data sources and the corresponding predictions. A probit model is used in the lower-level stochastic user equilibrium problem for flow prediction. Extensive experiments have been performed on two test networks.

4 - Risk Equitable Routing and Prohibition Stratesis for Hazardous Materials Transportation

Ashrafur Rahman, Visiting Assistant Professor, Bunknell University, 116 Court Street, New Haven, CT, 06511, United States of America, arahman@engr.uconn.edu, Nicholas Lownes

A new risk measure for hazardous materials transportation is proposed. The new risk measure is used in mathematical modeling considering equity concept to suggest routing and prohibition strategies for hazmat transportation.

Vehicle Routing I

Contributed Session

Chair: Shong-Iee Su, Professor, Soochow University, No. 56, Sec.1, Kwei-Yang Street, Taipei, 100, Taiwan - ROC, sisu@scu.edu.tw

1 - An ALNS for a Two-echelon Vehicle Routing Problem Arising in City Logistics

Philippe Grangier, Ecole des Mines de Nantes, 4 Rue Alfred Kastler, Nantes, 44300, France, philippe.grangier@mines-nantes.fr, Michel Gendreau, Fabien Lehuédé, Louis-Martin Rousseau

We consider a Two Echelon Vehicle Routing Problem (2E-VRP) which integrates constraints arising in City Logistics such as: time windows, synchronization, and multiple trips for some vehicles. We have developped an ALNS that benefits both from custom ruin and recreate heuristics and an efficient feasibility check.

2 - The Cross-docking Delivery Route Planning for a Supermarket Chain

Shong-Iee Su, Professor, Soochow University, No. 56, Sec.1, Kwei-Yang Street, Taipei, 100, Taiwan - ROC, sisu@scu.edu.tw

This paper presents the delivery route planning background, methodology and results of a study of a new cross-docking logistics center for a large supermarket chain in Taiwan. The number of stores is 274 with revenue at about US$ 9 billion. The transformation of the supermarket from a multi-layer distribution network to a single-layer cross-docking network has shown dramatic improvement on the delivery efficiency, assent productivity, and the reduction of green house gas emissions.

3 - Vehicle Routing with Uncontrolled Batch Arrivals

Wouter van Heeswijk, PhD Candidate, Universiteit Twente, Hallenweg 17, Enschede, Netherlands, w.j.a.vanheeswijk@utwente.nl, Martijn Mes, Marco Schutten

We study a VRP with uncontrolled batch arrivals of LTL goods at an urban consolidation center. These arrivals reflects the delivery of goods by independent carriers. By assessing waiting policies and considering delivery windows at the customers, we propose a heuristic approach aimed at efficiently dispatching city freighters. As such, we facilitate the need for planning at the urban distribution level, where the arrival process of goods at the consolidation center has a significant impact.

4 - The One-to-one Pickup and Delivery Problem with Unloading Considerations

Marjolein Veenstra, University of Groningen, Nettelbosje 2, Groningen, 9747 AE, Netherlands, marjolein.veenstra@rug.nl

We present a new variant of the one-to-one pickup and delivery problem that aims at minimizing the sum of travel, loading and unloading times. The sequence in which locations are visited determines the sequence of packages in the vehicle and thereby the time needed to unload the packages. In this paper, we present models that take into account the effects of loading and unloading times on the vehicle routing decisions.

5 - Multiobjective Green Vehicle Routing Problem under Uncertainty
Nazanin Tajik, Graduate student, ProfessorKash Barker/University of Oklahoma, 202 W. Boyd St., Room 434, Norman, Ok, 73071, United States of America, nazanin.tajik@ou.edu, Kash Barker

The aim of green vehicle routing problems-G-VRP-is to develop technical solutions minimizing not only economic costs but also pollution resulting CO2 emissions.We provide a robust multiobjective G-VRP that accounts for costs such as travel distant,travel time,tardiness/earliness while also minimizing CO2 emissions as a function of acceleration,speed,and loads,among others,accounting for the stochastic nature of inputs.The formulation is solved with MIOCA

1 - A Hierarchical Model for Cash Transfer System Design Problem
Abdullah Dasci, Sabanci University, Orta Mahalle, Tuzla, 34956, Istanbul, Turkey, dasci@sabanciuniv.edu, Engin Topaloglu

We present a model that incorporates location of cash management centers, number and routes of vehicles, and the cash inventory control to minimize the cost of owning and operating while maintaining a pre-defined service level. An iterative solution approach with a feedback mechanism is proposed. Numerical results show that such an approach is quite effective in reaching greatly improved solutions with just a few iterations, making it a promising approach for similar hierarchical models.

2 - Incentive-Compatible, Budget-Balanced Combinatorial Double Auctions for Carrier Collaboration
Su Xiu Xu, The University of Hong Kong, Dept. of IMSE, The University of Hong Kong, Hong Kong, Hong Kong - PRC, xusuxiu@gmail.com, Shuyan Lin

This paper is the first proposing incentive-compatible, budget-balanced combinatorial double auctions (CDA) for the carrier collaboration problem with bilateral exchange (CCPBE), which is generally the problem of how to realize the potential of carrier collaboration over a bilateral exchange transportation network. In the CCPBE, each carrier may ask for or offer a bundle of lanes and each lane may include multiple truckloads. The model realizes asymptotical efficiency in some conditions.

3 - Propagation of Uncertainty in Dense Storage Environments
Patrick Reilly, University of Central Florida, 4000 Central Florida Blvd, Building 91 R, Orlando, Fl, 32816, United States of America, pjreilly@knights.ucf.edu, Jennifer Pazour

In dense storage systems, where all items are not directly accessible, to retrieve an item often requires shifting of other items. In such systems, uncertainty in item location due to a lack of asset tracking results in wasteful search time. The model proposed intends to describe how this uncertainty propagates throughout a dense storage system over time and develops an expected search time for a given item at a certain point in time.

4 - Integer Programming Formulations for Integrated Hub Location and Vehicle Routing Problems
Zuhal Kartal, Anadolu University, Industrial Engineering Departmant, Eskisehir, Turkey, zkartal@anadolu.edu.tr, Andreas Ernst, Servet Hasgul

In this study, we present integer programming formulations of five types 'Integrated Hub Location and Vehicle Routing Problems' which are integrated fixed p-hub location and vehicle routing problem, integrated p-hub location and vehicle routing problem, integrated hub location with fixed costs and vehicle routing problem, integrated p-hub center and vehicle routing problem and lastly, integrated p-hub covering and vehicle routing problem.

Airline Crew Management

Sponsor: Aviation Applications

Sponsored Session

Chair: Shahram Shahinpour, Senior of Operations Research, Sabre Holdings, Inc, 3150 Sabre Dr., Southlake, TX, 76092, United States of America, Shahram.Shahinpour@sabre.com

1 - Exploiting underlying Network Structures to Solve the Crew Pairing Problem via the Pulse Framework
Daniel Duque, Instructor, Universidad de los Andes, Cra 1 No. 18A-12, Bogota, Colombia, d.duque25@uniandes.edu.co, Daniel Matteo Eslava, Manuel A. Bolívar, Andrés L. Medaglia

In the airline industry, the crew pairing problem consists in determining the minimum-cost pairings such that every flight is covered exactly once. Under a column generation scheme, it is customary to solve repeatedly a shortest path problem with resource constraints. In this work, we adapt a specialized framework for hard shortest paths that exploits the underlying network structure to efficiently generate diverse and feasible pairings.

2 - The Best Strategy in using an Option-based Mechanism to Reduce Overbooking Risk for Allied Airlines
Xiaojia Wang, PhD Student, City University of Hong Kong, A,14/F,Palatial Stand,118 Wuhu St., Hung Hom, Kowloon, Hong Kong, Hong Kong - PRC, xiaojia.wang@my.cityu.edu.hk, Y.K., Richard Fung

In the context of parallel alliances, we propose an option-based mechanism that allows an airline to transfer bumped passengers to its alliance partner's flight. Based on an analytical model built to calculate the net benefit that the airlines can obtain from the proposed mechanism, we develop a simulation-based algorithm to derive the best strategy in using the mechanism, namely how many options the allied airlines should transact between each other and how much the option should be priced.

3 - Scheduling Aircraft and Personnel to Meet On-station Patrol Requirements
Ramzi Mirshak, Defence R&D Canada, 101 Colonel By Drive, Ottawa, ON, Canada, ramzi.mirshak@drdc-rddc.gc.ca, Alex Bourque, Paul Massel, Bill Ansell, Bao Nguyen

Determining the number of aircraft and personnel required to maintain a given presence on station is an important problem in surveillance contexts. Here, integer programming is used to minimize the number of aircraft and crews required to meet an on-station requirement. Unplanned maintenance is captured with a parameterized serviceability model. As illustrated by a case study, this easy to implement methodology provides quick and insightful results to the decision makers.

4 - Progress in Airline Crew Recovery at Sabre Airline Solutions
Chunhua Gao, Lead Operations Research, Sabre Holdings, 3150 Sabre Drive, Southlake, United States of America, chunhua.gao@sabre.com, Tina Shaw

This presentation will update progress and developments in airline crew recovery at Sabre Airline Solutions. We proposed an approach for handling disruptions during irregular operations that simultaneously solves the crew pairing and roster recovery problems to quickly find solutions that are fully deployable. In this talk, we will introduce how the approach is enriched to meet airline requirements and applied to solve real-time airline crew recovery problems.

1 - How Does Human Resource Management Influence JIT and TQM Implementation? A Meta-analysis
Yiwen Chen, Tsinghua University, Beijing, China, www.yiwenchen@gmail.com, Sriram Narayanan, Li Zheng, Jayashankar Swaminathan

Through meta-analytic technique employed on a database of 101 studies, we examine how HRM influences the implementation of JIT and TQM. Previous literatures differ on whether, and which, specific HR practice facilitates JIT and TQM implementation. So, we develop a structural equation model to synthesis these studies. We find that all three dimensions of HR system positively influence JIT and TQM implementation, among which opportunity-enhancing HR practices have the strongest effect.

2 - Early Detection of Unforeseen Failure in Seasonal Manufacturing via Control of Sensitivity Parameter

Kiwook Jung, Guest Researcher, National Institute of Standards and Technology, 100 bureau drive, Gaithersburg, MD, 20899, United States of America, kiwook.jung@nist.gov, Hyunbo Cho

The impact of unforeseen failures in seasonal manufacturing is significant. A timely review of failure records to detect failure modes is not always possible. This talk presents several techniques for quantifying failure records in a vector space model to conduct automated cluster analysis. The techniques are validated with real data sets. The proposed model quickly detects unforeseen-failures via control of sensitivity parameters.

3 - Stochastic Assembly Line Design with Work-sharing in the Bottleneck Station for Assembly Planning

Ehsan Nazarian, Post-doctoral Research Associate, University of Nebraska Lincoln, 135 Nebraska Hall, Lincoln, NE, 68588, United States of America, enazarian@unl.edu, Jeonghan Ko, Hui Wang

Processing time variation over a cycle time can result in line stop in synchronous assembly lines, but utility workers and extra offline processing increase costs. We present a stochastic chance-constrained programming model utilizing non-productive times in the next station of the bottleneck to handle the possible overload with preemption allowed. We also present statistical evaluations of stochastic station times. The result can be used for subassembly planning with uncertain joining times.

Operations Management/Marketing Interface II

Contributed Session

Chair: Emre Ertan, PhD Candidate, University of Texas at Dallas, Sm30, Jindal School of Mgmt, 800W Campbell Road, Richardson, TX, 75080, United States of America, emre.ertan@utdallas.edu

1 - Analysis of Consumers' Purchase Timing Decisions

Emre Ertan, PhD Candidate, University of Texas at Dallas, Sm30, Jindal School of Mgmt, 800W Campbell Road, Richardson, TX, 75080, United States of America, emre.ertan@utdallas.edu, Ozalp Ozer, Kathy Stecke

The consumer purchase timing decision is analyzed by using discounted expected utility theory, where consumers act to maximize their utility over time. The consumer's sequential decision-making process is formalized under uncertain product availability. An optimal purchase timing policy is identified in a market environment, in which a strategic customer knows the markdown pricing scheme, available inventory level, and remaining time to the end of the selling horizon.

2 - Price and Inventory Competition with Customer Switching

Chunyan Gao, Assistant Professor, Southwestern University of Finance and Economics, No. 555 Liutai Avenue, Wenjiang District, Chengdu, 611130, China, gaochy_2007@126.COM, Qiang Gong, Dongling Cai

This paper invests price and inventory competition with market uncertainty. There exist multiple pure strategy sub-game perfect equilibria. It is possible that the profit of retailers with customer switching is Pareto better than that with no customer switching, because the retailer can better take advantage of the inventory pooling in asymmetric equilibrium. In addition, customer switching leads to higher inventory level but not necessary lower price.

3 - Joint Production and Pricing Decisions for Multiple Products with Cap-and-Trade Regulation

Xiaoping Xu, University of Science and Technology of China, School of Management, 96 Jinzhai Road, Hefei, China, xxp2010@mail.ustc.edu.cn

This paper studies the joint production and pricing decisions under cap-and-trade regulation. We find that the emission trading decisions follow a two-threshold policy and the optimal total emissions and production quantities are constants when the cap is low or high. We also find that the profit may increase when the cap is sufficiently large. We then explore the impact of the emission trading prices on the optimal decisions. We finally conduct numerical examples to illustrate our findings.

4 - Dynamic Pricing, Production, and Channel Coordination with Stochastic Learning

Tao Li, Santa Clara University, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, tli1@scu.edu, Xiuli He, Suresh Sethi

We study a decentralized two-period supply chain in which a manufacturer produces a product with stochastic cost learning, and sells it through a retailer facing a price-dependent demand. The manufacturer may or may not have inventory carryover option. We examine the impact of learning on the strategies of channel members. We show the traditional double marginalization problem becomes worse in the presence of learning. We obtain revenue sharing contracts that coordinate the dynamic supply chain.

Matching-Based Service Allocation Models

Sponsor: Service Science

Sponsored Session

Chair: Yichuan Ding, Assistant Professor, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Daniel.Ding@sauder.ubc.ca

1 - A Dynamic Pricing Mechanism via Fisher Market Equilibrium

Dragos Florin Ciocan, Assistant Professor, INSEAD, 70 Pacific St, Apt 227, Cambridge, Ma, 02139, United States of America, florin.ciocan@gmail.com, Vivek Farias

We consider a general equilibrium inspired allocation mechanism for online advertising. This allows an ad network to dynamically price impressions achieving several attractive properties. In particular, regardless of inventory uncertainty, the budgets of the advertisers are exhausted, while simultaneously guaranteeing that even in the presence of arbitrarily large inventory volatility, the utility that each advertiser achieves is a constant factor of the offline Pareto optimal.

2 - Dynamic Matching in Overloaded Waiting Lists

Jacob Leshno, Columbia University, 3022 Broadway, Uris Hall, 406, New York, NY, 10027, United States of America, jleshno@columbia.edu

We consider the efficiency of the allocation via waiting lists. Welfare is maximized when agents decline mismatched items; as items can be assigned to others agents and generate higher value without effecting aggregate waiting costs. However, agents may misreport preferences to get an earlier item. Abstract We calculate welfare loss from misallocation of standard waiting lists. Using derive optimal policies which use randomization and present a simple and robust policy.

3 - An Overloaded Bipartite Queueing System with Scoring-Based Priority Rules

Yichuan Ding, Assistant Professor, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, Daniel.Ding@sauder.ubc.ca, Peter Glynn, Stefanos Zenios

We consider an overloaded bipartite queueing system (OBQS) with multitype customers and service providers. Service is provided first to the customer with the highest score, which is computed based on customer type, waiting time, and server type. We characterize the fluid limit process in such a system. This result has three immediate applications: (1)it predicts the outcome of the OBQS; (2) it derives the optimal score formula; (3) it addresses the open question raised by Talreja & Whitt (2008).

1 - Empirical Study on Surgery Delays

Elvin Coban, Assistant Professor, Ozyegin University, Orman Sok. Cekmekoy, Istanbul, 34794, Turkey, elvin.coban@ozyegin.edu.tr, Gulsah Alper, Tugce Pinar

We examine delays in surgery schedules using a dataset from a leading hospital in Turkey. Various steps starting from surgery appointment till patient discharge are analyzed for different medical departments. In this talk, we will discuss patterns of existing delays in addition to how we can manage them to compute robust surgery schedules.

2 - On Inpatient Bed Capacity Management by Cluster Analysis

Andriy Shapoval, Georgia Institute of Technology, 765 Ferst Dr. NW, Atlanta, GA, 30332, United States of America, ashapoval3@gatech.edu, Eva Lee

We consider a problem of partitioning clinical services in hospitals into groups with the goal to allocate efficiently inpatient beds. One strategy is pooling the bed capacity. Alternatives include dividing the capacity into groups with restricted access up to the complete specialization, also called focused care. Using the similarity principle from cluster analysis, we propose a two-stage framework with discrete optimization and queueing components.

3 - Trends in Servitization
Jina Kim, PhD Student, Korea University Business School, LG-POSCO Hall, KUBS, 145 Anam-ro Seoungbook-gu, Seoul, Korea, Republic of, jina0810@korea.ac.kr, Hosun Rhim, Kwangtae Park

Servitization is the concept including Product Servitization added service into product and Service Productization added product into service. Manufacturing Company can improve its performance and create customer value by combining service with product. Also, Service Company adds product into service in order to increase financial performance and satisfy customer satisfaction. This paper investigates trends in servitization: Product Servitization and Service Productization. .

4 - The Probabilistic Profitable Tour Problem
Mengying Zhang, University of Science and Technology of China, Jin Zhai Road 96, Hefei, China, zmy0908@mail.ustc.edu.cn

The probabilistic profitable tour problem is the problem of finding an a priori tour which maximizes the difference between the expected profits collected by visiting customers and the corresponding expected traveling costs. We formulate this problem and propose a genetic algorithm to solve it.

Health Care Modeling Optimization IV

Contributed Session

Chair: Banafsheh Behzad, Assistant Professor, California State University, Long Beach, Department of Information Systems, College of Business Administration, Long Beach, CA, 90840, United States of America, behzad1@illinois.edu

1 - using Subject Specific Data to Improve Biomechanical Modeling
Menekse Salar, PhD Student, Auburn University, 215 S. Gay Street, #204, Auburn, AL, 36830, United States of America, mzs0053@auburn.edu, Richard Sesek, Celal Gungor, Ruoliang Tang

Many bio-mechanical modeling methods rely on oversimplifying assumptions regarding muscle geometry. The aim of this study was to build regression relationships that can predict low back geometry using only easily measured subject parameters such as height, weight and gender. This paper explores the errors that would be expected using this regression relationship as compared to assuming a fixed muscle lever arm based on the population or gender stratified mean values which is typically done.

2 - Hazard Rate Models for Estimating Patient's Length-of-Stay in Emergency Departments
Seung Yup Lee, Wayne State University, Wayne State University, Detroit, MI, 48202, United States of America, seungyup@wayne.edu, Michael Lederle, Ratna Babu Chinnam, Alper Murat, Evrim Dalkiran, Qingyu Yang, Sina Faridimehr, Azade Tabaie, Hakimuddin Neemuchwala

Research suggests that effective prediction of a patient's length-of-stay is an important prerequisite for evaluation of ED service quality as well as the performance of real-time decision support systems for improving patient flow. We present results from statistical and machine learning hazard rate models using data from a VA Medical Center that offer a number of interesting insights.

3 - Capacity Planning of Operating Rooms
Tarun Mohan Lal, Senior Health Services Analyst, Mayo Clinic, Robert D. and Patricia E. Kern, Rochester, MN, United States of America, mohanlal.tarun@mayo.edu, Kal Pasupathy, Narges Hosseini, Jeanne Huddleston

Effective use of operating rooms is critical for meeting the patient demand and for the financial viability of hospitals. This presentation will discuss a decision support system that was developed for Urology practice of a large academic medical center to estimate number of different types of OR's(robotic, non robotic)required considering practice constraints as well as balancing the over and underutilized costs. Future research opportunities to improve the model will also be discussed.

4 - Asymmetric Bertrand-Edgeworth-Chamberlin Competition: A Pediatric Vaccine Pricing Model
Banafsheh Behzad, Assistant Professor, California State University, Long Beach, Department of Information Systems, College of Business Administration, Long Beach, CA, 90840, United States of America, behzad1@illinois.edu, Sheldon Jacobson

The pricing strategies in the United States pediatric vaccines market are studied using a Bertrand-Edgeworth-Chamberlin price game. The game analyzes the competition between asymmetric capacity- constrained manufacturers producing differentiated products. The model completely characterizes the unique pure strategy equilibrium in this game in an oligopoly setting. Complete characterization of mixed strategy equilibrium is provided for a duopoly setting.

5 - Optimal Rotation of Duties of Hemodynamics Units: A Case Study
Giovanni Righini, University of Milan, Via Bramante, 65, Crema, Italy, giovanni.righini@unimi.it

We consider optimization problems arising in the reorganization of the regional health care system in the province of Milan, concerning the treatment of patients affected by acute myocardial infarction. Namely we consider some tactical level problems to suitably define a cyclic schedule of hemodynamics units to be un duty during nights and week-ends. We present integer linear programming models and we provide computational results obtained for the province of Milan.

Chair: Xiaojun Shan, Postdoctoral Research Associate, CEEEP at Rutgers University, 33 Livingston Ave, New Brunswick, NJ, 08901, United States of America, xiaojun.shan@ejb.rutgers.edu

1 - Pareto Optimal Designs for CO2 Cap and Trade Policies on Deregulated Electricity Networks
Felipe Feijoo, University of South Florida, 4202 E. Fowler Ave, ENB118, Tampa, United States of America, felipefeijoo@mail.usf.edu, Tapas Das

This paper presents two layers model to develop Pareto optimal designs for CO2 Cap and Trade policies. The top layer involves design of optimal cap-and-trade policy over a planning horizon. The bottom layer involves, for a given cap-and-trade policy, finding equilibrium bidding strategies of the competing generators while maximizing social welfare via DC-OPF.

2 - The Modern Electric Grid: Implications for National Security
Anu Narayanan, Associate Engineer, RAND corp, 4570 Fifth Avenue, Suite 600, Pittsburgh, PA, 15213, United States of America, anarayan@rand.org

The modernization of the electric power grid includes the deployment of intelligence, controls and distributed generation resources across the power delivery system. These upgrades come with opportunities for increased system resilience and security as well as potential risks. In this talk I will touch on both sides, considering technical, economic and policy issues and identifying questions to ask as we try to make the best use of available and emerging technologies.

3 - Effectiveness of Defensive Investments in the Light of Cascading Failure
Sinan Tas, Penn State University-Berks, 1800 Tulpehocken Road, Reading, Pe, 19610, United States of America, sut12@psu.edu

Limited capacities and old technologies make cascading failure a crucial aspect of our critical infrastructure including power grids and telecommunication networks. In this talk, we will analyze how effective our defensive investments can be when intelligent adversaries consider cascading failure as part of their attack strategies. We will also discuss the practical implications of efficient security investments that may lead to more sustainable security policies.

4 - Designing Intervention Scheme for Public-Interest Goods: California Electric Vehicle Market Case
Ece Demirci, Ph.D. Student, Bilkent University, Department of Industrial Engineering, Ankara, 06800, Turkey, edemirci@bilkent.edu.tr, Nesim K. Erkip

This study explores the problem of designing an intervention scheme for public-interest goods. We consider a system composed of a retailer and a central authority with fixed budget. The central authority regulates the system by two intervention tools: investment on demand increasing strategies and subsidies. We use bi-level programming for modeling the system, provide some structural properties and calibrate our model with California electric vehicle market data.

Healthcare and Humanitarian Logistics

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Maria Besiou, Associate Professor of Humanitarian Logistics, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, 20457, Germany, maria.besiou@the-klu.org

1 - Global Vehicle Supply Chain Management in Humanitarian Operations

Alfonso Pedraza-Martinez, Assistant Professor, Kelley School of Business, Indiana University, 1309 E 10th Street, Kelley School of Business, IU, Bloomington, In, 47405, United States of America, alpedraz@indiana.edu, Luk Van Wassenhove, Jon Stauffer

We use dynamic hub location models to investigate the vehicle supply chain of an international humanitarian organization. Using real data we obtain vehicle demand following the Haiti earthquake and multiple development programs. We show how temporary hubs in major disaster areas can balance costs and responsiveness in global humanitarian supply chains.

2 - Predicting the Unpredictable: Deciding Where to Locate Strategic Stock using Real Data

Marianne Jahre, Professor, BI Norwegian Business School, Visiting Researcher MIT Humanitarian Response Lab, Sorgenfrigata 18a, Oslo, Ch, 0365, Norway, marianne.jahre@bi.no, Stein Erik Grönland

The Humanitarian Assistance Demand Forecast (HADF) is a tool to establish annual global demand for disaster relief goods and logistics services in international assistance. IFRC used HADF as a decision support tool to make evidence based decisions on locations and volumes of relief items to be prepositioned, thus forming their new global structure of physical, human and financial resources. The paper presents how real data helped IFRC make optimal decisions in designing their network.

3 - Humanitarian Transportation Planning: Human and Modeling Approaches

Erica Gralla, Assistant Professor, George Washington University, 1776 G St NW Suite 101, Washington, DC, 20052, United States of America, egralla@email.gwu.edu

A key logistics challenge in disaster response is planning and prioritizing the use of trucks and helicopters to transport humanitarian aid to affected communities. This paper explores ways to improve humanitarian transportation planning by building on the strengths of both humans and models. We identify decision-making algorithms, prioritization policies, and organizational structures that are nearly as effective as optimizers, but much simpler to implement in the humanitarian context.

4 - Patients with Chronic Disease: A System Dynamics Approach

Maria Besiou, Associate Professor of Humanitarian Logistics, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, 20457, Germany, maria.besiou@the-klu.org, Charalampos Tziogas, Patroklos Georgiadis, Reinhard Angelmar

Chronic diseases are lifelong medical conditions that evolve over a person's lifespan. Even if they can be treated and controlled, their long-term effects pose great pressure to the global healthcare sector. Motivated by the need for active and sustainable interventions in the healthcare sector, we develop a system dynamics model to capture the chronic disease patient flow. We also use a numerical example to study the non-linear complex dynamic behavior of the system under study.

Information Systems 3

Contributed Session

Chair: Zsolt Ugray, Utah State University, 3515 Old Main Hill, MIS Department, Logan, UT, 84322-3515, United States of America, zsolt.ugray@usu.edu

1 - Optimized Autoscaling in Cloud Computing

Parijat Dube, IBM, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, pdube@us.ibm.com, Anshul Gandhi, Alexei Karve, Andrzej Kochut, Li Zhang

We develop a Kalman-filtering based automated solution to dynamically scale cloud deployments to meet application-level performance targets. Our solution leverages resource-level and application-level statistics to determine the required scaling actions in a cost-effective manner. The core of DC2 is a modeling and execution engine that internalizes the monitored statistics and infers the necessary system parameters.

2 - What Value Does Management Expect from BI/BA Projects? – Findings from Qualitative Case Studies

Zsolt Ugray, Utah State University, 3515 Old Main Hill, MIS Department, Logan, UT, 84322-3515, United States of America, zsolt.ugray@usu.edu, David Paper, Jeffrey Johnson

The use of business intelligence and business analytics (BI/BA) tools has become quite common in the past two decades. Some companies choose to make big investments in resources to support these efforts, while others approach possible investments very cautiously. We report on findings from our qualitative case studies of a variety of firms where our focus is to investigate management's perceptions of the value they can gain from BI/BA projects.

3 - How Strategic IT Organizations Enable Business Teams to Make Well-informed Business Decisions

Phil Weinzimer, President, Strategere Consulting, Alltentown, PA, 18104, United States of America, pweinzimer@strategere.com

The power of Information is valuable if it enhances the knowledge and enables operational personnel, business unit management, and executives to make well-informed business decisions that lead to significant business outcomes. A new book, The Strategic CIO; Changing the Dynamics of the Business Enterprise, based upon 150 CIO and business Executive interviews, explores, via case studies, how CIOs, using a common four-phase methodology, leverage information/technology for competitive advantage.

4 - Crowdsourced Digital Goods and Firm Productivity

Frank Nagle, Harvard Business School, Wyss 100, Soldiers Field, Boston, MA, 02163, United States of America, fnagle@hbs.edu

Crowdsourced digital goods are becoming more freely available and more frequently used as inputs by firms. However, the current literature on the returns to IT investment mismeasures non-pecuniary digital inputs. I measure the impact of one such good, open source software (OSS), on firm productivity. I find a positive and significant return to the usage of OSS. I address endogeneity concerns by using an instrumental variable approach and a matching estimation.

Big Data 2

Contributed Session

Chair: Hing Kai Chan, Associate Professor, University of Nottingham Ningbo China, Business School China, Ningbo 315100, China, hingkai.chan@nottingham.edu.cn

1 - A Multi-disciplinary Approach to Quantify Social Media Data

Hing Kai Chan, Associate Professor, University of Nottingham Ningbo China, Business School China, Ningbo 315100, China, hingkai.chan@nottingham.edu.cn

Social media data are freely available and lots of useful data are available. Unfortunately, they are not fully utilized partly because of their nature: unstructured, subjective, and massive size. The proposed approach makes use of multiple research methods to process the social media. First part of the method is exploratory in nature, followed by statistical cluster analysis. The exact meaning of the data will then be extracted by entropy concept.

2 - A Knowledge Driven Hypotheses Generation Method to Uncover Actionable Information from Medical Data

Nuo Xu, Assistant Professor, University of Alabama at Birmingham, 1150 10th Ave South, Birmingham, AL, United States of America, nuoxu@uab.edu, Xuan Huang

The greatest challenge in utilizing Big-Data in healthcare is the hypotheses-driven paradigm that dominates clinical practice and research and its incompatibility to data driven paradigm. We propose an expert knowledge driven hypotheses generation mechanism to discover actionable knowledge based on two techniques, 1) knowledge driven feature creation and 2) model-free feature selection. We demonstrate the effectiveness of our approach with a 2-year diabetic intervention study at UAB hospital.

3 - Antecedences and Consequences of Multichannel Sharing Behaviors

Tianshu Sun, PhD Candidate, Smith School of Business, University of Maryland, 3330 Van Munching Hall, PhD Student Office, College Park, MD, 20742, United States of America, tianshusun@rhsmith.umd.edu, Elena Zheleva, Siva Viswanathan

With the rapid rise of the "sharing economy" there has been a renewed interest in understanding the antecedents and consequences of information sharing behaviors. We examine how product and social network characteristics drive information sharing across channels and before/after purchase. Using a granular dataset on customer sharing of daily deals and a rich set of product and social network characteristics our study provides novel insights into multi-channel sharing behaviors

4 - Clickstream Big Data and Delivery before Order Making" Mode for Online Retailers

Yeming Gong, EMLYON Business School, Rue Dunoir 12, Lyon, 69003, France, gong@em-lyon.com, Haoxuan Xu

Our research is inspired by a leading online retailer using clickstream big data to estimate customer demand and then ship items to customers or hubs near customers by a mode of "delivery before order making" (DBOM) mode. Using clickstream data to obtain advance demand information in order quantities, we integrate the forecasting with a single-item uncapacitated dynamic lot sizing problem in a rolling-horizon environment.

5 - A One-shot Approach to Distributed Sparse Regression

Yuekai Sun, Stanford University, 475 Via Ortega, Stanford, United States of America, yuekai@gmail.com, Qiang Liu, Fernando Perez, Jason Lee, Jonathan Taylor

We devise a one-shot approach to distributed sparse regression in the high-dimensional setting. The main idea is to estimate the regression coefficients by averaging corrected lasso estimates. We show the approach recovers the convergence rate of the lasso as long as the number of machines does not grow too quickly.

Health Care Modeling Optimization VI

Contributed Session

Chair: Michelle Alvarado, PhD Candidate, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, alvarado.michelle.m@gmail.com

1 - Scheduling for a Clinical Network

Dongyang Ester Wang, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, wdy@utexas.edu, Douglas Morrice, Kumar Muthuraman

The process that prepares outpatients for surgery is service intensive and requires timely access to multiple services. However, scheduling outpatient appointments is not coordinated among the clinics. We develop a model that centralizes scheduling for a clinical network and our approach has the potential to identify a system-wide optimal solution.

2 - ICU Nurse Scheduling under Uncertainty

Ece Karpuz, Hazine Mustesarligi, Inonu Bulvari, No: 36, Emek, Ankara, Turkey, ece.karpuz@hazine.gov.tr, Sakine Batun

In this study, we consider the problem of scheduling ICU nurses under uncertainty in the required patient care. We formulate the problem as a two-stage stochastic program that minimizes the expected overtime and undertime hours. We estimate the value of the stochastic solution by considering practical instances constructed based on real data.

3 - Nurse Scheduling in Infusion Center

Kamil Ciftci, Lehigh University, 200 West Packer Avenue, Bethlehem, 18015, United States of America, kac208@lehigh.edu

Recently, it is a big challenge for infusion center management to control the environment in order to reduce operation cost, improve the quality of care, satisfy patients, and provide staff preferences. In this paper, MILP models are developed to find optimal nurse scheduling in an infusion center while minimizing patient waiting time. A heuristic policy is proposed for large problems. We design simulation model to compare proposed models with current practice in a local hospital.

4 - Analyzing the Financial Effects of HIE in a Health Care System using Simulation

Yu Fu, Graduate Student, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, yufu.ise@tamu.edu, Andy Banerjee

A Health Information Exchange (HIE) is expected to improve the effectiveness of healthcare services and reduce cost for the payers and providers. The focus of this research study is to model the complicated interactions of multiple participants in the health care system using simulation, compare the financial outcomes under different scenarios, and therefore analyze the financial effects of HIE in a health care system.

5 - Integrated Simulation and Optimization for Scheduling Chemotherapy Appointments under Uncertainty

Michelle Alvarado, Ph.D. Candidate, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, alvarado.michelle.m@gmail.com, Lewis Ntaimo

Scheduling of chemotherapy appointments is a difficult task due to uncertainty in appointment durations, acuity levels, and resource availability. To address this problem, we developed a new methodology that integrates a discrete event system specification (DEVS) simulation model with a stochastic mixed integer programming model (SMIP). The methodology and SMIP scheduling algorithms are evaluated from both the patient and management perspectives using data from a Texas oncology clinic.

Co-Chair: Timothy C. Y. Chan, University of Toronto, 5 King's College Rd., Toronto, Canada, tcychan@mie.utoronto.ca

1 - Eliciting Cholesterol Management Guidelines' Valuation of Future Life

Iakovos Toumazis, PhD Student, University at Buffalo (SUNY), Buffalo, NY, United States of America, iakovost@buffalo.edu, Osman Ozaltin, Murat Kurt, Nilay Shah, Brian Denton

Lipid abnormalities increase the risk of heart attack and stroke. Treatment guidelines are developed to deal with the complexity of treating these abnormalities. We consider the trade-off between the benefits and side effects of statins, and develop an inverse stochastic dynamic program to elicit time valuation of current guidelines. We use clinical data to illustrate the outcomes on Type 2 diabetes patients.

2 - Estimating Lipid Management Guidelines' Risk Value of a Life Year on Treatment

Niraj Kumar Pandey, University at Buffalo (SUNY), 342 Bell Hall, University at Buffalo(SUNY), Buffalo, NY, 142602050, United States of America, npandey@buffalo.edu, Murat Kurt, Mark Karwan

Statins reduce the risk of coronary heart disease and stroke, but may have adverse side effects. Except for some surveys there has not been any emphasis on the measurement of these side effects to be used for better decision making. In this study, we develop an inverse dynamic programming model to quantify the side effects of statin treatment from a central policy maker's point of view. We present computational results based on the national lipid management guidelines from several countries.

3 - Reverse Engineering Bacterial Metabolism via Inverse Optimization

Ioannis Paschalidis, Professor, Boston University, Dept of ECE, 8 Saint Mary's St, Boston, MA, 02215, United States of America, yannisp@bu.edu

We develop an Inverse Flux Balance Analysis (IFBA) method which is a novel inverse linear optimization framework for inferring the metabolic objective function. Understanding the structure of the cell's objective can help reverse engineer" a bacterium of interest and infer useful information regarding its evolution. We validate IFBA under both simulated (E. coli and Yeast) and experimental data (TEAM) with excellent results. (Joint work with Q. Zhao, A. Stettner, and D. Segre)

4 - Preference Preservation in Inverse Optimization for Radiation Therapy Treatment Planning

Taewoo Lee, PhD Candidate, University of Toronto, 5 King's College Road, Toronto, Canada, taewoo.lee@mail.utoronto.ca, Timothy C. Y. Chan

We present a new inverse convex optimization model that accommodates any input solution, including one that cannot be optimal for the forward problem, and determines a nonzero weight vector that preserves the original preference of the decision maker who generated the solution. We show how a linear approximation to the model and a successive linear programming algorithm can trade off between preference preservation and computational efficiency, using prostate cancer radiation therapy data.

1 - Bayesian Network Detection of Breast Cancer Treatment Disparities

Milton Soto-Ferrari, Western Michigan University, 4601 Campus Drive, Kalamazoo, MI, 49008, United States of America, miltonrene.sotoferrari@wmich.edu, Diana Prieto, Lorena Pena

We developed a Bayesian network (BN) and a logistic regression model (LR) that simulate the decision process of physicians in diagnosing a hormone therapy treatment, and the effect of non-clinical factors in the final receipt of the treatment in breast cancer patients. The clinical factors include: post-menopausal and hormone receptor status, treatment and adjuvant treatment received. We calculate the statistical power of the two methods and compare their results and performance.

2 - Profiling and Visualizing Utilization and Cost for Pediatric Asthma Care in the Medicaid System

Ross Hilton, PhD Candidate, Georgia Institute of Technology, 755 Ferst Dr. NE, Atlanta, GA, 30332, United States of America, rhilton3@gatech.edu

We summarize the utilization and cost relational system between providers for pediatric asthma care in the Medicaid system using large patient-level claims data. We apply sequence clustering analysis to the utilization profiles and derive a probabilistic network of care and a cost relational system for each cluster. ED visits contribute a large portion of the total cost while the majority of ED costs-per-visit are similar to other care types suggesting that many ED visits are for routine care.

3 - Drug Procurement with Long Term Considerations: Volume Splits and Volume Guarantees

Alexander Rothkopf, Post Doc, Julius-Maximilians-University, Stephanstrafle 1, Wuerzburg, 97070, Germany, alexander.rothkopf@uni-wuerzburg.de, Eirini Spiliotopoulou

Our analysis is motivated by recent decisions of global health procurement organizations to grant volume guarantees to existing suppliers: in addition to awarding the volume of the upcoming procurement cycle to incumbent suppliers a procurer also guarantees a specific volume of future procurement cycles to these suppliers today. With this mechanism organizations aim to reduce prices through competition and higher economies of scale at the suppliers.

4 - Random Acts of Violence: Examining Mass Killing Events in the United States as a Stochastic Process

Douglas King, University of Illinois at Urbana-Champaign, 117 Transportation Bldg., 104 S. Mathews Ave., MC-238, Urbana, IL, 61801, United States of America, dmking@illinois.edu, Sheldon Jacobson

Recent mass killings such as those in Newtown, CT and Aurora, CO, have brought attention to mass killings in the United States. This talk examines 236 mass killings between 2006 and 2014, finding that they do not significantly differ from a homogeneous Poisson process. This implies a stable frequency of mass killings from 2006 to 2014, and that mass killing events are random in the sense that the occurrence of one mass killing event does not signal whether another mass killing event is imminent.

System Dynamics in Health I

Sponsor: Health Applications

Sponsored Session

Chair: Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu

1 - Increasing Healthy Food Access and Equity? Dynamics of Nutritious Food Innovation

Jeroen Struben, Assistant Professor, Desautels Faculty of Management - McGill University, 1001 Sherbrooke Street W, Montreal, QC, H3A1G5, Canada, jeroen.struben@mcgill.ca, Derek Chan, Laurette Dube

We examine dynamics of and trade-offs between market-driven and social innovations in efforts to increase healthy food consumption, especially within disadvantaged populations. We develop a behavioral, dynamic, and empirically grounded nutrition market transformation model with population socio-demographically disaggregated. We identify conditions under which single-faceted or collaborative policies, involving multiple stakeholders promoting nutritious food and healthy lifestyles, are effective.

2 - Impact of Patient Non-compliance on Diabetes Care System

Sahar Hashmi, MD, PhD candidate, Massachusetts Institute of Technology, 10 Emerson Place, 16C, Boston, MA, 02114, United States of America, drhashmi@mit.edu

We studied the effect of diabetes patients with increased missed appointments on their disease progression with different insurance coverage. We measured the impact of disease progression on the cost of the diabetes management system. We have developed a system dynamic model, which identifies the key variables and causal loops involved. We suggest better aligning of the insurance coverage on preventive and counseling services to save the cost of overall spending in the diabetes clinic services.

3 - Optimal Screening Policy for Post-Traumatic Stress (PTS)

Navid Ghaffarzadegan, Assistant Professor, Virginia Tech, Blacksburg, VA, United States of America, navidg@vt.edu, Richard Larson

We develop a screening policy model for PTS including social forces that inhibit receiving early care. We simulate to analyze the characteristics of the optimal" screening policy for PTS. We show that there is a tipping point in this system, and to make a long-term difference, the screening rate should be much higher than the current numbers. Otherwise, investments only have short term effects. Implications include potentially screening everyone and tolerating false positives.

4 - System Dynamic Models of Dengue Fever

Kun (Maggie) Hu, Research Scientist, IBM, 650 Harry Rd, San Jose, CA, 95120, United States of America, khu@us.ibm.com, James Kaufman

Dengue is a major international public health concern with no vaccine. Infection with one strain affords temporary cross immunity (CI) to other strains which increases the risk of having lethal complications due to antibody-dependent enhancement (ADE). We propose two SD models of dengue fever which exhibit a transition from steady state to periodic dynamics as a function of CI and ADE. Our results show the need for ADE to explain the dynamics of the epidemiological behaviors observed in reality.

1 - Optimal Order Splitting on a Multi-slot Machine in the Printing Industry

Philipp Baumann, University of Bern, Department of Business Administration, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, philipp.baumann@pqm.unibe.ch, Salome Forrer, Norbert Trautmann

In the real-world offset printing process under study, customer-specific designs are imprinted on napkin pouches. For the planning of this process, given customer orders are to be split among several slots of printing plates, such that the total costs are minimized subject to several technological and organizational constraints. We present two alternative MILP formulations and analyze how symmetric solutions can be removed efficiently from the search space.

2 - Media Selection with Yield Uncertainty

Justin Goodson, Assistant Professor, Saint Louis University, 3674 Lindell Blvd., St. Louis, MO, 63108, United States of America, goodson@slu.edu, Reuven Levary, Luca Bertazzi

Firms advertising a product or service seeking to maximize target audience exposure often face yield uncertainties, i.e., indeterminate future events resulting in bumped media spots. Yield may be affected by breaking news, natural disasters, or political events. Although advertisers may receive refunds for bumped spots, it is difficult to recover lost exposure. We consider strategies to hedge against yield uncertainty, developing upper and lower bounds on the value of an optimal policy.

3 - Weighted Target Set Selection

Rui Zhang, University of Maryland, R. H. Smith Business School, College Park, MD, United States of America, ruizhang@rhsmith.umd.edu, Raghu Raghavan

The Target Set Selection (TSS) problem is a fundamental problem about the diffusion of influence in social networks. In our work, we consider the weighted version of it (WTSS problem). Motivated by the desire to develop mathematical programming approaches, we first focus on developing a strong formulation for the problem on trees. We present a tight and compact extended formulation for it. Furthermore, based on this strong formulation, a branch and cut approach is proposed for general networks.

4 - Assortment Optimization in Fashion Retail

Marie-Claude Côté, JDA Software, 4200 st-laurent, Montreal, Canada, marie-claude.cote@jda.com, Louis-Martin Rousseau, Marc Brisson, Eric Prescott-Gagnon, Vincent Raymond

The assortment problem aims at selecting the best set of items to be carried in each store of an chain for a future season based on user-defined constraints. To support the particularity of the fashion industry where items can change significantly from one season to another, we use a genetic algorith, a MIP and a Neural Network to create new interesting items and items with similar characteristics considering the constraints to give the user a meaningful set of product to create his assortment.

1 - Are You on the Edge of Failure? Let the Customer Checkin Tell You

Lei Wang, Assistant Professor, Pennsylvania State University, 454 Business Building, University Park, PA, 16802, United States of America, Lei.Wang@business.uconn.edu, Joseph Pancras, Ramesh Shankar, Ram Gopal

It is vital to understand how businesses can leverage the real-time data generated by location-based services. Using data collected from Foursquare and Yelp, we aim to find out the predictive power of customer checkins on business failure for restaurants in New York City. We find that customer checkin data from the focal restaurant and its neighbors have shown strong predictive power on business failure. Incorporating customer checkins data gives a remarkable improvement on predictive accuracy.

2 - Push or Pull? Design of Content Delivery Systems

Sean Marston, Assistant Professor, Western Kentucky University, 1906 College Heights Blvd. #21058, Bowling Green, KY, 42101, United States of America, Sean.marston@wku.edu, Hong Guo, Yuwen Chen

Advances in information technology, especially the expansion of cellular and WiFi networks, are dramatically changing how people consume digital content. This paper addresses this challenge by identifying the key factors for the design of content delivery systems and explicitly modeling their interactions. We investigate two content delivery systems ñ push and pull systems, and solve for the content provider's optimal push frequency decision and consumers' push versus pull decision.

3 - Information Technology and Transformation of Government Services

Min-Seok Pang, Assistant Professor, Temple University, United States of America, mins.pang@gmail.com, Henry C. Lucas, Jr., Sunil Mithas

In the context of U.S. Social Security, we study how use of online self-service technologies (SST) is associated with customer satisfaction. Using a large-scale individual-level dataset with more than 2,700 respondents, we find that successful use of SST in Social Security benefit applications is associated with higher levels of service satisfaction, compared to the in-person channel. We also show that a service failure on the online channel is related to customer dissatisfaction.

Sponsored Session

Chair: Ken Schultz, Associate Professor, Air Force Institute of Technology, 4950 Hobson Way, WPAFB, OH, 45433, United States of America, kenneth.schultz@afit.edu

1 - Individual Behavior and Supplier Pricing to a Newsvendor

Julie Niederhoff, Syracuse University, Syracuse, NY, United States of America, Jniederh@syr.edu, Panos Kouvelis

Previous studies have examined pricing in contracts to find that they are on average sub-optimally set. However, current literature is primarily focused on average behavior. This neglects the heterogeneity of decision makers. We explore 3 individual biases within a price-setting supplier context to better understand which decision makers get it right, which deviate, and why..

2 - Data Analysis of Service Times in Call Centers

Noah Gans, OPIM Department, Wharton - University of Pennsylvania, Philadelphia, PA, United States of America, gans@wharton.upenn.edu, Haipeng Shen, Han Ye

We have been analyzing large datasets from telephone call centers to better characterize pervasive but little-studied phenomena that affect their operations. In this talk, we'll discuss agent call times, which show considerable heterogeneity and evolve according to somewhat predictable patterns.

3 - A General Framework for the Influence of Load on Service Time

Ken Schultz, Associate Professor, Air Force Institute of Technology, 4950 Hobson Way, WPAFB, OH, 45433, United States of America, kenneth.schultz@afit.edu, Bora Kolfal, Mahammad Delasay, Armann Ingolfsson

Do service times increase or decrease with load? The answer is "Yes" or, more accurately, "It depends". We construct a general framework that is useful to both researches and practictioners investigating the affects of load on service times. We propose a thorough examination of the interactions of "load characteristics," "system components," and "service time determinants.

Games and Optimization over Networks

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Swati Gupta, Graduate Student, Massachusetts Institute of Technology, 77 Massachusetts Avenue, MIT ORC, E40-149, Cambridge, MA, 02139, United States of America, swatig@mit.edu

1 - On the Quickest Flow Problem in Dynamic Networks – A Parametric Min-cost Flow Approach

Maokai Lin, Massachusetts Institute of Technology, 7 7 Massachusetts Avenue,MIT ORC,, Cambridge, MA, 02139, United States of America, lmk@mit.edu, Patrick Jaillet

We consider the quickest flow problem in dynamic networks: given flow F, find the minimum time to send it through a network over time. We introduce a new linear programming model for the problem. Using the parametric nature of the model, we develop a cost-scaling algorithm that runs in O(nmlog(n^2/m)log(nC)) time, where C is the maximum arc cost. This result shows for the first time that the quickest flow problem is no harder than the min-cost flow problem in static networks.

2 - A Decentralized Coalition Loyalty Program using Credit Networks

Arpit Goel, Student, Stanford, 1520 Sand Hill Road, Apt 302, Palo Alto, Ca, 94304, United States of America, argoel@stanford.edu, Pranav Dandekar, Ashish Goel

We propose a decentralized system for forming coalition loyalty programs by extending the model of 'credit networks'. We show two important properties of the proposed `path independence' and `no arbitrage'. We introduce a model of customer utility in frequency loyalty program, and show under what conditions coalitions perform better than individual programs.

3 - Finding Small Stabilizers for Unstable Graphs

Karthekeyan Chandrasekaran, Harvard University, 19 Pleasant St, Apt 12, Cambridge, MA, 02139, United States of America, karthe@gatech.edu, Britta Peis, Jochen Koenemann, Laura Sanita, Adrian Bock

Stable graphs play an important role in cooperative game theory. An undirected graph is stable if its inessential vertices (those that are exposed by at least one maximum matching) form a stable set. In this work we study the following edge-deletion question: given a graph G, can we find a minimum-cardinality subset of edges whose removal from G yields a stable graph? We show hardness results and efficient approximation algorithms for sparse graphs and for regular graphs.

4 - Games People (could not) Play

Swati Gupta, Graduate Student, Massachusetts Institute of Technology, 77 Massachusetts Avenue, MIT ORC, E40-149, Cambridge, MA, 02139, United States of America, swatig@mit.edu, Patrick Jaillet, Michel Goemans

Every 2-player zero-sum game has an optimal mixed strategy that can be found by solving an LP. But this approach fails to give a polytime algorithm when the number of pure strategies for each player is exponential in the representation of the game, e.g. if players play spanning trees of a graph. We give fast algorithms to compute approximate Nash-equilibria for exponential succinct games for a class of payoff functions using ideas from convex and combinatorial optimization and machine learning.

Computational Challenges for Sequential Stochastic Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Warren Powell, Professor, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08544, United States of America, powell@princeton.edu

1 - Multiple Timescale Stochastic Optimization for Integrating Renewable Resources

Suvrajeet Sen, Professor, University of Southern California, University Park Campus, LA, CA, 90089, United States of America, s.sen@usc.edu, Harsha Gangammanavar

We present a stochastic optimization model which accommodates decisions at multiple timescales: a coarse timescale for thermal generation decisions and a fine timescale to control of renewable resources, storage devices etc. This model is solved using a joint stochastic decomposition-approximate dynamic programming algorithm. Our computational results are based on incorporating wind simulation into this algorithm.

2 - Dynamic Measures of Risk on Dynamic Programs

Ricardo Collado, Assistant Professor, Stevens Institute of Technology, Castle Point on Hudson, Hoboken, NJ, 07030, United States of America, ricardo.collado@stevens.edu, Warren Powell

We discuss dynamic measures of risk on finite and infinite horizon dynamic programs. We focus our attention on identifying main properties of such dynamic risk measures and its implementation challenges. We finish our presentation with a discussion of threshold risk measures and its application to finite and infinite horizon dynamic programs.

3 - Approximation Strategies for Multistage Stochastic Programs

Tsvetan Asamov, Post-doctoral associate, Princeton University, Sherrerd Hall, Princeton, NJ, 08544, United States of America, tasamov@princeton.edu, Warren Powell

Using the contextual setting of optimizing grid-level energy storage, we study the effect of dimensionality on the performance of different approximation strategies. We build on the algorithmic framework of approximate dynamic programming to introduce novel machine learning strategies which overcome the curse of dimensionality inherent in scenario trees. The energy storage setting is used to create families of problems which exhibit different characteristics of the information state.

4 - A Nested Newsvendor Model to Integrate Rolling Wind Forecasts in the Energy Commitment Problem

Genna Gliner, Graduate student, Princeton University, Sherrerd Hall, Princeton, NJ, 08544, United States of America, genna@princeton.edu, Warren Powell

We formulate the energy commitment problem with wind energy as a lagged, nested newsvendor problem in the presence of rolling forecasts. We present a stochastic model of the rolling forecasts, and show how these can be used to produce an analytical solution of the energy commitment problem. We then study the sensitivity of the solution to changes in forecasts and use the model to predict how these changes affect the commitment decisions and the objective function value.

Optimization, Robust 2

Contributed Session

Chair: Dimitri Papadimitriou, Pr.Eng.Research, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@alcatel-lucent.com

1 - Multi-agent Probe Localization/Configuration Problem

Dimitri Papadimitriou, Pr.Eng.Research, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@alcatel-lucent.com

The probe localization/configuration problem aims at minimizing the number of probes/workload together with their placement to realize a measurement task under various spatial and resource constraints. When applied to systems subject to uncertainty, one often lacks full information on the nature of this uncertainty. We propose a multi-agent computational method capable to resolve large-scale instances of this problem over time for any realization of uncertainty (in a given set).

2 - Robust Optimization and Predictive Model: A Marketing Use Case

Oliver Bastert, FICO, Maximilianstr. 35a, Munich, Germany, OliverBastert@fico.com, Sébastien Lannez, Shalini Raghavan, Susanne Heipcke

In this paper we present FICO's solution to optimize marketing campaigns, and describe an extension that is used to take into account information about the forecast accuracy during the optimization process. The scalability of the tool is ensured by FICO Xpress Optimization Suite and its distributed computation capability.

3 - Robust Optimization Formulations for Planning Problems

Susanne Heipcke, FICO, Starley Way, Birmingham, United Kingdom, susanneheipcke@fico.com, Zsolt Csizmadia, Pietro Belotti, Sébastien Lannez

Planning, whether long-term or short-term, typically involves uncertain data: demand forecasts rarely are fixed values, availability of resources or raw materials may be uncertain. Robust Optimization provides a means of incorporating such uncertainties into standard" optimization problems. We discuss robust formulations for examples from various application domains, including production planning, logistics, and power generation, and comment on their implementation with Xpress-Mosel.

4 - Options-Mix Demand Specification for Robust Assembly Line Rebalancing

Bryan Pearce, Clemson University, Freeman Hall, Clemson, SC, 29634, United States of America, bpearce@g.clemson.edu, Mary Elizabeth Kurz, Laine Mears, Kavit Antani

We consider the assembly line rebalancing problem that emerges in make to order facilities. Specification of the demand model-mix becomes intractable with very large product customization options. An options-mix demand structure is presented instead, for a single period forecast. A two-stage robust optimization procedure is applied to maximize line efficiency and a horizontal balancing metric.

Sponsored Session

Chair: Kelly Sullivan, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, United States of America, ksulliv@uark.edu

1 - The Shortest Path Problem with Replenishment

Sarah Nurre, Assistant Professor, Graduate School of Engineering & Management, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, Sarah.Nurre@afit.edu, Brian Lunday

We examine the problem of identifying a path through a network from a start node to a terminus node, wherein traversing any arc both increments the length of the path traveled and depletes a capacitated resource. Such a resource is necessary for arc traversal, but it may be replenished at any one or more of a subset of the nodes. We seek to minimize a combination of the path length and number of replenishments. Three exact methods which map the efficient frontier are computationally compared.

2 - Hybrid Optimization Approaches for Dynamic Network Interdiction Models

Chase Rainwater, University of Arkansas, Bell Engineering Center, Office #4207, Fayetteville, AR, 72701, United States of America, cer@uark.edu, Thomas Sharkey, Forough Enayaty

We consider a dynamic network interdiction problem in which adversarial actors seek to maximize illegal flow while protective actors utilize resources to minimize this flow. We discuss an integer programming representation of our problem and then explore hybrid constraint and integer programming techniques for solving larger problem variants. We conclude with a discussion of the role that information plays when our problem is applied to a law enforcement application.

3 - Study on Multi-objective Home Health Care Nurse Routing Problem

Kunlei Lian, Graduate Student, University of Arkansas, Bell 4130, 1 University of Arkansas, Fayetteville, AR, 72701, United States of America, klian@email.uark.edu, Ashlea Milburn, Ronald Rardin

The nurse routing problems in this research involves providing consistent service to patients with the objectives of minimizing traveling cost and improving service quality. An improved non-dominated sorting genetic algorithm is proposed to find the trade-offs between these objectives. Large neighborhood search is employed to improve solution diversity and quality. Computational results are presented and observations regarding tradeoffs among the competing objectives are made.

Optimization, Integer 1

Contributed Session

Chair: Pierre Le Bodic, School of Industrial Systems and Engineering, Georgia Institute of Technology, Atlanta, 30332, United States of America, lebodic@gatech.edu

1 - Insights on Branching in MIP Solvers

Pierre Le Bodic, School of Industrial Systems and Engineering, Georgia Institute of Technology, Atlanta, 30332, United States of America, lebodic@gatech.edu, George Nemhauser

The branch and bound algorithm is the standard component around which MIP solvers are designed. We will give insights on branching and show the importance of taking good branching decisions. In particular, we will exhibit a family of instances for which a fixed-size branch-and-bound tree exists, but for which state-of-the-art MIP solvers need an increasing amount of resources.

2 - Cloud Branching – How to Exploit Dual Degeneracy in Global Search

Timo Berthold, Fair Isaac Europe Ltd, Takustr. 7, Berlin, 10551, Germany, timoberthold@fico.com

We study branching strategies for mixed-integer programs that exploit the knowledge of *multiple* alternative optimal solutions (of the current LP relaxation. They naturally extend state-of-the-art methods like strong branching, pseudocost branching, and their hybrids. We show that by exploiting dual degeneracy (thus, alternative optima) it is possible to enhance traditional methods.

3 - Inequality Merging in the Multiple Knapsack Polyhedron

Randal Hickman, Assistant Professor, United States Military Academy, 3428 Westbaker St., Manhattan, KS, 66503, United States of America, hickman97@earthlink.net, Todd Easton

Inequality merging constructs a new category of cutting planes for IP problems. The technique merges two or more valid inequalities into a single cutting plane. Theoretical results related to merging cover inequalities for the multiple knapsack (MK) polyhedron are presented. A computational study demonstrates an average decrease of about 9% in computational effort for some benchmark MK instances.

4 - The Multi-Point Separation Strategy as a Column Generation Stabilization Technique

Francois Vanderbeck, Prof, University of Bordeaux & INRIA, 351, Cours de la Libération, Talence, 33405, France, fv@math.u-bordeaux1.fr, Ruslan Sadykov, Eduardo Uchoa, Artur Pessoa

Column generation suffers from slow convergence. Algorithmic strategies have been designed to accelerate convergence of cutting plane algorithms in mixed integer programming. They have their counterpart in column generation. We show that the Multi-Point Separation" strategy translates into a column generation stabilization technique that consists in restricting the dual solution to be in the convex hull of the selected multi-point set.

Operations/Quality Management

Contributed Session

Chair: Miri Gilenson, Technion - Israel Institute of Technology, Industrial Engineering and Management, Technion City, Haifa, 3200003, Israel, miray.g@gmail.com

1 - In-Situ Quality Control of High Concentration CNT Suspension and Multistage Buckypaper Manufacturing

Mingchia (Dawn) Yang, Florida State University/High Performance Material Institute, 2005 Levy Ave, Tallahassee, Fl, 32310, United States of America, myang@fsu.edu, Sida Luo, Richard Liang, Michael Moench, Brian Wiesner, Arda Vanli

A multistage quality monitoring approach is proposed to achieve reproducible and repeatable buckypaper manufacturing with the aid of UV-vis-NIR spectroscopy and Dynamic Light Scattering (DLS) techniques to quantify dispersion quality of high concentration CNT suspensions. Process variables in different stages are specified and studied through in-situ suspension characterization, design of experiments statistical modeling and process control techniques.

2 - Setting Quality Control Requirements to Balance Cycle Time and Yield

Miri Gilenson, Technion - Israel Institute of Technology, Industrial Engineering and Management, Technion City, Haifa, 3200003, Israel, miray.g@gmail.com, Michael Hassoun, Liron Yedidsion

The design of quality monitoring operations has direct impact on cycle time and yield. A major design factor of these operations is the control limits, traditionally set by yield requirements. To challenge this concept, we develop a bi-criteria trade-off formulation between yield and cycle time in a system monitored by inspection stations, where the control limits are decision variables. Our model enables decision makers to knowingly sacrifice yield to shorten cycle time and vice versa.

3 - The Supply Chain Construct Imbedded within the Malcolm Baldridge National Quality Award

Xianghui Peng, University of North Texas, 1155 Union Circle #311396, Denton, TX, 76203, United States of America, xianghui.peng@unt.edu, Victor Prybutok

In this research, we examine the conceptual framework of the Malcolm Baldridge National Quality Award (MBNQA) and the items associated with supply chain issues. This examination resulted in the positing of a restructured MBNQA model that includes and emphasizes the supply chain construct.

4 - Managing Service Delivery Contracts
Ray Strong, Research Staff Member, IBM, Almaden Research Center, 650 Harry Rd, San Jose, CA, 95120, United States of America, hrstrong@us.ibm.com

We describe how to convert the business process for worldwide delivery of long term service contracts into a comparative management technique using historical financial data.

Optimization, Heuristic

Contributed Session

Chair: Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - Information Workflow Optimization with Bandwidth Constraints
Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com, Hector Ortiz-Pena

Workflow management systems allow for visibility, control, and automation of some of the business processes. Recently, nonbusiness domains have taken an interest in the management of workflows. In this research we have developed a rigorous mathematical programming formulation of the information workflow optimization problem, incorporating bandwidth constraints. Multiple heuristics have been developed to solve this problem, and results will be presented.

2 - Heuristic Approach to Navigation Dredge Scheduling
Furkan Oztanriseven, University of Arkansas, BELL Engineering Center, Office #4207, Fayetteville, AR, 72701, United States of America, foztanri@uark.edu, Heather Nachtmann, Edward Pohl, Ridvan Gedik

Dredging operations are necessary to maintain the navigation channels within the U.S. maritime transportation system. Due to budget limitations, equipment availability, and environmental restricted periods, there is a need for system-level dredge project scheduling and vessel assignment. We present a simulated annealing-based heuristic approach to this problem.

3 - A Parallel Heuristic Solution to the Quadratic Assignment Problem
Clara Novoa, Associate Professor, Texas State University, 601 University Dr, San Marcos, TX, 78666, United States of America, cn17@txstate.edu, Apan Qasem, Abhilash Chaparala

We solve a Quadratic Assignment Problem by developing a parallel 2-opt heuristic that runs in the Graphical Processing Unit (GPU). We fine tune the thread block configuration and exploit inter-thread data locality through improved shared memory allocation. We experiment with 17 QAPLIB data sets. Our algorithm on average, outperforms an OpenMP implementation by a factor of 16.31. Algorithm accuracy is satisfactory. It is contrasted to a Tabu search GPU implementation performed by other authors.

4 - Unitload Warehouse Control: A Time Based Approach for Routing
Nadeepa Wickramage, Graduate Student, Clemson University, 110 Freeman Hall, Clemson, SC, 29631, United States of America, nwickra@g.clemson.edu, William Ferrell Jr.

Most unitload containers are capable of being stacked on each other. We explore the ability to improve the efficiency of storing and picking unit-load operations in a warehouse by stacking containers. A time-based approach is used to generate pick and store routes that minimizes total routing and handling time. For warehouses that have millions of trips per year, the multiplicative effect of small time saving in each trip can have a dramatic cumulative effect on the cost savings.

5 - Concurrent Generation of Feasible Integer Solutions using Random Walks
Utku Koc, Post Doctoral Fellow, Northwestern University, 2145 Sheridan Rd, Industrial Engineering and Mgmt Sciences, Evanston, IL, United States of America, utkukoc@northwestern.edu, Sanjay Mehrotra, Kuo-Ling Huang

We present an approach to parallelize generation of feasible solutions for mixed integer linear programs. The approach runs multiple feasibility pump instances concurrently, with different starting solutions generated by random walks, and allowing them to share information. Computational results suggest that the improvement resulting from parallelization is statistically significant. The heuristic starting from vertices generated by random walk points outperforms other heuristics tested.

Finance, Financial Engineering 1

Contributed Session

Chair: Joongyeub Yeo, PhD Student, Institute for Computational and Mathematical Engineering, Stanford University, 88 Hulme Court, Apt 107, Stanford, CA, 94305, United States of America, yeo@stanford.edu

1 - Regime Change in Dynamic Correlation Matrices of Financial Data
Joongyeub Yeo, PhD Student, Institute for Computational and Mathematical Engineering, Stanford University, 88 Hulme Court, Apt 107, Stanford, CA, 94305, United States of America, yeo@stanford.edu

We propose a new computational method to estimate the correlation structure of high-dimensional financial data. We use free random variable techniques and minimize the spectral distance between the theoretical and empirical spectral density. The comparison between the estimated parameters and the mean-reversion time from an Ornstein-Uhlenbeck model give consistent results for regime changes in residuals. We discuss applications in algorithmic trading. Joint work with George Papanicolaou.

2 - Limit Order Books with Stochastic Market Depth
Ningyuan Chen, Columbia University, 321 S. W. Mudd Building, 500 W. 120th Street, NEW YORK, NY, 100275811, United States of America, nc2462@columbia.edu, Steven Kou, Chun Wang

We propose a model for limit order books with stochastic market depth, consistent with empirical studies. To show the analytical tractability of the model, in addition to a dynamic programming formulation of the optimal execution problem, we provide easily computable and tight upper and lower bounds for the optimal execution cost, as well as their resulting trading strategies via quadratic programming and jump-linear-quadratic control.

3 - Investment Decisions and Debt Priority Structure: Straight Debt and Convertible Debt
Kyoko Yagi, Akita Prefectural University, 84-4 Ebinokuchi, Tsuchiya, Honjo, Akita, 015-0055, Japan, yagi@akita-pu.ac.jp, Ryuta Takashima

In this paper we consider an investment problem of a firm with outstanding straight debt. The firm finances the investment cost with convertible debt. We explore the interaction between financing and investment decision. Furthermore, we discuss the effect of the debt priority structure on the agency cost of debt and the some consistencies of results in our theoretical model with empirical evidences.

4 - Perpetual Game Call Options with Jumps
Atsuo Suzuki, Meijo University, Nijigaoka 4-3-3, Kani, Gifu, Japan, atsuo@urban.meijo-u.ac.jp, Katsushige Sawaki

In this paper, we deal with perpetual game call options with jumps. Game option is a contact that the seller and the buyer have the rights to cancel and to exercise it at any time, respectively. We give the optimal boundaries for the seller and buyer and present the value function of perpetual game call option with jumps. The pricing of this option can be formulated as a coupled optimal stopping problem which is analyzed as Dynkin game.

5 - On the Impulse Control Problem with Outside Jumps
Makoto Goto, Hokkaido University, Kita 9, Nishi 7, Kita-ku, Sapporo, Japan, goto@econ.hokudai.ac.jp

In this paper, we study the impulse control problem with oudside jumps. As represented by (s,S) policies, impulse control problems usually have inside jumps. Namely, when the inventory level goes down and hits a threshold, it jumps up by the order placement. However, in terms of capacity choice problems, firms should install additional capacities when the demand is increasing. That is, the impulse control problem we consider has outside jumps, which is hard to solve through usual approaches.

Behavioral Portfolio Selection and Asset Pricing

Sponsor: Financial Services Section

Sponsored Session

Chair: Xuedong He, Assistant Professor, Columbia University, 316 Mudd, 500 W. 120th street, New York, NY, 10027, United States of America, xh2140@columbia.edu

1 - Equilibrium Asset Pricing with Rational and Irrational Investors

Jing Guo, Columbia University, 500 W 122nd Street, Apt. 1E, New York, NY, 10027, United States of America, jg3222@columbia.edu, Xuedong He

We study multi-period asset pricing with rational and irrational investor. The rational investor maximizes log utility and the irrational has additional cumulative-prospect-theory utility. We prove the existence and uniqueness of equilibrium price. We derive a stock performance measure and show that irrational investor invests less if and only if his loss-aversion degree is higher than the measure. We show the market dominance of rational investor. We do numeric analysis for polynomial utility.

2 - A Processing-Consistent Non-Bayesian Inference Model

Di Xiao, Columbia University, United States of America, dx2125@columbia.edu, Xuedong He

We consider a generic dynamic inference model, which is a generalization of the Bayesian model by applying distortion on the prior density and replacing likelihood with quasi-likelihood. We show this model is processing consistent, i.e., the posterior density resulting from this model does not depend on how the samples are grouped and processed, if and only if there is no distortion on the prior density at any time except for the initial time and the quasi-likelihood satisfies a product rule.

3 - Sensitivity Analysis of Nonlinear Behavior with Distorted Probability

Xiangwei Wan, Assistant Professor, Shanghai Jiao Tong University, RM108, 4 Building, 535 Fahuazhen Road, Shanghai, 200052, China, xwwan@sjtu.edu.cn, Xi-Ren Cao

We propose a sensitivity-based analysis to study portfolio selection problem under non-expected utility with probability distortions. For the complete markets case, the first-order condition is derived and optimal wealth deduced. For the incomplete markets case, a dual characterization of optimal policies is provided; a solvable incomplete market example with unhedgeable interest rate risk is also presented.

4 - Self-control in Time Inconsistent Decision Making via Commitment by Punishment

Duan Li, Professor, The Chinese University of Hong Kong, Dept. of Syst. Eng. & Eng. Manag., Shatin, Hong Kong - PRC, dli@se.cuhk.edu.hk, Xiangyu Cui, Yun Shi

To cope with time inconsistent dynamic decision problems, we develop a planner-doer two-tier game model with self-control, where planner and doers represent different facets of the same decision maker at different time instants and the planner can manipulate the decisions of the doers through commitment by punishment. This strategy of self-control enables an optimal decision to attain a degree of coordination between inherently conflicting long- and short-term objectives.

Sponsored Session

Chair: Claudia D'Ambrosio, CNRS & LIX, Ecole Polytechnique, Batiment A. Turing, Palaiseau CEDEX, 91128, France, dambrosio@lix.polytechnique.fr

1 - Short-term Hydro Scheduling and Unit Commitment with Head-Dependent Reservoirs

Raouia Taktak, LIX, Ecole Polytechnique, 91128 Palaiseau CEDEX, Palaiseau, France, taktak@lix.polytechnique.fr, Wim van Ackooij, Claudia D'Ambrosio, Claudio Gentile, Antonio Frangioni, Kostas Tavlaridis-Gyparakis

The problem we study consists in finding an optimal short-term scheduling of a multi-unit power stations in hydro valleys. The problem is extremely hard due to its strong non-linearity and its combinatorial constraints. Using an enhanced linearization technique, we model the problem as a MILP that takes into account the head effects on power production. We also devise an algorithm based on decomposition techniques and Lagrangian relaxation in order to solve real-world instances.

2 - Optimal Location of Smart Technologies within an Electrical Distribution Network

Sonia Toubaline, LIX - Ecole Polytechnique, 91128 Plaiseau Cedex, Palaiseau, France, s.toubaline@gmail.com, Pierre-Louis Poirion, Leo Liberti, Claudia D'Ambrosio

Reporting from the SO-grid project: we discuss a mixed-combinatorial optimization problem occurring in running smart grids, i.e. the optimal positioning of electrical equipment on a power distribution network, some algorithmic ideas, and preliminary computational results.

3 - A Robust Optimal Placement of Smart Technologies within an Electrical Distribution Network

Pierre-Louis Poirion, LIX - Polytechnique, LIX - UMR 7161 Ecole Polytechnique, 91128 Palaiseau, France, Pierre-Louis.Poirion@ensta-paristech.fr, Leo Liberti, Sonia Toubaline, Claudia D'Ambrosio

Reporting from the SO-grid project: we continue Dr. Toubaline's presentation by discussing aspects related to solution robustness for a localization problem in a power distribution network. We will present a mathematical model which takes into account uncertainties in the demand and production of electricity, and some algorithmic ideas to solve the problem.

Chair: Michael Racer, Assistant Professor, University of Memphis, 334 Fogelman, Memphis, Te, 38135, United States of America, mracer@memphis.edu

1 - Georgia Tech's Quality Enhancement Plan: Community, Sustainability, Service Learning

Beril Toktay, Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, beril.toktay@scheller.gatech.edu, Ellen Zegura

As part of the 10-year reaffirmation of its accreditation, Georgia Tech has selected a Quality Enhancement Plan (QEP) for student learning that focuses on learning anchored in real-world sustainability problems and that emphasizes community engagement through service learning. This presentation will outline the high-level objectives and structure of the QEP.

2 - Useful Tools in Teaching Sustainability

Xu Yang, Assistant Professor, San Jose State University, Dept of Marketing and Decision Sciences, San Jose State University, San Jose, CA, United States of America, xu.yang@sjsu.edu

Topics can be included in the sustainability curricular need to be defined and discussed. Several tools were introduced in an undergraduate business logistics course (under the topic of sustainability). Examples include: EIO-LCA, "sourcemap", and EPA GHG Equivalencies Calculator. Students applied these tools in a course project and demonstrated the effectiveness of teaching/learning sustainability.

3 - Teaching Sustainable Operations to MBAs at Tepper

Alan Scheller-Wolf, Professor, Carnegie Mellon University, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, awolf@andrew.cmu.edu

I will share some successes, failures, insights and lessons I have learned from teaching the MBA elective Sustainable Operations at Tepper.

4 - Integrating Sustainability Concepts within a Traditional Operations Management Course

Ravi Subramanian, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree NW, Atlanta, GA, 30318, United States of America, ravi.subramanian@scheller.gatech.edu

This presentation will discuss how sustainability and ethics issues have been integrated within the core MBA-level Operations Management course offered at the Scheller College of Business at Georgia Tech. This curriculum development was supported by the Rich Foundation.

Scheduling II

Contributed Session

Chair: Seyedehfarzaneh Nojabaei, PhD Candidate/Researcher, University of Toledo, 2255 University Hills Apt,# F206, Toledo, 43606, United States of America, farzanehn25@gmail.com

1 - Optimizing of Efficiency Supply Chain System via Development of Priority Oriented Scheduling Method

Seyedehfarzaneh Nojabaei, PhD Candidate/Researcher, University of Toledo, 2255 University Hills Apt,# F206, Toledo, 43606, United States of America, farzanehn25@gmail.com, Matthew Franchetti

Optimization of supply chain is becoming a pivotal aspect for each manufacturing system and scheduling plays a crucial role in sustaining it. The applicability of distributed computing to coordinate and execute jobs has been investigated in the past literature. Moreover, it is ostensible that even for sensitive industrial systems the only criterion of allocating jobs to appropriate machines is based on the FIFO policy. On the other flip, many researchers are of the opinion that the main reason behind failing to provide fairness in distributed systems is considering the only criterion of time stamp to judge upon and form the queue of jobs with the aim of allocating those jobs to the machines. In order to increase the efficiency of supply chain in industrial system, this paper takes into consideration of three criteria of each job including priority, time action and time stamp. The methodology adopted by this paper is definition of job scheduler and positioning jobs in temporary queue and sorting via developing bubble sort. In sorting algorithm criterion of priority, time action should be considered besides time stamp to recognize the tense jobs for processing earlier. To evaluate this algorithm first a numerical test case (simulation) is programmed and then the case study performing in order to optimize supply chain efficiency in real manufacturing system. Eventually the results of this study provided evidence on that the rate of supply chain efficiency is increased.

2 - Major Systems Acquisition Planning as a Resource-Constrained Project Scheduling Problem (RCPSP)

Roger Burk, Associate Professor, US Military Academy, Dept of Systems Engineering, West Point, NY, 10996, United States of America, Roger.Burk@usma.edu, Abram Gross

The US Army has been exploring how to formulate its long-range acquisition plan as a variation of the RCPSP and using a heuristic to quickly build schedules based on system priority. We show how this procedure can save both time and money, which making the long-range planning process quicker, more accurate, and easier.

3 - Job Shop Scheduling with Machine Breakdowns by using Risk Assessment

Shudong Sun, Professor, Northwestern Polytechnical University, No.127 West Youyi RD, Xi'an, 710072, China, sdsun@nwpu.edu.cn

The paper considers makespan and risk assessment simultaneously. Risk assessment is determined by the expected value of the difference between the deterministic and actual makespans. The probability models of the occurrence and degree of machine breakdowns are constructed. A risk assessment model of machine breakdowns is set up. A schedule with a better efficiency and robustness is finded. Simulation results shown that the proposed method has good performance and robustness.

4 - Single Machine Scheduling under Availability Constraints

Mohamed Labidi, Assistant Professor, King Saud University, King Abdallah Road, Riyadh, Saudi Arabia, mlabidi@ksu.edu.sa, Anis Gharbi, Mohamed Haouari

We investigate the one machine problem under availability constraints.It arises in the context of machine scheduling with planned preventive maintenance.A new lower bound based on the concept of semi-preempton is proposed (SPLB) and an exact algorithm that requires solving a sequence of one-machine problems without availability constraints is developed.Experiments show that the SPLB is very tight and that our algorithm consistently delivers optimal solution for big instances with short CPU times.

Inventory Management V

Contributed Session

Chair: Emre Berk, Professor, Bilkent University, Department of Management,, Bilkent University, Central Campus, Ankara, 06800, Turkey, eberk@bilkent.edu.tr

1 - Optimal Policies for a Dual-Sourcing Inventory Problem with Stochastic Leadtimes

Li Xiao, National University of Singapore, BIZ 2 Building,Basement B2-03, 1 Business Link, NUS Business School, singapore, Singapore, lixiao@nus.edu.sg, Hanqin Zhang, Paul Zipkin, Jing-Sheng Song

We consider a single-product dual-source system. The normal supply system consists of a two-stage tandem queue with finite capacity. However, we can expedite an order by skipping the first stage of the supply process with a fee. We characterize the optimal ordering policy that minimizes the discounted system cost.

2 - Leadtime Backordering in Multiechelon Systems: A Simulation Assessment

Emre Berk, Professor, Bilkent University, Department of Management,, Bilkent University, Central Campus, Ankara, 06800, Turkey, eberk@bilkent.edu.tr, Ozgur Toy

We study via simulation divergent two-echelon inventory systems in the presence of Poisson demands and lead time dependent backordering. Based on a large experimental set, we investigate the sensitivity of the policy parameters and system structures, impact of information content and its managerial implications, and dynamic assignment policies.

3 - Net Effect of Batching on the Expected on-hand Stock in (r,q) Policies with Fixed Service Level

Agustin Bompadre, SAP Labs, LLC, 1251 Waterfront Place, Third Floor, Pittsburgh, PA, 15222-4212, United States of America, abompadr@gmail.com

In Reorder-Point/Order-Quantity policies with fixed service level target, the effect of the batch size on the expected on-hand stock is twofold. On the one hand, it increases the on-hand stock by creating cycle stock. On the other hand, because of the presence of the cycle stock, there is less need of safety stock. We show that, under certain conditions, increasing the batch size never decreases the expected on-hand stock.

4 - Segmentation Methods for Large-Scale Service Parts Performance Based Logistics Systems

Alireza Sheikhzadeh, Graduate Student, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, 72701, United States of America, asheikhz@uark.edu, Manuel Rossetti

Performance based logistic (PBL) is a new generation of after-sale repair, maintenance and spare part provisioning contracts. The purpose of this research is to create, analyze new methods that can significantly improve the management of service parts systems within the context of performance based logistics. Innovative approaches that significantly reduce the size and complexity of problems through the use of inventory segmentation methods.

5 - Integrated Optimization of Safety Stock and Transportation Capacit

Horst Tempelmeier, Professor, University of Cologne, Albertus Magnus-Platz, Koeln, 50923, Germany, tempelmeier@wiso.uni-koeln.de, Oliver Bantel

We consider an inventory and a transportation system facing random demands. A given in-house transportation capacity can be extended by costly external transportation capacity. We show that stock-outs introduce volatility in the workload of the transportation system. Geunes and Zeng 2001 have shown for a base-stock system, that backordering decreases the variability of transportation orders. We show that in inventory systems with order cycles longer than one period the opposite is true.

1 - A Hybrid Joint Replenishment Policy for A Stochastic Inventory System with Lost Sales

Ulku Gurler, Professor, Bilkent University, Department of Industrial Engineering,, Bilkent University, Central Campus, Ankara, 06800, Turkey, ulku@bilkent.edu.tr, Emre Berk, deniz yenigun

We consider a stochastic inventory problem with multiple products and negligible lead times under a hybrid periodic review joint replenishment policy, where the unsatisfied demand is lost. The proposed control policy classifies the items into two sets - a leader set and a follower set - and employs two separate control policies for each set conjunctively. We derive the operating characteristics and provide numerical results.

2 - Inventory Optimization for the U.S. Navy

Javier Salmeron, Associate Professor, Naval Postgraduate School, Operations Research Dept., Glasgow Hall, Monterey, CA, 93943, United States of America, jsalmero@nps.edu, Emily Craparo

We present a mixed-integer linear optimization model designed to guide wholesale inventory decisions for the Naval Supply Systems Command (NAVSUP), Weapons Systems Support. Optimal reorder points minimize deviations from target fill rates for tens of thousands of repairable and consumable items while modeling demand uncertainty and budget constraints. We solve the problem using Lagrangian relaxation and compare our results with those of other tools used by NAVSUP.

3 - A Risk-averse Inventory Model with Fluctuating Purchasing Costs

Sungyong Choi, Assistant Professor, Yonsei University, 1 Yonseidae-gil, Wonju, 220-710, Korea, Republic of, sungyongchoi@gmail.com

I study a dynamic risk-averse inventory model using additive utility functions. I also assume Markovian behavior of purchasing costs. For finite-time models, I first prove (joint) concavity of the model for each state and obtain a (modified) base-stock optimal policy. Then, I conduct comparative static analysis for model parameters and derive monotone properties to the optimal solutions. For infinite-time models as a limiting case, I show that stationary base-stock optimal policies exist.

4 - Inventory Control for Spectrally Positive Levy Demand Processes

Kazutoshi Yamazaki, Associate Professor, Kansai University, Faculty of Engineering Science, 3-3-35 Yamate-cho, Suita, 606-8354, Japan, kyamazak@kansai-u.ac.jp

We revisit the single item continuous-time inventory model. In the same problem setting as in Bensoussan et al. (2005), we show the optimality of an (s,S)-policy for a general spectrally positive Levy demand process. Using the fluctuation theory of spectrally one-sided Levy processes, we express the value function analytically using the scale function. The case with no fixed ordering costs is also studied.

5 - Ordering Problem with Updated Demand Forecast and Quantity Constraints

Meimei Zheng, PhD Student, Nanyang Technological University, #0544, Jurong West Avenue 5, blk 19, Singapore, 649492, Singapore, meimeizheng2009@gmail.com, Kan Wu

When facing highly uncertain demand, a retailer can utilize an emergency order to enhance his responsiveness. However, the emergency ordering quantity is constrained due to the short lead time. This study analyzes a two-stage system with regular and emergency orders under demand forecast updating and quantity constraints. Through dynamic programming, the optimal ordering policy is obtained, and the properties of the optimal solutions are derived. Some insights are gained from numerical results.

Organization Theory 1

Contributed Session

Chair: Zhehui Xiao, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, China, zhehuixiao@gmail.com

1 - The Role of Entrepreneurial Leadership in New Ventures

Shenglan Huang, University of Science and Technology of China, School of Management, Hefei, 230026, China, Huangsl@mail.ustc.edu.cn

The literature has called for more research on entrepreneurial leadership. However, few studies has investigated entrepreneurial leadership in entrepreneurial context. This paper will explore the influence mechanisms of entreprenrial leadership on new venture performance.

2 - Cross-Functional Integration, Organizational Transactive Memory Systems and Performance

Diogo Cotta, PhD Candidate, IE Business School, Calle Maria de Molina, 12, bajo, PhD office, Madrid, 28005, Spain, dcotta.phd2015@student.ie.edu, Fabrizio Salvador

How do firms integrate organizationally dispersed knowledge? This research shows that firms facing high levels of cross-functional interdependence manifest the operation of distinct Transactive Memory Systems acting as integration devices in the execution of different organizational routines. However, contrary to what is posited by both TMS and integration literature, the research finds evidence that the concurrent deployment of several TMSs may have detrimental effects on performance.

3 - A Conceptual Framework of Talent Management in Virtual Organization

Muhammad Yasir, Assistant Professor, Hazara University Mansehra, Department of Management Sciences,, Hazara University Mansehra, Mansehra, 21300, Pakistan, Abdul Majid, Philip Johnson

In this paper we have developed a conceptual framework for talent management (TM) in virtual organization (VO) which explains that process of TM must be performed at three levels i.e. individual-level; organization-level; and extra-organization level for outsourced operations. We argue that VOs require special emphasis on the development of media and social talent to maintain effective communication and collaboration. We conclude that effective TM strategies could improve the performance of VOs.

Applied Probability 1

Contributed Session

Chair: Harsha Honnappa, University of Southern California, 3740 McClintock Ave, Los Angeles, CA, 90089, United States of America, honnappa@usc.edu

1 - Assessing the Additional Information Obtained by an Ultrasound Following a Mammogram in BCS Problem

Sait Tunc, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, stunc@wisc.edu, Oguzhan Alagoz, Elizabeth Burnside

We construct an information-theoretic framework to assess the additional information obtained by an ultrasound following a mammogram in Breast Cancer Screening (BCS) problem to understand ultrasound recommendation. We provide a new information function, a modified version of Shannon's mutual information and determine the relation between this function and BCS performance measures like false positive rate with the assumption that screening decisions are described by a linear regression function.

2 - Generalized Empirical Process Limits

Harsha Honnappa, University of Southern California, 3740 McClintock Ave, Los Angeles, CA, 90089, United States of America, honnappa@usc.edu

We develop generalizations of the well known Glivenko-Cantelli and Donsker's Theorems in empirical process theory, where in samples are non-i.i.d. By using the notion of a random distribution function (Dubins and Freedman 1963), we provide constructive proofs of the limit theorems. These results have interesting implications for mean field theory in games and queues, that we discuss in detail.

3 - Optimal Maintenance Policy for the Repairable System under Warranty

Minjae Park, Hongik University, 72-1 Sangsu-dong Mapo-gu, Seoul, Korea, Republic of, mjpark@hongik.ac.kr, Ki Mun Jung, Dong Ho Park

The effects of renewable free-replacement warranty are investigated on the classical age replacement policy for a repairable product with an increasing failure rate. The expected cost rates are developed for two cases: when the preventive replacement age occurs before or after the warranty expires. The optimal replacement ages that minimized the cost rates are determined and the impact of a warranty on the optimal replacement age is illustrated with a numerical example.

4 - A General Intuitive Design Pattern for Optimally Sequencing Treatment Combinations in 2^k DOE

H.-S. Jacob Tsao, Professor, San Jose State University, 1 Washington Square, Industrial & Systems Engineering Dept., San Jose, CA, 95192-0085, United States of America, jacob.tsao@sjsu.edu, Minnie Patel

Parameter count of a 2^k experiment grows exponentially. Conventional methods seek a fractional/partial design that best fits the problem. Necessary number of treatment combinations (TCs) for estimability of significant parameters is often exceeded; confounding often results. Given a parameter sequence in decreasing significance, we propose a general design pattern to produce a corresponding sequence of TCs for estimability of significant parameters with least TCs and without confounding.

5 - Evaluating the Performance of Various Control Charts for Short Production Runs

Ioannis Nikolaidis, Assistant Professor, University of Macedonia, Applied Informatics Department, Egnatia 156, Thessaloniki, 54636, Greece, nikolai@uom.gr, Mingyuan Chen

In aerospace manufacturing the application of SPC tools is challenging because usually these processes produce large size items with slow production rates. Consequently there cannot be the Phase I period when control chart parameters are estimated. In this paper several types of control charts for self-starting production runs are evaluated using simulation, such as simple, CUSUM and EWMA X and Q charts, with various control limit and parameter (e.g. K for CUSUM, ? for EWMA etc.) values.

Dynamic Programming/ Control 1

Contributed Session

Chair: Marek Petrik, IBM, 1101 Kitchawan Rd, Yorktown, NY, United States of America, mpetrik@us.ibm.com

1 - Dynamic Information Acquisition for Emissions Control

Viet Anh Nguyen, Ecole Polytechnique Federale de Lausanne, EPFL CDM MTEI OES, Odyssea, Station 5, Lausanne, 1015, Switzerland, viet-anh.nguyen@epfl.ch, Thomas Weber

To implement emissions-reduction targets, regulators can impose state-contingent taxes. At each time period, policy makers obtain a current estimate of the pollution state and decide whether to acquire costly information of a chosen precision. We show that information collection is optimal whenever the current state-variance estimate is above a threshold and provide analytical results for the value function. We also provide optimality conditions when information collection involves fixed cost.

2 - Approximate Dynamic Programming for Lateral Transshipment Problem in Multilocation Inventory Systems

Olga Rusyaeva, Kuehne Logistics University, Grofler Grasbrook 17, Hamburg, Germany, olga.rusyaeva@the-klu.org, Joern Meissner

To fix the mismatch between actual customer demand and the available stock in multiple locations, companies often turn to lateral transshipments. We introduce a transshipment policy that answers questions ñ when, how much, and from which location to transship in advance to maximize the revenue of the network and to avoid stock outs. For high-dimensional instances, we develop a heuristic that constructs a concave piecewise-linear approximation and updates it using stochastic sample gradients.

3 - Using ANN in Approximate Dynamic Programming for Controlling Complex Production Systems

Han Wu, Student, University of Louisville, 2301 S 3rd St, Louisville, KY, 40294, United States of America, h0wu0009@louisville.edu, Gerald Evans

Development of efficient production and inventory control policies for complex and dynamic production systems is very difficult. The uncertain demands and large changeover times at the work stations cause significant problems. In this research, an Artificial Neural Network (ANN) model is embedded in approximate dynamic programming algorithm to approximate the state value of the system and look for a better production and inventory control policy for a dishwasher wire rack production system.

4 - New Cuts for Unbounded Knapsack Problem with Dynamic Programming

Xueqi He, University of Florida, 3800 SW 34th St, Apt. P138, Gainesville, FL, 32608, United States of America, xueqihe@gmail.com

We present a new cut-and-branch approach for solving the unbounded knapsack problem, where valid inequalities are generated for an integer programming formulation based on intermediate solutions of an equivalent dynamic programming formulation. These inequalities provide more accurate description for the feasible region defined in the equivalent integer programming formulation, and therefore improve the computational efficiency.

5 - Approximate Dynamic Programming by Robust Markov Decision Processes

Marek Petrik, IBM, 1101 Kitchawan Rd, Yorktown, NY, United States of America, mpetrik@us.ibm.com

State aggregation is one of the simplest forms of value function approximation for solving large Markov decision processes (MDPs). A major improvement in approximation error bounds can be achieved if aggregation weights are based on the limiting state occupancy distribution. However the the state occupancy distribution is not known apriori. In this paper, we show that the same error bounds can be achieved when robust Markov decision processes are used for the approximation.

Sponsored Session

Chair: Yehua Wei, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, yehua.wei@duke.edu

1 - Retailing with Opaque Products

Adam Elmachtoub, Ph.D. Candidate, MIT, 77 Mass. Ave., Cambridge, MA, 02139, United States of America, adamelmachtoub@gmail.com, Yehua Wei

A product is said to be opaque when the customer only knows what they have purchased after the transaction is complete. Opaque products have been used in the hotel industry where customers purchase rooms without knowing the brand name. Here we propose the use of opaque products in the retail industry, where there are nonperishable goods and supply chain costs. We show that a small amount of opaque selling can achieve significant ordering and holding costs savings for the supply chain.

2 - Optimal Sparse Designs for Process Flexibility via Probabilistic Expanders

Yuan Zhou, Carnegie mellon University, 5840 Alderson Street, Apt 1, Pittsburgh, PA, 15217, United States of America, yuanzhou@cs.cmu.edu, Xi Chen, Jiawei Zhang

We study the problem of designing a sparse flexible process structure in a balanced and symmetrical production system to match supply with random demand more effectively. By introducing a new concept called probabilistic graph expanders, we provide an optimal design, i.e., the sparsest design, to achieve (1-eps)-optimality relative to the fully flexible system, improving the previous result by Chou et al. We also show the analysis for chaining systems by Wang and Zhang is asymptotically tight.

3 - Optimality Gap of Constant-order Policies Decays Exponentially in the Leadtime for Lost Sales Models

Linwei Xin, PhD Student, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, lwxin@gatech.edu, David A. Goldberg

Recently, Goldberg et al. (2012) laid the foundations for a new approach to solving lost sales inventory models with lead times, by proving as the lead time grows large, a simple constant-order policy is asymptotically optimal. However, the bounds proven there are impractical. In this work, we prove that the optimality gap of the same constant-order policy actually converges exponentially fast to zero. We also derive explicit bounds which make the result practical for realistic lead time values.

4 - Inventory Allocation: Analysis of Myopic Policies under Sparse Preferences

Arash Asadpour, NYU Stern, New York, NY, United States of America, aasadpou@stern.nyu.edu, Jiawei Zhang, Xuan Wang

We study the effect of consumer substitution behavior on the performance of inventory policies. In particular, we investigate the number of stock-outs under a simple myopic offline policy. We show that even with sparse, local, and deterministic customers' preferences, the total number of stock-outs only depends on the number of variants in the choice model — and not the size of the market. We will provide experimental results that suggest a similar effect under myopic online policies.

1 - Designing Selling Mechanisms to Learn and Earn

Bora Keskin, The University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, bora.keskin@chicagobooth.edu, John Birge

We consider a dynamic mechanism design problem in which a firm sells multiple products to a population of potential customers that are heterogeneous in terms of their price-sensitivity. We show how the firm should design a selling mechanism that can dynamically identify customers' price-sensitivities, and accumulate revenues in the optimal way.

2 - Learning by Competing: Dynamic Duopoly Pricing with Unknown Linear Demands

Matthew Stern, University of Chicago - Booth School of Business, 5807 S Woodlawn Ave, Chicago, 60637, United States of America, stern@chicagobooth.edu, John Birge

We consider the problem of dynamic pricing under uncertainty while competing against a rival product. Observing the prices in each period, as well as their own private demand realizations, firms compete for profits while learning the parameters of their linear demand curves. We examine pricing policies that balance the tradeoffs between actively learning the demand parameters, pricing to optimize current period rewards and favorably influencing the rival firm's future prices.

3 - Demand Model Estimation for a Competitive Airline Market

Xinchang Wang, Georgia Institute of Technology, School of Industrial and Systems Enginee, Atlanta, GA, 30332-0205, United States of America, xwang336@gatech.edu, Anton Kleywegt

We describe various models of customer booking choices in a competitive airline market, and the estimation of the models with available data. The models are designed to capture several important aspects, such as customer sensitivity to price and change refund, and unobserved heterogeneous customer preferences for different departure times. We also compare the revenues obtained using the choice models in optimization problems with the actual revenue.

4 - A Leader-Follower Partially Observed Markov Game: Value of Information

Yanling Chang, Georgia Institute of Technology, North Avenue, Atlanta, GA, 30324, United States of America, changyanling@gatech.edu, Alan Erera, Chelsea White

We consider a partially observed Markov game involving two agents: a leader and a follower. The follower selects its policy knowing the leader's policy. Each agent inaccurately observes the other's state at each epoch. We investigate how the leader's criterion value changes due to changes in the leader's quality of observation of the follower.

5 - Fast Demand Learning for Ad Allocation

Vivek Farias, MIT, 100 Main Street, E62-566, Cambridge, MA, 02139, United States of America, vivekf@mit.edu, Dragos Florin Ciocan

This talk is motivated by Ad-Display type network RM problems, where each impression (demand) type is a vector in a high-dimensional user feature space. We show that such demand spaces can still be estimated efficiently with a sample complexity scaling polynomially in the feature dimension. We use importance sampling to construct a demand estimator that informs a simple near-optimal bid-price allocation policy.

Journal of Quality Technology Invited Session

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Bradley Jones, SAS/JMP, Bradley.Jones@jmp.com

1 - Some Current Directions in the Theory and Application of Statistical Process Monitoring

William Woodall, Virginia Tech, Blacksburg, VA, United States of America, bwoodall@vt.edu, Douglas Montgomery

The purpose of this talk is to provide an overview of recent research and applications of statistical process monitoring. The focus is on work done over the past decade or so. We review briefly a number of important areas and offer some ideas for further research.

2 - Bayesian Binomial Assurance Tests for System Reliability using Component Data

Brian Weaver, theguz@lanl.gov, H. F. Martz, Alyson Wilson, Randy Griffiths, Michael Hamada

This talk illustrates the development of Bayesian assurance test plans for system reliability assuming that binomial data will be collected on the system and that previous information is available from component testing. The posterior consumer's and producer's risks are used as the criteria for developing the test plan. Using the previous component information reduces the number of tests needed to achieve the same levels of risk. The proposed methodology is illustrated with examples.

Gaussian Process and Spatial Data Analysis (I)

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Chia-Jung Chang, Assistant Professor, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16802, United States of America, cchang@psu.edu

Co-Chair: Kaibo Wang, Associate Professor, Tsinghua University, Department of Industrial Engineering, Beijing, 100084, China, kbwang@tsinghua.edu.cn

1 - Manifold Learning and Visualization of Variation Sources in Dimensional Metrology Data

Daniel Apley, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, apley@northwestern.edu, Zhenyu Shi, George Runger

Spatially dense dimensional metrology data (e.g., laser or machine vision) is prevalent in manufacturing quality control. Although fitting parametric features like circles and planes to individual parts is common, there has been little prior research on how to utilize the data to discover the nature of part-to-part variation patterns that are more nuanced than simple, premodeled parametric patterns. We propose the use of manifold learning techniques to extract and visualize such information.

2 - Control Charts for Spatial Data

Scott Grimshaw, Professor, Brigham Young University, Statistics Department, Provo, UT, 84602, United States of America, grimshaw@byu.edu

New technology provides the opportunity to obtain multiple measurements at different locations on the same unit. While the hope is that control charts using more measurements will be more sensitive to detecting flaws in local regions, the intuition is that measurements close together will be correlated. Multivariate SPC is extended to spatial data by modeling the covariance matrix with a semivariogram. The spatial control chart is illustrated with an application from bottle manufacturing.

3 - Approximating and Calibrating a Computer Model with Non-Gaussian Spatial Output

Murali Haran, Associate Professor, Statistics, 326 Thomas Building, University Park, PA, 16802, United States of America, mharan@stat.psu.edu, Won Chang, Patrick Applegate, Klaus Keller

Predicting the future behavior of the Greenland ice sheet is a difficult problem that involves combining output from a Greenland ice sheet model with observational data regarding the past and present state of the ice sheet. Emulation and calibration for the ice sheet model is challenging due to the nature and size of the spatial data and model output. I will describe a computationally expedient Gaussian process-based approach to address these challenges.

4 - Unaligned Profile Monitoring with Fused LASSO

Yangyang Zang, PhD Student, Tsinghua University, Department of Industrial Engineering, Beijing, 100084, China, zangyy12@mails.tsinghua.edu.cn

It's common that the means of a profile change or shift from a change point. Under this practical assumption, we proposed a monitoring profiles method with the equal lengths. The profiles are firstly aligned by using the adaptive DTW. And then monitoring the GLRT statistic to the aligned curve, in which, the process mean is estimated by the fused LASSO algorithm. Both the simulation studies and a real example are used to demonstrate the effectiveness of the proposed monitoring procedure.

Recent Advances in Stochastic Simulation

Sponsor: Simulation

Sponsored Session

Chair: Henry Lam, Boston University, 111 Cummington Mall, Boston, United States of America, khlam@bu.edu

1 - Ordinal Optimization and Pure Exploration Multi-armed Bandit Methods

Sandeep Juneja, Professor, Tata Institute of Fundamental Research, HB Road, Colaba, Mumbai, 400005, India, juneja@tifr.res.in, Peter Glynn

Consider finding a design amongst many with largest mean when means are unknown but design samples can be simulated. Typically, by selecting design with largest sample mean, false selection probability Pf decays exponentially. Lately researchers have sought algorithms to get guarantees on Pf by estimating its large dev rate function. We argue that such guarantees are misleading. We adapt methods from multi-armed bandit literature to devise algorithms with exponential decay guarantees on Pf.

2 - Rare-event Simulation for Stochastic Korteweg-de Vries (KdV) Equation

Jingchen Liu, Columbia University, 1255 Amsterdam Ave, Room 1030, New York, NY, 10027, United States of America, jcliu@stat.columbia.edu, Gongjun Xu

We consider the dynamics of a soliton wave that is described by the stochastic Korteweg-de Vries Equation with homogeneous Dirichlet boundary conditions under a stochastic time-dependent force. The random force is modeled as a time-dependent Gaussian noise. The asymptotic approximation and an efficient rare-event simulation algorithm of the probabilities that the soliton wave exceeds a high-level is derived.

3 - Epsilon-Strong Simulation for Multidimensional SDEs via Rough Path Analysis

Jing Dong, Northwestern University, 2145 Sheridan Road, Evanston, 60208, United States of America, jdong028@gmail.com, Jose Blanchet, Xinyun Chen

Under standard regularity conditions for SDEs, we construct a probability space, supporting both the SDE and a piecewise constant, fully simulatable process which is within epsilon bound from the SDE with probability one. Our construction requires a detailed study of continuity estimates of the Ito map using Lyon's theory of Rough Paths. We approximate the underlying Brownian motion, jointly with the Levy areas with a deterministic error in the corresponding rough path metric.

4 - Sampling Rare Events of Random Walks with Regularly Varying Increments: A Dichotomy

Guido Lagos, Georgia Institute of Technolgy, 755 Ferst Drive NW Room 326, Atlanta, GA, 30332-0205, United States of America, glagos@gatech.edu, Ton Dieker

We consider the problem of sampling paths up to the maximum of a random walk and study the case where the step-sizes are regularly varying with parameter alpha. The threshold alpha=3/2 appears in several papers that develop the framework of Blanchet and Glynn (2008), and we reveal how it is connected to a sharp dichotomy related to the boundedness of the likelihood ratio. Our work has implications for Acceptance-Rejection type algorithms for sampling heavy-tailed random walks.

OR for the Developing World

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Carlos Abad, IEOR, Columbia University, 321 S. W. Mudd Building, 500 W 120th St, New York, NY, 10027, United States of America, ca2446@columbia.edu

1 - Macro-level Hybrid Energy Planning Model with Pumped Hydro Storage – India Case Study

A. Selin Kocaman, askocaman@gmail.com, Tim Huh, Vijay Modi

Fast depleting fossils fuels and their environmental hazards increase the importance of renewable sources for sustainable energy planning. However, renewable energy sources are intermittent and heavily dependent on spatial location. Here, we address the problem of modeling hydro and solar energy production and allocation, including pumped hydro storage. We examine the role of solar energy and high hydropower potential in Himalaya Mountains in meeting the growing electricity demand of India.

2 - Two-Stage Stochastic Model for Optimal Operation of Combined Wind-Pumped Storage System in Kenya

Maureen Murage, Graduate Student, Cornell University, 319 Riley Robb, Ithaca, United States of America, mwm88@cornell.edu, Gabriela Martinez, C. Lindsay Anderson

Wind power in Kenya will contribute approximately 17% of the total installed electricity capacity once the Lake Turkana Wind Power (LTWP) project is completed. High wind penetration may lead to curtailment of wind power, especially during surplus periods. Pairing of the wind farm with storage could mitigate this problem, and provide enhanced reliability. We therefore propose a two-stage stochastic model for the optimal operation of the LTWP coupled with pumped hydro storage system.

3 - Dynamic Power Allocation in Solar Micro-grids

Carlos Abad, IEOR, Columbia University, 321 S. W. Mudd Building, 500 W 120th St, New York, NY, 10027, United States of America, ca2446@columbia.edu, Garud Iyengar, Vijay Modi

Solar micro-grids are currently being deployed in Sub-Saharan Africa. These micro-grids service 10-20 customers, have a storage backup, and use very simple control algorithms. Customers are assigned constant power limits and daily energy limits and, whenever their consumption exceeds these values, they are shut off. The algorithm we propose dynamically sets the limits in order to maximize the profit of the operator while maintaining system reliability.

Economics

Contributed Session

Chair: Indranil Chakraborty, Professor, National University of Singapore, Department of Economics, 1 Arts Link, AS2 #06-02, Singapore, 117570, Singapore, indro@nus.edu.sg

1 - Screening in Auctions with Risk Averse Bidders

Indranil Chakraborty, Professor, National University of Singapore, Department of Economics, 1 Arts Link, AS2 #06-02, Singapore, 117570, Singapore, indro@nus.edu.sg

Revenue-optimal IPV-auctions involve screen bidders via equivalent tools of reserve and bidding fee. This is inefficient. Not screening becomes optimal if the seller can charge an ex ante entry fee before bidders become privately informed. We show that when bidders are risk averse it is optimal for the seller to screen even if she can charge ex ante fee. Reserve price and bidding fees are also not equivalent for screening and which is better varies under first- and second-price rules.

2 - Sentiments, Systemic Risk and Financial Stability

Diego Feijer, Massachusetts Institute of Technology, 32 Vassar St. D758, Cambridge, MA, 02139, United States of America, feijer@mit.edu, Munther Dahleh

We study welfare of competitive equilibria in an economy with banks runs and costly fire sales, formalizing the importance of "animal spirits" for financial stability. Feedback between financial constraints and market prices results in a systemic externality not internalized by banks in the process of private money creation. Macroprudential policies that acommodate to fluctuations in market confidence can restore constrained efficiency.

3 - Optimal Government Debt Management: Currency Portfolio and Payments

Ricardo Huaman-Aguilar, PhD Student, University of Alberta, 632 Central Academic Building, Edmonton, AB, T6G 2G1, Canada, huamnagu@ualberta.ca, Abel Cadenillas

We develop a theoretical model for optimal currency government debt portfolio and debt payments, which allows both jumps in the exchange rates and aversion of the government to debt. We derive first a stochastic differential equation for public debt, and then solve explicitly the optimal currency debt problem. This is the first theoretical model that provides a rigorous explanation of why developing countries have reduced consistently their proportion of foreign debt in their portfolios.

Ad Auctions

Cluster: Auctions

Invited Session

Chair: Eric Sodomka, Facebook, 1601 Willow Rd, Menlo Park, Ca, 94025, United States of America, eric.sodomka@gmail.com

1 - Partner-Tiering in Display Ads

Anand Bhalgat, bhalgat@fb.com

In display ads delivery system, the ad allocation engine assigns ads to satisfy contracts between advertisers and publishers, at the same time, try to maximize the overall quality of assignment. The classical online-matching model of this problem misses an important aspect that a set of varying quality of publishers are presented by middle-man, and advertsiers prefer these publishers differently. We formulate this problem as a hierarchical online matching problem and study its properties.

2 - Lessons from Agent Design for the Online Advertising Trading Agent Competitions

Elizabeth Hilliard, Brown University, Providence, RI, United States of America, betsy@cs.brown.edu

We present algorithms and analysis of bidding strategies for the two Trading Agent Competitions which simulate the two predominate methods of auctioning online advertisement impressions, keyword auctions and ad exchange bidding. Focusing on the optimization step of agent design for these two scenarios, we show how these problems can be modeled as a knapsack problem and weighted matching problem and then analyze the performance of classic and modified algorithmic solutions to these problems.

3 - Approximate Revenue Maximization in Interdependent Value Settings

Hu Fu, Microsoft Research, Cambridge, MA, United States of America, hufu@microsoft.com

We study revenue maximization in settings where agents' values are interdependent: each agent receives a signal drawn from a correlated distribution and agents' values are functions of all of the signals. We introduce a variant of the generalized VCG auction with reserve prices and random admission, and show that this auction gives a constant approximation to the optimal expected revenue in matroid environments.

4 - Advertising in a Stream

Samuel Ieong, Stanford University, Stanford, CA, United States of America, sieong@cs.stanford.edu

We formulate an optimization problem that captures how to place ads in a streaming setting, such as a news feed. We give an approximation algorithm that provably achieves a value close to the optimal, and show how this algorithm can be turned into an incentive compatible mechanism. We also give a simple practical algorithm that makes the allocation decisions in an online fashion. We prove this algorithm to be approximately welfare-maximizing and show that it also has good incentive properties.

Energy V

Contributed Session

Chair: Alcides Santander-Mercado, Universidad del Norte, Km 5 Via Pto. Colombia, 8-44 K, Barranquilla, Colombia, asantand@uninorte.edu.co

1 - Bundle Methods for Convex Hull Pricing in Energy Markets

Yu Zhang, University of Minnesota, 117 Pleasant St, SE, Room 450, Minneapolis, MN, 55455, United States of America, zhan1220@umn.edu, Georgios Giannakis

Leveraging dual variables associated with the supply-demand constraints of unit commitment problems, convex hull pricing (CHP) minimizes uplift payments. A dual decomposition based distributed approach is formulated for CHP with large-scale demand response in day-ahead energy markets. A convergence-guaranteed bundle method is also developed for solving the dual problem. Numerical results corroborate the improved convergence of the novel approach which results in reduced communication overhead.

2 - A Multiobjective Program with Equilibrium Constraints to Determine Volume Requirements for the RFS

Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N Charles St, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu, Adam Christensen

The Renewable Fuel Standard (RFS) ensures that a minimum volume of renewable fuel is included in transportation fuel sold in the United States. Determining the RFS volume requirements involves anticipating market reaction as well as balancing policy objectives. We present a multiobjective program with equilibrium constraints to model the biofuels market, with the upper-level giving policy choices of volume obligations for the RFS.

3 - Distributed Coordination of DERs in Imperfect Information Regimes

Hesamoddin Ahmadi, Student, Penn State University, 107 Holderman Hall, University Park, PA, 16802, United States of America, hza108@psu.edu

We investigated the distributed management of distributed energy resources (DERs) in settings when cost functions or demand are unavailable but may be learnt by a distinct learning process. We develop distributed joint first order schemes in which optimization and learning is coupled. Preliminary numerics suggest the schemes perform well.

4 - Integration of Clean Energy Sources into a Power Grid using Optimal Control Theory

Maryam Parsa, PhD Student, Purdue University, 550 Stadium Mall Dr., West Lafayette, IN, 47907, United States of America, mparsa@purdue.edu, Nasir Uddin Ahmed, Mustapha C.E. Yagoub, Srinivas Peeta

Pontryagin Minimum Principle of Optimal Control Theory is utilized to find the optimum strategy for integration of all currently available renewable energy sources into a power grid. The ultimate goal is to eliminate production from fossil fuels while minimizing the implementation costs. Dynamic Lotka-Volterra model represents the level of power generation from each energy source at any time. Official released data from the U.S. Energy Information Administration is used as a case study.

5 - A Bat-inspired Algorithm for the Solution of a Location and Sizing of Distributed Generation Units

Alcides Santander-Mercado, Universidad del Norte, Km 5 Via Pto. Colombia, 8-44 K, Barranquilla, Colombia, asantand@uninorte.edu.co, John Candelo, Helman Hern·ndez

Location of distributed generation units for renewable energy has important technical and economic benefits for the performance of energy distribution systems. This research presents the development of a bat-inspired algorithm (BA) for the solution of a multiobjective problem, considering location and sizing, of distributed generation units for renewable energy and capacitors. The results show that BA obtains good solutions regarding the minimization of power loss as well as generation cost.

Models and Algorithms for Renewable Energy Integration

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Neng Fan, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, nfan@email.arizona.edu

1 - Production-Inventory Planning with Integration of Onsite and Grid Renewable Energy

Mehdi Golari, Graduate Research Assistant, University of Arizona, Systems and Industrial Engineering Department, Tucson, AZ, 85719, United States of America, golari@email.arizona.edu, Tongdan Jin, Neng Fan

Recently a growing number of companies see low-carbon manufacturing as a new competitive edge in the global market and directly invest in onsite wind and solar technologies for powering their energy-intensive facilities. In this talk, we present a multistage stochastic optimization model to guide the manufacturers how to design and operate the production system under intermittent power as well as an efficient decomposition algorithm to tackle this problem.

2 - Limited Corrective Actions for the Security-constrained Optimal Power Flow Problem

Dzung Phan, Reseach Staff Member, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, NY, 10598, United States of America, phandu@us.ibm.com, Andy Sun

We present a new model for the corrective security-constrained optimal power flow problem. The main purpose of our study is to reduce the number of corrective actions and run time by using sparse optimization techniques and an efficient decomposition algorithm.

3 - Two-Stage Robust Unit Commitment Considering Fast Generators
Bokan Chen, Iowa State University, 203 Campus Ave, Unit 4, Ames, IA, 50014, United States of America, bokanc@iastate.edu, Lizhi Wang

Robust optimization is a popular method for stochastic power system operation problems. In this project, we take fast-responding generators into consideration and present a new two-stage robust unit commitment model. The resulting trilevel optimization problem is decomposed into a master problem and a bilevel subproblem. To solve the bilevel mixed-integer subproblem, we also developed a new branch and cut algorithm, which is among the first algorithms to solve such problems.

4 - A Decision Dependent Power Generation Expansion Model with Wind Power
Yiduo Zhan, University of Central Florida, 4000 Central Florida Blvd, P.O. BOX 162993, Orlando, FL, 32816, United States of America, yzhan@knights.ucf.edu, Jianhui Wang, Qipeng Zheng

Decision dependent stochastic model has played an important role on expansion planning for wind power generation dealing with future uncertainty. Here we present a discrete choice model with non-fixed stochastic probability in the multi-stage stochastic model to provide decision dependent information to the decision makers.

■ WA74

Parc- Mission II

Advanced Algorithms for Power System Operations

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Anna Danandeh, University of South Florida, 4202 E Fowler Ave, Tampa, FL, United States of America, annadanandeh@mail.usf.edu

1 - Optimal Distributed Control of Power Systems
Ghazal Fazelnia, Columbia University, 120th St, New York, NY, 10027, United States of America, ghazal.fazelnia@gmail.com, Ramtin Madani, Abdulrahman Kalbat, Javad Lavaei

This talk studies the optimal distributed control of power systems. Since future power networks will have a large number of controllable distributed devices, the objective is to design an optimal distributed control to guarantee some global performance. We show that there is an effective convex relaxation for this NP-hard problem. The efficacy of our method will be demonstrated in several examples, including the frequency control of the New England system and optimal penetration of renewables.

2 - Coordinated Scheduling of Electric Vehicle Fleets and Wind Generation in Power Systems
Mohammad Khodayar, Assistant Professor, Southern Methodist University, 62, Dallas, TX, 75205, United States of America, mkhodayar@smu.edu

The increase in penetration level of variable wind energy resources affects the hourly schedule of thermal power generation in electricity markets and brings significant challenges in power system operation and control. The proposed approach for the coordinated operation of wind generation and charging/discharging scheduling of plug-in electric vehicle fleets mitigates the variability of the wind energy, decreases the operation cost, and reduces the spinning reserve capacity in power grids.

3 - Improved Formulations for the Unit Commitment Problem
Semih Atakan, PhD Student, University of Southern California, University Park Campus, Los Angeles, CA, 90089, United States of America, atakan@usc.edu, Guglielmo Lulli, Suvrajeet Sen

In this talk, we propose alternative formulations to the Unit Commitment problem that lead to significant time savings, when compared to the state-of-the-art formulations in the literature. We emphasize that these savings carry great potential for efficiently solving more sophisticated models, such as the ones that consider uncertainty in the problem parameters.

4 - Concentric Relaxations and Transmission Switching
Mike Hare, University of Tennessee, 525K John D. Tickle Building, 851 Neyland Drive, Knoxville, Tn, 37996, United States of America, mhare1@utk.edu, Jim Ostrowski, Jianhui Wang

Transmission switching (TS) alters the structure of an electrical network to reroute flow. For a large network, the problem becomes computationally difficult. To combat this problem, we use the fact that switching a line typically only affects the local neighborhood of that line. We use TS in the relaxation neighborhood to reduce the number of switched lines. This will render a problem that is more computationally tractable.

Parc- Mission III

Reliability III

Contributed Session

Chair: David Han, University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, david.han@utsa.edu

1 - Multi-objective Optimization of Degrading System Considering System Reliability and Redundancy Cost
Sanling Song, PhD Candidate, Rutgers University, 707B, Donaldson St, Highland Park, NJ, 08904, United States of America, sanling@eden.rutgers.edu, David Coit, Qing Li

In this research, we propose a method to optimization system maintenance cost as well as performance by determine the number of standby units for subsystem/component.We develop an integer programming model to maintain high and up-to-date system reliability while saving system maintenance cost, and the model also uses the number of standby for each component as decision variables. The developed techniques are illustrated by numerical examples of a multi-component degrading system.

2 - A Capacity and Travel Time Reliability Analysis on Transportation Networks for Emergency Operations
Ayberk Kocatepe, Doctorate Student, Florida State University Civil Engineering Department, Florida State University, 2525 Pottsdamer St, Tallahassee, FL, 32310, United States of America, ak13y@my.fsu.edu, Eren Ozguven, Arda Vanli

This research presents a network capacity and travel time reliability analysis on transportation networks in the aftermath of a disaster focusing on the stochastic conditions where some or all links of a roadway network cannot be fully utilized due to extreme events such as flooding or hurricanes.

3 - Applying Trend Analysis Methods in Degradation-based Prognostics
Seyed Niknam, Western New England University, 1215 Wilbraham Road, Springfield, MA, 01119, United States of America, seyed.niknam@wne.edu, John Kobza, J Wesley Hines

In degradation-based prognostic, monotonicity is an important parameter feature that deals with underlying positive or negative trend of parameters assuming that systems do not experience any form of healing. The objective of this research is to minimize the uncertainty in remaining life estimation by means of trend analysis techniques, estimation of monotonic trends and trend-based segmentation of degradation data for repairable systems with potential non-monotonic prognostic parameters.

4 - Spatio-temporal Monitoring for Highway Safety
Rupert Giroux, Florida State University and Florida Department of Transportation, 2525 Pottsdamer St, Tallahassee, United States of America, Rupert.Giroux@dot.state.fl.us, Eren Ozguven, Arda Vanli

Highway safety is part of the Strategic Highway Research Program (SHRP) and monitoring crash hot spots is a critical component of ensuring transportation safety. In this talk we present a multivariate CUSUM control chart approach for spatio-temporal monitoring of traffic crash data to identify crash hot spots and determine if significant changes occur. A case study involving data from Leon County, Florida is presented.

5 - Optimal Accelerated Life Tests under a Cost Constraint with Non-uniform Stress Durations
David Han, University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, david.han@utsa.edu

Due to constrained resources, several variables such as the allocation proportions and stress durations must be determined carefully at the design stage of ALT. This talk discusses these optimal decision variables based on several optimality criteria under the constraint that the total cost is below a pre-specified budget. A general scale family of distributions is considered to accommodate different lifetime models for flexible modeling with linearly decreasing stress durations.

Exposing Students to Practice with a Case Competition

Sponsor: Analytics

Sponsored Session

Chair: Polly Mitchell-Guthrie, Sr. Manager, Advanced Analytics Customer Liaison, SAS, SAS Campus Dr., Cary, NC, 27513, United States of America, Polly.Mitchell-Guthrie@sas.com

1 - Creating a Student Case Competition

Polly Mitchell-Guthrie, Sr. Manager, Advanced Analytics Customer Liaison, SAS, SAS Campus Dr., Cary, NC, 27513, United States of America, Polly.Mitchell-Guthrie@sas.com

SAS and the Analytics Section of INFORMS created the Student Analytical Scholar Competition to help students learn more about the practice of analytics by challenging them to try the process of structuring and presenting a compelling proposal for analytical work. This talk will cover how we went about creating the competition, what benefits students have reported to us from their participation, what we have learned along the way, and implications for teaching and learning of analytical practice.

2 - Choosing Case Studies and Judging Submissions

Ivan Oliveira, SAS, 100 SAS Campus Dr, Raleigh, NC, United States of America, ivan.oliveira@sas.com, Jeff Day

This talk will address the kinds of projects that we use for the case studies in the student competition, what we look for in winning submissions (similar to our recruiting), and the skills we use in working with customers on these kinds of problems.

3 - Creating Big Industry Success Cases through Academic-Industry Collaboration in Business Analytics

Young Jae Jang, Assistant Professor, KAIST, 291 Daehak ro, Industrial and Systems Eng, KAIST, Daejeon, 305701, Korea, Republic of, yjang@kaist.ac.kr, Shin Woong Sung

We present successful industry case studies in Business Analytics through academic-industry collaborations. We particularly discuss the students' role in the industry projects as well as role we believe academia has in relationship to practice. We also present how industry cases are utilized in classroom.

4 - Great Opportunity for Students in Business Analytics

Shin Woong Sung, Ph.D. Candidate, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, sw.sung@kaist.ac.kr, Young Jae Jang

We share the experience on participating SAS and INFORMS Analytics Section Student Analytical Scholar Competition. The motivation to apply to the competition and the solution approach based on the framework of business analytics are presented. We also discuss what we learn through the competition. Finally, we present the current business analytics project with Kolon Sports, the biggest outdoor retailer in Korea.

Decision Analysis 6

Contributed Session

Chair: Chao Fang, Associate Professor, Wuhan University, Economics and Management School, Wuhan, 430072, China, chao.c.fang@gmail.com

1 - Ensemble Methods in Credit Scoring

Waldyn Martinez, Assistant Professor Business Analytics, Miami University, 117 Country Club Dr., Oxford, OH, 45056, United States of America, martinwg@miamioh.edu

Credit Scoring refers to the utilization of analytical techniques to determine the creditworthiness of a person. In this research we explore the use of ensemble methods in this area. Ensemble methods generally perform better than individual classifiers and have been shown to possess some desirable statistical properties. Specifically, we explore the most common ensemble methods and compare them to the more traditional statistical techniques used in credit scoring.

2 - Risk Analysis and Management for Critical Infrastructures in the Age of Complexity

Chao Fang, Associate Professor, Wuhan University, Economics and Management School, Wuhan, 430072, China, chao.c.fang@gmail.com

The growing complexity renders the engineering systems exposed to more risks of interdependency. Under complexity, the nature and assessment of the identified risks would change. This paper presents some work about using network theory and importance measures for risk analysis in critical infrastructures. The approach shall be used for identifying key risk factors or vulnerabilities in the system. It brings innovative insights on risks and guides the subsequent managerial decision-makings.

3 - Modelling Latent Preferences in Discrete Choice Analysis.

Martin Spollen, Dr, Queens University Belfast, David Bates Building, University Road, Belfast, BT7 1NN, United Kingdom, martin.spollen@gmail.com, Karen Cairns, Adele Marshall

The observed outcome of consumer choice behavior may conceal true (or latent) preferences when the availability of some popular alternatives is insufficient to meet market demand. Standard RP studies will return biased parameter estimates in these circumstances. We present three models to analyse latent preference data that correct for such bias; with potential for application to non-market situations or where price may not clear the market efficiently.

4 - A Real Options Analysis Framework Based on Managerial Cash-Flow Estimates Accounting for Timing Risk

Yuri Lawryshyn, Associate Professor, University of Toronto, 200 College Street, Toronto, ON, M5S3E5, Canada, yuri.lawryshyn@utoronto.ca, Matt Davison

We propose a real options (RO) approach which utilizes cash-flow and timing estimates from managers as key inputs. We introduce an observable, non-traded indicator process. The process is partially correlated to a traded index. By applying the minimum martingale measure, we are able to develop a financially consistent RO model ñ properly accounting for market and private risk. We introduce a second process, to account for timing risk. We apply our model to an actual drug development project.

5 - Characterizing Hidden Risks using Knowledge Gap and Separation Principles

Seong Dae Kim, assistant professor, University of Alaska Anchorage, 3211 Providence Dr. University Center R, Anchorage, AK, 99508, United States of America, sdkim2@uaa.alaska.edu

Unidentified risks have traditionally been underemphasized by risk management. Most of them are believed to be impossible to find or imagine in advance. But this study reveals that many are not truly unidentifiable. After comprehensive literature review, this study develops a model using different types of knowledge gap and separation principles of TRIZ to explain the mechanism that makes some risks hard to find in advance and show potential areas for identifying hidden risks.

Joint Session DAS/MAS: Game Theory, Decision Analysis, and Homeland Security, Part I

Sponsor: Decision Analysis & Military Applications Society

Sponsored Session

Chair: Jun Zhuang, University at Buffalo, 317 Bell Hall, Buffalo, NY, 14260, United States of America, jzhuang@buffalo.edu

1 - Improving the Value of Analysis for Biosurveillance

Henry Willis, Director, RAND Homeland Security and Defense Center, RAND Corporation, 4570 Fifth Avenue, Pittsburgh, PA, 15217, United States of America, hwillis@rand.org

Biosurveillance provides information that improves decisions about mitigating the effects of disease outbreaks and bioterrorism. Applying two standard risk and decision analysis tools to biosurveillance -decision trees and value-of-information analysis. I demonstrate an approach for evaluating strategies to enhance biosurveillance and to improve decisions about whether and how to act after detection of a biosurveillance signal.

2 - Regret-based Optimization and Preference Elicitation for Stackelberg Security Games with Uncertainty

Thanh Nguyen, USC, 3737 Watt Way, Los Angeles, United States of America, nguyenhongthanh87@gmail.com, Milind Tambe

Stackelberg security games (SSGs) have been deployed in a number of real-world domains. One key challenge in these applications is the uncertainty in attacker payoffs. Previous work has studied SSGs with uncertain payoffs modeled by interval uncertainty and provided maximin-based robust solutions. In contrast, in this work we propose the use of the less conservative minimax regret decision criterion and address the challenge of preference elicitation, using minimax regret.

3 - Combating Nuclear Materials Smuggling: Making Effective Use of Container Inspection History

Gary Gaukler, Associate Professor, Peter F. Drucker Graduate School of Management, Claremont Graduate University, Claremont, CA, 91711, United States of America, Gary.Gaukler@cgu.edu, Yu Ding, Chenhua Li

DHS and other agencies are concerned about adversaries attempting to smuggle special nuclear materials into the US. In response, both domestic and overseas ports have been equipped with radiation detection equipment, providing distributed detection data. In this talk, we provide insights into two primary questions: First, how should a decision maker at a domestic port use detection data from an overseas port? Second, can the use of prior data actually harm decision making at the domestic port?

4 - Multi and Parallel Stage Screening Strategies in the Face of Strategic Applicants

Cen Song, University at Buffalo, 317 bell hall, Buffalo, censong@buffalo.edu, Christopher Diaz, Jun Zhuang

This paper analyzes the optimal screening policy in an imperfect screening system, balancing security and congestion in the face of strategic normal and adversary applicants. We provide analytical optimal level of screening strategies for the approver and best application strategies, integrating game theory and queueing theory. We extend the basic model to: (a) comparison between one-stage and two-stage screening systems; and (b) parallel model.

5 - Choosing What to Protect, and How: Resource Allocation Among Countermeasures With Multiple Attribute

Elisabeth Paulson, Department of Mathematics, The Pennsylvania State University, 201 Old Main, University Park, PA, 16802, United States of America, elisabethpaulson63@gmail.com, Jeffrey Keisler, Igor Linkov

We study a sequential game between an attacker and defender. The defender allocates resources amongst countermeasures and targets, and the attacker chooses a threat and target. We propose a model for optimal resource allocation by combining game theory with a multi-attribute utility model. We find that (i) losses are worst in a zero-sum game, (ii) the defender makes the attacker indifferent between multiple attacks, and (iii) secret/target-independent countermeasures increase cost-effectiveness.

How Sound Decision-making Can be Taught and Measured

Sponsor: Decision Analysis

Sponsored Session

Chair: Nadine Oeser, PhD Candidate, LSE, Rheinstrasse 63, Berlin, 12159, Germany, N.Oeser@lse.ac.uk

1 - On the use of Team-Based Learning (TBL), Games and Clickers for Teaching Analytics

Michael Johnson, Simon Fraser University, 8888 University Dr, Burnaby, BC, V5A 1S6, Canada, mjohn@sfu.ca

There is a growing body of evidence that classroom engagement and learning can be stimulated through the use of a variety of pedagogical approaches. In this study, we discuss and evaluate student perceptions of three interactive approaches (TBL, games and clickers) that were utilized in a third year analytics class in a school of business.

2 - Challenges and Successes in Teaching and Assessing Decision Skills

Chris Spetzler, Executive Director, Decision Education Foundation, 2 Oak Forest Ct, Portola Valley, CA, 94028, United States of America, Chris@decisioneducation.org

Decision Education Foundation has made assessment and evaluation an ongoing commitment and goal of our programs. This talk will highlight both our successes and our struggles to capture measurable changes in Decision Competence. Two core issues - what is being taught and what is being measured - are at the heart of this quest as we seek to both improve curriculum and prove the value of tools to capture the essence of executive function.

3 - Developing the Multidimensional Proactive Decision-Making Scale

Johannes Siebert, Habilitand, University of Bayreuth, Universitatsstr. 30, Bayreuth, Germany, johannes.siebert@uni-bayreuth.de, Reinhardt Kunz

We conducted two studies for developing a theoretically consistent and psychometrically-sound scale of proactive decision-making (PDM). PDM consists of four proactive cognitive skills 'systematical identification of objectives', 'systematical search for information', 'systematical creation of alternatives', 'decision radar', and two proactive personality traits 'striving for improvement' and 'showing initiative'. Individuals with high PDM scores show higher decision satisfaction.

4 - Individual Decision-Making Competence (IDMC) – Validation of a Psychometric Test

Nadine Oeser, PhD Candidate, LSE, Rheinstrasse 63, Berlin, 12159, Germany, N.Oeser@lse.ac.uk

Most advanced research defines IDMC mainly in terms of an individual's ability to resist decision biases, a concept that is derived from behavioral decision theory. This approach does not cover decision analytical components such as the ability to envision one's objectives. To provide a broader understanding of IDMC from a DA perspective, this research aims to validate a psychometric test that allows one to measure decision-making performance on various decision analytic components.

Data Analytics for Manufacturing System Design

Sponsor: Data Mining

Sponsored Session

Chair: Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, United States of America, kliu8@wisc.edu

1 - An Integrated Monitoring and Scheduling System for Energy Reduction of Machine Shop Operations

Chao Meng, The University of Arizona, 1127 E. James E. Rogers Way Room 162, Tucson, AZ, 85721, United States of America, meng@email.arizona.edu, Sung Joong Kim, Young-Jun Son, Sojung Kim

A real-time monitoring and scheduling system for machine shop operations is proposed to reduce their energy consumption while enhancing the productivity. The proposed system consists of 1) power meter to monitor the energy consumption, 2) in-line refractometer to monitor the machine coolant concentration, 3) smartphone apps for alert notification and automatic machine control, and 4) simulation for operation scheduling. The proposed system is demonstrated at a manufacturing company in Arizona.

2 - Adaptive Data Collection Algorithm for Decision Making of Manufacturing System

Leyuan Shi, Professor, Department of Industrial and System Engineering, University of Wisconsin-Madison, 1513 University Avenue,Madison,Wisconsin, Madison, WI, 53706, United States of America, leyuan@engr.wisc.edu, Xianchao Zhang

The data used for decision making of manufacturing system are from a variety of sources, including process data, manufacturing data, operations data, etc. We study an algorithm of adaptive data collection guided by the decision making based on Nested-Partitions Method and Nonlinear Programming to increase the accuracy of data, reduce collecting time and improve decision quality. Some cases are shown to demonstrate the validity of the algorithm.

3 - Analytics in Smart Manufacturing

Soundar Kumara, Allen E. Pearce/Allen M. Pearce Professor, The Pennsylvania State University, 222 Leonhard Building, Industrial Engineering, University Park, PA, 16802, United States of America, skumara@psu.edu, Sudarsan Rachuri, Christopher Saldana

The advent of Internet of Things and the advances in network science has triggered new directions of research in manufacturing systems design. In this work we look at the use of clustering in large scale networks and develop a novel application in the smart manufacturing context. We develop the framework from a sustainability point of view and discuss the modeling methodology, and implementation details.

4 - A Systematic Approach for Business Data Analytics with a Real Case Study

Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, United States of America, kliu8@wisc.edu, Jianjun Shi

Business data analytics is a process of utilizing analytic techniques for resolving business issues based on the business performance data. In this talk, we propose a systematic step-by-step procedure for business data analytics. This proposed framework is illustrated and validated by a real case study involving choosing an optimal location for opening of a new retail site.

Multicriteria Decision Making 1

Contributed Session

Chair: Jian Hu, Assistant Professor, University of Michigan - Dearborn, 4901 Evergreen Rd., HPEC 2220, Dearborn, MI, 48128, United States of America, jianhu@umich.edu

1 - Evaluating Efficiency under Uncertainty with a GPDEA Model & Fuzzy Theory: A Real Application

Fernando Marins, Full Professor, UNESP, Rua Vigario Martiniano, 74, Centro, Guaratinguet·, SP, 12501060, Brazil, fmarins@feg.unesp.br, Marcos Santos, José Roberto Luche, Aneirson Silva

The paper proposes a new model, called Fuzzy Goal Programming & Data Envelopment Analysis (FGPDEA) to aid in determining efficiencies of DMUs (Decision Making Units) in environments subject to uncertainty. A real application of the FGPDEA model was carried out to evaluate the efficiency of seven automotive component mini-factories. Results obtained identified which mini-factories were efficient and which were more sensitive to the uncertainty effect.

2 - An Improved PROMETHEE III Based on DMs' Risk Preferences

Yu-Ting Chang, Tamkang University, Dept. of Management Science, 151 Yingzhuan Road, Taipei, 25137, Taiwan - ROC, balindachang@gmail.com, Hsu-Shih Shih

The study tries to integrate S-shaped value functions with gains and losses into PROMETHEE III for considering the risk preferences of DMs. In addition to the risk preference incorporation, the proposed method has an ability to differentiate many more alternatives. An evaluation of E-waste recycling plants is illustrated.

3 - Synergy of Multicriteria Methods for Common Agricultural Policy's Reform

Athanasios Valiakos, University of Piraeus, 80, Karaoli & Dimitriou Street, Piraeus, 18534, Greece, avaliakos@unipi.gr, Yannis Siskos

Under the Common Agricultural Policy's reform, governments take action to distribute correctly the direct payments to farmers. A framework is proposed to calculate the direct payment, based on evaluation of agricultural units using robust ordinal regression (ROR) approach. The synergy of two methods, additive evaluation model and goal programming regression model is proposed to measure the final financial aid. Post-optimality analyses are applied by computing complementary robustness measures.

4 - A Robust Additive Multiattribute Preference Model using a Nonparametric Shape-Preserving Perturbation

Jian Hu, Assistant Professor, University of Michigan - Dearborn, 4901 Evergreen Rd., HPEC 2220, Dearborn, MI, 48128, United States of America, jianhu@umich.edu, Yung-Wen Liu, Sanjay Mehrotra

We develop a multiattribute preference ranking rule in the context of robustness. A nonparametric perturbation of a given additive reference utility function is specified to solve the problem of ambiguity and inconsistency in utility assessments, while preserving the additive structure and the decision maker's risk preference under each criterion. A concept of robust preference value is defined using the worst expected utility of an alternative incurred by the perturbation.

5 - Generating Natural Language Explanations for MCDM Problems

K.Nadia Papamichail, Associate Professor in Information and Decision Systems, The University of Manchester, Manchester Business School, Booth Street East, Manchester, M15 6PB, United Kingdom, nadia.papamichail@mbs.ac.uk, Theodor J. Stewart

This paper discusses a method for developing explanation facilities in MCDM tools. We present a system that generates natural language explanations for interpreting MCDM decisions. We focus firstly, on explanations that support the choice of a single alternative and secondly, on explanations of pairwise comparisons. Finally, we explain how we have designed a text planner to structure the content of the explanations and a sentence generator to produce the explanatory text.

Data Mining 1

Contributed Session

Chair: Jeaha Yang, IBM Research, Thomas J Watson Research Center, Yorktown Heights, NY, 10598, United States of America, jeaha@us.ibm.com

1 - Bounded Isotonic Regression

Ronny Luss, IBM, 1101 Kitchawan Rd Route 134, Po Box 218, Yorktown Heights, NY, United States of America, rluss@us.ibm.com, Saharon Rosset

Isotonic regression offers a flexible modeling approach under monotonicity assumptions, however often suffers from overfitting as the monotonicity constraints do not offer sufficient complexity control. We propose regularization using the range of the fitted model (i.e., the difference between the maximal and minimal predictions). Given the non-regularized solution, we show how to easily derive a path of range-regularized solutions, making this approach applicable to large datasets.

2 - A Cloud-Based Hub of Incident Analytics in IT Services

Jeaha Yang, IBM Research, Thomas J Watson Research Center, Yorktown Heights, NY, 10598, United States of America, jeaha@us.ibm.com, Ta-Hsin Li, Juhnyoung Lee

An important IT service is to resolve incidents related to IT infrastructures. Incidents are recorded as structured and unstructured ticket data, which contain characteristics such as timestamps, problem description and resolution. This cloud-based hub facilitates in-depth statistical analysis of incident tickets, enables root-cause analytics and benchmarking across accounts. Actionable insights are also provided.

3 - A Heuristic Boosting Algorithm for Classification and Regression Trees with Reserved-judgment Region

Abdolmanaf Zargoush, PhD Candidate, McGill University, 1001 Sherbrooke, Montreal, QC, H3A1G5, Canada, abdolmanaf.zargoush@mcgill.ca, Vincenzo Esposito Vinzi, Farrokh Alemi

We propose a heuristic algorithm for boosting the accuracy of CART methods. As we show through extensive simulated and real experiments, this algorithm not only improves the classification accuracy of CART in majority of instances, but it also retains the graphical strength of CART by providing few ensemble of trees. This is a key advantage over the competing ensemble methods like Boosting and Bagging, which deliver too many small tree classifiers that can't be used for scientific reasoning.

4 - Control Charts Pattern Recognition and Fault Diagnostic in Multivariate Process

Parvaneh Jahani, PhD Student, University of Louisville, Department of Industrial Engineering, JB Speed School of Engineering, U of L, Louisville, KY, 40292, United States of America, p0jaha01@louisville.edu, Suraj Alexander

SPC methods for detecting process mean shift have high computational costs and they are not effective in detecting trends. We propose a new methodology to recognize the abnormal patterns of multivariate process using Control Charts Pattern Recognition (CCPR). Two strategies of fault diagnostics after failure occurrence are presented and compared in term of accuracy. The validation of the model is tested in a real world case study.

New Voices in Military Operations Research

Sponsor: Military Applications Society

Sponsored Session

Chair: Harrison Schramm, Campaign Analysis Deputy, OPNAV N81, 1507 22nd Street South, Arlington, VA, 22202, United States of America, Harrison.Schramm@gmail.com

1 - Theory-Driven Modeling and Big Data in the Quest to Identify Threats to US National Security

Robert Lantz, Manager and Operations Analyst, Sentinel Applied Analytics, 8618 Westwood Center Drive, Suite 315, Vienna, VA, 22182, United States of America, rob.lantz@sentinelappliedanalytics.com, Jennifer Stave, Alonzo Barnett

Using the illegal proliferation of unmanned aerial systems (UAS) as an example, we explain how agencies can use big data to augment their operations. We investigate data-driven techniques to find illicit shipments of military equipment to foreign destinations. We show that big data can reveal threat signal from the abstracted perspective of a predictive model that would not otherwise be evident. Finally, we explain how these techniques can be used to address other threats to national security.

2 - Evaluating Structural Disruption in Adaptive Networks
Jon Roginski, PhD Student, Naval Postgraduate School, 833 Dyer Road, BLDG 232, Spanagel 249B, Monterey, CA, 93940, United States of America, roginskij21@gmail.com, Erik Rye

The promise of network science is to provide a foundation that supports understanding the large, dynamic, complex networks that characterize life today. In the military, as in any competitive pursuit, we seek to leverage this understanding toward insight into how we may influence tomorrow. Ongoing research at the Naval Postgraduate School contributes by providing a means to compare the structures of graphs and networks-as in determining how a network is structurally different after an attack.

Modularity in the Context of Service Management

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Juliana Hsuan, Professor, Copenhagen Business School, Dept. of Operations Management, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, jh.om@cbs.dk

1 - The Impact of Product and Service Modularity on Servitization Strategy
Thomas Frandsen, Assistant Professor, Copenhagen Business School, Dept. of Operations Management, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, tfr.om@cbs.dk, Juliana Hsuan

Manufacturers are increasingly bundling products with service offerings as integrated solutions to improve competitiveness. Based on case research and an industry workshop, we report on how value propositions can be extended through servitization, and how companies should strategize in order to move forward through the lenses of product and service modularity.

2 - Commonalities and Differences in Measuring Service Modularity and Related Effects
Tilo Boehmann, Professor, University of Hamburg, Department of Informatics, Vogt-Koelln-Str. 30, Hamburg, 22527, Germany, Tilo.Boehmann@uni-hamburg.de, Regine D^rbecker

The principle of modularity has become increasingly important as service providers seek to reduce time and cost of delivering customized services. Extant research on the topic has mainly conceptual character and there is a dearth of empirical studies on the antecedents and effects. We study the measurement of service modularity and its effects in comparison to other contexts like product or software development. We particularly analyse whether a service-specific measurement concept is needed.

3 - Innovation, Modularity and Standardization in KIBS: The Performance Implications
Anna Cabigiosu, Assistant Professor, Universita Ca' Foscari, San Giobbe Dorsoduro 873, Venezia, 30121, Italy, diego.campagnolo@unipd.it, Diego Campagnolo

Using fs/QCA on a sample of 319 KIBS, we explore how innovation and service types interact in firm's performance. Our results highlight complementarity between process innovations and service standardization on a firm's profitability, while they emphasize complementarity between process innovations, service customization, and modularity of a firm's growth.

4 - Modularity used as a Pricing Model in a Software Company
Eric Bentzen, Associate Professor, Copenhagen Business School, Dept. of Operations Management, Solbjerg Plads 3, Frederiksberg, DK-2000, Denmark, eb.om@cbs.dk

In this paper we will look at a pricing model used in a software company that use the principle of modularity in their pricing of products. The company has many available software products and with the use of modularity they have now moved further from originally software algorithm and procedures to software applications.

Social Media and Business Analytics

Sponsor: eBusiness

Sponsored Session

Chair: Hailiang Chen, City University of Hong Kong, Department of Information Systems, Kowloon, Hong Kong - PRC, hailchen@cityu.edu.hk

1 - Nudging Consumers' Behaviors in Recommender Systems with Capacity Constraints
Na Zhang, Purdue University, nancy.zhangna@gmail.com, Karthik Kannan, George Shanthikumar

This paper investigates how customers may be nudged by information and coupons to purchase products with capacity constraints. A Support Vector Machine based recommender system is developed to rank order customers based on their purchase potential and identify targeted customers. We compared our technique with standard ones using a rolling time window based on data from an online grocery store. A field experiment was also conducted to evaluate our approach and found consistent results.

2 - Relationships among Minimum Requirements, Facebook Likes, and Groupon Deal Outcomes
Gang Wang, University of Connecticut, 2100 Hillside road, Storrs, CT, 06269, United States of America, Gang.Wang@business.uconn.edu, Bill Ross, James Marsden, Xue Bai

The empirical work examines the relationships between minimum requirements and social media linkages and deal outcomes for one major daily deal site, Groupon. Using time-stamped empirical data we captured electronically, we complete an initial high-level statistical analysis followed by a propensity score approach to analyze causal effects for four major Groupon product categories. We find that the presence of a minimum requirement increases Facebook likes, and coupon outcomes.

3 - Dynamics among Social Media Marketing, Word of Mouth, and Movie Revenues
Hailiang Chen, City University of Hong Kong, Department of Information Systems, Kowloon, Hong Kong - PRC, hailchen@cityu.edu.hk

Social media sites have recently become a venue for firms to interact with consumers and influence their conversations. This study explores how firms could influence word-of-mouth (WOM) among consumers through proactive social media marketing efforts. The dynamics among movie studios' marketing communication, consumer-to-consumer communication, and box office sales are examined.

Operations Management and Marketing Interface

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Hamed Mamani, Assistant Professor, University of Washington, Foster School of Business, ISOM Department, Seattle, WA, 98195, United States of America, hmamani@uw.edu

Co-Chair: Foad Iravani, Assistant Professor, University of Washington, Foster School of Business, Seattle, WA, 98195, United States of America, firavani@uw.edu

1 - Gray Markets, Contracts and Supply Chain Coordination
Foad Iravani, Assistant Professor, University of Washington, Foster School of Business, Seattle, WA, 98195, United States of America, firavani@uw.edu, Hamed Mamani, Reza Ahmadi

The diversion of genuine products to gray markets continues to challenge many companies. Industry surveys report that the abuse of channel incentives contributes to the growth of gray markets. We analyze the impact of gray markets on classic contracts. We show contracts that solely depend on order quantity cannot coordinate the supply chain and propose priceñdependent quantity discount contracts to coordinate the supply chain. Our proposed contracts also enhance consumer welfare.

2 - Optimizing Product Launches in the Presence of Strategic Consumers
Ilan Lobel, Assistant Professor, NYU Stern School of Business, 44 W 4th St, New York, NY, 10012-1126, United States of America, ilobel@stern.nyu.edu, Jigar Patel, Gustavo Vulcano, Jiawei Zhang

We consider the problem of a technology firm deciding the optimal timing of its product launches. Consumers are strategic and weigh the value of purchasing improved products in light of future technological improvements. We characterize the optimal launch policies for two cases: one where the firm pre-announces the product launch times in the market, and the second where no information about the future launches is divulged.

3 - Optimal Design of Crowdfunding Campaigns
Saeed Alaei, Cornell University, Upson Hall, Ithaca, United States of America, saeed@cs.cornell.edu, Azarakhsh Malekian, Mohamed Mostagir

Crowdfunding is quickly emerging as an alternative to traditional methods of funding new products. In a crowdfunding environment, a producer solicits financial contributions from consumers in the form of pre-purchasing a still-unrealized product. These contributions are collected only if a pre-determined funding goal is met before a deadline. We model the social dynamics of contributors and show how they are affected by the funding goal, the price of the product, and the campaign duration.

4 - Collaboration between Competitors through Inventory Exchange
Liang Ding, University of Michigan, 701 Tappan Street, R0400, Ann Arbor, MI, 48109, United States of America, lgding@umich.edu, Roman Kapuscinski, Ozge Sahin

An increasing number of companies establish some level of partnership with their competitors. This paper studies the effect of collaboration and competition by a resource exchange model. We explore that whether/when a resource exchange contract can help both firms and what is the influence on consumer surplus. The results show that the resource exchange is a win-win solution when there is no competition, or when purchasing cost is neither very low nor very high given strong competition.

Economics in Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Manu Goyal, Assistant Professor, University of Utah, College Of Business, Salt Lake City, UT, United States of America, Manu.Goyal@business.utah.edu

1 - On the use of Public Warnings in Counterterrorism Operations
Nitin Bakshi, Assistant Professor, London Business School, NW1 4SA, London, United Kingdom, nbakshi@london.edu, Edieal Pinker

Public warnings have long been deemed an effective lever to ward off terrorist threats. Paradoxically, warnings might be a victim of their own success. Previous alerts that negated an attack result in the perception of a false alarm. Going forward, when a warning is issued, people would be less inclined to believe that an attack will materialize. We study the trade-off between the short-term benefit of a deferred attack, and long-term costs such as erosion of credibility through false alarms.

2 - Stage-Gate Contracts for New Product Development
Chunlin Wang, PhD Candidate, David Eccles School of Business, University of Utah, 1655 East Campus Center Drive, Salt Lake City, UT, 84112, United States of America, chunlin.wang@business.utah.edu, Glen Schmidt, Krishnan Anand

In the setting of outsourcing an NPD project, either the agent or the principal can have inside information on the project's viability. We study the principal's use of stage-gate contracts as a screening device in the former scenario and as a tool of achieving separating and pooling equilibria in the latter, and compare the performance of stage-gate contracts with traditional outsourcing contracts.

3 - Honesty in Incomplete Supply Chain Contracts
Manu Goyal, Assistant Professor, University of Utah, College Of Business, Salt Lake City, United States of America, Manu.Goyal@business.utah.edu, Krishnan Anand, He Chen

In a world with bounded rationality, we study a multi-period (incomplete) contractual relationship between a manufacturer and his supplier. We prove that a profit-maximizing manufacturer, who is constrained by honesty, can outperform the quintessential unconstrained profit-maximizer, even though the unconstrained manufacturer can mimic the honest manufacturer. Thus, honesty emerges endogenously as an optimal policy.

Urban Spatial Issues

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Elena Belavina, Assistant Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, United States of America, belavina@uchicago.edu

Co-Chair: Karan Girotra, Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, karan.girotra@insead.edu

1 - Bike Share: Accessibility and Availability
Karan Girotra, Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, karan.girotra@insead.edu, Ashish Kabra

We study bike-share systems as implemented in large cities such as Paris, London, New York. We develop a structural empirical model that captures the elasticity of user demand w.r.t. distance to a station as well as long-term and short-term effects of service level. We exploit changing choice set due to stockouts as well as instrument variables for identification. To deal with computational challenges, we transform our estimation problem from the time-domain to the system state-space domain.

2 - Which is Environmentally Friendlier- Online Retailing or Brick-and-Mortar Retailing?
Gerard Cachon, Wharton University, Philadelphia, PA, United States of America, cachon@wharton.upenn.edu

Products can travel from suppliers to consumers via on-line retailers or brick-and-mortar retailers. Traditional brick-and-mortar retailing involves consumers completing the final mile" to their home, whereas with on-line retailing products arrive at a consumer's doorstep. This paper discusses which distribution approach is better from the point of view of carbon emissions.

3 - Household-level Economies of Scale and Package Delivery
John Carlsson, Assistant Professor, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, jgc@umn.edu

One of the fundamental concerns in the analysis of logistical systems is the trade-off between localized, independent provision of goods and services versus provision along a centralized infrastructure such as a backbone network. We study the mini-economies" of scale that arise when households make multi-stop trips rather than using package delivery services.

4 - Pricing for Grocery Delivery: Subscription of Per-Order Pricing
Elena Belavina, Assistant Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, United States of America, belavina@uchicago.edu, Karan Girotra

Grocery delivery is a market that many try to conquer. Appropriate pricing is key for success. There is little consensus among different players (at times even within one firm operating in different locations) on what is the best pricing scheme. For example, Amazon Fresh in Seattle is using per order pricing while in San Francisco - subscription fee. We provide recommendation for the preferred pricing scheme based on various characteristics (delivery logistics, demand variability etc.).

Supply Chain Management III

Contributed Session

Chair: Xiaojuan Zhang, Xi'an Jiaotong University, School of Management, No.28, Xianning West Road, Xi'an, China, xiaojuanzh@stu.xjtu.edu.cn

1 - Newsvendor Game with Limited Supply and Inventory Transshipment
Ziteng Wang, North Carolina State University, Daniels 443, North Carolina State University, Raleigh, NC, 27695, United States of America, zwang23@ncsu.edu, Sha Luo, Tiantian Nie, Jian Luo, Shu-Cherng Fang

When the supply is limited, the newsvendors may manipulate their orders to receive a preferred inventory allocation. Inventory transshipment can satisfy more demand and complicate newsvendors' decisions. In such a game, Nash equilibrium exists under certain conditions and its uniqueness depends on the supply capacity. A larger supply capacity brings more profit to the newsvendors and the supply chain. The newsvendors can be coordinated if they are allowed to negotiate the transshipment prices.

2 - A Stochastic Facility Location Problem with Supply Chain Risk Propagation

Myles Garvey, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, myles.garvey@rutgers.edu, Steven Carnovale

Many current FLP in the extant literature have either single objectives such as cost or distance minimization or multiple objectives. However, much of the literature does not capture the intricacies of risk for supply chain disruption and it's potential to propagate through a supply network due to its structure. In this paper, we develop a model and a solution methodology to solve the capacitated and constrained FLP problem by considering risk propagation as the main objective.

3 - Measuring Resilience in an Agricultural Supply Chain

Daniel Romero, PhD Student, University of South Florida/ Universidad Autonoma del Caribe, East Fowler Avenue, SVC1034, Tampa, FL, 4202, United States of America, danielromero@mail.usf.edu, Fabian Sanchez, Fernando Gonzalez, Alex Savachkin, Weimar Ardila

Resilience has been measured in different type of systems but is not clear the differences between the different types of metrics in real settings. The following research is a case study of an agricultural supply chain in Colombia were resilience is measured using different metrics in order to establish advantages and disadvantages of each approach.

4 - Competition and Cooperation in a Duopoly Transportation Market with Empty Equipment Repositioning

Xiaojuan Zhang, Xi'an Jiaotong University, School of Management, No.28, Xianning West Road, Xi'an, China, xiaojuanzh@stu.xjtu.edu.cn, Sheng Hao Zhang

We consider a transportation market with two firms providing service between two locations. Their realized demands in both directions depend on the price decisions of both firms. Because equipment is needed to transport goods, each firm may face unbalanced demands and has to reposition empty equipment. Cooperation on empty equipment repositioning reduces both firms' cost. We study firms' competition and cooperation strategies and their impact on environments such as carbon emission.

Text Analytics Applications in Social Media

Cluster: Social Media Analytics

Invited Session

Chair: Praveen Lakkaraju, Manager, Advanced Analytics R&D, SAS, SAS Campus Dr, Cary, NC, 27513, United States of America, Praveen.Lakkaraju@sas.com

1 - Identifying Emerging Researchers using Social Network Analysis

Syed Billah, University of Arkansas, 41 Fireside Ln, East Setauket, NY, United States of America, syed.masum.billah@gmail.com, Susan Gauch

Finding rising stars in academia early in their careers has many implications. Typically, the impact of a researcher is assessed by a measurement called h-index that grows linearly with the academic age. Therefore, h-indices of researchers in the early stages of their careers are almost uniformly low, making it difficult to identify those who will emerge as influential leaders. Here, we make use of social network analysis to identify young researchers most likely to become successful.

2 - Sports Analytics - Uncovering Patterns in Social Media

Dan Zaratsian, Text Analytics Consultant, SAS Institute, 100 SAS Campus Dr, Cary, NC, 27513, United States of America, Dan.Zaratsian@sas.com

If you take a look at all of your customer touch-points, all of the opportunities that your business has to interact with customers, what percentage are you leveraging today? Analyzing online conversations for major sporting events can drive fan engagement, understand fan sentiment, enhance marketing campaigns and more. Through this process we are able to identify trends and opportunities within social media relating to sports analytics that deliver business value.

3 - Analyzing Tweets: Text Mining and Sentiment Mining

Goutam Chakraborty, Professor (Marketing), Oklahoma State University, 420 A Spears School of Business, Stillwater, OK, 74078, United States of America, goutam.chakraborty@okstate.edu

In this presentation, we will discuss results from analyzing tweets that provide insights on the impact of the Digital Rights Management (DRM) policies of a major software manufacturer on their customers' reactions. Results from sentiment analysis of tweets pre-post of a launch of a new product by the manufacturer will also be presented.

4 - Probabilistic Semantics for Customizable Social Media Analytics

Viswanath Avasarala, Manager, SAS, World Headquarters, SAS Campus drive, Cary, NC, 27513, United States of America, Viswanath.Avasarala@sas.com, Praveen Lakkaraju, David Styles, Richard Crowell, Saratendu Sethi, James Tetterson

SAS provides sophisticated rule-based natural language processing (NLP) technology to enable accurate categorization and identification of complex relationships within unstructured data. In this paper, we will discuss the design of our new technology, the semantic framework, that allows enterprise analysts to build powerful social media applications with minimal configuration.

Meta-Algorithms – Algorithms That Improve Other Algorithms

Cluster: Cognitive Analytics

Invited Session

Chair: Meinolf Sellmann, Co-Lead Global Technology Outlook, IBM Research Headquarters, 1101 Kitchawan Rd, Yorktown, NY, United States of America, meinolf@us.ibm.com

1 - Programming by Optimization: A Practical Paradigm for Computer-Aided Algorithm Design

Kevin Leyton-Brown, Professor, University of British Columbia, 2366 Main Mall, Vancouver, BC, V6T1Z4, Canada, kevinlb@cs.ubc.ca, Holger Hoos, Frank Hutter

Programming by Optimization means specifying a large design space and then applying machine learning and optimization to find a design that will perform well in a given use context. This talk will share the vision of PbO, describe key algorithmic techniques that make PbO practical, and illustrate the power of the approach. Specifically, it will describe some state-of-the-art methods for automated algorithm configuration, portfolio-based algorithm selection, and automated portfolio construction.

2 - Algorithm Portfolios Based on Cost-Sensitive Hierarchical Clustering

Horst Samulowitz, IBM Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, samulowitz@us.ibm.com, Meinolf Sellmann, Ashish Sabharwal, Yuri Malitsky

Different solution approaches for combinatorial problems often exhibit incomparable performance that depends on the concrete problem instance to be solved. Algorithm portfolios aim to combine the strengths of multiple algorithmic approaches by training a classifier that selects solvers dependent on the given instance. We discuss a classifier that selects solvers based on a cost-sensitive hierarchical clustering model.

3 - Instance-Specific Algorithm Tuning

Yuri Malitsky, Cork Constraint Computation Centre, School of Computer Science & IT, Cork, Ireland, Yuri.Malitsky@gmail.com, Carlos Ansótegui, Meinolf Sellmann

We present ISAC++, a tool for tuning algorithms instance-specifically. ISAC++ is based on the instance-oblivious algorithm tuner GGA and the CSHC algorithm portfolio methodology. A portfolio of MaxSAT solvers was tuned with ISAC++ and won six out of eleven categories at the 2013 International MaxSAT Evaluation.

Operations/Sustainability 2

Contributed Session

Chair: Adam Ng, National University of Singapore, 1 Engineering Drive 2, Singapore, 025874, Singapore, isentsa@nus.edu.sg

1 - Linear Programming Models for Resilient Supply Systems Planning
Adam Ng, National University of Singapore, 1 Engineering Drive 2, Singapore, 025874, Singapore, isentsa@nus.edu.sg, Muchen Tang

We consider linear programming models of general supply systems subject to supply disruptions. Our objective is to develop a framework to measure supply resilience for such models. We first propose axiomatic characterizations of resilience measures, and then show their representation using adjustable uncertainty sets. We next develop algorithms for evaluating resilience measures defined by some simple adjustable sets, and present computational studies on a natural gas supply network.

2 - Green Procurement Behaviors Observation from Game Theory Perspective
Ping JI, The Hong Kong Polytechnic University, EF606, Hung Hom, Hong Kong, Hong Kong - PRC, p.ji@polyu.edu.hk, Xin Ma

An increasing number of manufacturers pay more attention to green procurement. Selection green supplier has become an important issue in supply chain management. A game model is proposed to study the relationship between manufacturers and green suppliers. Behaviors of two players are presented by using different strategies, which also be demonstrated by simulation.

3 - Analysis of Recycled Content Claims under Supply Uncertainty and Demand Benefit
Aditya Vedantam, Doctoral Student, Krannert School of Management,Purdue University, 147 Arnold Drive Apt 14, West Lafayette, IN, 47906, United States of America, avedanta@purdue.edu, Ananth Iyer, Paul Lacourbe

Manufacturers making claims regarding recycled content on product packaging, see demand from Environmentally Preferable Purchasing (EPP) and industry buy recycled procurement. However, the availability of quality post-consumer recycled content is cause for concern due to contamination in the municipal waste stream. We study the impact of uncertain supply and demand benefit and show that concerted effort to ease supply constraints and create demand side incentives can lead to win-win conditions.

4 - Collaborative Planning to Increase Resource Efficiency in Industrial Symbiosis
Renzo Akkerman, Professor, Technische Universitat München, Arcisstrafle 21, München, 80333, Germany, renzo.akkerman@tum.de, Gabor Herczeg

Resource efficiency is a key aspect in relation to economic and environmental performance in sustainable supply chains. To improve resource efficiency in industrial symbiosis, one company's production waste substitutes virgin resources in another company's production process. Tactical planning activities need to include waste treatment, storage, as well as resource procurement. We develop collaborative planning models that consider the matching of waste supply and demand.

Supply Chain, Risk Management II

Contributed Session

Chair: Seyed Vahid Rez Nooraie, PhD Student, North Carolina A&T State University, 1601 E Market Street, Greensboro, NC, 27411, United States of America, vnooraie@gmail.com

1 - Backup Sourcing Model with Credit Guarantee Mechanism
Cheng-Feng Wu, National Taiwan University, College of Management, Floor 9, Taipei, Taiwan - ROC, d99741006@ntu.edu.tw, David Chiang

The strait of capital shortage in SMEs causes them difficult to fulfill orders, resulting in poor performance of the supply chain. Therefore, obtaining and operating financial support for SMEs is a significant issue. This study attempts to develop the dual sourcing model with a backup supplier under trade guarantee mechanism by applying incentive theory from manufacturer's perspectives.

2 - Innovative Menu of Contracts for Coordinating a Supply Chain with Multiple Mean-Variance Retailers
Chun-Hung Chiu, Associate Professor, Sun Yat-sen Business School, Business School, Sun Yat-sen University, No. 135 Xingang West Road, Guangzhou, 510275, China, chchiu2000@gmail.com, Tsan-Ming Choi, Gang Hao, Xun Li

We consider the coordination challenge with a risk-neutral manufacturer which supplies to multiple heterogeneously mean-variance (MV) retailers. To achieve coordination, we develop an innovative menu of TSR contracts. All contracts in the menu that achieves SCC must be non-MV inferior and non-dominated, and the associated conditions are examined.

3 - Mitigating Supply Chain Risks through the Assessment of Trade-off among Investment in Capabilities
Seyed Vahid Rez Nooraie, PhD Student, North Carolina A&T State University, 1601 E Market Street, Greensboro, NC, 27411, United States of America, vnooraie@gmail.com, Mahour Parast, Saeed Zamiri Marvizadeh

One of the central questions in supply chain design is how to properly invest in supply chain capabilities in order to be more responsive to supply chain disruptions.

Incentive Issues in Sustainable Operations

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Luyi Gui, luyig@uci.edu

1 - On the Effectiveness of Emission Penalties in Decentralzied Supply Chains
Saif Benjaafar, Distinguished McKnight University Professor Professor, University of Minnesota, 111 Church St SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu, Xi Chen

We show that pricing emissions in a decentralized supply chain can paradoxically lead to higher overall supply chain emissions and for this emission to increase in the emission price. We discuss potential remedies and the social welfare implications of each. We illustrate our analysis with several applications.

2 - Manufacturers' Recycling Strategies: Competition and Cooperation in Sustainability
Fang Tian, Ph.D. Candidate, Department of Data Sciences and Operations, Marshall School of Business, University of Southern California, Los Angeles, CA, 90089, United States of America, tianfang@usc.edu, Greys Sosic, Laurens Debo

We study recycling of products from two categories, each with (possibly) multiple brands, and focus on product heterogeneity vs. economies of scale. Our analysis suggests that recycling organized by government disregards product brands, and either focuses on categories or takes advantage of economies of scale (through all-inclusive recycling). On the other hand, if competing manufacturers form recycling coalitions, all products from the same brand may be recycled together regardless of category.

3 - Supply Chain Design for Unlocking the Value of Remanufacturing under Uncertainty
Wenyi Chen, MIT-Zaragoza, C/ Bari 55, Edificio N·yade 5, Zaragoza Logistics Center, Zaragoza, 50197, Spain, wchen@zlc.edu.es, Maria Jesus Saenz, Beste Kucukyazici, Vedat Verter

We present a two-stage stochastic closed-loop supply chain design model that incorporates uncertainties as well as the differences in customer valuations of new and remanufactured products. We integrate SAA with integer L-shaped to tackle the arising mixed integer quadratic program, which we implement in a German company.

4 - The Value of Product Returns: Intertemporal Product Management with Strategic Consumers
Narendra Singh, Narendra.Singh@scheller.gatech.edu, Karthik Ramachandran, Ravi Subramanian

Consumer product returns are a significant and growing concern in many industries, and firms typically deem returns to be undesirable. We study the impact of returns on the intertemporal product strategy of a firm facing strategic consumers. Importantly, we show that returns may act as a device for the firm to mitigate the well-known time inconsistency problem, and firm profit could increase with the return rate.

Education 2

Contributed Session

Chair: Fikret Korhan Turan, Asst. Professor Dr., Istanbul Kemerburgaz University, Mahmutbey Dilmenler Cad., No:26 Bagcilar, Istanbul, 34217, Turkey, korhan.turan@kemerburgaz.edu.tr

1 - using Predictive Analytics to Increase Graduation Rates

Helmut Schneider, Professor, Louisiana State University, LSU BEC, Baton Rouge, LA, 70803, United States of America, hschnei@lsu.edu, Xuan Wang

Predictive analytics will be used to deploy advising and mentoring to increase graduation rates. We also employ Bayesian networks and simulation to gain further insight into what drives graduation rates. Using four years of data this paper also identifies key performance indicators that affect graduation rates.

2 - A Learner-Analytics Based Approach for Attenuating the Course-Level Dropout Rate

Aysegul Demirtas, Arizona State University, 1055 W 5th St, Apt 10, Tempe, AZ, 85281, United States of America, Aysegul.Demirtas@asu.edu, Esma Gel, Jennifer Bekki, George Runger

Despite their potential to attract large numbers of diverse students, online courses remain plagued by a critical student attrition problem. Using data from three different online undergraduate courses, we apply data mining techniques to model the relationship between learner interactions with the Learning Management System (LMS) and course level dropout. The findings serve as the basis for incorporating earlier detection of at-risk students in online courses.

3 - OR Education with LEGO Mindstorms EV3

Young Jae Jang, Assistant Professor, KAIST, 291 Daehak ro, Industrial and Systems Eng, KAIST, Daejeon, 305701, Korea, Republic of, yjang@kaist.ac.kr

The Industrial and Systems Engineering at KAIST recently developed Automated Manufacturing Systems with LEGO Mindstorms EVS. With the tool kit, a physical production line was constructed that produce a multiple products with automated material handling systems. We explain how the system has been applied to OR classrooms. The motivational benefit and pedagogical implication of the system are also discussed.

4 - Sustainability in Higher Education: A Statistical Analysis of Stakeholder Needs for Group Decision

Fikret Korhan Turan, Asst. Professor Dr., Istanbul Kemerburgaz University, Mahmutbey Dilmenler Cad., No:26 Bagcilar, Istanbul, 34217, Turkey, korhan.turan@kemerburgaz.edu.tr, Saadet Cetinkaya, Ceyda Ustun

Istanbul Kemerburgaz University management considers implementing a set of projects to improve the university's sustainability performance as a higher education institute. Using analytic hierarchy and network processes, we conduct a 30-participant stakeholder survey whose results will be used in a multi-objective stochastic program to find an optimal portfolio. Survey results show statistical differences in stakeholder needs, and how they change under low, medium and high financial constraints.

5 - Capturing Heterogeneity in University Choice

Ricardo Paredes, Prof Economics, PUC, Vicuna Mackenna 4860, Macul, Santiago, Chile, rparedes@ing.puc.cl, Alejandro Schmidt, Juan de Dios Ortuzar

Considering the possibility groups differ on their preferences, we estimate a latent-class logit model to analyse the determinants of university choice in Chile, and show how these vary depending on group characteristics. We conclude that groups of individuals with different selection patterns exist, that those groups are not only differentiated by their income and that their choice sensitivity to different university characteristics (cost, quality, and location).

Supply Chain, Practice, Empirics

Contributed Session

Chair: Jing Zhou, Associate Professor, UNC Charlotte, 9201 University City Blvd, Belk College of Business, Charlotte, NC, 28223, United States of America, jzhou7@uncc.edu

1 - Lean Supply Chain in Small Businesses

Steve Zhou, University of Houston Downtown, One Main Street, Houston, TX, United States of America, drbinzhou@yahoo.com

This research investigates lean supply chain management and its impacts on small businesses' performance. It has provided insights into the current status of lean supply chain practices and related implementation issues in small businesses.

2 - Generational Shift and Consumer Complaints in Automobile Industry

Sourish Sarkar, Penn State Erie, 4701 College Drive, Erie, PA, 16563, United States of America, szs15@psu.edu, Balaji Rajagopalan

We analyze consumer complaints data for light vehicles sold in U.S. during the years 2002-2013 by 41 major brands. Based upon this data, we investigate the factors that influence the number of complaints for any specific car-model. Factors that significantly contribute to the complaints are analyzed.

3 - Who Should Build the Network of Charging Stations for Electric Vehicles, Manufacturers or Dealers?

Tian Wang, School of Management, Huazhong University of Science of Technology, 1037 Luoyu Road, Wuhan City, Hu, 430074, China, wangtian3261@gmail.com, Shiming Deng

We investigate the issue of how to facilitate the expansion of the network of charging stations for Electric Vehicles (EVs). In particular, who should take the lead to build and own the network of charging station, manufacturers or dealers, to achieve a larger network to alleviate consumers' driving range anxiety? We study this from the supply chain perspective and provide strategies that may lead to a large market acceptance of EVs.

4 - Penalty – Reward Contracts to Coordinate a Manufacturer and its Logistics Service Provider

Emel Aktas, Senior Lecturer, Cranfield University, Cranfield School of Management, Cranfield, United Kingdom, emel.aktas@cranfield.ac.uk, Fusun Ulengin, Seda Yanik

Contracts coordinate disparate but interdependent members of the supply chain. Conflicting objectives of members and lack of coordination among them lead to inefficiencies in matching supply with demand. We model the logistics contract between a manufacturer and its service provider. We examine delivery order, penalty, and reward as contract parameters and report contract efficiency relative to full and no coordination. Delivery order, penalty, and reward contracts help achieve coordination.

Revenue/Yield Management III

Contributed Session

Chair: Yalcin Akcay, Assoc. Professor, Koc University, Sariyer, Rumelifeneri Yolu Sariyer, Istanbul, 34450, Turkey, yakcay@ku.edu.tr

1 - Approximate Dynamic Programming for Network Revenue Management under Substitution

David Sayah, Johannes Gutenberg University Mainz, Chair of Logistics Management, Jakob-Welder-Weg 9, Mainz, 55129, Germany, sayah@uni-mainz.de

In network revenue management, algorithms producing high-fidelity value function approximations like approximate linear programming and Lagrangean decomposition recently have been the centre of attention within the community. This presentation will show extensions of some of these approaches to generalized problem settings in which the assortment may consist of flexible products allowing companies to choose a specific execution mode from a given set of alternative modes.

2 - Joint Pricing and Sourcing under Supply and Demand Risk

Amirmohsen Golmohammadi, McMaster University, 1280 Main Street West, DeGroote School of Business, Hamilton, ON, L8S4M4, Canada, golmoha@mcmaster.ca, Elkafi Hassini

We consider a newsvendor sourcing and pricing problem in a single and multiple period models. We present new results on joint optimal prices and order quantities when both supply and demand are uncertain. We present the concept of expected lost sale fill rate elasticity and show how it can be used to find the optimum policy in both single and multiple period cases. We also show how some of the previous results in the deterministic yield case relate to our models.

3 - How to Use Dynamic Local Knowledge: The Case for Intermodal Revenue Management

Yalcin Akcay, Assoc. Professor, Koc University, Sariyer, Rumelifeneri Yolu Sariyer, Istanbul, 34450, Turkey, yakcay@ku.edu.tr, Long Gao, Ting Luo

We focus on core operations of a local manager for an intermodal transportation company, load acceptance and container leasing/repositioning, over a short horizon. We develop a decentralized framework that jointly optimizes local operations and achieves network coordination. We introduce an MDP-based scarcity pricing scheme which self-regulates how each location interacts with the transportation network. We characterize the impact of dynamic forecasting on profitability and policy choice.

4 - Supply Allocation under Advance Demand Information
Felix Papier, Associate Professor, ESSEC Business School, Av. Bernard Hirsch, Cergy, 95021, France, papier@essec.edu

We study the problem of allocating limited supply to different markets with uncertain demand but for which advance demand information (ADI) can be obtained. Our research is motivated by an agri-food manufacturer that operates in several European countries and tries to maximize revenues. We use Markov Decision Processes to model the problem, develop an efficient heuristic solution, and derive structural properties that lead to several insights for supply chain managers in the agri-food industry.

5 - Analysis of Optimal Threshold in Batch Service Queueing Systems
Yun Zeng, Ohio State University, OH, United States of America, zeng.153@buckeyemail.osu.edu, Cathy Xia

In delivery systems with limited resources, one critical issue is to properly schedule the service so as to ensure customer satisfaction. We consider a batch service queueing system with Poisson arrivals and infinite holding/serving capacity, and study the optimal batching policy so as to minimize the expected waiting time of customers. Through closed-form analysis, we reveal the structure of the optimal policy and propose a simple strategy to find the optimal threshold. The results are further supported by simulation and can be applied to various practical delivery systems.

Behavorial Bias and Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Michael Z. F. Li, Professor, Nanyang Technological University, Nanyang Business School, Nanyang Avenue, Singapore, 639798, Singapore, zfli@ntu.edu.sg

1 - Advance Selling with Overconfident Consumers
Michael Z. F. Li, Professor, Nanyang Technological University, Nanyang Business School, Nanyang Avenue, Singapore, 639798, Singapore, zfli@ntu.edu.sg

We study a retailer's advance selling strategy when some consumers are overconfidence in their valuations. We prove that advance selling is not always beneficial to retailer. The retailer should do advance selling when the difference of the regular consumers' expected valuation and expected surplus when not buying in advance is no less than a threshold.

2 - When Fixed Pricing Meets Priority Auction: Dual Modes of Service Systems
Jiayang Gao, Cornell University, 296 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, jg838@cornell.edu, Huseyin Topaloglu, Krishnamurthy Iyer

Consider a service center operating both a fixed price, FIFO market (pay as you go, PAYG), and a spot market running priority auction. We derive the unique equilibrium, in which customers with both high and low patience participate in spot market and the rest goes to PAYG. We discuss the social optimality of operating only the spot market, and the revenue maximizing price and server allocation.

3 - Pricing Product Versions for Strategic Impatient Customers
Vinod Cheriyan, School of Industrial and Systems Engineering, Georgia Tech, 755 Ferst Drive NW, Atlanta, GA, 30332, United States of America, vinod.cheriyan@gatech.edu, Anton Kleywegt, Ravi Subramanian

We consider a monopolist who regularly introduces new product versions. Potential buyers anticipate new versions, and are heterogeneous in their ownership of versions and in their impatience to own a new version. The seller has to decide what discount to offer for the current version before each new version is introduced or what trade-in discount to offer after each new version is introduced. We characterize the seller's optimal pricing decisions and buyers' optimal purchase decisions.

4 - Estimating Elasticity of Demand for Commodity-based Manufacturers
David Rodriguez-Gomez, Director, PROS, 101 Montgomery Street, Suite 400, San Francisco, CA, 94104, United States of America, drodriguez@pros.com

We describe an econometric model that predicts the quantity demanded of a product in a demand segment at a certain time period given a particular lead time. The quantity demanded is a function of the net price quoted, history, trends, seasonality and the customer's elastic response to price and other marketing drivers. We discuss the methodology for estimating the parameters of the model given observed transactional data, with a focus on the own-price elasticity of demand.

Reducing and Accommodating Customer Variability in Services

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Ryan Buell, Assistant Professor, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States of America, rbuell@hbs.edu

1 - Collection Control with Customer Choice Behavior for Rental Companies
Marco Bijvank, University of Calgary, Haskayne School of Business, Calfary, AB, T2N1N4, Netherlands, marco.bijvank@haskayne.ucalgary.ca, Iris Vis, Jaap Boter

We study the availability of items within a collection of items in a setting of public libraries, where we include the behavior of customers in case of a stock out. Next to field experiments about customer behavior, we model the setting as a continuous review inventory system with base-stock levels and emergency lateral transshipments to analyze library collections. A case study demonstrates the performance of our heuristic procedure to redistribute books over the different branches.

2 - On the Value of Customer Flexibility in (Electrified) Car-sharing
Philipp Ströhle, Karlsruhe Institute of Technology, Englerstr. 14, Karlsruhe, 76131, Germany, philipp.stroehle@partner.kit.edu, Christoph Flath

We present a multi-objective scheduling model that lets car-sharing providers decide between fleet utilization and customer walkways. We evaluate the model based on real-world customer reservation behavior and estimate the value of spatial flexibility to the provider. Moreover, we show to what extent flexibility can assist in introducing electric vehicles into car-sharing fleets. Our results show that car-sharing poses a promising field for the electrification of individual transportation.

3 - When and How to Differentiate? Implications for Strategic Delay, Prioritization, and Free Service
Arvind Sainathan, Nanyang Business School, NTU, S3-B2A-03 50 Nanyang Avenue, Singapore, Singapore, asainathan@ntu.edu.sg

We consider customers purchasing a service from a retailer/service provider. They may be heterogeneous both in their delay sensitivity and how much they value this service. We analyze the retailer's problem of minimizing her cost while providing them adequate service. Strategic delay and prioritization are two simple ways of differentiating customers, while a free service has key implications for marketing. We find conditions under which these features are optimal for the retailer.

4 - Staffing Service Systems when Capacity has a Mind of its Own
Itai Gurvich, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu, Antonio Moreno-Garcia, Martin Lariviere

We study capacity optimization when (nonsalaried) workers determine their own work schedule. Our study is motivated by recent innovations in service delivery such as work-from-home call centers and ride-sharing services. The provider in these settings cannot directly assign agents to time intervals but has to guarantee sufficient participation. Tensions between profit maximization and agent-earning constraints lead to departures from standard operations both in terms of decisions and outcomes.

Chair: Sila Cetinkaya, Cecil H. Green Professor, SMU, Lyle EMIS and Cox ITOM, Dallas, TX, United States of America, sila@smu.edu

Co-Chair: Fatih Mutlu, Qatar University, MIE Department, Doha, 2713, Qatar, fatihmutlu@qu.edu.qa

1 - Linearly Decreasing Pricing for Shipment Consolidation

Bo Wei, research assistant, Dept of ISEN at Texas A&M, 1501 Holleman Dr Apt 166, college station, TX, 77840, United States of America, feixianxing@neo.tamu.edu, Lin Feng, Sila Cetinkaya

In this work, we study the optimal pricing strategies in the pure shipment consolidation model with linear demand function. We propose a linearly decreasing pricing strategy and analytically show that it achieves more profit than the optimal static price strategy. Finally, we prove rigorously that the linearly decreasing pricing strategy is optimal by using Pontryagin's maximum principle.

2 - Optimal Inventory and Warranty Pricing for Items with Imperfect Quality under Trade Credit

Yi Zhang, ISE Department, Texas A&M University, 1001 Harvey Rd. Apt. 50, College Station, TX, 77840, United States of America, dolphinazy@neo.tamu.edu, Sila Cetinkaya, Elif Akcali

Trade credit and warranty compensation are ubiquitous in B2B transactions. Trade credit can ease the financial burden of large upfront payments for purchasing the goods. Warranty compensation provides protection against potential losses due to imperfect quality of the goods. We develop a stochastic model to determine the optimal inventory and warranty pricing decisions in a two-stage supply chain to model and investigate the impact of imperfect quality and the duration of trade credit period.

3 - Contractual Pricing for a Carrier under Vendor-Managed-Inventory (VMI)

Sila Cetinkaya, Cecil H. Green Professor, SMU, Lyle EMIS and Cox ITOM, Dallas, United States of America, sila@itu.edu, Fatih Mutlu

We address channel coordination issues in a simple yet practical setting where a carrier is to ship the items within a two-echelon supply channel consisting of a supplier and a buyer. We consider the case where the supplier-buyer pair is operated under a VMI agreement whereas the carrier is a separate entity. We develop alternative transportation pricing contracts between the carrier and VMI partnership.

Revenue Optimization under Uncertainty in Healthcare

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Aurelie Thiele, Visiting Associate Professor, MIT, 77 Mass Ave Rm E40-121, Cambridge, MA, 02139, United States of America, aut204@lehigh.edu

Co-Chair: Tengjiao Xiao, Doctoral student, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, tex209@lehigh.edu

1 - A Forward Looking Risk Adjustment Approach using Markov Chains

Gregory McKinney, Business Analytics Consultant, Kaiser Foundation Healthplan, Inc., 1950 Franklin St. (MIA/MARS), Oakland, CA, 94612, United States of America, gmckinne@pacbell.net

Risk Adjustment models are used to set payments so health plans receive more for members with multiple chronic conditions compared to healthier members. The Centers for Medicare & Medicaid Services (CMS) define a model for payments covering over 15 million members. CMS payments use diagnoses from the prior year leading to a backward looking process. Revenue planning requires future risk score prediction. This paper offers an approach to predict future risk scores using Markov Chains.

2 - Robust Optimization Models in Healthcare Finance: The Role of Community Benefit Programs

Shuyi Wang, Doctoral student, Lehigh University, 217 W Packer Ave, Room 201, Bethlehem, PA, 18015, United States of America, shw210@lehigh.edu, Aurelie Thiele

Most hospitals in United States are non-profit and are federal tax exempt. In order to maintain their tax exempt status, these hospitals must contribute part of their revenue to benefit their communities. Most of the contributions are in the form of direct financial assistance. Many believe that if we can shift that amount of money upstream to invest in community-based activities that can prevent disease, we can improve people's health while decrease the rising healthcare cost.

3 - Robust Hospital Readmission Payment Adjustment

Tengjiao Xiao, Doctoral student, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, tex209@lehigh.edu, Aurelie Thiele

This paper introduces robust optimization models to address uncertainty in hospital readmission reduction, which imposes a financial penalty on hospitals with excess readmissions. We investigate the level of nurse staffing to minimize the probability of being penalized, while balancing between provider margins and payer costs. The impact lag is also incorporated in the models to ensure the financial viability of the hospital as the benefits are slower to materialize than expected.

Chair: Fethi Calisir, Industrial Eng. Department, Istanbul Technical University, Istanbul, Turkey, calisirfet@itu.edu.tr

1 - Assessment of Intellectual Capital (IC) Efficiency of Food Industry with DEA

Fethi Calisir, Industrial Eng. Department, Istanbul Technical U., Istanbul, Turkey, calisirfet@itu.edu.tr, Ayse Elvan Bayraktaroglu, Mine Isik

In this work, the Value-Added Intellectual Coefficient (VAIC) method that deals with financial, structural and human capitals are used to evaluate the efficiency of value creation. Then, DEA is used to reveal the relative performance of 12 companies on the Istanbul Stock Exchange. The IC performances and efficiency values of the companies are gathered by means of Charnes Cooper Rhodes methods. The benchmark set and the input, output evaluations are depicted by the efficient frontier. Additionally, the change of VAIC during the years 2009 to 2012 is compared with utilizing Malmquist index.

2 - Intellectual Capital and Firm Performance in Turkish Chemicals, Petroleum, Plastic Products Industry

Ayse Elvan Bayraktaroglu, Industrial Eng. Department, Istanbul Technical U., Istanbul, Turkey, ayseelvan@gmail.com, Murat Baskak, Fethi Calisir

Using the VAIC approach, the relationship between intellectual capital performance and firm performance for some firms listed in Istanbul Stock Exchange is analyzed. The relationship between VAIC components (human capital efficiency: HCE, structural capital efficiency: SCE, capital employed efficiency: CEE) and firm performance indicators are examined using canonical correlation analysis and commonality analysis. The common contribution of the three VAIC dimensions is found to be more decisive on the firms' performance compared to the individual effects of HCE, SCE, and CCE.

3 - The Use of Qualitative Data When Managing External Variety for Configurable Products

Erkin Isiklie, Bogazici University, Department of Industrial Engineering, Bebek, Istanbul, 34342, Turkey, ErkinIsiklie@itu.edu.tr

The reduction of external variety is a strategic decision that is made under the consideration of various factors. In this study, using online consumer reviews on a configurable product, text mining techniques were employed with the aim of helping this decision making process by shrinking the set of product variants without losing too much critical information. The results indicate that when building demand models, such qualitative models should Definitely be utilized in order to obtain better insights.

Maritime Transportation

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Harilaos Psaraftis, Professor, Technical University of Denmark, Bygningstorvet 1, Lyngby, 2800, Denmark, hnpsar@transport.dtu.dk

1 - Optimal Compliance Strategies to Shipping Emission Regulation

Michele Acciaro, Assist. Professor of Maritime Logistics, The Kuehne Logistics University (KLU), Grosser Grasbrook 17, Hamburg, 20459, Germany, michele.acciaro@the-klu.org, J. Rod Franklin

The development of emission regulation in shipping has increased managerial complexity. In order to provide support to shipping firms, this paper presents an application of decisions analysis under technology and fuel price uncertainty. Results show that operational strategies are optimal only as long as fuel price variability remains high.

2 - Practical Applications of Operations Research Tools in Marine Transportation

Henry Chen, Chief Naval Architect, Jeppesen Marine, 1000 Atlantic Avenue, Suite 108, Alameda, CA, 94501, United States of America, henry.chen@jeppesen.com

More than 90% of world's cargo are carried by ships. Optimizing design, operations and logistics can greatly improve the efficiency and safety of this supply chain, especially in today's high fuel cost and restricted carbon emission. Examples are: Voyage simulations for comparing ship designs, and establishing METOCEAN criteria for tows; Minimizing fuel consumption on a given schedule, specific ship loading conditions under a set of response based constraints and weather forecast.

3 - Planning Liner Shipping Services

Christian Vad Karsten, The Technical University of Denmark, Produktionstorvet Bygning 426, Kgs. Lyngby, 2800, Denmark, chrkr@dtu.dk, Anant Balakrishnan

We address the Liner Shipping Service Selection Problem that entails selecting the best subset of sailing routes from a pool of candidate routes to maximize the satisfied demand subject to limits on the number of transshipments and routing constraints. We propose a hop-constrained multi-commodity arc flow model on an augmented network, and outline a preprocessing procedure to reduce problem size. We present computational results for problems from the LINER-LIB benchmark suite.

4 - Efficient Dynamic Programming Approach for the Container Relocation Problem

Virgile Galle, MIT Operations Research Center, Cambridge, United States of America, vgalle@mit.edu, Cynthia Barnhart, Setareh Borjian, Vahideh Manshadi, Patrick Jaillet

We propose a fast and efficient Dynamic Programming approach for optimally solving the container relocation problem (also referred to as block relocation problem). Our method is capable of obtaining optimal solutions in a reasonably short time and is thus applicable in real time operations. Further, we extend our solution approach to a new version of the container relocation problem: the incomplete information case when the entire departure schedule of containers is not known beforehand.

5 - Emissions Minimization Ship Routing Problem

Christos Kontovas, Assistant Professor, Technical University of Denmark, Bygningstorvet 115, Lyngby, 2880, xkontovas@gmail.com, Harilaos Psaraftis

We investigate some possible reformulations of existing ship routing and scheduling models so as to incorporate emissions considerations. Speed decisions are also taken into account. Because of the non-linear relationship between speed and fuel consumption, it is obvious that a ship that goes slower will emit much less than the same ship going faster. In that context, some fundamentals are outlined, the main trade-offs are analysed, and some decision models are presented.

1 - The Identity of Religious Research Universities in the Face of Secularization

Dave Whetten, Emily Block, Alan Wilkins

Abstract is not available at this time.

2 - Bottle Revolution: Constructing Consumer and Producer Identities in the Craft Brewery Industry

Cameron Verhall, Emily Block, Michaela DeSoucay, Jo-Ellen Pozner, Katarina Sikavika

This paper considers the conundrum that in a market that co-evolved with an identity movement and that possesses a clearly defined organizational form identity, how do market participants manage to de-partition the market to the point that generalists and specialists compete directly? We believe this unexpected dynamic is driven by the intentional use of language on the part of both generalist and specialist producers, and aided by the evolution of the identity movement itself. We investigate the ways that language drives market structure, drawing on organizational ecology, neo-institutional theory, and theories of linguistic and cultural framing. We focus on language as a set of shared meanings that mobilize actors in support of change, propagate new identities, and help actors make or dispute claims of legitimacy.

Container Supply Chain Coordination

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Jan C. Fransoo, Professor, Eindhoven University of Technology, School of Industrial Engineering, PO Box 513, Pav F4, Eindhoven, 5223 GV, Netherlands, j.c.fransoo@tue.nl

1 - Cost, Carbon Emissions and Modal Shift in Intermodal Network Design Decisions

Yann Bouchery, Ecole de Management de Normandie, 30, Rue de Richelieu, Le Havre, 76087, France, y.bouchery@tue.nl, Jan C. Fransoo

Intermodal transportation is generally considered as efficient for reducing carbon emissions without compromising economic growth. In this article, we present a new intermodal network design model in which the terminal location and the allocation between direct truck transportation and intermodal transportation are optimized. The model allows for studying the dynamics of intermodal transportation in the context of hinterland networks from a cost, carbon emissions and modal shift perspective.

2 - The Impact of Demurrage and Detention Tariffs on Hinterland Container Planning

Jan C. Fransoo, Professor, Eindhoven University of Technology, School of Industrial Engineering, PO Box 513, Pav F4, Eindhoven, 5223 GV, Netherlands, j.c.fransoo@tue.nl, Stefano Fazi, Tom Van Woensel

Demurrage and detention are charged to shippers and freight forwarders for the usage of containers between the port of arrival and unloading at the receiver's location. In this study, we investigate the consequences of D&D, based on actual tariff structures in Rotterdam. Our findings show that the tariff structure leads to increased overall costs of transportation and to excessive storage of containers in the scarce space of the deepsea quay.

3 - Barge Port-Hinterland Container Network Design with Synchronization Constraints

Rob Zuidwijk, Professor, Rotterdam School of Management, PO Box 1738, Rotterdam, 3000 DR, Netherlands, rzuidwijk@rsm.nl, Panagiotis Ypsilantis

A barge operator schedules its minimum cost barge services at the tactical level to accommodate container transport between seaport and its hinterland. He decides on deployment and routing of his barge fleet exploiting economies of scale. The corresponding MIP problem is solved for a particular real-life case in the Netherlands. Our results show the effects of economies of scale, number of calls per trip, and required service frequency on total costs.

4 - Carrier Portfolio Management in Liner Shipping

Tao Lu, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, tluaa@ust.hk, Chung-Yee Lee, Jan C. Fransoo

We study a shipper transporting seasonal products from overseas to the destination market. In addition to spreading the risk arising from uncertain transit times, we find that using a combination of fast and slow liner services can help tackle the demand uncertainty in the destination. When carriers' arrival sequence is fixed, we fully characterize the optimal solution with an efficient frontier. A DP-based algorithm is further proposed to optimally solve the problem with setup costs.

5 - Fractional Price Matching Policies Arising from the Ocean Freight Service Industry

Rui Yin, Associate Professor, Arizona State University, Dept of Supply Chain Management, W.P.Carey School of Business, Tempe, AZ, 85287, United States of America, rui.yin@asu.edu, Jaehyung An, Chung-Yee Lee, Chris Tang

We consider a situation in which shippers can purchase ocean freight services either directly from a carrier in advance or from the spot market just before the departure of an ocean liner. The price is known in the former case, while the spot price is uncertain ex-ante in the latter case. We examine if the carrier should bear some of the price risk by offering a "fractional" price matching contract that will "partially match" the realized spot price when it is lower than the regular price.

Transportation, Intelligent Systems I

Contributed Session

Chair: Young-Ji Byon, Khalifa University (KUSTAR), Al Saada St. and Muroor Rd., Abu Dhabi, United Arab Emirates, youngji.byon@kustar.ac.ae

1 - using Smartphones to Improving Safety and Mobility for Pedestrians

Sara Khosravi, Research Assistant, University of Arizona, 811 E Prince Rd #221, Tucson, AZ, 85719, United States of America, sarakhosravi@email.arizona.edu, Larry Head, Navin Katta

The purpose of this project is to make use of emerging and state-of-the-art technologies including Smartphones and 3G/4G/LTE, Wi-Fi, and DSRC communications, to find innovative and effective ways to improve pedestrian safety and mobility. These improvements can be achieved by integrating pedestrian information with the Connected Vehicle system to provide effective and timely warnings to both pedestrians and motorists.

2 - Finding the Distribution of Maximum Queue Length using Probe Vehicle Data with Low Penetration Rate

Xin Qi, Tsinghua University, Shunde Building 519A, Beijing, 100084, China, x-qi12@mails.tsinghua.edu.cn, Hai Jiang

We develop a model to estimate the distribution of queue lengths at signalized intersections using GPS data from probe vehicles. We validate our model using data from both microscopic simulation and NGSIM. Results show that our model can produce satisfactory results.

3 - Comparing Efficiency of Different Intelligent Transportation Systems using Agent Based Simulation

Amirhosein Gholami, State University of New Yourk at Binghamton, 13 Goethe St., Binghamton, United States of America, agholam1@binghamton.edu, Nasim Nezamoddini

The traffic congestion problem in urban areas has been addressed by developing different types of intelligent systems. Agent based modeling has been applied to model systems including system with intelligent traffic signal timing and dynamic route guide and combination of them. Efficiency of each system, has been tested in presence of the unexpected events with different failures rates. Proposed transportation management systems have been tested under different assumption and traffic situations.

4 - Determination of Noise Accumulation using ADS-B Signals and Geographic Information Systems

Young-Ji Byon, Khalifa University (KUSTAR), Al Saada St. and Muroor Rd., Abu Dhabi, United Arab Emirates, youngji.byon@kustar.ac.ae, Joonsang Baek, Young-Seon Jeong

Emerging ADS-B technologies enable transportation engineers access real-time trajectories of airplanes. Near airports, the density of such signals are higher. Since ADS-B passively emits information about type of each airplane, it is possible to estimate the amount of noise accumulation that affects the nearby grounds. By using DEM in GIS, more accurate distribution of the noise can be determined.

5 - Semi-quantitative Risk Assessment of Adjacent Track Accidents on Shared-use Rail Corridors

Chen-Yu Lin, Graduate Research Assistant, University of Illinois at Urbana-Champaign, Room B-118, 205 N. Mathews Ave., Urbana, IL, 61801, United States of America, clin69@illinois.edu, Mohd Rapik Saat

Adjacent track accident (ATA) is one of the most important safety concerns on shared-use rail corridors. ATA refers to train accident scenarios where a derailed equipment intrudes adjacent tracks. The research described in this paper presents a comprehensive risk assessment to identify factors affecting the likelihood and consequence of ATA. A semi-quantitative risk analysis model is developed to evaluate the ATA risk.

Chair: Seong Wook Hwang, The Pennsylvania State University, 232 Leonhard Building, The Pennsylvania State University, University Park, PA, 16802, United States of America, soh5223@psu.edu

1 - An Global Approximation Model for the Continuous Network Design Problem

BO DU, Nanyang Technological University, N1-B4b-07, 50 Nanyang Avenue, Singapore, 639798, Singapore, bdu1@e.ntu.edu.sg, Zhiwei Wang

Continuous network design problem is often formulated as a bi-level program with equilibrium constraints, and only approximation solution can be obtained due to its non-convexity. Based on geometric programming, this paper develops an equivalent single-level model to find an approximated global optimal solution. The principle of solving this problem is to apply a monomial approximation method to transform it to an equivalent nonlinear but convex problem, which is amenable to a global solution.

2 - Temporal Analysis of Origin-destination Matrices Estimation based on Passenger Cars Traffic Counts

Carlos Gonzalez-Calderon, Postdoctoral Research Associate, Rensselaer Polytechnic Institute, 110 8TH ST, JEC 4037, TROY, NY, 12180, United States of America, gonzac8@rpi.edu, Susana Restrepo Morantes, John Jairo Posada Henao, Catalina Osorio

This research introduces an entropy maximization demand model to estimate origin-destination matrices for passenger vehicles on the basis of traffic counts for different years. The performing of the formulation for the different time periods (2001-2008) is tested in the Medellin, Colombia network.

3 - Unit-Train Multiple Car Expected Quantity of Release Modeling

Hsiao-Hsuan Liu, Graduate Research Assistant, University of Illinois at Urbana-Champaign, 205 North Mathews Avenue, Urbana, Il, 61801, United States of America, hliu70@illinois.edu, Jesus Aguilar Serrano, Christopher PL Barkan, Mohd Rapik Saat

Railroads transport large quantities of hazardous materials over long distance in North America. The release size of an incident is a crucial factor for hazardous materials transportation risk. A probabilistic methodology is developed in this study to estimate the expected quantity of release based on the number of tank cars releasing.

4 - On-route Ride Sharing in Closed User Groups

Rick van Urk, University of Twente, P.O. Box 217, Enschede, 7500AE, Netherlands, r.vanurk@utwente.nl, Martijn Mes, Marco Schutten

A challenge ride sharing initiatives face is to encourage users to accept a shared ride even though this results in longer travel times. To solve this, we propose a method where only on-route ride sharing is allowed. We consider a closed user group, which creates a network of trusted drivers using the ride sharing network. We match users using the arcs of individual optimal routes of users.

5 - Robust Strategy for Alternative Fuel Refueling Station Location under Demand Uncertainty

Seong Wook Hwang, The Pennsylvania State University, 232 Leonhard Building, The Pennsylvania State University, University Park, PA, 16802, United States of America, soh5223@psu.edu, Sang Jin Kweon, Jose A. Ventura

In this research, we apply robust optimization to a multi-period planning problem of locating refueling stations on a transportation network with uncertain alternative fuel vehicle (AFV) demand. Forecasting AFV demand over multiple periods, we consider a refueling station location problem to find the number of stations and their locations over each period.

Vehicle Routing II

Contributed Session

Chair: Wei Zhou, Research Assistant, University of Illinois at Chicago, 892 W Taylor St, Chicago, IL, 60607, United States of America, wzhou27@uic.edu

1 - An Adaptive Large Neighborhood Search Method for Solving the Electric Vehicle Routing Problem

Bulent Catay, Sabanci University, FENS, Tuzla, Istanbul, 34956, Turkey, catay@sabanciuniv.edu, Merve Keskin

The Electric Vehicle Routing Problem with Time Windows is a new variant of the classical Vehicle Routing Problem with Time Windows where the vehicles are routed to service a set of customers under recharging constraints. In this study, we propose an Adaptive Large Neighborhood Search method to solve this problem. Our initial results show the proposed method is effective in finding good solutions.

2 - A New Fuzzy Modeling Approach for Joint Manufacturing Scheduling and Shipping Decisions

Can Celikbilek, PhD Candidate, Ohio University, 285 Stocker Center Ohio University, Athens, OH, 45701, United States of America, cc340609@ohio.edu, Gursel A. Suer

This study discusses a new fuzzy modeling approach for joint manufacturing scheduling and shipment decisions within a supply chain network. The aim of this study is to maximize the total net profit while minimizing the risks caused by selecting alternative transportation modes. Different transportation modes are considered in this study. This study will be unique in the sense of considering an integrated fuzzy approach with manufacturing scheduling and transportation mode selections.

3 - The Parking Time Dilemma and Chinese Postman's Revenue

Nichalin Summerfield, Full Time Lecturer, University of Massachusetts Dartmouth, 285 Old Westport Rd, North Dartmouth, MA, 02747, United States of America, nsummerfield@umassd.edu, Moshe Dror, Morris Cohen

We model an administrative activity of issuing parking tickets in a dense city street grid as a revenue collection Chinese Postman Problem. After demonstrating that our design of inspection routes maximizes the expected revenue we investigate decision rules that allow the officers to adjust online their inspection routes in response to the observed parking permits' times. A simulation study concludes that allowing the officer to selectively wait by parked cars increases the expected revenue.

4 - The Dynamic Pollution-Routing Problem with Time-dependent Travel Time

Wei Zhou, Research Assistant, University of Illinois at Chicago, 892 W Taylor St, Chicago, IL, 60607, United States of America, wzhou27@uic.edu

This paper presents the so-called Dynamic Pollution-Routing Problem, a coupling of Dynamic Vehicle Routing Problem and Pollution-Routing Problem. In urban areas, travel speed and changes drastically during the day because of congestion, thus DPRP treats the travel time functions as step functions. In this paper, mathematical models under dynamic context are presented for the time-dependent DPRP. A mixed integer linear programming approach is developed to solve the problem.

5 - A Branch-and-Price Algorithm for Vehicle Routing with Demand Allocation Considerations

Ahmed Ghoniem, Assistant Professor, Isenberg School of Management, 121 Presidents Dr., University of Massachusetts Amherst, Amherst, MA, 01003, United States of America, aghoniem@isenberg.umass.edu, Mohammad Reihaneh

We develop a branch-and-price algorithm for vehicle routing with demand allocation problems (VRDAP) which arise in food bank operations, the delivery of healthcare services in developing countries, and beyond. The VRDAP selects distribution sites, allocates "customers" to the latter, and optimizes the routes of delivery vehicles. The objective function minimizes a weighted average of the distance traveled by customers to reach distribution sites and that traveled by delivery vehichles.

Contributed Session

Chair: Youssef Boulaksil, Assistant Professor, UAE University, College of Business and Economics, P.O. Box 15551, Al Ain, United Arab Emirates, youssef.boulaksil@gmail.com

1 - Reliable Intermodal Freight Network Expansion: Case with Uncertain Network Disruptions

Fateme Fotuhiardakani, Research Assistant, University of South Carolina, 300 Main st, Columbia, SC, 29208, United States of America, fotuhiar@email.sc.edu, Nathan Huynh

This paper develops a robust model to improve the reliability of an intermodal network to enable it to perform well in normal and disrupted situations. The objective of the model is to identify critical links to "harden", locations to establish new terminals, and existing terminals to expand, within a given budget. We propose a Hybrid Genetic Algorithm (HGA) to solve the model. The experimental results demonstrate the efficacy and computational efficiency of the proposed HGA.

2 - A Stochastic Programming Model for Yard Storage Allocation under Uncertainty

Yue Wu, University of Southampton, School of Management, Southampton, SO17 1BJ, United Kingdom, y.wu@soton.ac.uk

This paper investigates allocation of yard space to containers under uncertainty. Two types of stacks are defined: containers with the same destination are assigned to dedicated stacks in the same block; containers in shared stacks have different destinations. A two-stage stochastic model is developed to determine an optimal storage strategy. The first-stage decision is to allocate containers to dedicated stacks and the second-stage decision is to place additional containers to shared stacks.

3 - Maintenance and Service Logistics Planning in the Maritime Sector: A Research Agenda

Ayse Sena Eruguz, Postdoc, Eindhoven University of Technology, P. O. Box 513, Eindhoven, 5600 MB, Netherlands, a.s.eruguz@tue.nl, Tarkan Tan, Geert-Jan Van Houtum

Maintenance and service logistics support are required to ensure high availability and reliability for maritime assets and represent a significant part of exploitation costs. In this talk, we will present a classification of the maintenance and service logistics literature considering the specific characteristics of the maritime sector. We will discuss unexplored issues and shortcomings of existing models and suggest a research agenda.

4 - Distributing FMCG to Small Retailers in Emerging Markets

Youssef Boulaksil, Assistant Professor, UAE University, College of Business and Economics, P.O. Box 15551, Al Ain, United Arab Emirates, youssef.boulaksil@gmail.com

Distributing fast moving consumer goods to small retailers in emerging markets is a challenging task. The small retailers offer informal credits to their customers, which makes them operate with limited and uncertain availability of cash. Since distributors require payment in cash at the moment of delivery, 'empty deliveries' may result in case of insufficient amount of cash available. We conduct a simulation study to better understand empty deliveries, which reveals interesting insights.

Breaking the Silos in Airline Crew Scheduling

Sponsor: Aviation Applications

Sponsored Session

Chair: Norbert Lingaya, Manager of Optimization Technologies, Ad OPT, a Division of Kronos, 3535 Queen Mary Rd, Suite 650, Montreal, QC, h3v1h8, Canada, nlingaya@Kronos.com

1 - Thinking out of the Box by Breaking the Silos

Norbert Lingaya, Manager of Optimization Technologies, Ad OPT,a Division of Kronos, 3535 Queen Mary Rd, Suite 650, Montreal, QC, h3v1h8, Canada, nlingaya@Kronos.com

"Think outside the box" is a catchphrase that has become somewhat cliché and void. In this talk we focus on "breaking the silos" as one way to think outside the box when applied to optimized Crew Planning. We present a rationale for the opportunity to break some silos, the challenges to be addressed and the expected benefits.

2 - Integrated Crew Paring and Crew Assignment by Dynamic Constraint Aggregation

Mohammed Saddoune, Université Hassan II, Mohammedia, Casablanca, Morocco, mohammed.saddoune@gerad.ca

The crew scheduling problem is commonly decomposed into two stages which are solved sequentially. Crew pairing generates a set of pairings covering all flight legs. Crew assignment generates anonymous blocks covering all pairings. The simultaneous problem generates a set of blocks covering all flight legs. It is a large set covering problem highly degenerated. We solve it with column generation and the dynamic constraint aggregation and save up to 9% on real-life problems.

3 - Simultaneous Optimization of Crew Pairing and Personalized Monthly Schedules

Atoosa Kasirzadeh, Ecole Polytechnique de Montreal & GERAD, 2900 Boulevard Edouard-Montpetit,, Montreal, QC, H3Z 1J9, Canada, Atoosa.Kasirzadeh@gerad.ca, Francois Soumis, Mohammed Saddoune

We present a set-covering formulation and an iterative heuristic algorithm for personalized integrated cockpit pairing and assignment problems. The objective is having as much as possible similar pairings between pilots and co-pilots to increase the schedules robustness, even if pilots and co-pilots monthly schedules are different to satisfy their preferences. We use a solution approach based on column generation and numerical results are provided based on a major US carrier data set.

4 - Integrated Aircraft Routing, Maintenance Planning and Robustness for Operation

Francois Soumis, Ecole Polytechnique, Cp. 6079, Montreal, QC, H3C 3A7, Canada, francois.soumis@gerad.ca, Stephen Maher, a Division of Kronos, 3535 Queen Mary Rd, Suite 650, a Division of Kronos, 3535 Queen Mary Rd, Suite 650, Montreal, QC , h3v1h8, Canada, nlingaya@Kronos.com, Montreal, QC, h3v1h8, Canada, nlingaya@Kronos.com, Guy Desaulniers

It is common to solve the aircraft routing and maintenance planning problems many months in advance but infeasibilities appear due to perturbations in operations. We present a novel approach generating aircraft routes for a single day and ensuring a sufficient number of routes from each city going to maintenance next night. The solution is protected from disruptions by applying a recoverable robustness framework. Tests on large scale problems demonstrate significant reduction in recovery costs.

Manufacturing 2

Contributed Session

Chair: Xi Gu, PhD Candidate, University of Michigan, 1210 H. H. Dow, 2300 Hayward Street, Ann Arbor, MI, 48109, a Division of Kronos, 3535 Queen Mary Rd, Suite 650, Montreal, Q , h3v1h8, Canada, nlingaya@Kronos.com, United States of America, xig@umich.edu

1 - Resilient Design for Manufacturing Systems

Xi Gu, Ph.D. Candidate, University of Michigan, 1210 H. H. Dow, 2300 Hayward Street, Ann Arbor, MI, 48109, United States of America, xig@umich.edu, Jun Ni, Xiaoning Jin

Resilience is regarded as a competitive advantage of manufacturing systems. A resilient system has the ability to quickly recover from faults/failures to normal conditions with no or least performance loss. The objective of this research is to model and analyze the resilience measures of manufacturing systems with unreliable machines and finite buffers. Both the steady-state and transient behavior of such systems is studied, and system design strategies are investigated.

2 - Ergonomic Risk Mapping at the Refrigerator Company

Ilgin Acar, Anadolu University, Faculty of Eng. Dept. of Industrial Eng., Eskisehir, Turkey, ipoyraz@anadolu.edu.tr, Gizem Deniz, Ozlem Urem, Ibrahim Yilmaz

As is known, there could be discomfort in almost every job due to the heavy and repetitive workload. We consider a production line at the refrigerator company that has 110 work stations to assess the ergonomic risk. NISOH, REBA and Lumbar Motion Monitor (LMM) are used to map the ergonomic risk at the work stations. Improvements are offered based on the findings of related methods.

3 - Simultaneous Line Balancing and Worker Allocation in a U-shaped Production Line

Joseph Ekong, Auburn University, 2319 Shelby Center, Auburn, AL, 36849, United States of America, jje0003@auburn.edu

An MIP model for a simultaneous U-shaped assembly line balancing and worker allocation problem is proposed. Tasks are assigned to stations and workers are assigned to the stations resulting in a global solution. The objective is to minimize deviation of operation times of workers. Impact of variability is investigated.

4 - Applying Six Sigma Techniques to Reduce Defect Rate of Deep Drawing Process for Aluminum Products

Theyab Alhwiti, Auburn University, 362 W Glenn Ave APT 104, Auburn, Al, 36830, United States of America, tza0002@auburn.edu, Nader Al Theeb

Sheet metal deep drawing is an important process to produce many products. The goal of this research is to improve this process to reduce the defective percentage rate of scratches, flange wrinkling, and earing defects appear in aluminum deep drawn products from 3% to 0.8% by adopting new mold with an excellent parameter values and control. A design of experiment phase is conducted to find the best factorial level combination of the clearness, holding force, speed, and lubricant parameters.

5 - Comparison of Simulation and Optimization Models to Support Decisions in Semiconductor at Operations

Shihui Jia, Graduate Research Assitant, The University of Texas at Austin, Graduate program in IE/OR, University of Texas at Austin, Austin, TX, 78712, United States of America, sjia@utexas.edu, Jonathan Bard

This talk presents simulation and optimization models to support machine setup and lot dispatching decisions for assembly & test operations in semiconductor manufacturing. The simulation model was built in AutoSched AP and improved by incorporating setup output from the optimization model and customizing the dispatch rules. Experiments were conducted on six datasets and results compared using the following metrics: hot lot shortages, weighted throughput, resource usage, and machine utilization.

Applying Computational Creativity in Service Industries

Sponsor: Service Science

Sponsored Session

Chair: Ying Li, Research Staff Member, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, yingli@us.ibm.com

1 - Computational Creativity for Personalized Artifact Creation

Nan Shao, Research Staff Member, IBM T. J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, nanshao@us.ibm.com, Pavankumar Murali, Anshul Sheopuri

Can a computer create an artifact which is judged to be creative by a targeted group of individuals? We explore data-driven computational creativity for personalized artifact design based on two key attributes, quality and novelty. We present the methodology, comment on the available data sources, and illustrate the concept using an example in the culinary recipe creation.

2 - Intelligent Search Methods for Computational Creativity

Pavankumar Murali, Research Staff Member, IBM T. J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, pavanm@us.ibm.com, Nan Shao, Anshul Sheopuri

Computational creativity for designing artifacts requires searching through a combinatorially complex design space. Traditional methods resort to greedy heuristics to identify and evaluate artifacts for creativity. We present an alternative optimization framework where the evaluation metrics are used to prune the design space subject to theoretical underpinnings. We evaluate the performance of the proposed solution using public datasets on food recipes, cuisines, ingredients and chemistry.

3 - Assessing Aesthetics of Food Dishes using Computational Methods

Ying Li, Research Staff Member, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, yingli@us.ibm.com, Anshul Sheopuri

We propose and implement a novel approach to assess the aesthetics of food dishes. Our framework builds upon work in the area of color science, psychology and statistics to enable users to computationally assess whether the image of a dish is unique and visually appealing with the appropriate texture. Using Google Glass as an innovative way to interact with consumers on this application is also under active investigation, which will bring us a new dimension from wearable computing.

4 - Can Computational Creativity Produce a Commercially Successful Artificial Songwriter?
Dan Ventura, Professor, Brigham Young University, Provo, UT, 84602, United States of America, ventura@cs.byu.edu

Music is a promising domain for studying computational creativity. Music is also a huge industry, and the potential of a computational song-writing system that can produce consumable music is enticing from both a research standpoint and an economic one. We will discuss some of the challenges involved in building such a system and some approaches to their solution, including incorporation of affect, discovery of musical motifs, flexible style composition, and the combination of music with lyrics.

5 - Computational Narrative Intelligence: Opportunities and Challenges for Sense-Making with Data
Mark Riedl, Professor, Georgia Institute of Technology, 85 5th Street NW, Atlanta, GA, 30308, United States of America, riedl@cc.gatech.edu

Narrative intelligence is an entity's ability to organize, explain, and generate experiences in narrative terms. Computational story understanding and generation can be used to automatically seek familiar and novel patterns in data, create human-readable explanations of temporal changes in data, and hypothesize about occurrences in missing data.

6 - An Optimization Model for Determining Assortment of New Product at Store Level for Fashion Retailers
Dingding Lin, IBM Research - China, Building 19A, Dongbeiwang West Rd 8#, Zhongguancun Software Park, Beijing, 100193, China, ddlin@cn.ibm.com, Yongqing Xue, Ganggang Niu, Yue Tong

Store assortment is critical to help achieve retail success. However, due to highly volatile demand, short lifecycle of products, and high ratio of new styles, fast fashion retailers are facing great challenges on store assortment planning. An assortment optimization model for new products is proposed and a planning system based on this model is developed to aid fast fashion retailers in decisions of which new products to stock at store level.

1 - Optimal Dynamic Pricing of Mobile Data Plans in Wireless Communications
Xiaoyu Ma, Tsinghua University, Haidian District, Beijing, China, maxythu@gmail.com, Tianhu Deng

With smartphones sweeping the world, customers use much more data service than voice service nowadays. Because mobile data service occupies much more network capacity than voice, wireless network is frequently congested. We build a dynamic cell phone plan control model where the service provider can decide a subset of plans to open at the beginning of each period. In a case study, we analyze a large mobile service provider in Asia using 10,000 real individual-level data.

2 - Planning and Competition in Information Chain
Boyoun Choi, UCLA Anderson School, 110 Westwood Blvd, Gold Hall, Suite B-512, Los Angeles, CA, 90095, United States of America, bchoi@anderson.ucla.edu, Uday Karmarkar

We examine aspects of information chains, which process and distribute digital content in a way analogous to goods in supply chain. We consider the capacity planning problem for information content, where we decide in each period how many workers to utilize and how many items to process to make them available in the database, which is then available to customers. On competitive side, we investigate optimal release time and pricing of content such as video and model competition among vendors.

3 - Operations Management Practices in Service and Performance
Asma Al Zaidi, Assistant Professor, Sultan Qaboos University, CEPS, PO Box 20 PC123, Alkhoudh, Muscat, 123, Oman, alzidia@squ.edu.om, Zainab Al Balushi

This study proposes a model that conceptualizes the dimensions of operations management practices in managing the service quality. The model also tests the hypothesized relations between the operations management practices and performance. The results have confirmed the conceptualized model and its relations.

4 - Contract for Professional Services
Ting Luo, The University of Texas at Dallas, 7208 Fair Valley Way, Plano, TX, 75024, United States of America, ting.luo@utdallas.edu

Professional service firms turn human capital into specialized service where their clients couldn't but hope to duplicate. When they enter the contract, the client can't verify everything not because of costly observation but the disparity in expertise. The literature assumes the agent reveals true type under IC and IR constraints, but what if the principal can't understand the exact type? A principal and agent model will be presented where the principal is less knowledgeable than the agent.

5 - A Network Economic Model of a Service-Oriented Internet with Choices and Quality Competition
Sara Saberi, Isenberg School of Management, University of Massachusetts, 121 Presidents Drive, Amherst, MA, 01002, United States of America, ssaberi@som.umass.edu, Anna Nagurney, Dong Li, Tilman Wolf

A dynamic network economic model is developed for a service oriented Internet with service differentiation. We utilize variational inequality theory for formulation of Nash equilibrium. The projected dynamical systems provide a continuous-time evolution of service volumes and quality levels. We recall stability analysis results and construct a discrete-time version of the adjustment process that yields an algorithm. The algorithm is utilized to solve several examples with sensitivity analysis.

New Product Development 1

Contributed Session

Chair: Niharika Garud, Postdoctoral Research Fellow, IIM Bangalore, M213 Madhav Nagar, Gwalior, MP, 474002, India, niharika.garud@gmail.com

1 - A Dynamic Model for Trade-off Analysis of New Green Products
Mohammad Reza Gholizadeh Toochaei, Student, Concordia University, 1455 De Maisonneuve Blvd. west, Montreal, QC, H3G 1M8, Canada, gholizadeh.mr@gmail.com, Nadia Bhuiyan

Companies can design their products for the environment based on different strategies. It is imperative for companies to forecast their profit at the design stage through a trade-off analysis in the new product development process. This paper is an attempt to introduce a dynamic model that considers effective factors that impact the total yearly profit based on managers' decisions regarding the level of development when products are designed for resource and energy efficiency or recyclability.

2 - Development of Customer Satisfaction Function Based on Kano's Quality Model
Daisuke Amano, student, Tokyo Metropolitan University, 6-6, Asahigaoka, Hino, 191-0065, Japan, amano_daisuke_1023@yahoo.co.jp, Yasutaka Kainuma

In this study, we suggest the way of determining which quality element by identifying the degree of importance of a product's quality element and identifying the functional relationship by conforming to the Target Planning V-model. In the analysis process, we combined the AHP and the Kano's quality model so that it can be able to grasp the weights of importance and quality model. In the synthesis process, we conduct group decision making passed through consensus building.

3 - New Product Design Evaluation and Flexibility Planning under Technological and Market Uncertainty
Amir Sanayei, Wayne State University, 4815 Fourth St., Detroit, MI, 48202, United States of America, sanayei@wayne.edu, Leslie Monplaisir

Product architecture decisions are one of the most critical decisions that are maid in early stages of the new product development with huge impact on all downstream activities and product success in the market. In this research we propose a frame work to evaluate the new product design in order to incorporate managerial flexibility into NPD projects and decrease technical and market risks, while increasing potential market value.

4 - In-depth Features of the IBM CPLEX Optimization Studio IDE
Frederic Delhoume, Software Engineer, IBM, 9 Rue de Verdun, Gentilly, 94253, France, delhoume@fr.ibm.com

We will present many features that allow IBM CPLEX Optimization Studio IDE users to accelerate their model development. Tips and tricks will be presented, related to editing models, viewing results, debugging and writing custom scripting code, profiling. This presentation will also introduce the Eclipse environment IBM CPLEX Optimization Studio is based on.

1 - Multi-preposition Decisions under Resource Constraints

José Gonçalves, U. of Porto, Rua Dr. Farias, s/n, Porto, Portugal, jfgoncal@fep.up.pt, Jarrod Goentzel, Jaime Andrés Acevedo Casta-eda

The subject of this study is a Newsstand (multi-item Newsvendor) setting under resource constraints in the context of preposition decisions. The authors explore how individuals react to different resource levels when they preposition multiple emergency supplies that differ in their cost levels, assessing thus how constrained resources affect preposition decisions.

2 - Supply Chain Optimization of the Distribution of Mosquito Nets in Ivory Coast

Paulo Gonçalves, University of Lugano, Via Giuseppe Buffi 13, Lugano TI 6900, Switzerland

The use of insecticide-treated mosquito nets is one of the most effective ways to reduce malaria deaths. To help plan UNICEF's distribution of 12 million bed-nets in Ivory Coast, we developed a model to optimize the costs from purchasing and prepositioning at Districts level, achieving 7% logistics cost reduction.

Next Generation Decision Support for the Next Pandemic

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Samuel V Scarpino, Omidyar Fellow, Santa Fe Insitute, 1399 Hyde Park Road, Santa Fe, NM, 87501, United States of America, scarpino@santafe.edu

1 - Detecting Epidemics using Wikipedia Article Views using Language as a Proxy for Location

Geoffrey Fairchild, Los Alamos National Laboratory, P.O. Box 1663, Mailstop P939, Los Alamos, NM, 87545, United States of America, gfairchild@lanl.gov, Sara Del Valle, Reid Priedhorsky, Nicholas Generous, Alina Deshpande

We propose an open data source previously unexplored for infectious disease surveillance: Wikipedia access logs. We demonstrate that these data feasibly support an approach that overcomes challenges traditional systems face. Specifically, our proof-of-concept yields models with r^2 up to 0.92, forecasting value up to the 28 days tested, and several pairs of models similar enough to suggest that transferring models from one location to another without re-training is feasible.

2 - An Integrative Surveillance System for Influenza-associated Hospitalizations in at Risk Populations

Samuel V Scarpino, Omidyar Fellow, Santa Fe Insitute, 1399 Hyde Park Road, Santa Fe, NM, 87501, United States of America, scarpino@santafe.edu, James Scott, Rosalind Eggo, Lauren Meyers, Nedialko Dimitrov

Influenza hospitalizations are positively associated local measures of poverty. We developed a framework for combining multiple data sources to predict influenza outbreaks in at-risk populations. The data sources considered were: emergency department visits, primary healthcare providers, and Google Flu Trends. We demonstrate that out-of-sample performance was lowest in the most at-risk zip codes, which highlights the importance of understanding the dynamics of influenza in these populations.

3 - Optimizing Vaccine Allocations for Pandemic Influenza

Bismark Singh, The University of Texas at Austin, 204 E. Dean Keeton St., Austin, TX, 78712-0292, United States of America, bismark.singh@utexas.edu, Hsin-Chan Huang, David Morton, Lauren Meyers

We develop a decision-support tool to optimize vaccine allocations during an influenza pandemic. Our allocation is proportionally fair for user-specified target populations, and we further analyze a weighted proportionally fair allocation. Using 2009 H1N1 data in the state of Texas, we show how the Texas Department of State Health Services can reserve a small percentage of doses and achieve fair coverage, while most vaccines are allocated based on healthcare provider requests.

4 - Epidemiological Consequences of An Ineffective Bordetella Pertussis Vaccine and an Option for Reducing Rising Whooping Cough Incidence

Ben Althouse, Santa Fe Institute, Santa Fe, NM, United States of America, althouse@santafe.edu, Haedi DeAngelis, Samuel V Scarpino

The recent increase in Bordetella pertussis incidence (whooping cough) presents a challenge to global health. Recent studies have called into question the effectiveness of acellular pertussis vaccination in reducing transmission. Here we examine the epidemiological consequences of an ineffective pertussis vaccine and present a cost-benefit analysis of an alternative scenario – priming individuals with one dose of the older, side effect-prone whole-cell vaccine. Using dynamic transmission models, we find that: 1) an ineffective vaccine can account for the observed increase in pertussis incidence; 2) asymptomatic infections can bias surveillance and upset situational awareness of pertussis, including obfuscating assessment of the population-level effectiveness of vaccination programs; 3) vaccinating individuals in close contact with infants too young to receive vaccine (so called "cocooning" unvaccinated children) may be ineffective; and 4) priming individuals with a single dose of whole-cell vaccine can reduce overall pertussis morbidity and may provide up to a 10-fold reduction in societal costs of pertussis infection. Our results have important implications for pertussis vaccination policy and present a complicated scenario for achieving herd immunity and pertussis eradication.

Information Systems 4

Contributed Session

Chair: Wael Jabr, Assistant Professor, University of Calgary, 2500 University Dr NW, Calgary, AB, T2N1N4, Canada, wjabr@ucalgary.ca

1 - Firm Transition into Hybrid Systems as a Function of Exploration and Exploitation

Sukruth Suresh, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, 12180, United States of America, suress@rpi.edu

IT firm offerings have transitioned from only products or services to one of a hybrid model encompassing both. This is attained by organic growth, by acquisitions or through alliances with firms that have strong service or product backgrounds. While organic growth can be seen as exploitative in nature, acquisitions or alliances are explorative. We posit that the attributes of industry concentration and firm prestige moderate the mode in which firms choose between exploration and exploitation.

2 - Hand Anthropometry: A Missing Construct in Technology Acceptance Model

Pei-Lee Teh, Senior Lecturer, Monash University, Jalan Lagoon Selatan, Bandar Sunway, Selangor, 46150, Malaysia, teh.pei.lee@monash.edu, Soon-Nyean Cheong, Emily Yim Lee Au, Wen-Jiun Yap, Pervaiz K. Ahmed, Ravindra S. Goonetilleke

Technology Acceptance Model (TAM) is regarded as a robust theoretical model for predicting technology usage. Given that more technologies are operated by gesture-based Interface, it is surprising that no study of the hand anthropometry effects on TAM has been conducted. This study examines how hand anthropometry influences user technology acceptance.

3 - Theorizing Information Systems as Technology: Might it be Fruitful?

E. Burton Swanson, Research Professor, UCLA Anderson School, 110 Westwood Plaza, Ste. D502, Los Angeles, CA, 90095, United States of America, burt.swanson@anderson.ucla.edu

Information systems scholars have struggled with the field's fundamental relationship to technology. They have debated whether the IT artifact is unwisely taken for granted and whether it lies at the field's core. Here, applying Arthur's general theory of technology,it is suggested that IS may itself be theorized as technology, opening up new avenues for research, where the unit of analysis is the technology itself and the focus is its evolution.

4 - Research on Construction & Techniques of Social Manufacturing-driven Personalized Enterprise Space

Zhen Zhao, Arizona State University, 2343 W main St, Apt 1048, Mesa, AZ, 85201, United States of America, reebokalone2001@gmail.com, Pingyu Jiang, Mei Zheng

The paper proposed personalized enterprise space (PES) which is the basic node of social manufacturing network (SMN) by 1.establishing framework of PES to illustrate its configuration and operation method; 2.discussing four key enabling technologies in detail, including role-based access control model, manufacturing capability assessment, context-based information recommendation, order generation & tracking; 3.developing a prototype platform to verify the feasibility and practicability.

Big Data 3

Contributed Session

Chair: Samik Raychaudhuri, 24/7 Customer Pvt. Ltd., EGL Business Park, Off Intermediate Ring Road, Bangalore, 560071, India, samikr@gmail.com

1 - Design of Palatable Credit Scorecards as a Highly Automated Analytic Service

Gerald Fahner, FICO, 181 Metro Drive, San Jose, United States of America, ehershman@iqprinc.com

Lenders require accurate and interpretable credit scoring models. Scorecards fulfill these needs. Designing such models has remained a laborious data-guided task. With new data sources abounding and environments changing fast, lenders would like to design, update and test models, predictors and segmentation schemes frequently, objectively and cost-effectively. We propose designing scorecards as an automated analytic service.

2 - using Predictive Analytics for Customer Intent Mining

Samik Raychaudhuri, 24/7 Customer Pvt. Ltd., EGL Business Park, Off Intermediate Ring Road, Bangalore, 560071, India, samikr@gmail.com, Ravi Vijayaraghavan

In this presentation, we discuss about an emerging and niche area of application of predictive analytics with big data, known as customer intent mining. We serve millions of end customers through various channels on behalf of our clients. We provide an intuitive experience when the customers contact us by leveraging the rich interaction data that we come across through various customer touchpoints, and predicting intent in real time using machine learning models on big data.

3 - Intelligent Data Management through the Data Burst (Best Practices)

Hussain Alajmi, Team Leader, Kuwait Oil Company, Poboc 9758, Ahmadi, 61008, Kuwait, hussain@kockw.com

In KOC we achieved the better data management through different projects to overcome the data burst, which represents the main challenge in the decision making process. Our solution started with the conformance analysis to have a detailed numerical description and statistics of different data issues. The workflows nature depend on the nature of data itself and the issue.

Health Care Modeling Optimization VII

Contributed Session

Chair: Steven Cohen, AHRQ, 540 Gaither Road, Rockville, MD, 20850, United States of America, steven.cohen@ahrq.hhs.gov

1 - The Impact of Misclassification and Nonresponse Errors when Oversampling Dynamic Populations

Steven Cohen, AHRQ, 540 Gaither Road, Rockville, MD, 20850, United States of America, steven.cohen@ahrq.hhs.gov

Achieving sample size targets for population subgroups that are dynamic in nature is a difficult enterprise.Attention is given to the utility of a model-based approach to oversample dynamic populations.Model performance is evaluated in terms of predictive capacity, sensitivity and specificity, assessing levels of misclassification errors inherent in alternative model specifications and its impact on precision targets and survey cost.

2 - Using Simulation to Advocate Process Improvement at a Clinical Lab

Yang Sun, Sacramento State College of Business, 6000 J St, Sacramento, United States of America, suny@csus.edu

Clinical lab testing is central to many healthcare processes. As this industry is experiencing rapid demand growth, job arrivals have reached such a high level at a large clinical lab in a southwestern state that it simply cannot process them in a timely and efficient manner. In order to gain management support on a heuristics-based process remodeling solution, simulation is used as an advocating tool to demonstrate potential benefits of the renovated design of the specimen area of the lab.

3 - Mixed Integer Programming Approaches for Two-Step Multiple Provider Practices

Hari Balasubramanian, University of Massachusetts Amherst, 160 Governors Drive Amherst MA 01003, Amherst, MA, 01002, United States of America, hbalasub@admin.umass.edu, Hyun-Jung Oh, Ana Muriel

We propose mathematical programming formulations for scheduling patient appointments in primary care with nurse and provider steps, stochastic service times at both steps, and flexibility in the nursing step.

4 - Managing Bouncebacks to a Cardiac Intensive Care Unit

Yazan F. Roumani, Assistant Professor, Oakland University, 342 Elliot Hall, Rochester, MI, 48309, United States of America, roumani@oakland.edu, Yaman Roumani, Luis Vargas

Bounce backs increase the complexity of managing ICUs. We propose a strategy to reduce the probability of bouncing back by setting a minimum required initial length of stay for patients visiting a cardiac ICU. We find no statistically significant increase in means of: time spent in hospital, immediate upstream unit and all upstream units of the intensive care unit after implementing the proposed strategy.

5 - A Novel Approach for Vascular Sounds of Arteriovenous Fistulas and Vascular Stenoses

Wheyming Song, Professor, National Tsing Hua University, 101, Sec. 2, Kuang-Fu Rd., Hsinchu, 30013, Taiwan - ROC, wheyming_song@yahoo.com

This research focuses on increasing the sensitivity and specificity of existing approaches on analyzing vascular Sounds of arteriovenous fistulas and vascular stenosis. The proposed approach is based on a series of scientific procedures, including (1) design of analysis (2) independent component analysis. Results show that the sensitivity and specificity of the proposed approach are all above 99% and 98%, respectively.

Inverse Planning for Cancer Treatment

Sponsor: Health Applications

Sponsored Session

Chair: Dionne Aleman, Associate Professor, University of Toronto, 5 King's College Road, Toronto, ON, M5S3G8, Canada, aleman@mie.utoronto.ca

1 - Pareto Robust Optimality in Breast Cancer Radiation Therapy Treatment

Houra Mahmoudzadeh, University of Toronto, 5 King's College Road, Toronto, ON, M5S3G8, Canada, houra@mie.utoronto.ca, Thomas G. Purdie, Timothy C. Y. Chan

We quantify the benefit of applying the concept of Pareto robust optimality to radiation therapy treatment planning of breast cancer where the uncertainty is in the patient's breathing. Pareto robust optimal solutions have the same performance as robust optimal solutions under worst-case, but may perform better under non-worst case scenarios. We apply this method for different patients and compare the results with those of robust optimization and current clinical treatment methods.

2 - Mixed-integer Methods for Radiation Therapy with Continuous Beams

Kimia Ghobadi, University of Toronto, 5 King's College Road, Toronto, ON, M5S3G8, Canada, kimia@mie.utoronto.ca, Dionne Aleman, David Jaffray

We explore exact and heuristic methods in modelling treatment planning for Gamma Knife Perfexion, where the radiation is delivered with a continuous beam instead of conventional discrete beams. We explore artificial intelligent path finding methods, and formulate mixed-integer models to find beam times for the selected path. We discuss challenges and advantages of our proposed method and explore practicality of implementing it on conventional radiation units.

3 - Inverse Planning for Focal Ablation in Liver Cancer Treatment

Shefali Kulkarni-Thaker, Graduate Student, University of Toronto, 5 King's College Road, Toronto, ON, M5S3G8, Canada, shefali@mie.utoronto.ca, Aaron Fenster, Dionne Aleman

In focal ablation, current is passed through a needle inserted into a tumor to generate heat, killing the tumor. We develop a mathematical framework to design optimal ablation treatments. First, we obtain the needle position and orientation using optimization and geometric approximations. Next, we solve a thermal dose optimization (TDO) to obtain the treatment time for adequate thermal dose delivery. We also propose an approximation for TDO to obtain a lower bound on the treatment time.

Hilton- Union Sq 21

Supply Chain Management II

Contributed Session

Chair: Kai Hoberg, Kühne Logistics University, Grofler Grasbrook 17, Hamburg, 20457, Germany, kai.hoberg@the-klu.org

1 - What Drives Supplier Selection Decisions? A Firm-Level Investigation in the Automotive Industry

Kai Hoberg, Kühne Logistics University, Grofler Grasbrook 17, Hamburg, 20457, Germany, kai.hoberg@the-klu.org, Florian Badorf, Felix Papier

We empirically analyze the relationship between firm-level factors such as relationship strengths, market share, and financial stability and the probability that a supplier is selected for a sourcing project. We use empirical data from the automotive industry with more than 60,000 supplier selection decisions. We develop a regression model, test its robustness, and analyze it in different industry contexts. Furthermore, we present a prediction model for supplier selections with high accuracy.

2 - Selecting Suppliers

Serhat Yilmaz, Graduate Student, Texas State University, 902 Sagewood Trl., San Marcos, TX, 78666, United States of America, s_y29@txstate.edu

One of the most important issue that supply chain manager faces is selecting the right suppliers. This project presents the important effect of supply selection on the supply as a whole. It also presents the supplier selection criteria by reviewing and analyzing the qualitative criteria.

3 - Supply Chain Coordination under Moral Hazard

Taesu Cheong, Assistant Professor, National University of Singapore, 1 Engineering Drive 2, Blk E1A #06-25, Singapore, Singapore, taesu.cheong@outlook.com, Sang Hwa Song

We address moral hazard issues in supply chain contract. It has been discussed that risk sharing among supply chain players through contracts such as buyback contract can help coordinating a supply chain. However, we present a negative example of buyback contract in practice due to moral hazard stemming from incentive conflicts among participants in a supply chain and further discuss how well it could be possibly managed and coordinated by the base stock policy under the moral hazard problem.

4 - Optimal Procurement Strategies for Contractual Assembly System with Fluctuant Procurement Price

Yi Yang, Associate Professor, Zhejiang University, School of Management, Hangzhou, China, yangyicuhk@gmail.com

We consider a multi-component assembly system in which the assembler produces a final product in order to satisfy the one-time demand at a future time. Components can be purchased from outside suppliers with positive leadtimes under either time-inflexible or time-flexible contracts. One of the components faces an uncertainty in its procurement price.The assembler needs to determine how much to purchase and when to purchase each component. We characterize the optimal procurement strategies.

5 - Coordinating a Supply Chain when Consumers Strategically Wait for Sales

Tian Li, East China University of Science and Technology, School of Business, Shanghai, 200237, China, litian@ust.hk, Man Yu

A supply chain consists of a manufacturer and a newsvendor retailer selling a seasonal product to strategic consumers. A simple buyback contract is shown to coordinate the chain, where the aggregate demand is both price-dependent and quantity-dependent. Nevertheless, the set of coordinating buyback contractual terms shrinks as consumers are more willing to wait. The retailer gains from strategic waiting in a coordinated chain.

System Dynamics in Health II

Sponsor: Health Applications

Sponsored Session

Chair: Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu

1 - How Will Mandated Medicare Payment Rate Reductions Affect Hospitals and Patients to 2050?

Jack Homer, Homer Consulting & MIT, 72 Station Hill Road, Barrytown, NY, 12507, United States of America, jhomer@comcast.net, Liming Cai, Gary Hirsch

The Affordable Care Act mandates permanent Medicare payment growth rate reductions to non-physician providers. Medicare's Office of the Actuary initially calculated that these reductions could cause most such providers to become unprofitable by 2040, likely leading to hospital closures and adverse impacts for patients. But this calculation was simplified and ignored several dynamic factors. OACT is using system dynamics modeling to study these factors and develop more nuanced projections.

2 - A Model of Human Growth and Body Weight Dynamics

Hazhir Rahmandad, Associate Professor, Virginia Tech / MIT, MIT Sloan School of Management, Cambridge, MA, 02139, United States of America, hazhir@vt.edu

Quantifying human weight and height dynamics due to growth, aging, and energy balance can inform clinical practice and policy analysis. I present a simulation model of dynamics of body weight, composition and height. The model replicates key trends in human growth including A) Changes in energy requirements from birth to old ages. B) Short and long-term dynamics of body weight and composition. C) Stunted growth with chronic malnutrition and potential for catch up growth.

3 - A System Dynamics Approach to Predict the Overall Impact of Interventions to Improve CKD Care

Hyojung Kang, PhD Candidate, Penn State University, 940 Stratford Ct., State College, PA, 16801, United States of America, hqk5116@psu.edu, Harriet Nembhard

Chronic kidney disease (CKD) is a growing health problem in the U.S. Patients with CKD have had critical care gaps that have perhaps led to a more rapid progression of CKD toward end stage renal disease (ESRD). In response to the need to improve CKD outcomes, we have conducted an interdisciplinary study. Using a system dynamics approach, this research aims to develop a platform for prospective planning of interventions that help slow and prevent the disease progression to ESRD.

4 - Exploring Task-shifting in Primary Care: The Case of the University of Utah Community Clinics

Andrada Tomoaia-Cotisel, PhD Candidate, London School of Hygiene & Tropical Medicine, 15-17 Tavistock Place, London, WC1H 9SH, United Kingdom, andradat@lshtm.ac.uk, Jaewhan Kim, Bernd Rechel, Michael Magill, Karl Blanchet, Jenny Neuburger, Martin McKee, Andy Haines, Samuel Allen, Debra Scammon, Timothy Farrell, Julie Day, Zaid Chalabi

A key element of the patient centered medical home lies in expanding the Medical Assistant role, or task-shifting. System dynamics was used to uncover the causal mechanisms and leverage points resulting in observed tensions and mixed outcomes at an academic medical center. Variation in physicians' estimation of time delays in team learning is hypothesized to drive variations in implementation and patient health. This research is informing management's revised implementation plan.

The Interface between Information Systems and Operations Management

Sponsor: Information Systems

Sponsored Session

Chair: Oliver Yao, Associate Professor, Lehigh University, 621 Taylor Street, Bethlehem, 18015, United States of America, yuy3@lehigh.edu

1 - Influence of Organizational Design for Enacting IT Complementarities
Kailing Deng, University of Arkansas, WCOB217D, Information System Department, Sam M. Walton College of Business,, Fayetteville, United States of America, Kdeng@walton.uark.edu, Pankaj Setia

This study unravels how organizational design influences enactment of complementarities for capability-building. Due to different micro-level interactions, organizational designs influence match between the use of information technologies and business initiatives. Authors build a computational model that uses survey data to show enactment of complementarities for building demand management capabilities.

2 - Does Logistics Matter in E-commerce? An Empirical Study of the Last Mile Problem
Jifeng Luo, Associate Professor, Shanghai Jiao Tong University, Fahuazhen RD. 535, Shanghai, China, luojf@sjtu.edu.cn, Huan Zheng, Ying Rong

Leading e-commerce companies are rapidly expanding their logistics networks to deliver items faster and more reliably. This improved logistics quality drives customers to share their positive experiences online. Using a dataset from China's largest e-marketplace platform, we empirically explore the role of logistics services and their effects on online consumer purchasing behaviors. We find that consumers do consider both delivery time and WOM about logistics performance.

From Deadline to Reciprocity: Assorted Topics in Behavioral Operations

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Kay-Yut Chen, University of Texas at Arlington, Arlington, TX, United States of America, kychen@uta.edu

1 - Is a Newsvendor More Bounded Rational Making Two Decisions Instead of One?
Kay-Yut Chen, University of Texas at Arlington, Arlington, TX, United States of America, kychen@uta.edu, Shan Li

The behavior newsvendor literature focuses on scenarios of a single (but repeated) decision. We conduct an experimental study with newsvendor making two unrelated (managing independent stores) and related (via transshipment) decisions simultaneously. We found non-trivial correlations between decisions across stores, and constructed a behavioral/learning model to explain the findings.

2 - Optimizing a Reciprocal Workforce
Cipriano Santos, Deep Analytics Architect, Hewlett-Packard, 3000 Hanover St, Palo Alto, CA, 94304, United States of America, cipriano.santos@hp.com, Alex Zhang, Kay-Yut Chen, Claudia Marquez, Haitao Li

We study a workforce planning problem in which employees reciprocate to higher wages by increasing productivity; we incorporate reciprocity in the form of a productivity response function which is nonlinear. Our problem is to decide on the wage levels and the workforce capacities to minimize the total cost.

3 - Power and Fairness
Diana Wu, University of Kansas, United States of America, dianawu@ku.edu, Tony Cui, Paola Mallucci

Understanding what is "fair" is central to research on fairness. While different theories have been proposed to explain how decision makers evaluate the fairness of an outcome, one important characteristic of social interaction, power, is missing from the picture. In this research, we offer laboratory evidence that power has significant impact on perceptions of fairness.

4 - An Experimental Comparison of Reserve Price Auctions and Auctions with Renegotiation
Lijia Tan, Xiamen University, Wang Yanan Institute for Studies, D109, Economics Building, Xiamen, 361005, China, ljtan.wise@gmail.com, Jason Shachat

We conduct an experimental comparison of auctioneer behavior in reserve price auctions and post-auction decisions to engage the auction winner in ultimatum game bargaining. Both auctions forms, when used optimally, implement the Myerson optimal mechanism. However, subjects fail to act optimally for different behavioral reasons in the two formats as the number of bidders change. We show examples of how this leads to economically significant performance differences in varying costs environments.

Advances in Mixed-integer Programming Theory

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Dan Steffy, Oakland University, Dept. of Mathematics and Statistics, 2200 N. Squirrel Road., Rochester, MI, 48309, United States of America, steffy@oakland.edu

1 - Optimality Certificates and Sensitivity Analysis for Mixed Integer Programming Problems
Babak Moazzez, Carleton University, 1125 Colonel By Drive, Ottawa, ON, K1S 5B6, Canada, bmoazzez@math.carleton.ca

After solving a mixed integer program, a certificate can be used the check the optimality of the solution at hand. We present generalized subadditive generator functions which can be used as certificates of optimality and also as a tool for sensitivity analysis for MILPs. These are subadditive dual feasible functions with desirable properties. The certificates generated are much easier to check compared with the time needed to solve the optimization problem.

2 - On the Intersection of Two Mixing Sets with a Cardinality Constraint

Kevin Ryan, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States of America, kevin.ryan30@gmail.com, Shabbir Ahmed, Santanu Dey

Mixing sets with cardinality constraints are frequently encountered in integer programming reformulations of chance constrained optimization problems. We study an extended formulation for the polyhedron defined by the intersection of two mixing sets with a cardinality constraint.

3 - On the Complexity of Inverse Optimization Problems

Ted Ralphs, Lehigh University, 200 W Packer Avenue, Bethlehem, PA, 18015, United States of America, ted@lehigh.edu

Inverse optimization is the problem of determining the unknown values of certain problem parameters that are closest to given estimates and will make a given solution optimum. We show that the inverse mixed integer linear optimization problems (MILP) with unknown objective function is coNP-complete. Moreover, we generalize this result to the higher level optimization problems. We also propose a cutting plane algorithm for solving inverse MILPs for practical purposes.

4 - The L-Shape Search Method for Triobjective Integer Programming

Martin Savelsbergh, Professor, University of Newcastle, Callaghan, Newcastle, NSW2308, Australia, martin.savelsbergh@newcastle.edu.au, Hadi Charkhgard, Natashia Boland

We present a new criterion space search method, the L-shape search method, for finding all nondominated points of a triobjective integer program. The method is easy to implement, and is more efficient than existing methods. Moreover, it is intrinsically well-suited for producing high quality approximate nondominated frontiers early in the search process. An extensive computational study demonstrates its efficacy.

Monte Carlo Simulation-Based Methods for Stochastic Programming

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Güzin Bayraksan, Associate Professor, Ohio State University, 1971 Neil Ave., Columbus, OH, 43210, United States of America, bayraksan.1@osu.edu

1 - Mitigating Uncertainty via Compromise Decisions in Two-stage Stochastic Linear Programming

Yifan Liu, University of Southern California, University Park Campus, GER 240, Los Angeles, CA, 90089, United States of America, yifanl@usc.edu, Suvrajeet Sen

Stochastic Programming (SP) has long been considered as a well-justified yet computationally challenging paradigm for practical applications. For a class of two stage stochastic linear programming, we present exciting computational results with Stochastic Decomposition (SD). A new solution concept which we refer to as the compromise decision is introduced.

2 - Bias and Variance Reduction when Estimating the Optimal Value of Stochastic Programs

Burak Buke, The University of Edinburgh, School of Mathematics, JCMB King's Buildings, Edinburgh, EH9 3JZ, United Kingdom, b.buke@ed.ac.uk, Lukasz Szpruch

Monte Carlo methods are used extensively for assessing the solution quality in stochastic programs. It is known that the using sample average approximations provide us with a biased estimator of the optimal objective value. In this work, we suggest a Monte Carlo method, which relies on estimating the objective value as a telescopic sum, and discuss how it helps us reduce the bias and variance in an efficient manner.

3 - Variance Reduction Techniques for Non-Sequential and Sequential Sampling in Stochastic Programming

Rebecca Stockbridge, Assistant Professor - Research, Wayne State University, 656 W. Kirby, Detroit, MI, 48202, United States of America, rstockbridge@math.wayne.edu, Güzin Bayraksan

We apply variance reduction techniques, specifically antithetic variates and Latin hypercube sampling, to optimality gap estimators used in standalone procedures as well as sequential sampling algorithms. We discuss both theoretical and computational results on a range of test problems.

4 - Scenario Aggregation Regions for Portfolio Selection with Tail Risk Measures

Jamie Fairbrother, PhD Student, STOR-i CDT, Fylde College, Lancaster University, Lancaster, LA1 4YF, United Kingdom, j.fairbrother@lancaster.ac.uk, Stein W. Wallace

Tail risk measures, such as the conditional Value-at-Risk, are used in stochastic programming to mitigate or reduce the probability of large losses. A key observation about these is that they don't depend on the main body of the loss distribution. A ramification of this is that for scenario-based optimization problems, outcomes never incurring large losses can be aggregated, thus reducing the computational cost of their solution. We demonstrate this principle for a class of portfolio problems.

Optimization, Robust 3

Contributed Session

Chair: Giovanni Paolo Crespi, Associate Professor, University of Valle d'Aosta, Loc. Grand Chemin 73/75, Saint Christophe, 11020, Italy, g.crespi@univda.it

1 - Quasiconvexity of Set-valued Maps Assures Well-posedness of Robust Vector Optimization

Giovanni Paolo Crespi, Associate Professor, University of Valle d'Aosta, Loc. Grand Chemin 73/75, Saint Christophe, 11020, Italy, g.crespi@univda.it, Matteo Rocca, Daishi Kuroiwa

We formulate robust and the optimistic counterparts of an uncertain non-linear vector optimization problem as set optimization problems, to study well-posedness of both. We apply the embedding technique for set optimization developed by Kuroiwa and Nuriya (2006). To prove our main results we study the notion of quasiconvexity for set-valued maps. We provide a general scheme to define the notion of level sets and we study the relations among different subsequent definitions of quasi-convexity.

2 - Robust Integrated Scheduling of Crane Handling and Truck Transportation in Container Terminals

Narges Kaveshgar, PhD Candidate, University of South Carolina, 300 Main Street, Room C110, Columbia, SC, 29208, United States of America, kaveshga@email.sc.edu, Nathan Huynh

To lower the vessel turn time, the operations of quay cranes, yard cranes and yard trucks need to be coordinated. Most of the studies have optimized these operations individually and have assumed that they have deterministic task processing times. This study develops and solves a robust model that jointly schedules operations while considering non-deterministic processing times and other operational constraints such as tasks precedence relationship, blocking and quay crane interference.

3 - Robust Optimization of Gas Production with Pressure and Routing Constraints

Pelin Cay, Lehigh University, 200 W Packer Ave., Bethlehem, PA, United States of America, pec212@lehigh.edu, Luis Zuluaga, Robert Storer

We consider the problem of optimizing the production of a gas with pressure and routing constraints. In general, this problem can be formulated as a non-linear integer programming problem. We propose a methodology to obtain solutions that avoids drastic changes in production levels in response to forecasted changes in demand and/or production costs. We illustrate our results with relevant numerical experiments.

4 - Two-Stage Robust Optimization and Stochastic Programming: Drawing Parallels and Distinctions

Aldis Jakubovskis, University of Missouri - St. Louis, 229 Express Scripts Hall, One University Boulevard, St. Louis, MO, 63121, United States of America, jakubovskisa@missouri.edu, Haitao Li

A direct comparison of robust optimization (RO) to stochastic programming (SP) is not always a convenient task, as SP and RO rely on two distinct interpretations of uncertainty. A two-stage facility location and capacity planning model with random demands is used to compare RO and SP on four criteria: the type of probability distribution, the ratio of the robust interval in RO and a variability measure in SP, the magnitude of the penalty costs in SP, and the effect of correlated demands.

5 - Price Uncertainty and Robust Planning of Oil Refineries

Jens Bengtsson, Associate Professor, NMBU School of Economics and Business, P.O. Box 5003, Aas, 1432, Norway, jens.bengtsson@nmbu.no, Patrik Flisberg, Mikael R^nnqvist

Several studies indicate relationships between changes in product prices and crude oil prices and vice versa. It is of interest to analyze how these relationships can be formulated in terms of uncertainty constraints used in robust optimization. From there it is also of interest to analyze how different uncertainty constraints will affect the planning of an oil refinery supply chain, risk exposures and the cost of robustness.

Network Optimization and Its Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Tachun Lin, Assistant Professor, Bradley University, 1501 W Bradley Ave, Peoria, IL, 61625, United States of America, djlin@bradley.edu

1 - Bus Bridging Design for Public Transportation Incident and Event Response

Zhili Zhou, Research Staff Member, IBM Research Collaboratory Singapore, Singapore, Singapore, zhili@sg.ibm.com

The subway system serves as the main component of public transportation system. In this study, bus bridging routes are designed for express buses serving for subway incident/event impacted original-destination (OD) demands. Stochastic models are built to handle uncertain OD demands and uncertain travel time. Column generation based algorithm and pre-processing algorithms are proposed for routing generation and computational complexity reduction. Real Incident scenarios are tested.

2 - Minimum-Cost Lambda-Edge-Connected k-Subgraph Problem

Elham Sadeghi, Graduate Research Assistant, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, sadeghi@email.arizona.edu, Neng Fan

We propose exact algorithms based on integer programming formulations to solve the minimum-cost lambda-edge-connected k-subgraph problem, or the (k,lambda)- subgraph problem. This problem is to find a minimum-cost lambda-edge-connected subgraph with at least k vertices. Numerical experiments are performed on randomly generated graphs.

3 - Robustness of Layered Networks against Failure Probabilities

Tachun Lin, Assistant Professor, Bradley University, 1501 W Bradley Ave, Peoria, IL, 61625, United States of America, djlin@bradley.edu

We study the design of layered networks, where the upper-layer network maintains its connectivity against single and multiple lower-layer network failures with various failure probabilities. We propose integer programming formulations with the objective of guaranteeing the network connectivity with a given probability.

Optimization, Integer 2

Contributed Session

Chair: Todd Easton, Associate Professor, Kansas State University, 2037 Durland Hall, Manhattan, KS, 66506, United States of America, teaston@ksu.edu

1 - Facets of the Latin Square Polytope

Dimitrios Magos, Professor, Technological Educational Institute of Athens, Ag. Spyridonos Str., Egaleo, 12210, Greece, dmagos@teiath.gr, Ioannis Mourtos

A Latin Square is an n by n matrix where in each row and column every number between 1 and n appears exactly once. Latin squares are pertinent to planar assignment structures. In the current work, we study the facial structure of the polytope associated with Latin Squares. We present families of facet-defining inequalities induced by odd holes of the related column intersection graph. We also report computational experience of odd-hole inequalities when used as cutting planes.

2 - The Existence and Usefulness of Equality Cuts in the Multidemand Multidimensional Knapsack Problem

Todd Easton, Associate Professor, Kansas State University, 2037 Durland Hall, Manhattan, ks, 66506, United States of America, teaston@ksu.edu, Levi Delissa

Valid equality cuts for integer programs are described. Equality cuts decrease the dimension of a linear relaxation space by at least one. Applying the idea of equality cuts to the multidemand multidimensional knapsack problem results in a new class of cutting planes named anticover cover equality (ACE) cuts. ACE cuts can be extended to an infeasibility condition. The cuts are implemented in a branch and cut scenario, which resulted in an 11% improvement to some benchmark instances.

3 - Modeling General Integer Programming Problems using XQX

Vijay Ramalingam, Ph.D. Student, University of Mississippi, School of Business, University, MS, 38677, United States of America, vramalingam@bus.olemiss.edu, Haibo Wang, Bahram Alidaee

We propose a xQx based modeling for general integer programming problems where the constraints could be inequality, equality, or a combination of the both. We present the detailed derivation of our general xQx model and the implementation procedures. We apply our model and solution procedures to multi-dimensional knapsack problems and present results from solving instances of various sizes.

Optimization, Nonlinear 1

Contributed Session

Chair: Juliane Mueller, Cornell University, CEE, 220 Hollister Hall, Ithaca, NY, 14853-3501, United States of America, juliane.mueller2901@gmail.com

1 - A Filter-filled Function Method for Nonlinear Global Optimization

Wei Wang, Professor, East China University of Science and Technology, No.130, Meilong Road, Shanghai, China, wangwei@ecust.edu.cn, Xiaoshan Zhang

This work presents a filled function method based on the filter technique for global optimizations. Filled function method is one of effective methods for nonlinear global optimization. Filter technique is usually applied to local optimization methods for its excellent numerical results. In order to optimize the filled function method, the filter method is employed for global optimization. A new filled function is proposed in this manuscript, and the algorithm and its properties are proved.

2 - The Dynamic Lot-sizing Problem with Convex Economic Production Cost

Ramez Kian, Bilkent University, Department of Industrial Engineering, Central Campus, Ankara, 06800, Turkey, ramezk@bilkent.edu.tr, Emre Berk, Ulku Gurler

In this work the deterministic uncapacitated dynamic lot-sizing problem is considered with convex production costs. We formulate the problem as a mixed integer, non-linear programming problem and obtain structural results which are used to construct a forward polynomial time DP algorithm. Additionally, six heuristics with numerical study are provided.

3 - Surrogate Model Framework for Computationally Expensive Mixed-Integer Black-Box Global Optimization

Juliane Mueller, Cornell University, CEE, 220 Hollister Hall, Ithaca, NY, 14853-3501, United States of America, juliane.mueller2901@gmail.com

We consider optimization problems that have computationally expensive objective functions whose analytical description is not available (black-box) and that have integer and continuous variables. We develop a class of algorithms that combines surrogate models and evolutionary strategies to efficiently solve these problems. We introduce a new algorithm that combines a global and a local search in order to obtain solutions of higher accuracy.

4 - Arc Search Methods for Linearly Constrained Optimization

Nicholas Henderson, Stanford University, 3943 El Camino Real #14, Palo Alto, CA, 94306, United States of America, nwh@stanford.edu

We present an arc search algorithm for linearly constrained optimization. The method constructs and searches along smooth arcs that satisfy a small set of properties. When second derivatives are used, the method is shown to converge to a second-order critical point. We introduce a new arc that scales to large problems, does not require modification to the Hessian, and is rarely dependent on the scaling of directions of negative curvature.

5 - Analytical and Computational Study of Ibaraki\rq{}s Modified Binary Search Algorithm

Chong Hyun Park, Graduate Student, Purdue University, 140 Airport Rd APT 5, West Lafayette, IN, 47906, United States of America, park456@purdue.edu

In this paper, the modified binary search (MODBIN) algorithm developed by Ibaraki (1983) for root finding is analyzed and compared to Newton's method and the algorithm of Pardalos and Phillips (1991). Although the MODBIN algorithm was originally proposed for solving fractional programming problems, we study the MODBIN algorithm as a general root finding algorithm. We develop our analysis of the MODBIN algorithm for finding the root of monotonic, convex, and twice differentiable functions.

Optimization, Large Scale 1

Contributed Session

Chair: Mojtaba Maghrebi, University of New South Wales, UNSW, Sydney, Australia, maghrebi@unsw.edu.au

1 - Integrating Artificial Intelligence with Optimization for Solving Large Scale Logistic Problems

Mojtaba Maghrebi, University of New South Wales, UNSW, Sydney, Australia, maghrebi@unsw.edu.au, Travis Waller, Claude Sammut

Obtaining exact solution for large scale logistic problems is computationally intractable. Experts are hired in the industry to find practical solutions for these problems. The authors found that there is a chance to reconstruct experts' decisions by machine learning. Real data from a concrete delivery was used for testing the proposed concept. The results show that there is a potential for implementing machine learning techniques in logistic while the competitive solutions have been obtained.

2 - Challenges in Varying Fixed Parameters in a Real-World Large-Scale Army Acquisition Problem

Frank Muldoon, R&D S&E Computer Scientist, Sandia National Laboratories, P.O. Box 5800, MS 1188, Albuquerque, NM, 87185-1188, United States of America, fmmuldo@sandia.gov

Traditional MIP fleet modernization formulations involve systems with fixed parameters, e.g., cost and performance, which answers the question "When to modernize?" but not the question "What should the modernized systems be?" Given a way to define systems in terms of their parameters, we look at the challenge of parameters being variable creating bilinear terms. We consider an Army acquisition problem and explore linearization techniques for the bilinear terms and numerical instability issues.

3 - Optimizing a Class of Generalized Assignment Problems with Location/Allocation Considerations

Tulay Flamand, PhD Student, University of Massachusetts Amherst, Isenberg School of Management, 121 Presidents Drive, Amherst, MA, 01003, United States of America, varol@som.umass.edu, Mohamed Haouari, Ahmed Ghoniem

We address a novel class of generalized assignment problems with location/allocation considerations which is motivated by shelf space allocation decisions in retail stores among other applications. Exact and effective heuristic approaches, including Very Large-Scale Neighborhood Search, are discussed using computationally challenging instances.

4 - Optimal Consolidation of Air Freight for an Intercontinental Cargo Carrier

Guvenc Sahin, Associate Professor, Sabanci University, Orhanli, Tuzla, Istanbul, Turkey, guvencs@sabanciuniv.edu, Birol Yuceoglu, Gorkem Yencak

Air cargo carriers consolidate the freight in order to avoid extra handling effort and cost during transfers as consolidated freight is easier to transfer. All stations may not be equipped with consolidation capability or might have limited facilities. We study a network design problem to determine the stations to be equipped with consolidation capability and their facilities. We formulate the problem as a set-covering problem and solve it using decomposition techniques.

Finance, Financial Engineering 2

Contributed Session

Chair: Yue Sun, University of Virginia, 151 Engineer's Way, Charlottesville, United States of America, ys6dn@virginia.edu

1 - Negativity Bias in Attention Allocation: Retail Investors' Reaction to Stock Returns

Tomas Reyes, Assistant Professor, Pontificia Universidad Catolica de Chile, Dpto Ingenierìa Industrial y Sistemas, Av. Vicuna Mackenna 4860, Macul, Santiago, RM, 7820436, Chile, threyes@ing.puc.cl, Isaac Hacamo

We argue negative stock market performance attracts more attention from retail investors than comparable positive performance. Specifically, we test and confirm the hypothesis that retail investors pay more attention to negative than positive extreme returns, using a measure of attention at the aggregate and company specific level from Google.

2 - High-frequency vs. Insider Trading

Yue Sun, University of Virginia, 151 Engineer's Way, Charlottesville, VA, United States of America, ys6dn@virginia.edu, Alfredo Garcia

In recent years, the role of high frequency trading has received increased attention. It is commonly argued that high frequency trading increases market volatility and the probability of mis-pricing. In this paper we study the effects of high frequency trading when there is also insider trading activity in the market. We find that high frequency traders play a beneficial role as they limit the extent of insider trading rents thus protecting noise traders and enhancing market liquidity.

3 - Optimal Claiming Behavior for Third-Party Auto Insurance Market in Turkey

N. Onur Bakir, Istanbul Kemerburgaz University, Mahmutbey Dilmenler Caddesi, No:26, Bagcilar, Istanbul, 34217, Turkey, onur.bakir@kemerburgaz.edu.tr, Salih Tekin, Derya Gülel

In Turkish automobile insurance market with bonus-malus system, the annual premium depends on the insured's claim experience record in addition to other factors. When a motorist has an accident, he is faced with the decision whether to pay all the cost associated with the accident himself, or claims the costs from the insurance company. Based on data obtained from a well-established company in Turkey, we analyze the optimal behavior with a risk-averse Markov decision model.

4 - The Study on Principal-agent Relationship among Venture Capitalist, Bank and Entrepreneur

Zha Bo, School of Management, Xi'an Jiao Tong University, P.O. Box 1851, Xi'an Jiao tong University, Xi'an, Shaanxi Province, 710049, China, zhabo127127@163.com

We establish principal-agent relationship among venture capitalist, bank and entrepreneur, prove that there exist the critical value of venture capitalists' supervision, and then we analyze the impact of overconfidence and supervision on the relationships among venture capitalist, bank and entrepreneur.

5 - Optimal Asset Allocation Strategies for Oil-based Sovereign Wealth Fund

Changle Lin, Princeton University, Princeton Univeristy, Sherrerd Hall, Charlton Street, Princeton, NJ, 08544, United States of America, changlel@princeton.edu, John Mulvey

Oil-exporting countries face two sets of recurring decisions: asset allocation of their sovereign wealth fund, and oil extraction. This paper models these decisions in an integrated fashion via an enterprise risk management system.First, a multi-stage stochastic program optimizes the asset allocation decisions. In a second step, the continuation value of oil reserves is estimated as a real option and linked to the stochastic program.We test the methodology via a case study to show advantages.

Chair: James Primbs, University of Texas at Dallas, Richardson, TX, United States of America, jap120030@utdallas.edu

1 - Towards Demystification of Technical Analysis: Stock Trading via Feedback Control

Shirzad Malekpour, University of Wisconsin-Madison, 1415 Engineering Dr., Madison, WI, United States of America, smalekpour@wisc.edu, B. Ross Barmish

In the finance literature, statistical analysis of historical data is often used to study the efficacy of technically-based stock-trading. This approach has been criticized due to lack of an explanatory theory for performance. In this paper we describe a new approach aimed at providing such a theory. Simple ideas based on feedback control lead to a theoretical rationale for a class of trend-following strategies. Going forward, our goal is to extend our ideas to demystify" other trading schemes.

2 - Robust Regression to Index Tracking

Jonathan Li, Assistant Professor, Telfer School of Management, 55 Laurier Avenue East Ottawa, Ottawa, Canada, jonathan.li@telfer.uottawa.ca

Constructing a portfolio that replicates the performance of a given financial index can be seen as a linear regression problem with additional constraints. In this work, we present new robust forms of regression models that have intuitive appeal to portfolio managers who intend to fully utilize the data in hand in constructing a tracking portfolio.

3 - Exploring the Dynamics of Order Book Depth
Sean Warnick, Associate Professor, Brigham Young University, 2222 TMCB, Provo, 84604, United States of America, sean.warnick@gmail.com, Scott Condie

Recent interest in high frequency trading has focused broad media attention on the dynamics of market-making and their possible susceptibility to manipulation. Here we explore NASDAQ's Totalview ITCH data, which reveals the full order book depth, and offer an introductory tutorial to the dynamics of market making and the various concerns that have received recent media attention.

4 - Asset Pricing Models with Idiosyncratic Comoments (I-COMs)
Yuji Yamada, Professor, University of Tsukuba, 3-29-1 Otsuka, Bunkyo-ku, Tokyo, 112-0012, Japan, yuji@gssm.otsuka.tsukuba.ac.jp

We propose a new framework in asset pricing models using idiosyncratic comoments (I-COMs), which provides a generalization of CAPM beta for higher order moments. First, we introduce definition of I-COMs and show that individual asset returns depend on not only CAPM beta (being given by the first order I-COM) but also higher order I-COMs. We also demonstrate risk premiums in asset returns using empirical data on Japanese stock markets and compare our framework with Fama-French 3 factor models.

Algorithmic and Computational Aspects of Mixed-Integer Nonlinear Optimization

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Aida Khajavirad, Assistant Professor, University of Texas at Austin, Austin, TX, aida.khajavirad@gmail.com

1 - On Feasibility-based Bounds Tightening
Leo Liberti, Research Staff Member, IBM Research, Yorktown Heights, NY, 10598, United States of America, leoliberti@gmail.com, Sonia Cafieri, Jon Lee, Pietro Belotti

Feasibility-based Bounds Tightening (FBBT) is used to tighten the variable ranges at the nodes of spatial Branch-and-Bound (sBB) algorithms for MINLP. FBBT may not converge finitely, even in the case of linear constraints. We model FBBT by using fixed-point equations in terms of the variable ranges. This yields an auxiliary linear program, which can be solved efficiently. We demonstrate the usefulness of our approach by improving the open-source sBB solver Couenne.

2 - Systematic Diagnosis of Infeasible NLP and MINLP Models
Yash Puranik, Carnegie Mellon University, 5000 Forbes Avenue DH 4200, Pittsburgh, PA, 15213, United States of America, ypp@andrew.cmu.edu, Nick Sahinidis

We present an approach for systematic diagnosis of infeasible and nonconvex NLP and MINLP models through the isolation of an IIS (Irreducible Inconsistent Set). Our approach relies on a preprocessing algorithm which uses feasibility based reduction techniques to achieve speedups in IIS isolation. We will present computational results with our compiled library of more than 1000 infeasible models on the efficacy of the proposed preprocessing algorithm as well as comparisons with other algorithms.

3 - On Simultaneous Convexification of Multilinear Functions
Aida Khajavirad, Assistant Professor, University of Texas at Austin, Austin, TX, aida.khajavirad@gmail.com, Alberto Del Pia

We study the polyhedral convex hull of a mixed-integer set defined by a collection of multilinear equations over the unit hypercube. We define an equivalent hypergraph representation of the mixed-integer set, which enables us to derive several classes of facet-defining inequalities, structural properties, decomposition and lifting operations for its convex hull. Our theoretical developments extend several well-known results from the Boolean quadric polytope and the cut polytope literature.

4 - A Lagrangian Relaxation Approach to a Class of Mixed-integer Bilevel Program
Mahdi Hamzeei, University of Wisconsin, Madison, WI, United States of America, hamzeei@wisc.edu, James Luedtke

We study a service network design problem in which a system operator chooses which facilities to open, and the allocation of customer demands to facilities is determined as a solution of an equilibrium problem driven by facility congestion. The problem is formulated as a mixed-integer bilevel programming problem which can be reformulated to a nonconvex MINLP. We use Lagrangian relaxation to obtain a lower bound and candidate feasible solution. Promising computational results will be reported.

1 - Incorporating Technology in Students' Professional Skills Assessment
Sadan Kulturel-Konak, Pennsylvania State University-Berks, Tulpehocken Rd. PO Box 7009, Reading, PA, United States of America, sadan@psu.edu

In this study, we introduce a web-based application, called Peer Evaluation and Assessment Resource (PEAR), to assess students' development in professional skills, namely in teamwork. PEAR has been designed based on the theory of Model of Domain Learning (MDL); hence, it can help explain the complex interactions among knowledge, interest level, and strategies with which knowledge is gained. We illustrate the workflow of PEAR and how MDL is integrated into the peer assessment process.

2 - Incorporating Technology in Classroom: A Case Study in an Engineering Course
Farnaz Ghazi Nezami, Assistant professor, Kettering University, Industrial and Manufacturing Engineering Department, 1700 University Ave.,, Flint, MI, United States of America, fghazinezami@kettering.edu, M Bayram Yildirim

This study analyzes the impact of education mode, face-to-face vs. online, on student's performance and persistence rate in Engineering Economy course. We also provide some insights about how the student's external characteristics can influence their enrollment decisions about online and face-to-face class options.

3 - POET: An Interactive Web-Based Tool for Learning Optimization Modeling Skills
Nelson Uhan, Mathematics Department, United States Naval Academy, Chauvenet Hall, Annapolis, MD, 21402, United States of America, uhan@usna.edu, Ji Soo Yi, Sung-Hee Kim, Rachael Kenney

POET is an interactive web-based tool designed to help students learn how to formulate optimization models from word problems, by establishing physical meaning for decision variables and constraints, and enabling students to test their models using concrete values for decision variables. We assessed its effectiveness with over 200 engineering students in an undergraduate optimization course over two semesters. Our studies indicate that POET helps students avoid several types of common errors.

4 - Bringing Linear Optimization to Life in the Classroom
David Czerwinski, San Jose State University, One Washington Square, San Jose, CA, 95192-0069, United States of America, david.czerwinski@sjsu.edu

We share two ways we have brought LPs to life in an undergraduate classroom. The first is a simple animation of solving an LP graphically. We discuss how to incorporate the animation in a lecture and touch on some subtle pedagogical points that can be made with it. The second is a project in which students create videos demonstrating optimization concepts. Highlights from some of the more entertaining videos will be shared, along with lessons learned about making the assignment successful.

Hilton- Golden Gate 2

Scheduling III

Contributed Session

Chair: Yasaman Malone, Oregon State University, 2494 NW Garryanna St, Apt. 29, Corvallis, OR, 97330, United States of America, yasaman.malone@oregonstate.edu

1 - Lower Bounding Methods for Solving a Dual Hybrid-flowshop Scheduling Problem
Yasaman Malone, Oregon State University, 2494 NW Garryanna St, Apt. 29, Corvallis, OR, 97330, United States of America, yasaman.malone@oregonstate.edu, Rasaratnam Logendran

This presentation addresses a hybrid-flow shop scheduling problem with both machine and labor as constraints in a supply chain. A linear mixed-integer mathematical programming model along with two lower bounding methods are proposed. In addition, a meta-search heuristic algorithm based on tabu search is developed in order to quickly solve the scheduling problems. The effectiveness and efficiency of the lower bounding methods and search algorithm are shown by using statistical analysis.

2 - Sequence-dependent Batch Scheduling Problem on Unrelated-parallel Machines
Rasaratnam Logendran, Professor, Oregon State University, School of MIME, 204 Rogers Hall, Corvallis, OR, 97331, United States of America, Logen.Logendran@oregonstate.edu, Omid Shahvari

We address a batch scheduling problem on unrelated-parallel machines with the objective of minimizing the weighted sum of weighted completion time and weighted tardiness, to respect the interests of the producer and customers. A mechanism for determining a lower bound on the number of jobs in a batch within the mathematical model is proposed, and dynamic job release and machine availability times are assumed. An example is used to demonstrate the application of tabu search to solve the problem.

3 - The Precedence Properties of the Flowshop Scheduling Problem
Jin-Pin Liou, Associate Professor, I-Shou University, 11F-1, No.9, Aly. 17, Ln. 50, Lida Rd., Kaohsiung, 81356, Taiwan - ROC, jinpin@isu.edu.tw

This research studies the static n-job m-machine permutation flowshop scheduling problems to minimize the makespan. At this study, we propose two precedence properties, which can significantly improve the efficiency of the existing branch and bound algorithms to arrive the optimal solutions of the flowshop scheduling problems. The simulated results are also provided to show the efficiency of these properties.

4 - Minimizing the Number of Tardy Jobs in a Stochastic Single Machine Scheduling Problem
Hossein Soroush, Professor, Kuwait University, Dept. of Statistics & Opns Research, POB 5969, Safat, 13060, Kuwait, h.soroush@ku.edu.kw

We study the problem of scheduling a set of jobs with fixed tardiness penalties and random processing times or due-dates on a single machine. The goal is to derive the sequence that minimizes the expected weighted number of tardy jobs. Special cases of the problem are solvable optimally in polynomial time while the general cases are tackled heuristically.

5 - Scheduling with Step-improving Processing Times
Eun-Seok Kim, Middlesex University, The Burroughs, London, NW4 4BT, United Kingdom, e.kim@mdx.ac.uk, Daniel Oron

We study a single machine scheduling problem of minimizing total completion time with step-improving processing times. For step-improving processing times, job processing times reduce by a job-dependent amount after a common critical date. We show that the problem is NP-hard in general. We formulate a Mixed Integer Programming model and develop an LP-based heuristic for the problem. Finally, we perform computational experiments showing that the heuristic provides effective solutions.

Group Decisions and Negotiation

Contributed Session

Chair: Michael Chuang, State University of New York, 1 Hawk Av, New Paltz, NY, United States of America, chuangm@newpaltz.edu

1 - Strong Leadership in Entrepreneurial Firms: The Distribution of Power in Top Management Teams
Martin Peitzner, PhD Candidate, TU Dortmund, Martin-Schmeifler-Weg 12, Dortmund, 44227, Germany, martin.peitzner@tu-dortmund.de, Andreas Engelen

This study examines the relationship between Top Management Team (TMT) power distribution and performance in different markets. To address equivocal results in extant research, it argues that the Entrepreneurial Orientation (EO) of a firm greatly influences how TMT members exercise their power. Based on secondary data of 61 S&P 500 companies, it finds that the more fragmented the market is, the more positively EO moderates the relationship between unequally distributed power and performance.

2 - Personality in Computer-Mediated Communication
Michael Chuang, State University of New York, 1 Hawk Av, New Paltz, NY, United States of America, chuangm@newpaltz.edu

When a group faces a barrage of information pieces for a decision, persuasion is important for reaching a consensus. However, there is lack of related study regarding whether individuals characterized by having different personalities exhibit differences. To fill the gap, this work investigates the impacts of communication modes and personality in computer-mediated communications environments.

3 - Visualizing Alignment to Predict Group Success and Failure
Michael Taylor, Principal, SchellingPoint, 109 Cratin Lane, Suite 200, West Chester, PA, 19380, United States of America, mtaylor@schellingpoint.com

Alignment is vital in collaborative activities yet considered binary - We are aligned or We aren't. False positives cause groups to create logical but flawed plans, the flaws arising in execution. AOT measures the Alignment Index of a group. In 200 uses every group's alignment was 44 to 83 on a 100-point scale. Alignment visualization show the group's path to success and what will cause them to fail, enabling them to pinpoint their necessary conversations.

Inventory Management VI

Contributed Session

Chair: Arnab Bisi, Associate Professor of Operations Management, Indian Institute of Management Calcutta, Joka, Diamond Harbour Road, Kolkata, India, abisi@iimcal.ac.in

1 - Alternative Incentives in Inventory Management: How do Performance Metrics Affect Inventory Decision
Michael Becker-Peth, Assistant professor, University of Cologne, Albertus-Magnus-Platz, Cologne, Germany, michael.becker-peth@uni-koeln.de, Kai Hoberg, Margarita Protopapa-Sieke

We analyze the impact of alternative incentive schemes on inventory decisions and the link to the company's performance. We find analytically that commonly used performance metrics focusing on inventory levels at the fiscal year end can seriously harm the overall firm performance. Furthermore we test these incentive schemes in lab experiments and find overreactions to end-of-year incentives as end-of-year-inventory levels are typically dropped significantly below the prescriptive levels.

2 - Resetting Base Stock Levels in Unbalanced Production Systems
Nha Nghi Huynh, University of Hamburg, Von Melle Park 5, Hamburg, 20146, Germany, nha-nghi.huynh@uni-hamburg.de, Hans Daduna

We analyze monotonicity of base stock levels in inventory-production systems and study single- and multi-item systems where demand triggers production of a new unit. Standard queueing theory suggests that the base stock level should increase with the utilization in the system. However, this intuition is not easy to prove. We present a proof of this presumption utilizing stochastic orderings and consider in particular unbalanced production systems.

3 - Pricing and Assortment Decisions for Perishable Products with Price- and Stock-dependent Demand

Erhun Kundakcioglu, Ozyegin University, Faculty of Engineering, Istanbul, Turkey, erhun.kundakcioglu@ozyegin.edu.tr, Arda Yenipazarli, Mehmet Onal

We introduce a product assortment and pricing problem for perishable products. The goal is to maximize the retailer's profit under shelf-space and backroom storage capacity constraints. The demand rate is a deterministic and multivariate function of selling price and on-display stock level. The model is reformulated and a heuristic solution method is proposed. Computational experiments identify how the variation in the total profit is apportioned to changes in demand parameters.

4 - On the Interaction of Service Level and Shelf Life Agreements in Perishable-product Supply Chains

Sandra Transchel, Associate Professor of Supply Chain and Operations Management, Kuehne Logistics University - The KLU, Grofler Grasbrook 17, Hamburg, HH, 20457, Germany, sandra.transchel@the-klu.org

We study a two-stage perishable-product supply chain of a manufacturer and retailer who negotiate a contract comprising a service level and shelf life agreement (remaining shelf life guaranteed by the manufacturer). The manufacturer has an incentive to produces larger batches that negatively impacts the remaining shelf life and thus the contract agreement. We investigate the interaction of service level and shelf life agreement and its impact on the supply chain performance and efficiency.

5 - The Value of Real Time Yield Information in Multi-stage Inventory Systems

Marcus Dettenbach, University of Cologne, Albertus Magnus Platz, Cologne, Germany, marcus.dettenbach@uni-koeln.de, Ulrich Thonemann

We consider the number of defective units in an order to be random. The information on the number of defective units is available at any time. This setting is compared to a setting in which the yield is observable upon arrival of an order. We solve a dynamic program for both settings. We develop close-to-optimal heuristics with short run times and conduct various numerical experiments and identify dependencies for the value of real time yield information. An extension considers fixed order cost.

Organization Theory 2

Contributed Session

Chair: Jay Lee, California State Univ Sacramento, 6000 J St, Tahoe Hall 2079, Sacramento, CA, 95819, United States of America, jlee@csus.edu

1 - The Relationship between Career Growth and Job Performance

Hui Yang, University of Science and Technology of China, School of Management, HeFei, China, nyanghui@163.com

This paper establishes a model to interpret the relationship between career growth and job performance, empirically analyzes the impact mechanism of employees' career growth on job performance. we using correlation analysis and regression analysis methods, revealing the professional growth of job performance of paths and processes. The study found that career goals progress within the organization and professional capacity development for job performance have certain influence.

2 - Global ICT (Information, Communication & Technology) Firm's International Strategy and Performance

Jay Lee, California State Univ Sacramento, 6000 J St, Tahoe Hall 2079, Sacramento, CA, 95819, United States of America, jlee@csus.edu

This study examines the different alliance activities of major global ICT (Information, Communication & Technology) firms as they pursue an international expansion strategy in a highly competitive business environment. As in many other industries, global strategic alliances have been increasingly popular among global ICT firms all over the world. Two network characteristics - geographical scope and frequency of strategic alliances among global ICT firms - are to look at in this study.

3 - A Network-Based Approach to Organizational Learning

Mark Avnet, Assistant Professor, Texas A&M University, 4075 Emerging Technologies Building, 3131 TAMU, College Station, TX, 77843-3131, United States of America, avnet@tamu.edu

An analytical approach for measuring organizational learning is presented. Using survey data of respondents' knowledge and views about a given situation or problem, networks of shared mental models in an organization are constructed at several points in time. Structural comparisons of these networks are used to quantify learning in the organization. The approach is tested by relating organizational learning to metrics of safety performance in a major oil and gas company.

4 - The Role of Leaders in Responding to Uncertainty: Evidence from China's Largest Real Estate Company

Xiaofeng Zhang, School of Management, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, Xi'an, China, xiaofeng.zh@mail.xjtu.edu.cn

Our constructing grounded theory study develops a conceptual model of leader dealing with uncertainty in China. We find that leaders search and grasp opportunity, follow policy and competition changes to respond to environmental uncertainty; promote organization evolution and mobilize resources for crisis management in the case of organizational uncertainty; consolidate position power and construct leader authority, accumulate experience and take external learning as to individual uncertainty.

■ WB62

Hilton- Plaza A

Applied Probability 2

Contributed Session

Chair: George Mytalas, NJIT, 257 86 Brooklyn, New York, United States of America, mytalas@njit.edu

1 - Multivariate Run Test for Detecting Non-Randomness in Process Control Charts

Young H. Chun, Professor of Decision Science, Louisiana State University, E. J. Ourso College of Business, 2219 Business Education Complex, Baton Rouge, LA, 70803, United States of America, prof@drchun.net

In a sequence of observations, a run is defined as a maximal subsequence of like observations. We propose a run test that checks a randomness hypothesis for a multi-valued data sequence. The randomness is tested based on the number of runs and the length of the longest run in a sequence of observations with multiple classes. The run tests can be applied to many practical situations, including the non-parametric test for statistical process control.

2 - An Efficient Decomposition Algorithm for Superquantile Regression

Dharmashankar Subramanian, IBM Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, dharmash@us.ibm.com, Pavithra Harsha, Ramesh Natarajan

A regression technique known as Superquantile regression, proposed by Rockafellar, Royset and Miranda 2013, is a method to estimate superquantile, well known as conditional value at risk, of a random variable that depends on covariates. The proposed linear program to estimate the coefficients of the regression fails to scale even for reasonably small instances. We present an efficient decomposition method to solve this problem even for very large instances with computational results.

3 - Optimal Call Center Forecasting and Staffing under Arrival Rate Uncertainty

Sihan Ding, PhD, Center for Mathematics and Computer Science, Science Park 123, Amsterdam, 1098 XG, Netherlands, S.Ding@cwi.nl, Ger Koole

We formulate the staffing problem in call centers as a new-vendor type problem, where the costs are the staffing costs. We show that under such a cost structure and the arrival rate uncertainty, the optimal staffing should occur according to a quantile of the distributional forecast, rather than the mean. It is also shown that the sum of quantile errors is asymptotically the optimal error measurement in call center forecasting. The results are validated numerically.

4 - Stochastic Enumeration for Counting SAW

Ad Ridder, Vrije University, de Boelelaan 1105, Amsterdam, 1081HV, Netherlands, ad.ridder@vu.nl, Slava Vaisman

In this talk we will consider counting the number of self-avoiding walks of length n on the 2D integer lattice. This is a so-called #P-complete counting problem. We will give a brief introduction to this complexity class and then present several randomized approximation schemes for estimating the number, including numerical results. Furthermore, we discuss the correspondence to efficient simulation algorithms for estimating rare event probabilities.

5 - An M/G/1 Queue System Subject to Disasters and Server Breakdowns

George Mytalas, NJIT, 257 86 Brooklyn, New York, United States of America, mytalas@njit.edu

We consider a M/G/1 queueing system subject to disasters and server breakdowns under N-policy. The server is turned off as soon as the system empties. When the queue length reaches or exceeds a value N (threshold), the server is turned on and begins to serve the customers. During the repair period arriving batches of customers accumulate in the queue without receiving service. Besides, the server has an exponential lifetime in addition to the catastrophe process.

Dynamic Programming/ Control 2

Contributed Session

Chair: Kun Zhao, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32608, United States of America, zhaokunzk@ufl.edu

1 - Dynamic Repairman Assignment in a Layered Queuing Network with Correlated Queues

Sandjai Bhulai, VU University Amsterdam, Department of Mathematics, De Boelelaan 1081a, Amsterdam, 1081 HV, Netherlands, s.bhulai@vu.nl, Jan-Pieter Dorsman, Maria Vlasiou

We study a machine-repair model in which the machines make products themselves. Due to correlations of the machine downtimes, the queue lengths of the products are correlated. We study how the repairman should allocate its repair capacity dynamically, so as to minimize the expected total number of waiting products. We derive several properties pertaining to the repairman's optimal strategy. We also obtain a near optimal policy that performs nearly as well over a wide range of parameter settings.

2 - Inspection Scheduling of Multi-unit Systems With Budget Constraint

Mahmood Pariazar, American Airlines, 4333 Amon Carter Blvd, Forth Worth, TX, United States of America, mppv6@mail.missouri.edu, Esra Sisikoglu Sir

Consider a multi-unit system such as a multi-machine production system in which each unit needs to be inspected/maintained under a limited budget. The budget constraint makes it infeasible to inspect each item according to its optimal inspection schedule. Group inspection policies become suboptimal as each item has its own degradation probability. We use dynamic programming to determine the optimal inspection schedule of multi-unit systems and use approximation for large scale problem instances.

3 - Dynamic Programming Based Inequalities for Multidimensional Knapsack Problems

Kun Zhao, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32608, United States of America, zhaokunzk@ufl.edu, Joseph Hartman

Forward dynamic programming for the multidimensional knapsack problem is used to generate inequalities for an equivalent integer programming formulation. We illustrate the effectiveness of the approach through experimental testing.

Methods for Staffing Nonstationary Queueing Systems

Sponsor: Applied Probability Society

Sponsored Session

Chair: Jamol Pender, Cornell University, 206 Rhodes Hall, Ithaca, NY, 14850, United States of America, jjp274@cornell.edu

1 - Optimal Allocation and Pricing of Servers under Uncertainty with Co-sourcing

Jeffrey Kharoufeh, Department of Industrial Engineering, University of Pittsburgh, Pittsburgh, PA, 15261, United States of America, jkharouf@pitt.edu, David Abdul-Malak

We consider the problem of optimally allocating servers in a multi-server queueing system in which the arrival rate is uncertain, a quality-of-service constraint must be satisfied, and server co-sourcing is available. Additionally, we determine the co-sourcing contractor's profit-maximizing pricing strategy by formulating the problem within the framework of a Stackelberg competition.

2 - Sizing Heterogeneous Servers with Non-stationary Arrivals for Time-stability

Soongeol Kwon, Texas A&M University, College Station, TX, United States of America, soongeol.kwon@gmail.com, Natarajan Gautam

We consider a set of parallel servers that could be powered on or off, and when on run at different speeds. Requests of multiple classes arrive according to a piecewise constant non-homogeneous Poisson process. Our objective is to make multiple decisions including assignment of classes to servers, routing probability of requests to servers, number of servers to be powered on, and the speed of each server. The goal is to minimize power consumption subject to achieving time-stable performance.

3 - Refining Piecewise Stationary Approximation for a Markov-Regulated Fluid Queue

Bo Zhang, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, United States of America, bozhang@gatech.edu, Guodong Pang, Bert Zwart

We present a refinement of the Piecewise Stationary Approximation for the stationary distribution of a Markov-regulated fluid queue. The refinement is analytically justified. Its accuracy and utility are demonstrated.

4 - Staffing Nonstationary Queues using Transition Rates

Jamol Pender, Cornell University, 206 Rhodes Hall, Ithaca, NY, 14850, United States of America, jjp274@cornell.edu

In this talk, we will present a new way to approximate and stabilize various performance measures of Markovian Jackson networks using the transition rates and the Kolmogorov forward equations of the Markov process. We show that the transition rates of the Markov process provide valuable information for approximating and stabilizing the probability of delay, abandonment probabilities, and the effective abandonment rate of the Jackson network.

1 - Incentivized Optimal Advert Assignment via Utility Decomposition

Neil Walton, University of Amsterdam, Science Part 904, Amsterdam, Netherlands, n.s.walton@uva.nl, Frank Kelly, Peter Key

For a large-scale Ad-auction over an infinite space of random searches, we show that a maximum aggregate utility can be solved in separate optimizations conducted by the advertisement platform and advertisers. Here, the platform solves an assignment problem and, on a slower time scale, each advertiser submits a bid which matches its demand for click-throughs with supply. This simple mechanism can incentivize truthful bidding and has a unique Nash equilibrium, which implements our decomposition.

2 - Supply Reservation in an Inventory Model for Cloud Computing

TongHoon Suk, Graduate Student, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, tonghoons@gatech.edu, Aaron Yen, Ilyas Iyoob, Ton Dieker

Motivated by the marketplace in cloud computing, we study an inventory model with uncertain demand for a perishable good that can be supplied at different prices depending on the length of the contractual commitment as measured by a lock-in period. This gives a trade-off between risk of having to buy last-minute capacity for a high price and buying resources that end up unused. We describe a data-driven approach to analyze this trade-off and illustrate our technique on a representative data set.

3 - Achievable Performance of Blind Scheduling Policies in Heavy Traffic

Bart Kamphorst, CWI, P.O. Box 94079, Amsterdam, 1090 GB, Netherlands, b.kamphorst@cwi.nl, Nikhil Bansal, Bert Zwart

It is well-known that SRPT is an optimal scheduling policy for minimizing the average sojourn time in G/G/1 queues. In practice one often does not know individual job sizes and a blind policy is required. Scheduling literature has shown strong bounds on the performance of blind scheduling policies in deterministic environments when compared to SRPT. I will show how the strong bounds on blind policies in deterministic environments can be used to obtain bounds in heavy traffic stochastic settings.

4 - Throughput Optimal Policies in a Flexible Fork-join Network

Yuan Zhong, Columbia University, 500 West 120th Street, New York, NY, 10027, United States of America, yz2561@columbia.edu, Jean Walrand, Ramtin Pedarsani

We consider a flexible fork-join processing network, that models applications in healthcare, cloud computing, manufacturing, etc. Jobs are modeled as directed acyclic graphs of tasks with precedence constraints among them. Servers are flexible with overlapping capabilities. In this talk, we present several throughput optimal scheduling policies for this network, and discuss their complexity and performance properties. We complement our results with simulations.

1 - Shape Deviation Modeling and Compensation for Fused Deposition Modeling Processes

Andi Wang, HKUST, Academic Bldg 4223, HKUST, Hong Kong, Hong Kong - PRC, awangab@ust.hk, Suoyuan Song, Fugee Tsung, Qiang Huang

In this research we intend to increase the geometric accuracy for Fused Deposition Modeling (FDM) process, one of the mostly adopted additive manufacturing technologies. Based on the FDM mechanism, we analyze the process and attribute the dimensional inaccuracy to two significant error sources: extruder positioning error and processing error. We further derived a effective compensation plan through changing the product design. Experiments show the effectiveness of our method.

2 - Optimal Meniscus Planning in SL-related AM for Improvement of Surface Finish and Geometric Accuracy

Yayue Pan, Assistant Professor, University of Illinois at Chicago, 739 Valley Circle Dr., Apt.103, Saline, United States of America, pyy2010@gmail.com

Surface quality is a big challenge in Additive Manufacturing (AM) processes.A meniscus method has been verified for surface finish improvement.Yet without proper settings, the geometric accuracy may have no improvement or even be worse.In this paper,different manufacturing process parameters in the SL-related AM systems were examined.Systematic models for surface quality control through meniscus deposition and process characterizations were developed and verified by experiments.

3 - Unified Predictive Modeling and Compensation Approach for 3D Printed Products

Qiang Huang, Associate Professor, University of Southern California, 3715 McClintock Avenue, Los Angeles, CA, 90089, United States of America, qiang.huang@usc.edu, Sobambo Sosina, Tirthankar Dasgupta, Hadis Nouri, Kai Xu, Yong Chen

Built upon our previous optimal compensation study of 3D printed products, this work aims at an unified modeling approach to predict the quality of both cylinder and polygon shapes. Experimental investigation of polygon shapes indicates the promise of predicting and compensating a wide class of products built through 3D printing technology

Data Fusion in Manufacturing Systems

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Ran Jin, Virginia Tech, Virginia Polytechnic Institute and State, University, 111 Durham Hall,, Blacksburg, VA, 24061, United States of America, jran5@vt.edu

1 - Approximate Likelihood Inference for Multistream Count Data Monitnoring

Devashish Das, PhD Candidate, University of Wisconsin, Madis, Department of Industrial Engineering, 1513 University Avenue, Madison, Wi, 53706, United States of America, ddas3@wisc.edu, Shiyu Zhou

In this paper we use a Poisson-Multivariate Normal density to model multistream count data. An approximate likelihood ratio test for this model is proposed, which significantly reduces the computational cost of multi-dimensional integrals involved in the likelihood function. These approximate likelihood tests were found to be effective in detecting changes to the in-control distribution. The proposed framework is compared with existing approaches as well as on a real data case study.

2 - Within-cycle Profile Monitoring and Fault Diagnosis using Multichannel Signals

Weihong Guo, Ph.D. Candidate, University of Michigan - Ann Arbor, 2860 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America, graceguo@umich.edu, Judy Jin, S. Jack Hu

Existing research on cyclic profile monitoring has been focusing on between-cycle detection at the end of part completion based on the entire cycle of signals. Extending from the authors' previous research on within-cycle profile monitoring for real-time defect prevention, this research develops a monitoring and diagnosis methodology to address the challenges and opportunities brought by multichannel signals for making monitoring decisions and fault diagnosis.

3 - Multiple Sensor Data Fusion in Degradation Modeling under Different Operation Conditions

Hao Yan, PhD Student, Georgia Institute of Technology, 755 Ferst Dr, NW, Atlanta, GA, 30332, United States of America, yanhao@gatech.edu, Kaibo Liu

System monitoring with multiple sensors in different operation conditions brings challenge to data fusion in degradation modeling. Thus, a data level fusion methodology is proposed to integrate data from multiple sensors in multiple operation conditions for accurate prediction of the remaining lifetime. The effectiveness of proposed method is demonstrated in the case study, which involves a degradation dataset of an aircraft in six different operation conditions.

4 - Dynamic Quality Models Considering Equipment Degradation in Manufacturing Systems

Ran Jin, Virginia Tech, Virginia Polytechnic Institute and State, University, 111 Durham Hall,, Blacksburg, VA, 24061, United States of America, jran5@vt.edu, Xinwei Deng

The reliability of manufacturing equipment plays an important role for product quality assurance. In this paper, we focus on modeling the effects of the equipment degradation to product quality. A novel dynamic model is proposed to characterize the varying effects of process variables to quality due to equipment degradation. We use both simulations and a real data set from crystal growth manufacturing to show the advantage of the proposed model.

1 - MSER Algorithms for the Initial Transient Problem

Raghu Pasupathy, Associate Professor, Purdue University, Dept. of Statistics, West Lafayette, United States of America, pasupath@vt.edu, Bruce Schmeiser

The problem of the initial transient asks how large an initial segment of a time series should be deleted before constructing the estimator of the steady state mean. The MSER family of algorithms is a popular method to address this problem; MSER's efficacy, however, is still unclear and has been the subject of ongoing debate. In this talk, we will attempt to further clarify the computational and theoretical performance of MSER. We also present two new MSER variations that have shown promise.

2 - On the Initial Transient Problem for Reflected Brownian Motion

Rob Wang, Ph.D. Student, Stanford University, 314M Huang Engineering Center, Department of MS&E, Stanford, CA, 94305, United States of America, robjwang@stanford.edu, Peter Glynn

We discuss the convergence to equilibrium of one-dimensional reflected Brownian motion (RBM) and related initial transient formulae. These results provide new insights into the initial transient problem for queueing systems in heavy traffic, for which RBM is an effective approximation.

3 - Choosing a Good Starting State in Discrete Event Simulation

Winfried Grassmann, Professor, University of Saskatchewan, Dept. of Computer Science, 110 Science Place, Saskatoon, SK, S7N 5C0, Canada, grassman@cs.usask.ca

When estimating expectations by simulation, two criteria should be used to find a good starting state: the closeness of the expectation provided by the starting state, and the drift, a concept to be discussed. Good starting states make warm-up periods redundant.

1 - Forecasting Crude Oil Prices using Machine Learning Methods

Erkam Guresen, Ph.D.Student, Turkish Military Academy, Devlet Mah., Ankara, Turkey, erkamguresen@gmail.com, Gulgun Kayakutlu

Oil price becomes an increasingly essential topic of concern to all kind of decision makers from small investors to government policy makers. In this study monthly Brent Crude Oil Prices from January 1980 to June 2013 are used. ARIMA,Exponential Smoothing, Regression, Radial Bases Function Network, Support Vector Machine, and Multi-Layer Perceptron (MLP) models are developed using SPSS software. Three additional MLP models are constructed using dynamic algorithms CA02V01, CA03V01 and CA03V02.

2 - Energy and Carbon Footprints of Alternative Vehicle Options: Inclusion of State-specific Variations

Nuri Onat, PhD Candidate, University of Central Florida, 4000 Central Florida Blvd, Orlando, United States of America, nconat@knights.ucf.edu, Omer Tatari, Murat Kucukvar

Temporal and spatial variations are quite influential when deciding which vehicle option is a better choice in terms of energy and carbon footprints. We compared electric, plug-in hybrid electric, and hybrid electric vehicles across 51 states considering state-specific electricity generation mix and driving patterns. Life cycle methodology is utilized to quantify impacts of the vehicles. This study highlights how temporal and spatial variations affect the vehicle preference at state level.

3 - Ranking Sustainability Performance of the US and Canada Metropoles: An IF-MCDM Approach

Serkan Gumus, Assistant Professor, Turkish Military Academy, Bakanliklar, Ankara, 06654, Turkey, sgumus@kho.edu.tr, Gokhan Egilmez, Murat Kucukvar

Environmental sustainability performance assessment of 27 U.S. and Canada metropoles is focused. Firstly, collecting the data and contacting experts from academia, U.S. government agencies and industry. Secondly, experts are evaluated their sustainability performance. Thirdly, IF-MCDM model is applied considering expert judgements. In the final step, the sustainability scores, rankings, results analysis and discussions, and statistical highlights about the research findings are provided.

4 - Energy-Water Nexus of Electric Vehicle Technologies in United States

Murat Kucukvar, Assistant Professor, Istanbul Sehir University, Kusbakisi Cad. No:27, Uskudar, Istanbul, 34666, Turkey, muratkucukvar@sehir.edu.tr, Nuri Onat

According to the recent statistics, we are running out of time" to take actions towards achieving sustainable vehicle transportation in the U.S. This research aims to provide new insights into the potential water consumption and withdrawals resulting from an increased use of electric vehicles in the 51 states. Four vehicles types including ICEV, HEV, PHEV, and BEV will be analyzed. Stochastic process-based life cycle assessment model will be developed to conduct well-to-wheel" analysis.

5 - Life Cycle Based Environmental Impact Intensity Assessment of National Freight Logistics

Yong Park, Ph.D. Student, North Dakota State University, Fargo, ND, 58108, United States of America, Yong.Park@my.ndsu.edu

In this study, the U.S. manufacturing and transportation industries' nexus will be addressed from life cycle perspective. The main objective of this study is to determine the environmental impact intensity scores of four transportation modes. To achieve this goal, Economic Input-Output Life-Cycle Assessment (EIO-LCA) model will be used to quantify the life cycle inventory and ton-kilometer shipment characteristics for intensity assessment purposes.

6 - Eco-efficiency Analysis of Manufacturing and Transportation Nexus in the U.S. with PCA

Gokhan Egilmez, Assistant Professor, North Dakota State University, Industrial & Manufacturing Engineering, NDSU Dept. 2485, PO Box 6050, Fargo, ND, 58108, United States of America, Gokhan.Egilmez@ndsu.edu

The relationship between the U.S. manufacturing and transportation industries is studied from a life cycle perspective. The main aim is to quantify the life cycle impacts of U.S. manufacturing in the transportation industry and perform eco-efficiency analysis. To achieve this goal, a combined application of Economic Input-Output Life-Cycle Assessment (EIO-LCA) and Principal Component Analysis (PCA) is performed.

Economics (Game Theory)

Contributed Session

Chair: Rachel Chen, University of California at Davis, 3208 Gallagher Hall, Davis, CA, 95691, United States of America, rachen@ucdavis.edu

1 - Three Equilibriums of Benefit-Seeking Behavior of Consuming Weak Regenerative Resource

Shaorong Sun, professor, University of Shanghai for Science and Technology, 516 Jungong Road Shanghai 200093 CHINA, School of Management, Shanghai, 200093, China, 438878648@qq.com, Yannan Zhang

Equilibrium curve and model of common weak regenerative resource under benefit-seeking behavior are deduced based on regeneration speed model of resource and consumption model of benefit-seeking behavior. Different equilibrium points of individual irrationality, individual rationality and collective rationality are deduced. Relationships of these points are analyzed. The number of members influents the profit of benefit-seeking behavior.

2 - Free Samples, Advertisement, and Targeting Strategies

Shiming Deng, Professor, Huazhong University of Science and Technology, 1037 Luo Yu Rd, Wuhan, China, smdeng@hust.edu.cn, Lingli Wu

Customers may be uncertain about the value of a product before having any experience on it. To reduce this uncertainty, companies may offer free samples to customer evaluation. We develop models to study the effectiveness of free samples for the cases they are offered alone or jointly with other ads. Furthermore, if selective marketing are possible, we develop algorithms for choosing customers who should receive samples and/or ads. Our research provides interesting managerial insights.

3 - Opaque Distribution Channels for Competing Service Providers: Posted Price vs. NYOP Mechanisms

Rachel Chen, University of California at Davis, 3208 Gallagher Hall, Davis, CA, 95691, United States of America, rachen@ucdavis.edu, Esther Gal-Or, Paolo Roma

Opaque selling has been widely adopted by service providers to sell off leftover capacity under stochastic demand. We study the impact of different selling mechanisms, Posted Price (PP) vs. Name-Your-Own-Price (NYOP), of an opaque reseller on competing service providers. We find that providers prefer that the opaque reseller uses a posted price instead of a bidding model. Our findings are consistent with the recent trend towards more published price sales for opaque products.

4 - Principal-Agent Framework for a Revenue Generating Unit

Shuo Zeng, University of Arizona, McClelland Hall 430, 1130 East Helen Street, Tucson, AZ, 85721, United States of America, shuozeng@email.arizona.edu, Moshe Dror, Moshe Shaked

We examine the contractual relationship between a principal (revenue generating unit) and an agent (service provider) in a Markovian setting with a risk neutral principal and a risk averse agent. We identify conditions for the existence of a contract and describe the terms for a Pareto-optimal contract. For risk averse agent we adopt a novel risk representation and show that both the principal and the agent are worse off in relation to risk aversion.

Auctions/ Mechanism Design 1

Contributed Session

Chair: Shivam Gupta, UT Dallas, 800 W Campbell Rd, Richardson, TX, United States of America, sxg104920@utdallas.edu

1 - Wheat Auction with Spot Market Competing

Ruoran Chen, Department of Industrial Engineering, Tsinghua University, 519A, Shunde Building, Tsinghua, Beijing, China, crr11@mails.tsinghua.edu.cn, Simin Huang

Chinese governments frequently hold auctions to sell their wheat reservation inventories. In those auctions, wheat of unknown quality is auctioned off to bidders who have private valuations on the wheat. Meanwhile, auction sellers compete with spot wheat market, and spot wheat has better quality which is accessible to all. We use auction theory to analyze the interaction between wheat auction and spot trading. We find this interaction leads to low allocation efficiency.

2 - Re-incentivizing Discovery: Mechanisms for Partial-Progress Sharing in Research

Siddhartha Banerjee, Postdoc, Stanford University, 475 Via Ortega, Stanford, Ca, 94305, United States of America, sidb@stanford.edu, Ashish Goel, Anilesh Krishnaswamy

Partial-progress sharing (PPS) – where a researcher shares information immediately on making a breakthrough - is essential for an efficient research ecosystem. However there is evidence that existing rewards in research discourage PPS. We study the problem of incentivizing information-sharing in research under a stylized model. Under very general conditions, we give conditions to ensure PPS is incentive-compatible for all agents, and suggest mechanisms for real-world settings.

3 - On Virtually Efficient and Optimal Mechanisms in Procurement

Shivam Gupta, UT Dallas, 800 W Campbell Rd, Richardson, United States of America, sxg104920@utdallas.edu, Milind Dawande, Ganesh Janakiraman, Wei Chen

In multi-unit procurement under single-dimensional private information, we show the following: (1) A virtually-efficient mechanism is optimal iff the production costs of the suppliers are linear in their private types. (2) A virtual" VCG mechanism is optimal if the revenue function of the buyer is linear in the total amount procured, the production costs of the suppliers are linear both in their quantity and types, and the feasibility constraints governing allocations define a polymatroid.

1 - Applied Partial Least Square Correlation Analysis to Brain Activity Pattern Identification

Yilling He, University of Central Florida, he.yiling2046@gmail.com

Previous studies have demonstrated that sleep deprivation will change human brain activity pattern during certain tasks. Sleep deprivation may impact the activity pattern in various ways during different tasks. By applying the partial least square correlation analysis, we will combine behavior data and fMRI data of subjects with regular restfullness and sleep deprivation, in order to identify the differences of brain activity pattern between these two groups of subjects.

2 - Causal Interaction of Neural Networks in Sleep-deprived Brain

Muyuan Li, Ph.D Candidate, GRA, University of Central Florida, University of Central Florida, P.O. Box 1, Orlando, FL, 32816, United States of America, muyuanli2009@gmail.com

Sleep deprivation is common in modern work environment due to increasing social and occupational demand. While its impact on performance impairment is well studied, the patterns of neural connectivity still largely remain unknown. The objective of this study is using granger causality analysis to reveal the inference interactions in sleep-deprived brain networks.

3 - Are Emergency Departments Becoming the New Outpatient Units?

Sara Nourazari, PhD Candidate, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States of America, s.nourazari@neu.edu, James Benneyan, Rifat Sipahi, Daniel Hoch

Delayed care access in outpatient settings may result not only in poor health outcomes and patient satisfaction but also contribute to non-urgent emergency department visits. This work investigates correlations between poor access to several neuro-specialties and the relative risk of scheduled or intended appointments balking or reneging into ED visits.

4 - Adaptive Borderline Cluster Based Oversampling Method to Balance Imbalanced Datasets

Iman Nekooeimehr, Presenter, University of South Florida, 14304 Wedgewood court Apt201, Tampa, Fl, 33613, United States of America, nekooeimehr@mail.usf.edu, Susana Lai-Yuen

In reality, many of the datasets are imbalanced which means different classes have different number of observations. This makes the classifiers fail to classify the minority classes correctly. We have proposed an adaptive borderline cluster based oversampling method which synthetically generates new minority instances to balance the dataset.

1 - The Influence of the Panama Canal on Global Gas Trade

Seksun Moryade, smoryade@umd.edu, Steven A. Gabriel

The Panama Canal expansion will provide the route with shorter distances, reducing the voyage by 7,000 nautical miles to Japan from the Gulf of Mexico. Applying the World Gas Model from the University of Maryland, this paper investigates the potential effects of varying Panama Canal tolls on the LNG markets via six scenarios of possible Panama Canal tariffs. Results are compared and examined with the focus on prices, LNG flows, and supply displacement.

2 - Two-Level, Mixed-Integer Programming Models for Energy Conservation Measures

Bill Champion, Director of Asset Management Consulting/Quality Assurance Manager of EMG, Cockeysville, MD, United States of America, bchampion@emgcorp.com, Steven A. Gabriel

Energy Conservation Measure selection is made difficult given real-world constraints, limited resources to implement savings retrofits, various suppliers in the market and project financing alternatives. The most common method of implementation planning is suboptimal. This presentation demonstrates how two-level mixed integer programming is used to optimize the selection of energy conservation measures.

3 - Joint Participation in Electric Power and Gas Markets: A MPEC Approach

Pablo Duenas, PhD, Comillas Pontifical University, Calle Alberto Aguilera 23, Madrid, Spain, pablo.duenas@iit.upcomillas.es, Sonja Wogrin

Climate change, renewable integration and abundant unconventional gas resources have boosted the utilization of gas for electricity generation. Generation companies with gas-fired power plants submit their hourly offers to organized electricity markets and make use of gas system infrastructure by nominating their planned utilized capacity on a daily basis. A MPEC problem has been developed to considering the temporal mismatch effects. Results are compared with the single level model.

4 - Joint Operational Model for Smartgrid with Community Microgrids under Carbon Emissions Control

Felipe Feijoo, University of South Florida, 4202 E. Fowler Ave, ENB118, Tampa, United States of America, felipefeijoo@mail.usf.edu, Tapas Das

This research presents a model for obtaining optimal operational strategies for microgrids subject to optimal dispatch of electricity by the smartgrid via a bi-level mixed integer programming model. A designed experiment using the results from the bi-level model and a Pareto analysis are used to provide policy design guidelines for microgrids.

1 - Robust Optimization of the Self-scheduling and Market Involvement for an Electricity Producer

Ricardo Lima, Laboratorio Nacional de Energia e Geologia, Estrada do Paco do Lumiar, 22, Lisboa, 1649-038, Portugal, ricardo.lima@lneg.pt, Augusto Novais, Antonio J. Conejo

This presentation addresses the optimization of the self-scheduling, forward contracting, and pool involvement of an electricity producer operating a system that combines thermal, hydro and wind sources, and uses a two stage adaptive robust optimization approach. The wind power production and the electricity pool prices are considered to be uncertain. The solution algorithms, computational performance, scheduling results, and the impact of risk management in the results are discussed.

2 - Robust Transmission Expansion Planning

Carlos Ruiz, Universidad Carlos III de Madrid, Avda. de la Universidad, 30, Leganes, 28911, Spain, caruizm@est-econ.uc3m.es, Antonio J. Conejo

We address the problem of transmission expansion planning in an electric energy system with different sources of uncertainty. An adaptive robust optimization model, formulated as a mixed-integer three-level problem, is used to derive the investment decisions that minimize the system's costs by anticipating the worst case realization of the uncertainty. The model is efficiently solved by using a cutting plane algorithm. A realistic case study is used to illustrate the proposed technique.

3 - Toward Fully Renewable Electric Energy Systems

Ruth Dominguez, Universidad de Castilla - La Mancha, Avenida Carlos III s/n, Toledo, Spain, Ruth.Dominguez@uclm.es, Antonio J. Conejo, Miguel Carrion

Global warming and fossil-fuel depletion motivate the increasing presence of renewable sources in power systems. We present an investment model that allows planning the transition from a thermal-dominated system to a renewable-dominated design. The objective is to minimize expected investment and operating costs. The model relies on stochastic programming and allows decisions in both generation and transmission facilities. This model has been tested on a real-world system.

4 - Integration of Plug-In Electric Vehicles in Fully-Renewable Power Systems

Miguel Carrion, Universidad de Castilla - La Mancha, Avenida Carlos III s/n, Toledo, Spain, Miguel.Carrion@uclm.es, Rafael Zarate-Mi-ano

During the last years, the usage of plug-in electric vehicles (PEVs) has been strongly promoted around the world. In this context, we analyze the impact of incorporating a large number of PEVs in a fully-renewable power system. The PEVs demand is modeled considering several charging profiles and different coordination schemes between the Independent System Operator and PEVs. The proposed model is tested in a case study based on the Iberian Peninsula Power System.

5 - Concepts and Practice using Stochastic Programs for Determining Reserve Requirements

Robert Entriken, Principal Technical Leader, EPRI, 3420 Hillview Avenue, Palo Alto, CA, 94304, United States of America, rentrike@epri.com, Russ Philbrick, Edward Lo, Larsen Plano, Aidan Tuohy, Garret LaBove, Eamonn Lannoye

We describe how to appropriately determine reserve reserve requirements. A model is designed to illuminate potential procurement issues for Load Following Up (LFU) reserve products, in both deterministic and stochastic problem formulations, and to show how to leverage modern power system optimization tools to automatically select resources that address deliverability issues in an economically efficient manner. Practical experience, gained from an operational model of the WECC, is also shared.

Queuing Models

Contributed Session

Chair: Rowan Wang, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, wang1075@umn.edu

1 - Individual Performance Analysis of a Discrete-time Queue Fed by a Group of DAR(1) Traffic Sources

Daniel Miao, Associate Professor, National Taiwan University of Science and Technology, 43, Keelung Road, Sec. 4, Taipei, 106, Taiwan - ROC, miao@mail.ntust.edu.tw, Xenos Lin

We study how the individual performance measures seen by a constituent traffic source are affected by other interfering sources when they are superposed into a deterministic queue. With each source modeled by a DAR(1) process, the mean and variance of the individual waiting time are derived in closed form and a recursive structure in its higher moments is established. Numerical examples are given to demonstrate the crucial role played by the autocorrelation structure among these traffic sources.

2 - Service Systems with Appointment-Driven Arrivals, Non-Punctual Customers, and No-Shows

Rowan Wang, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, wang1075@umn.edu, Oualid Jouini, Saif Benjaafar

We consider service systems where a finite number of customers arrive over time. The arrival of customers is driven by appointments. However, customers are not necessarily punctual. Customers may also not show up altogether. Customers are not homogeneous in their punctuality, show-up probabilities, and time between previous and subsequent appointments. We develop an exact analytical approach to obtain various performance measures of interest.

3 - M/ G/ Infinity with Exponentially Distributed Setup Times

Babak Haji, University of Southern California, 2553 Dearborn dr, Los Angeles, CA, 90068, United States of America, bhaji@usc.edu, Sheldon Ross

We consider an M/G/infinity model with exponentially distributed setup times. Arrivals result in an idle server setting a setup. Upon completing a setup, a server begins serving a waiting customer. Upon completing a service, with probability p the server becomes eligible to serve a waiting customer. We show, in steady state, that the number of busy servers has a Poisson distribution and is independent of the number of servers in setup.

4 - Service Systems with Uncertain Quality and Anecdote Reasoning Customers

Hang Ren, University College London, Dept of Management Science & Innovation, Gower Street, London, WC1E 6BT, United Kingdom, hang.ren.13@ucl.ac.uk, Tingliang Huang

We study service systems with random service quality and boundedly rational customers who estimate their own valuation of service quality from word of mouth. We analyze customers' equilibrium joining behavior and the influence on the firm's profit. We find that the revenue-maximizing price is increasing in the customers' rationality level when the expected service quality is high enough, and the maximized revenue is unimodal in the customers' rationality level.

5 - Between Little's Formula and Bullwhip Effect

Xiaoyue Jiang, Tulane University, Department of Computer Science, Baton Rouge, United States of America, xjiang@tulane.edu

Effort is made to bring a deterministic queuing method, Network Calculus (NetCal), back to convex analysis framework. By further interpreting the fundamental results via the notion of variability, the Bullwhip Effect (BWE) in the supply-chain field arises naturally, so does a NetCal counterpart of the Little's formula in queuing. The former reveals an additivity structure between variabilities of supply and demand, and the latter connects the worst case scenarios of two QoS metrics.

1 - Septic Shock Prediction for Patients with Missing Data

Joyce C. Ho, The University of Texas at Austin, 1 University Station, C0803, Austin, TX, 78701, United States of America, joyceho@utexas.edu, Cheng Lee, Joydeep Ghosh

Septic shock is a common and fatal condition. However, early prediction of patients at risk for septic shock is difficult due to the wide range of potential indicators, where missing data is a known issue. We investigate how different imputation selection criteria and methods can overcome the missing data problem. Our models, which use imputation methods in conjunction with predictive model, provide a generalized approach for predicting septic shock.

2 - Algorithm for Regression Subset Selection on a Network

Diego Klabjan, Professor of Industrial Engineering and Management Sciences Director of Master of Science in Analytics Program, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, d-klabjan@northwestern.edu, Sung Won Han, Judy Hua Zhong, Young Woong Park

We study a regression subset selection problem on a network, motivated from gene network inference. The problem is to build a regression model for each attribute by treating it as the response variable and the remaining attributes as explanatory variables, while preserving the acyclic structure of the selected variables. We solve the problem based on Lagrangian relaxation containing LASSO and maximum acyclic subgraph as sub-problems. A computational study is provided.

3 - The Role of the Microbiome in Women's Health

Paul Brooks, VCU, PO Box 843083, Richmond, United States of America, jpbrooks@vcu.edu, Greg Buck VMC

Next-generation sequencing technology facilitates conducting a DNA census of the microbiome, including the bacteria that reside in different body habitats. In this talk, we discuss the analysis of 16S metagenomic data generated from over 4,000 samples from female subjects. We observe differences in microbiome profiles based on diagnosis and demographic variables.

4 - Models for Predicting Objective Function Weights in Prostate Cancer IMRT

Justin J. Boutilier, University of Toronto, 5 King's College Road, Toronto, On, M5S 3G8, Canada, j.boutilier@mail.utoronto.ca, Timothy C. Y. Chan, Taewoo Lee, Tim Craig, Michael B. Sharpe

We demonstrate the clinical applicability of three machine learning models that predict optimization objective function weights from patient geometry for intensity-modulated radiation therapy of prostate cancer. Our weight prediction methodologies can produce clinical quality treatment plans by simultaneously predicting multiple weights and capturing trade-offs associated with sparing multiple OARs near a prostate tumor.

1 - Minor League Scout Scheduling

Oguzhan Ozlu, Georgia Institute of Technology, School of Ind & Sys Engineering, 765 Ferst Drive, NW, Atlanta, GA, 30318, United States of America, a.o.ozlu@gmail.com, Joel Sokol

An MLB team needs to schedule which scouts should see each of thousands of minor league games over six months, subject to business constraints on travel, baseball-related needs, time off, etc., while minimizing the overall transportation and lodging costs. We will describe different layers of the problem and present exact integer optimization and heuristic approaches to obtain 'good' schedules. We will also outline the strategies for schedule recovery and handling uncertainties.

2 - Armchair Baseball Manager: Exploring Baseball Strategies

Marina Polyashuk, Associate Professor of Mathematics, Northeastern Illinois University, 5500 N. St. Louis Ave., Chicago, IL, 60625, United States of America, m-polyashuk@neiu.edu

This presentation is focused on solving the problem of devising an optimal lineup for a given baseball game. The problem is decomposed into two parts: one, selecting a starting assignment of position players and two, choosing a batting order for a given set of starters. Proposed solutions are based on multiple criteria methods, graph theory, and statistical analyses.

3 - The Connection between Flexible Production Networks and Baseball Roster Construction

Douglas Fearing, The University of Texas at Austin, 2110 Speedway, Stop B6500, Austin, TX, United States of America, doug.fearing@mccombs.utexas.edu, Timothy C. Y. Chan

Drawing from the theory of production flexibility in manufacturing networks, we provide the first optimization-based analysis of the value of positional flexibility (the ability of a player to play multiple positions) for a major league baseball team in the presence of injury risk. Using publicly available data on baseball player performance, we derive novel baseball-related insights that can be generalized to the manufacturing context.

4 - Great Expectations: An Analysis of Major League Baseball Free Agent Performance

Sean Barnes, Assistant Professor, University of Maryland, 4352 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, sbarnes@rhsmith.umd.edu, Margrét Bjarnadóttir

We analyze MLB player data to characterize whether players meet the expectations set by free agent contracts. We develop two models using machine learning techniques: one based on market valuation and one based on future performance. We show that our second model more consistently matches previous performance with future value.

Analytic Hierachy Process

Contributed Session

Chair: Orrin Cooper, University of Memphis, 332 Fogelman, Memphis, United States of America, olcooper@memphis.edu

1 - Sensitivity Analysis for Analytic Network Models

Magda Gabriela Sava, PhD Student, Joseph M. Katz Graduate School of Business, University of Pittsburgh, 241 Mervis Hall, Pittsburgh, PA, 15260, United States of America, mgsava@katz.pitt.edu, Luis Vargas, Jerrold May

We propose an extension of the sensitivity and stability analysis for analytic network models previously developed. We study simple ANP models to understand how preference regions are created, and characterize their boundaries as the complexity of the network increases. We use optimization methods to find the most suitable boundaries between the preference regions and define the appropriate stability regions.

2 - Using Linking Pin Comparisons as Cluster Comparison Pivots

Orrin Cooper, University of Memphis, 332 Fogelman, Memphis, United States of America, olcooper@memphis.edu

The AHP pairwise comparison process is an innovative method that relies on our innate ability to make relative comparisons between objects. In practice, the differences between objects being compared should not normally exceed Saaty's 1-9 scale. Herein Linking Pin comparisons are used to make the comparisons to obtain the criteria cluster weights. This approach allows cluster weightings to exceed the 1-9 scale without using a new scale and to reduce the cognitive burden on the decision maker.

3 - Determining Customers' Selection Criteria: Comparison of Turkish Airline Companies

Ozay Ozaydin, Assistant Professor, Dogus University, Zeamet S. No:21 Acibadem, Istanbul, 34722, Turkey, oozaydin@dogus.edu.tr, Mine Isik, Emel Aktas

Airlines must dynamically adapt a number of competitive strategies in order to survive in the market and also expand their share. Criteria that customers use for selecting an airline are investigated, and a brief comparison of the local airlines' performances. AHP is used as a decision support system framework, combining numerical data such as fleet size, accident history, on-time performance with personal perception of decision makers to include all possible aspects of an airline success.

4 - Work Load Analysis by AHP

Baris Carikci, TUBITAK, Upriselite Sitesi A1 Blok No:67 Kartal /, Kartal / Istanbul, 34403, Turkey, baris.carikci@tubitak.gov.tr

Work Load Analysis is a tool to evaluate the necessary work force for the organization. Especially it is a must after the organizational restructuring and process oriented improvements. Without such an application, the organizations might be running with adequate or inadequate work force, which eventually leads the inefficiency and unmotivated labor force. In our case, we used AHP, which focuses on the business processes, to evaluate the work force needs.

Chair: Jun Zhuang, University at Buffalo, 317 Bell Hall, Buffalo, NY, 14260, United States of America, jzhuang@buffalo.edu

1 - Modeling Insurer-homeowner Interactions in Managing Natural Disaster Risk

Xiaojun Shan, Postdoctoral Research Associate, CEEEP at Rutgers University, 33 Livingston Ave, New Brunswick, NJ, 08901, United States of America, xiaojun.shan@ejb.rutgers.edu, Jamie Kruse, Yohannes Kesete, Yang Gao, Rachel Davidson, Jiazhen Peng, Linda Nozick

The system for managing natural disaster risk is problematic. Homeowners are often uninsured or underinsured while insurers often do not want to insure against these losses, which can cause an high chance of insolvency. To design an improved system for the different perspectives of the stakeholders, we develop a novel modeling framework integrating state-of-the-art hurricane loss and stochastic optimization models for decision supports to both the homeowners and insurer with governance.

2 - A Game-theoretic Model for Risk Sharing between Public and Private Sectors against Extreme Risks

Yang Zhang, Assistant Professor, Tsinghua University, Dept. of Industrial Engineering, Beijing, China, yangzhanguser@mail.tsinghua.edu.cn, Chen Wang

Public-private insurance programs can provide financial protection against catastrophic risks. We propose a sequential game with three parties, the government, an insurer, and potential policy holders, to investigate how the government can involve insurers to provide the service, while limiting their profits to avoid compromising the social welfare. We consider both natural and terrorism threats, assuming natural hazards to have considerably less ambiguity than terrorism risks.

3 - Public-private Partnerships in Disaster Management: Engaging with Multiple Private Sectors

Peiqiu Guan, Ph.D. Candidate, University at Buffalo, SUNY, 338 Bell Hall,, Department of ISE, Buffalo, NY, 14226, United States of America, peiqiugu@buffalo.edu, Jun Zhuang

Public sector would partner with multiple private sectors in different stages of disaster management to meet various needs. This research uses game-theoretical modeling, Monte Carlo Analytical Hierarchy Process, and expert opinions to study how to form optimal partnerships between the public section and multiple private sectors.

4 - Asymmetrically Prescriptive/Descriptive Game Theory with EU and PT Decision Makers

Philip Leclerc, Doctoral Student, Virginia Commonwealth University, 1501 Abelway Drive, Midlothian, VA, 23114, United States of America, philip.leclerc@gmail.com, Jason Merrick

Game theory assumes Expected Utility Theory preferences, but Prospect theory (PT) is presently the leading descriptive theory of choice under uncertainty. We study equilibria involving the full PT model for risk, and examine the impact of PT preferences on, e.g., existence and computational complexity. We develop examples illustrating that 1) each PT equilibrium may differ from the others and from NE, 2) PT equilibria may fail to exist, and 3) PT preferences can improve player welfare.

5 - Interdependent Network Performance Measures and Characteristics

Allison Reilly, Post-doctoral Researcher, Johns Hopkins University, 3400 N Charles Street, 303 Ames Hall, Baltimore, MD, 21210, United States of America, acr@jhu.edu, Andrew Samuel, Seth Guikema

Regulators are particularly concerned with predicting interdependent infrastructure system performance after a hazardous event given the threat of systemic disruption. In this work, we broaden the understanding by examining how competing network objectives impact investments and performance. We expand upon game-theoretic models of interdependent networks to ultimately aid decision-makers in setting effective regulatory strategies for encouraging efficient investments and improved performance.

1 - Infrastructure Risk Management: Prediction and Decision-Making

Seth Guikema, Assistant Professor, Johns Hopkins University, 313 Ames Hall, Department of Geog & Env. Engineering, Baltimore, MD, 21218, United States of America, sguikema@jhu.edu

Infrastructure in the US is aging, suffers from a lack of funding, and is subject to a number of significant natural hazards. At the same time, it is critical for societal functioning and security. Risk-based management of infrastructure is critical. This talk presents predictive risk models for infrastructure and shows how they can be used to support infrastructure management decision-making and investment. Examples from the electric power and potable water sectors are used.

2 - Improving the Computational Efficiency of the Interdependent Network Design Problem MIP Model

Andres Gonzalez, Rice University, 6100 Main St., MS-318, Houston, TX, 77005, United States of America, andres.gonzalez@rice.edu, Leonardo Duenas-Osorio, Andrés L. Medaglia, Mauricio Sanchez-Silva

The Interdependent Network Design Problem (INDP) focuses on finding optimal recovery strategies for a set of damaged interdependent infrastructure systems. In this work, we present an application of a Benders/Danzig-Wolfe decomposition hybrid algorithm to enhance the computational efficiency of the INDP MIP model. Hence, the presented hybrid algorithm enables the INDP model to study large and realistic infrastructure networks, thus contributing to resilience quantification.

3 - Resilience-Based Decision Making for Infrastructure Networks

Kash Barker, Assistant Professor, University of Oklahoma, 202 W Boyd St, Rm. 124, Norman, OK, 73019, United States of America, kashbarker@ou.edu, Charles Nicholson

We model network resilience as a function of vulnerability, the extent of impact after a disruption, and recoverability, the length of time required for restoration. We offer an optimization formulation to allocate resources to these two aspects of resilience, and test several heuristics for reducing the size of the network to reduce computational requirements.

4 - Resilience-Based Freight Transportation Infrastructure Network Design

Mohamad Darayi, PhD. Student, University of Oklahoma, 202 W Boyd St, Rm. 124, Norman, OK, 73019, United States of America, mdarayi@ou.edu, Kash Barker

Improving freight transportation infrastructure network design (i) by the addition of capacitated links/nodes or (ii) by increasing the capacity of current network components are explored as options to strengthen the functionality of the network and its effect on the multiple industries relying upon it. Considering different disruption scenarios, this research addresses a network completion decision making problem with respect to the network resilience, as well as multi-industry impacts.

1 - A Heuristic Algorithm to Solve the Single-facility LRP on RMS with Energy System Applications

Emre Tokgoz, Quinnipiac University, 275 Mount Carmel Ave., Hamden, CT, 06518, United States of America, emre.tokgoz-1@ou.edu, Samir Alwazzi, Theodore Trafalis

Solving LRP on Riemannian Manifold Surface (RMS) is a more realistic approach than using Euclidean surfaces because of the curved structure of the pathways on Earth with changing local RMS curvatures. In this work, we introduce a new LRP to be solved on RMS and find a heuristic algorithmic solution to this LRP. In particular, we formulate the LRP for a single facility on RMS. Applications in energy systems will be discussed in this talk.

2 - Kernel-based Regression in Natural Gas Storage Valuation

Alexander Malyscheff, malyscheff@gmail.com, Theodore Trafalis

The valuation of natural gas storage contracts has recently received significant attention in the energy management community. Least-Squares Monte Carlo (LSMC) represents one approach to value such contracts. We apply kernel-based machine learning techniques to derive the regression function required in the LSMC method.

3 - Securities Analysis of Selected Energy Companies Based on Data Mining and Machine Learning Approach

Zhen Zhang, Reserach Assistant, SCIPP, Norman, OK, United States of America, zhenzhang0217@gmail.com, Theodore Trafalis

Authors of this paper evaluate successful/failed energy moguls and aspiring new energy companies through quantitative and qualitative analysis facilitated by data mining and machine learning techniques. Quantitatively, it displays statistical superiority/inferiority based on a company's capitalization, earnings, dividends, assets, liabilities and operational data; Qualitatively, we focus on the industry, the general market, the role, the management, the prospect and the competitive advantage.

Multicriteria Decision Making 2

Contributed Session

Chair: Roman Slowinski, Professor, Poznan University of Technology, Pl. Marii Sklodowskiej-Curie 5, Poznan, 60-965, Poland, roman.slowinski@cs.put.poznan.pl

1 - Preference-driven Cone Contraction for Multiobjective Optimization

Roman Slowinski, Professor, Poznan University of Technology, Pl. Marii Sklodowskiej-Curie 5, Poznan, 60-965, Poland, roman.slowinski@cs.put.poznan.pl, Milosz Kadzinski

We present an interactive procedure for multiobjective optimization which involves robust ordinal regression in contraction of the preference cone in the objective space. The decision maker (DM) specifies pairwise comparisons of some non-dominated solutions from a current sample. The cone originating in a reference point is formed by all directions of isoquants of the achievement scalarizing functions compatible with the pairwise comparisons of solutions provided by the DM.

2 - MCDM and PROMETHEE Preference Functions for Crop Variety Selection

Jay Parsons, Optimal Ag Consulting, Inc., 3226 Ledgestone Ct., Fort Collins, CO, 80528, United States of America, jay.parsons@OptimalAg.com

Wheat varieties are typically evaluated for eleven different traits in addition yield data from test plots. The PROMETHEE methodology of multi-criteria decision making is a nice fit for this type of decision problem. In this paper presentation, I propose preference functions for the twelve criteria to be evaluated when selecting a wheat variety. Furthermore, I propose a software tool for integrating this information into a multi-criteria decision support system.

3 - The Robustness Space Pareto Set Reduction Problem

Daniel Jornada, Research Engineer Associate, Texas A&M University, 3367 TAMU, College Station, TX, 77843, United States of America, djornada@tamu.edu, V. Jorge Leon

We present a mathematical programming framework for identifying a subset of robust solutions from a given Pareto set arising from a multi-objective problem. The efficient set is mapped onto a 2-dimensional space, termed robustness space, representing model and solutions robustness with respect to uncertainties in prescribed solution values. We present theoretical properties, examples contrasting with existing Pareto set reduction approaches, and an approach for multi-objective linear programs.

4 - Bi-Objective Tabu Search for The Fleet Size and Mix Onshore Workover Rigs Scheduling Problem

Werner Soares, UFRN, UFRN - Centro de Tecnologia, Av. Sen. Salgado Filho s/n, Natal, Brazil, werner_soares@hotmail.com, Dario Aloise, Ana Paula Costa

Services on oil wells in onshore fields are performed by expensive workover rigs. A good choice of fleet size and mix and scheduling of such equipment is necessary. However, in literature, the quantities are considered fixed, a priori, and the rigs considered homogeneous. In this work, a Tabu Search heuristics is developed for obtaining a Pareto set of bi-objective solutions for a more robust version of this problem.

Chair: Chaojiang Wu, Assistant Professor, Drexel University, 3141 Chestnut Street, Philadelphia, Pe, 19104, United States of America, cw578@drexel.edu

1 - Tree Based Ensemble Methods in Travel Time Prediction

Yanru Zhang, University of Maryland, University of Maryland, Dept. of Civil & Environmental Eng., college park, MD, 20740, United States of America, yrzhang@umd.edu, Ali Haghani

Ensemble based algorithms have reached a celebrity status in solving prediction problems in recent years. Within them, tree based ensemble methods are successful ones that providing interpretable results, that are able to handle different types of predictor variables, and can fit complex nonlinear relationship. In this paper, we applied a gradient boosting regression tree method to analyze and model freeway travel time to improve the prediction accuracy and model interpretability.

2 - Using Global and Local Patterns for Improving Vehicle Trajectory Prediction

William Groves, University of Minnesota, 200 Union St SE Ste 4-192, Minneapolis, Mi, 55455, United States of America, groves@cs.umn.edu, Ernesto Nunes, Maria Gini

Location data collected from taxis contains a wealth of information about daily patterns of road use. We propose a framework for prediction of in-progress vehicle trajectories using eigen-based and Markov-based methods to leverage both general and highly localized patterns. We learn the road network and travel patterns directly from a large corpus of data (10,000 taxis observed for one week in a major city) to generate short-term predictions that correspond directly to the real-world situation.

3 - Evaluation of Airlines' Web Site Via Text Mining

Feyza Gürbüz, Erciyes ‹niversites, Erciyes Universitesi Müh. Fak. Endüstri, Kayseri, 38039, Turkey, feyza@erciyes.edu.tr, Esra Kahya-Ozyirmidokuz

The websites of airlines has a critical effect on customers. These websites use a lot of data which are unstructured. In this study the web text mining (TM) approach is performed on international airlines' web site data to extract knowledge from them. TM is used to extract the keywords based on the weight calculation of Term-Frequency Inverse-Document-Frequency and uses similarity analysis and support vector machine algorithms to cluster the airline websites.

4 - Dimension Reduction in Quantile Regression

Chaojiang Wu, Assistant Professor, Drexel University, 3141 Chestnut Street, Philadelphia, Pe, 19104, United States of America, cw578@drexel.edu, Yan Yu

To overcome the curse of dimensionality yet retain model flexibility, we propose two dimension reduction methods for modeling conditional quantiles: partially linear single-index models and partially linear additive models. The unknown univariate functions are estimated by penalized splines. Both simulations and real applications show encouraging results of the proposed estimators.

5 - Reacting in Real-time to New Malware Infections Committing Online Advertising Fraud

Jason Shaw, Senior Data Scientist, Integral Ad Science, 37 E 18th St, Fl 7, New York, NY, 10035, United States of America, jshaw@integralads.com, Kiril Tsemekhman

Most online advertising fraud is carried out by botnets built through malware. Immediate detection of newly infected machines is critical to fully protecting advertisers, but many techniques depend on algorithms which do not allow online classification of users as clean or infected. Using locality-sensitive hashing as the basis of a recommender system, we continuously incorporate a stream of tens of thousands of ads per second. With up-to-date data, new infections can be identified in minutes.

Risk, Incentives and Cooperation in Technology Management

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Niyazi Taneri, SUTD, 20 Dover Drive, Singapore, Singapore, niyazitaneri@sutd.edu.sg

1 - Cost-reducing Innovation and the Role of Patent Intermediaries

Shantanu Bhattacharya, Visiting Associate Professor of Operations Management, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, Shantanu.bhattacharya@insead.edu, Sameer Hasija, Anupam Agrawal

Patent intermediaries are non-practicing entities in the innovation domain. We analyze the competition between two identical incumbents and a PI for external cost-reducing innovations. We show PIs always win IP rights for incremental innovations, and for radical innovations with significant efficiency advantages and low uncertainty about the degree of innovation.

2 - How (and When) to Encourage Cooperation in Project Portfolios

Fabian Sting, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, fsting@rsm.nl, Yaozhong Wu, Pascale Crama

Inspired by an innovative real-life practice, we model a project portfolio system that shapes cooperative behavior. Help is at the core of this system in which employees may mutually ask for help, while management facilitates the exchange of help. We find that the company should take a nuanced approach to help. It is striking that asymmetric resource engagement emerges as an optimal approach: cooperative behavior may lead the company to induce different efforts even for symmetrical projects.

3 - Supplier Involvement in Component Development: Commitment versus Flexibility

Timofey Shalpegin, HEC Paris, 1 Rue de la Libération, Jouy en Josas, France, timofey.shalpegin@hec.edu, Zhixi Wan, Svenja Sommer

Manufacturers involve suppliers to develop prototypes of innovative component designs. A common practice is to set a target cost for each component design. Manufacturer can commit to a set of pre-determined cost targets or flexibly change the cost target of a design. We show that the flexible target cost scheme create benefits at the cost of provoking the supplier's strategic behavior. We examine the manufacturer's preference between the two types of target cost schemes.

Chair: Sameer Hasija, Assistant Professor of Technology and Operations Management, INSEAD, 1 Ayer Rajah Avenue, Singapore, Si, 138676, Singapore, Sameer.Hasija@insead.edu

1 - Avoiding Expiration of Medical Inventory for Emergency Response

Quan Zhou, University of Auckland, Room 6121, OGGB, 12 Grafton Road, Auckland City, Auckland, 1010, New Zealand, q.zhou@auckland.ac.nz, Tava Olsen

Even with a long shelf life, medical supplies in the national reserve for large-scale emergencies are at risk of expiration. We consider the perishability of long-life reserve supplies, and propose to rotate them to hospitals' operational use. We derive the optimal policies for the rotation decision in combination with the hospital's ordering decision. We obtain intuitively appealing results with some surprising properties, which could provide implications for rotation operations.

2 - Contracting in Medical Equipment Maintenance Services: an Empirical Investigation

Tian Chan, PhD, INSEAD, 1 Ayer Rajah Avenue, Singapore, Singapore, TianHeong.CHAN@insead.edu, Francis de Vericourt, Omar Besbes

Fixed-fee and pay-per-service contracts are two forms of maintenance service plans that structure payment between operators and service providers. Using data from 712 medical scanners, we empirically compare their effects on service outcomes. We exploit a warranty period to isolate incentive effects from adverse selection, finding (1) a pay-per-service contract leads to relatively higher reliability and lower costs, and (2) the effects are driven by both operator and service provider.

3 - Optimal Design of Co-Productive Services: Interaction and Work Allocation

Guillaume Roels, UCLA, 110 Westwood Plaza, B511, Los Angeles, CA, 90066, United States of America, guillaume.roels@anderson.ucla.edu

In this paper, we develop an analytical model of joint production between a service provider and a customer and characterize how a service firm should design its co-productive system. Our analysis gives rise to a service-process framework with three archetypes of co-productive services: collaborative services, service factories, and self-services. We discuss the implications of our results for service process reengineering.

Collaboration and Information in Supply Chains

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu

1 - Retailer's Forecast Capability Information and Demand Forecast Sharing in Supply Chains

Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Lakshmi Nittala

Does it help to know how good the retailer is at forecasting for sharing retailer's demand forecast information with the manufacturer? We demonstrate that it can actually hurt the forecast sharing between the retailer and the manufacturer.

2 - Online Retailer Competition with a Referral Service

Kihoon Kim, Korea University Business School, Anam-Dong, Seongbuk-Gu, Seoul, Korea, Republic of, kihoonk@gmail.com

We investigate whether two competing online retailers can be better off by adopting a referral service. When they adopt the referral service, a referral-offering online retailer faces a trade-off between generating additional revenues from referral fees and the risk of exposing its loyal consumers to the price of its referred online retailer. Our main result is that when the market shares of both retailers do not differ significantly, the referral service is likely to be adopted.

3 - Engage the Wisdom of Crowds: Structural Analysis of Dynamic User Contributions in Online Innovation

Wei Chen, University of California, San Diego, 9500 Gilman Drive, La Jolla, CA, 92093, United States of America, Wei.Chen@rady.ucsd.edu, Xiahua (Anny) Wei, Kevin Zhu

What engages users and keeps them active? This paper studies the dynamics of user contributions in an innovation community where contributions are analogous to public goods. We use a hidden Markov model to characterize the fluctuation of user contributions with two latent motivation states (active vs. inactive) and their effects on the level of participation. We find that reputational motivations and reciprocity are effective in turning inactive users into active users, and keeping them engaged.

Co-Chair: Pnina Feldman, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, feldman@haas.berkeley.edu

1 - Patient Portals in Primary Care: Impacts on Patient Health and Physician Productivity

Hessam Bavafa, Assissant Professor, Wisconsin School of Business, 975 University Ave, Madison, WI, 53706, United States of America, bavafa@wharton.upenn.edu, Christian Terwiesch, Lorin Hitt

Interest in innovative health care delivery models has increased due to measures such as the Affordable Care Act, which is designed to expand insurance coverage and contain health care costs. One innovation that has been forwarded as a low-cost alternative to office visits is e-visits," or secure messaging via patient portals. We evaluate the effect of e-visit adoption on patient health and physician productivity using a six-year panel dataset from a primary care provider in the United States.

2 - Pricing Reservations with Strategic Customers

Kate Ashley, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, kate_ashley@haas.berkeley.edu, Pnina Feldman

Many firms offer reservations for future service, which exposes them to costly no-shows. At the time reservations are offered, customers do not know their exact valuations for service, and may vary in their probabilities of showing up. This paper analyzes three different reservation pricing schemes that address the no-show problem, characterizes optimal prices and revenues under each scheme, and discusses managerial implications.

3 - Tournaments for Service Delivery

Karan Girotra, Professor, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, karan.girotra@insead.edu, Konstantinos Stouras, Serguei Netessine

We consider contests in service delivery environments such as virtual call centers, i.e. call centers with an on-demand geographically dispersed workforce. We identify tournament design modes that trade-off tournament participation, quality of service and delivery costs.

Hilton- Continental 4

Supply Chain Management V

Contributed Session

Chair: Olov Isaksson, EPFL, Station 5, Lausanne, Switzerland, olov.isaksson@epfl.ch

1 - The Role of Supply Chain Complexity: An Investigation of the Thousands of Villages" Supply Network

Guanyi Lu, Assistant Professor, Oregon State University, 200 Bexell Hall, Corvallis, OR, 97331, United States of America, guanyi.lu@oregonstate.edu, Xitong Guo

Supply chain complexity has been conceptualized through the number of suppliers, the degree of differentiation among these suppliers, and the level of interrelationships among the suppliers. Our study of a large supply network suggests that two additional factors,interactions among buyers and presence of powerful third party, would also affect supply chain complexity and supply chain performance.

2 - Orders and Reciprocity in the Technology Supply Chain

Heejong Lim, PhD Student, Purdue University, 403 W. State Street, West Lafayette, IN, 47907, United States of America, limh@purdue.edu, Ananth Iyer

Motivated by the semiconductor and the LCD industry, we incorporate the reciprocal game in a dyadic (buyer-supplier) supply channel. In our model, the buyer's anticipated reciprocal behavior influences the seller's order so as to protect the seller during the oversupply period. We provide an analysis under different level of reciprocity following accepted economic models in order to explore the impact on order size and channel coordination. Insights from practice are then provided.

3 - Bullwhip Effect and Demand Uncertainty on Firms' Cost Behavior

Shilei Yang, Professor, Southwestern University of Finance and Economics, Guang Hua Chun #55, Chengdu, 610074, China, syang@swufe.edu.cn, Jing Zhu

The research is an interface study between cost accounting and supply chain management. Using the Compustat data, we find that firms with greater bullwhip effect tend to have a more flexible cost structure, but higher demand uncertainty is more likely associated with a rigid cost structure with an exception for firms in the retailing sector. In particular, firms with lower firm-level bullwhip ratio are usually more capable to withstand the stress on cost structure caused by demand uncertainty.

4 - Knowledge Spillovers in the Supply Chain: Evidence from the High Tech Sectors

Olov Isaksson, EPFL, Station 5, Lausanne, Switzerland, olov.isaksson@epfl.ch, Markus Simeth, Ralf W. Seifert

We explore knowledge spillovers in the supply chain and empirically show that buyer innovation has a strong positive impact on supplier innovation. We find that the duration of the buyer-supplier relationship positively moderates this effect, but that tie strength has a negative moderating role. The technological proximity of the two firms, however, is not found to have a significant effect on spillovers.

Models of Human Dynamics in Social Data

Cluster: Social Media Analytics

Invited Session

Chair: Tauhid Zaman, MIT Sloan School of Management, 50 Memorial Drive, Cambridge, MA, 02139, United States of America, zlisto@mit.edu

1 - A Billion Social Networks: What Each of Our Networks Says About Us

Lars Backstrom, Facebook, 750 N Shoreline Blvd #68, Mountain View, CA, 94043, United States of America, lars@fb.com

At Facebook, over a billion people engage with their friends each month. All this activity gives us a unique opportunity to understand real social networks. In microcosm, we can watch as new friendships turn into relationships, then engagements and finally marriages, observing effects on the rest of the network. Zooming out, we can observe the small world effect on a significant fraction of the whole world. Studying human relationships is now possible on a scale never previously imagined.

2 - The Structure and Evolution of Communities on Twitter

Gabor Szabo, Staff Data Scientist, Twitter, 1355 Market St, Suite 900, San Francisco, CA, 94103, United States of America, gabor@twitter.com, Satanjeev Banerjee

Social media services oftentimes facilitate the creation of connections among the users, based on shared interests or real-life relationships. As determined by their local network structure, most users are only linked to a very small fraction of the entire user base. In this paper we identify these dense subgraphs of the Twitter follower network as communities through a scalable algorithm, and describe their self-similar structure and temporal evolution.

3 - Tweet Time: Optimizing the Timing of Content in Twitter

Sina Modaresi, Graduate Research Assistant, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, sim23@pitt.edu, Tauhid Zaman, Juan Pablo Vielma

In online social networks, such as Twitter, users generate content for which they wish to maximize engagement by other users. We show how one can select the time the content is posted in Twitter in order to maximize its engagement. We present a model of user behavior which combines temporal and network aspects of Twitter. Our model is fairly general and can extend to other social networks, but we focus on Twitter because the data is readily available.

4 - Twitter as a Sensor Network: Detecting Change-points in Social Signals

Arash Delijani, MIT, 404A Broadway, Cambridge, MA, 02139, United States of America, arashd@mit.edu, Tauhid Zaman

We study the problem of detecting trending events in Twitter. We model this as a change-point detection problem, and use the Cumulative Sum (CUSUM) algorithm, which is optimal for this task. We test different models of user behavior on a large amount of historical data, and use them along with CUSUM, to detect trending events and evaluate our performance on events with known starting times. We also provide theoretical bounds for the detection delay of CUSUM for various models of user behavior.

E-Business/ Commerce 1

Contributed Session

Chair: ShiKui Wu, Assistant Professor, University of Windsor, 401 Sunset Ave., OB-413, Windsor, ON, N9B 3P4, Canada, skwu@uwindsor.ca

1 - Modelling Pricing Strategies for Internet Domain Names
Claudia Loebbecke, University of Cologne, Pohligstr. 1, Koeln, Germany, claudia.loebbecke@uni-koeln.de, Thies Lindenthal

Interested in buyers' and sellers' pricing strategies for Internet domain names, we develop and empirically test a hedonic model for domain prices. We find differences in the implicit prices for selected domain attributes across different types of buyers, but no evidence of sellers being able to discriminate between the different buyer types.

2 - The Effect of Motivations on Mobile Coupon Sharing in Social Network Sites
Qing Tang, Huazhong University of Science & Technology, 1037 Luoyu Road, Wuhan, China, tangqing0825@gmail.com, Shan Liu

This study aims to examine the possible influence of SNS users' intrinsic and extrinsic motivations on m-coupon sharing and how users' coupon proneness affects sharing intention. Considering the act of sharing m-coupon is special case of viral marketing, we investigated four potential motivations: sense of self-worth and socializing from intrinsic motivations, economic reward and reciprocity from extrinsic motivations.

3 - The Role of E-commerce in Cross-border Transportation: An Integrative View
ShiKui Wu, Assistant Professor, University of Windsor, 401 Sunset Ave., OB-413, Windsor, ON, N9B 3P4, Canada, skwu@uwindsor.ca

This study investigates the role of e-commerce in a cross-border context at two levels: business-to-business and business-to-consumer. It examines the synergies between offline and online channels in key business operations, and investigates bidirectional and dynamic effects of e-commerce on transportation operations. Using case studies and simulations this study provides insights and guidelines for e-commerce practice in cross-border transportation.

4 - Goal-driven Analysis of Social Influencers
Roman Vaculin, Research Staff Member, IBM Research, 1101 Kitchawan Rd, Yorktown Heights, NY, 10598, United States of America, vaculin@us.ibm.com, Yosi Mass, Indrajit Bhattacharya, Jonathan Herzig

Definition and identification of social influencers largely depend on the purpose and context in which influencers are used. Given different goals, such as maximizing marketing campaign audience, maintaining brand awareness, spreading a credible message, or maximizing speed of message spread, different metrics achieve good results. In this work we present results of our experiments and demonstrate effectiveness of various traditional influence metrics with respect to given goals.

5 - Joint Optimization of Order Sourcing Assignment and Parcel Delivery for Online Supermarket with a Multi-warehouse System
Xiangpei Hu, Dalian University of Technology, Linggong Road,Ganjingzi District, Dalian, China, drhxp@dlut.edu.cn, Minfang Huang, Yuankai Zhang

For online supermarket with multi-warehouse system and two-stage distribution network, we develop a model for joint optimization of order sourcing assignment and parcel delivery, which can be regarded as the solution of a special kind of Location-Routing Problem. The model determines the assignment of order items to each warehouse and optimal delivery schemes to customers.

Supply Chain/Green I

Contributed Session

Chair: Vincent Slaugh, PhD Candidate, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, vslaugh@cmu.edu

1 - Rental Inventory Management with Usage-Based Loss
Vincent Slaugh, PhD Candidate, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, vslaugh@cmu.edu, Bahar Biller, Sridhar Tayur

We study the operation of a discrete-time stochastic rental system over a single selling season in which rental units may be purchased or damaged by customers. We provide structural results related to the expected profit function and the optimal policy for allocating rental units to meet customer demand. In an industrial use case motivated by a high-fashion dress rental business, we show significant value to accounting for inventory loss and using the optimal inventory allocation policy.

2 - Product Remanufacturing in China's Projector Market
Huanming Li, Mitsubishi Electric Air-Conditioning & Visual Informations Systems (Shanghai) Ltd, No.300 East Nanjing Road, Shanghai, Sh, 200001, China, huanming.li@mlc-cn.com, Yi Liao

The whole market size for projectors in exhibition has a dramatic rise in China? However, one of the most important projector market's features is "declining price". This case study addresses on how to implement collection and remanufacturing of used products to improve environmental performance as well as profits?

3 - Energy Efficiency Contracting in Supply Chains
Ali Shantia, HEC Paris, 1, Rue de la liberation, Jouy-en-Josas, 78350, France, ali.shantia@hec.edu, Sam Aflaki, Andrea Masini

Increasing energy efficiency (EE) diminishes production costs of upstream suppliers while mitigating their environmental footprint. This study analyses the effects of bargaining power of a downstream retailer and EE technology uncertainty on adoption of energy efficiency technologies by a single manufacturer. Analyzing and comparing multiple contracting arrangements currently practiced in the industry, we study how energy service companies can affect supply chain coordination for EE.

4 - A Green Logistics Framework for Integrated Production-Distribution under Uncertainty
Aly Megahed, Research Staff Member, IBM Research - Almaden, 650 Harry Road - Office D3-428, San Jose, CA, 95120, United States of America, aly.megahed@us.ibm.com, Nagham El-Berishy, Bernd Scholz-Reiter

We present a mathematical modelling framework for integrated production-distribution of a real-world problem in the batch process industry in which we incorporate the green aspect of carbon emissions under uncertainty. The emissions are modeled as a function of the realized velocities at different distribution routes. We show how such integration could achieve significant cost savings. We also illustrate the impact of environmental regulations that governments impose on total supply chain costs.

Hilton- Continental 8

Supply Chain, Risk Management III

Contributed Session

Chair: Bo Li, PhD Student, Texas A&M University, 4217 TAMU, 320M Wehner, College Station, TX, 77840, United States of America, bli@mays.tamu.edu

1 - Contagion Risks in Supply Chains
Alireza Azimian, PhD Student, WLU, Unit 103, 55 Hickory Street E, Waterloo, ON, n2j3j5, Canada, azim9110@mylaurier.ca, Hamid Noori, Kevin Hendricks

While most of the papers in the context of Supply Chain Risk Management have addressed the threats associated with customers and suppliers, risks posed by rivals have received little to no attention in the supply chain literature. This research fills this gap by exploring how adverse consequences of incidents happened for a focal firm's supply chain may spread to its industry rivals; and what factors may contribute to significance of such contagion effect.

2 - Supply Chain Risk Mitigation using Information Sharing
Ek Peng Chew, Associate Professor, National University of Singapore, 10 Kent Ridge Crescent, Singapore, 117576, Singapore, isecep@nus.edu.sg, Loo Hay Lee, Yi Tao

We study the impact of information sharing in a supply chain which consists of one retailer and two suppliers, among which each individual player has profit maximization as his primary objective. Using the game theory, we show that under some situations, prisoner dilemma phenomenon will exist. Hence some incentive schemes need to be implemented in order to incentivize the players in sharing the information.

3 - Supply-Chain Management under Conditional Value-at-Risk
Bo Li, PhD Student, Texas A&M University, 4217 TAMU, 320M Wehner, College Station, TX, 77840, United States of America, bli@mays.tamu.edu, Antonio Arreola-Risa

We consider a single item production-inventory system with stochastic demand and production, where inventory is controlled by a base-stock policy and unfilled demands are back-ordered. The relevant costs are inventory holding and back-ordering, which can be significant for high-value products. We propose Conditional Value-at-Risk (CVaR) as the decision criterion. We find the optimal base-stock level that minimizes CVaR for various model formulations and analyze the optimal solutions obtained.

4 - Characteristics of Risk Contagion along an Industrial Chain: Empirical Evidences from Shipbuilding

John Liu, Professor, City U of HK, Tat Chee Ave, Kowloon, Hong Kong - PRC, johnliu@cityu.edu.hk, Hui Bu, Yingfeng Wang

In this paper, we study empirical characteristics of risk contagion through an industrial chain, in the context of national shipbuilding-shipping industries, where risk contagion is referred to serially interrelated volatility triggered by uncertain events such as the global financial crisis of 2008. We develop DCC-GARCH models to estimate the conditional standard deviations and dynamic correlations of these time series.

5 - An Agriculture Feed Processing Supply Chain Modeling

Fesseha Gebremikael, Graduate Student, North Dakota State University, 253 University Village, Fargo, ND, 58102, United States of America, fesseha.gebremikael@my.ndsu.edu, Iddrisu Awudu, Khalid Bachkar

Risk management considering an agricultural firm that produces and sells transformed products. We consider a firm that has peanuts and corn as inputs. The supply chain consists of purchasing corn and peanuts, storage, transformation of the two inputs into the desired outputs, and shipping the outputs to customer destinations. A deterministic model is developed and further stochastic model is proposed. This case study is solved by using the AHP. The results indicate a good balance with buying and selling of the inputs in a hedging/risk management situation which is involves rationing.

Supply Chain Optimization I

Contributed Session

Chair: Guoqing Zhang, Professor, University of Windsor, 401 Sunset Avenue, Windsor, Canada, gzhang@uwindsor.ca

1 - Multi-item Dual-Channel Supply Coordination for Online Shopping

Guoqing Zhang, Professor, University of Windsor, 401 Sunset Avenue, Windsor, Canada, gzhang@uwindsor.ca

We consider an e-business retailer who has a dual-channel supply network with a fulfilling center and multi-supplier for different items. The retailer can deliver the products from either the fulfilling center or the manufacturer who produces the product, depending on the geographic location of the customers and product availability. The problem is to determine the optimal order quantities in both retailer's fulfilling center and the supplier's warehouse with considering the space limitation.

2 - On the Multiple-machine Tardiness-minimization Problem with Nested Sequencing and Shared Resources

Yijun Wang, Rutgers University, 1 Washington Park, Newark, NJ, 07029, United States of America, yijun@pegasus.rutgers.edu, Lei Lei, Kangbok Lee

We consider the multiple-machine scheduling problem where a) the processing of a subset jobs involves external contracted manufacturers; and b) the starting time of internal processing depends on the availability of a shared resource. The objective is to minimize the total weighted tardiness. We define this problem as a MIP model and introduce two polynomial-time solvable cases. Examples with real data are presented.

3 - Modeling the Biofuel Supply Chain System from Dedicated Energy Crop under Uncertainty

Yuanzhe Li, PhD Student, Department of Civil and Environmental Engineering, University of California, Davis, University of California Davis, One Shields Avenue, Davis, CA, 95616, United States of America, rgli@ucdavis.edu, Yueyue Fan, Nathan Parker, Quinn Hart

A stochastic program is developed to model a complex biofuel production system using dedicated energy crop as feedstocks. By integrating agricultural land allocation and poplar adoption decisions and considering uncertainties in poplar yield, we aim to finding the optimal strategies for maximum system profit. Statistical approximation and decomposition methods are used to solve the stochastic mixed-integer programming model.

4 - A Computational Study for Common Network Design in Multi-commodity Supply Chains

Ting Wu, Nanjing University, No more22,Hankou Road, Nanjing, China, tingwu@nju.edu.cn

In this paper, we study a supply chain network design problem which consists of one external supplier, a set of potential distribution centers, and a set of retailers, each of which is faced with uncertain demands for multiple commodities.The goal is to minimize the system-wide cost. We propose a general nonlinear integer programming model for the problem and present a cutting plane approach to solve it.Computational results show that the proposed algorithm is efficiently.

5 - A Bi-level Stochastic Programming Model for Supply Chain Network Design with Assembly Line Balancing

Nima Hamta, PhD Candidate, University at Buffalo, SUNY, 437 Bell Hall, Department of ISE, University at Buffalo, SUNY, Amherst, NY, 14260, United States of America, nimahamt@buffalo.edu, Sara Behdad, Mohsen Akbarpour Shirazi, S.M.T. Fatemi Ghomi

The purpose of this paper is to integrate the strategic and tactical decisions in the supply chain network design (SCND) under demand uncertainty. The new bi-level stochastic programming model developed in this paper considers the SCND problem as a strategic decision in the upper-level model, while addressing the assembly line balancing as a tactical decision in the lower-level model. In addition, a scenario-based heuristic method is proposed to solve the developed model.

Supply Chain/Decision Analysis

Contributed Session

Chair: Gang Xie, Associate Professor, Academy of Mathematics and Systems Science, Chinese Academy of Sciences (CAS), 55 Zhongguancun East Road, Haidian Distr, Beijing, Ch, 100190, China, gxie@amss.ac.cn

1 - Combined Qualitative and Quantitative Analysis of the Thai Silk Industry

Natawat Jatuphatwarodom, University of Portsmouth, Flat 88, Fellows Court, Weymouth Terrace, London, E2 8LN, United Kingdom, natawat.jatuphatwarodom@port.ac.uk

This research is aimed at developing logistic and supply chain models that support policy decisions of the Thai Silk manufacturers' key decision makers. The constraints that restrict the expansion of the Silk industry are analysed. Supplier selection and Inventory management models were selected to be focal studies. Operational Research models (AHP/DEA/GP) were applied within the case studies.

2 - Emission-dependent Production and Policy Implications Considering Government Subsidies

Yu Jiao Zhu, University of Science and Technology of China, School of Management, Hefei, China, yujiaozh@mail.ustc.edu.cn

Based on the newsvendor model, this paper studies the impacts of government subsidies policy on emission-dependent manufacturer's decision-makings, and discusses the right way for the manufacturer to obtain emission permits. The analysis shows that after pushing the subsidy policy, the optimal production quantity of the emission-dependent manufacturer decreases.

3 - Optimal Outsourcing Strategies when Capacity is Limited

Salar Ghamat, PhD Student, Richard Ivey Business School, 1255 Western Road, London, ON, N6G 0N1, Canada, sghamat@ivey.ca, Xinghao Yan, Hubert Pun

Many Original Equipment Manufacturer (OEM) outsource some of their products' components to third-party suppliers. Some of these suppliers are competitive component manufacturers (CCM) that produce substitutable products. We consider a model where OEM has two potential suppliers: an independent supplier and a capacitated CCM. We take a game theoretic approach to find OEM's optimal outsourcing strategy. We show that, CCM may decrease its own output to satisfy the component demand of the OEM.

Semiconductor Industry

Contributed Session

Chair: Mehmet Candas, Sr. Manager - IT Global Operations | Supply Chain, AMD, 7171 Southwest Pkwy., Austin, TX, 78735, United States of America, mfcandas@gmail.com

1 - Semiconductor Manufacturing Planning: Challenges and Solution Approaches

Mehmet Candas, Sr. Manager - IT Global Operations | Supply Chain, AMD, 7171 Southwest Pkwy., Austin, TX, 78735, United States of America, mfcandas@gmail.com, Enes Bilgin

Supply chain manufacturing planning involves many challenges, due to complexity and stochasticity of the manufacturing process, coupled with the sophisticated co-production, down-grading, and re-claiming activities. We will present our approach to handle these challenges while developing a decision support system for AMD's supply chain.

2 - Semiconductor Supply Chain Production Planning under Uncertainty

Jon Lowe, Graduate Research Assistant, Clemson University, 103 Freeman Hall, Clemson, SC, 29631, United States of America, jjlowe@clemson.edu, Scott Mason

Due to the high risk of obsolescence due to rapid technology changes, semiconductor manufacturers are reluctant to maintain large amounts of inventory in their supply chains. However, some inventory is needed to meet forecasted demand on time. We present a master planning stochastic program for the semiconductor supply chain and demonstrate the model's ability to schedule production under uncertain yield, lead time, and demand parameters using an industrial data set.

3 - Buyer Strategies to Maintain Suppliers in Development-Intensive Supply Chains

Mericcan Usta, Stanford University, 475 Via Ortega Ste 245, Stanford, CA, 94305, United States of America, usta@stanford.edu, Warren H. Hausman, Feryal Erhun

In industries including semiconductor and defense, the prominent buyer has to simultaneously maintain a supplier base and attain ambitious R&D goals. In collaboration with Intel, we propose several strategies through game-theoretic models. Those are: egalitarian value allocation in the face of relationship decline, commitment to develop non-focal suppliers against increased supplier asymmetry, and commitment to competitive price targets to achieve synergistic benefits of supplier collaboration.

Empirical Studies in Revenue Management and Pricing

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu

Co-Chair: Necati Tereyagoglu, Assistant Professor of Operations Management, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Necati.Tereyagoglu@scheller.gatech.edu

1 - Multisupplier Contact in the U.S. Ketchup Industry

Necati Tereyagoglu, Assistant Professor of Operations Management, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Necati.Tereyagoglu@scheller.gatech.edu, O. Cem Ozturk

We examine empirically the effects of multisupplier and multimarket contact on pricing decisions of retailers in the U.S. ketchup industry. We find that prices are higher in markets served by retailers with extensive contacts in others markets. Moreover, we show that prices are higher when retailers use the same suppliers.

2 - Identifying Competitors in Markets with Fixed Product Offerings

Marcelo Olivares, Assoc. Professor, Columbia University, Broadway 3027, New York, NY, United States of America, molivares@columbia.edu, Roger Lederman, Garrett van Ryzin

We develop a novel methodology to identify competitors in markets where spatial location is an important factor of differentiation. In these markets, competition is determined by the preferences of different customer segments, which we identify using variation in observable attributes that determine the size of the distinct customer segments. We apply our methodology in the hotel travel industry, where the characterization of key competitors is used in practice to benchmark hotel performance.

3 - Who Are My Competitors: Drivers of Hotel Online Competition

Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu, Serguei Netessine, Sergei Koulayev

Hotel managers who used to identify competition set by looking across the street, are now faced with extensive competition as availability and price information are made nearly transparent online. What (and who) drives hotel competition in the new era? Using consumer click-stream data from two major online travel intermediaries, we develop a model to describe how different types of consumers search and how do these distinct search patterns influence hotel online competition.

Design and Control of Service Systems

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Serhan Ziya, Associate Professor, University of North Carolina at Chapel Hill, NC. ziya@unc.edu

1 - Routing Based on Service Rates to Incentivize Strategic Servers in Many-Server Systems

Sherwin Doroudi, Tepper School of Business; Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, sdoroudi@andrew.cmu.edu, Ragavendran Gopalakrishnan, Amy Ward, Adam Wierman

Traditionally, research focusing on the design of routing policies for service systems has modeled servers as having fixed, possibly heterogeneous service rates. However, service systems are often staffed by people. Then, the rate a server chooses to work is impacted by the system's routing policy. We analyze the impact of "strategic servers" on system performance in many-server systems using a novel technique of differentiating the balance equations of the underlying heterogeneous M/M/N system.

2 - Tandem Queues with Reneging

Jianfu Wang, Assistant Professor, Nanyang Business School, Block S3, 50 Nanyang Avenue, Singapore, 639798, Singapore, jianfu.wang.ntu@gmail.com, Hossein Abouee Mehrizi, Oded Berman, Opher Baron

This paper considers a two-station tandem queueing system with reneging. We develop a new technique to solve two dimensional Markov chains. We use this technique to derive the distribution of number of customers in each station. This technique can be applied to many different settings for different service level measures. We employ the method to solve a system design problem and investigate the effect of cross-trained servers.

3 - Dynamic Multi-class Kidney Allocation

Valery Pavlov, University of Auckland Business School, Private Bag 92019, Auckland, 1142, New Zealand, v.pavlov@auckland.ac.nz, Ali Vahabzadeh

In the US alone, every year several thousand people die while waiting for a kidney transplant but, at the same time, thousands of suitable donor organs are eventually discarded. Our model is aiming to provide insights about possible measures, in-line with the current policies, to reduce the waste.

4 - The Effect of Random Waits on Customer Queue Joining and Reneging Behavior: A Laboratory Experiment

Zeynep Aksin, Koc University, Sariyer, Istanbul, Turkey, ZAKSIN@ku.edu.tr, Busra Gencer, Evrim Gunes, Ozge Pala

In many service settings, customers encounter queues and have to decide between joining, balking and reneging. This study investigates customers' queue joining and reneging behaviors via a laboratory experiment in which participants experience several observable queues with different characteristics in terms of queue length (long/short) and service times (deterministic/random)and decide to join, balk or renege. We analyze the effects of random service times on joining and reneging behavior.

Big Data Analytics and Predictive Modeling in Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Yingying Kang, Principal Operations Research Consultant, Sabre Holdings Inc., 3150 Sabre Drive, Southlake, TX, 76092, United States of America, Yingying.Kang@sabre.com

1 - A StaticModel in Single-leg Flight Airline Revenue Management

Behrooz Pourghannad, Ph.D. Student, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48104, United States of America, behrooz@umich.edu, J.B.G. Frenk, Semih O. Sezer

We present a static single-leg airline revenue management. Requests for fare classes arrive according to independent non-homogeneous Poisson processes where cancellation and no-shows are considered. The objective is to find an optimal closing time(s) which maximizes the expected net revenue. We consider the time-dependence of the demand. Compared to dynamic continuous time models, mostly exponential time-to-cancellations, our model can be applied with arbitrary distributions for cancellations.

2 - Shaping Demand to Match Anticipated Supply
Sifeng Lin, Graduate Student, the Graduate Program of Operations Research and Industrial Engineering, the University of Texas at Austin, Austin, TX, 78712, United States of America, sifenglin@utexas.edu, Anant Balakrishnan, Yusen Xia

Firms can use dynamic pricing strategies to match anticipated demand with supply. In this paper, we develop an economic model to address these short-run demand shaping decisions for vertically differentiated products. The manufacturer must decide what prices to set for high quality and low quality products to judiciously and dynamically segment the market so as to maximize total profits. We identify properties of the optimal price and sales trajectories and the benefit of dynamic pricing.

3 - Revenue Management for Off-street Parking Lots
Manuel A. Bollvar, Universidad de Los Andes, Cra 1 Este No 19A - 40, Edificio Mario Laserna, Bogot·, Colombia, ma.bolivar643@uniandes.edu.co, Andrés L. Medaglia, Carlos Felipe Valencia, Raha Akhavan Tabatab, Carlos Felipe Ruiz

Off-street parking lots rely on the fact that customers' needs differ from one another, encouraging the use of distinctive fares (i.e., per time-fraction and subscription) to increase the revenue. We propose a methodology to forecast demand and obtain near-optimal subscription-selling policies for new parking lots based on historical data from existing lots for a parking company in Bogot· while considering the decision makers' preferences in avoiding customer rejection.

Retail Operations

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Shengqi Ye, Indiana University at Bloomington, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, shye@indiana.edu

1 - The Operational Value of Social Media Information
Ruomeng Cui, Assistant Professor, Kelly School of Business, Bloomington, IN, 47405, United States of America, cuir@indiana.edu, Antonio Moreno-Garcia, Dennis Zhang, Santiago Gallino

We empirically explore how social media information helps sales forecasting. Using (1) daily sales data from an online apparel startup company that primarily advertises on Facebook, and (2) publicly available Facebook posts and the users' comments and likes data, we find a statistically significant improvement in sales forecast accuracy. We analyze the underlying mechanism—the attention effect and the word-of-mouth effect. We quantify the operational value of social media information.

2 - Campaign Earlier or Later? Sponsored Search Advertising when Customers Re-click
Shengqi Ye, Indiana University at Bloomington, 1309 E. 10th Street, Bloomington, IN, 47405, United States of America, shye@indiana.edu, Shanshan Hu, Goker Aydin

Customers might click a retailer's link and check its product multiple times before making purchasing decisions. Noting this behavior, we investigate the retailer's optimal advertising policy when selling seasonal products over a predetermined horizon. We show that the retailer may want to advertise aggressively early in the selling season.

3 - Learning Consumer Tastes from Dynamic Assortments: A Nonparametric Bayesian Model
Dorothee Honhon, Assistant Professor, University of Texas at Dallas, Naveen Jindal School of Management, Dallas, TX, 75080, United States of America, Dorothee.Honhon@utdallas.edu, Canan Ulu

We study assortment decisions of a firm learning about consumer tastes. Each period, the firm offers an assortment to maximize expected total profits given its subjective beliefs on consumer tastes. Consumers choose a product that maximizes their utility and the firm updates its beliefs after having observed sales. We develop a nonparametric Bayesian learning model using Polya tree priors. We develop upper bounds on the firm's profit and study various heuristic policies.

4 - Optimal Merchandise Testing with Limited Inventory
Zhe Wang, UNC Chapel Hill, CB 3490, Chapel Hill, NC, 27599-3490, United States of America, zhe_wang@unc.edu, Adam Mersereau, Li Chen

We consider a retailer allocating a limited inventory among its stores for a "merchandise test" to learn about demand prior to a main selling season. The key tradeoff is between spreading inventory among many stores to get more sales observations versus consolidating inventory in a few stores to avoid stockouts and demand censoring. We characterize optimal policies with identical and non-identical stores and with and without sales timing information.

1 - Dynamic Modeling for Arctic Resource Allocation
Richard Garrett, Ph.D. Student, Rensselaer Polytechnic Institute, 539 Congress Street, Troy, NY, 12180, United States of America, garrer3@rpi.edu, Thomas Sharkey, Martha Grabowski, William Wallace

Interest in energy prospects has increased the potential for an oil spill incident in the Alaskan Arctic. A dynamic network expansion problem with stochastic scenario considerations is proposed to assess oil spill response resource allocation policies. The focus is on addressing task lists required for all potential spills to improve the objective of weighted task completion times. Stochastic programming solution methods are employed, and observations and performance results are discussed.

2 - Aviation Resource Optimization Model for the USCG
Christie Nelson, CCICADA, Rutgers University, 4th Floor, CoRE Bldg, 96 Frelinghuysen Road, Piscataway, NJ, 08854-8018, United States of America, christie.l.nelson.phd@gmail.com, James Wojtowicz, Paul Kantor, Thomas Rader, Chad Conrad, Endre Boros, Fred Roberts, Brian Ricks, Kevin Hanson, Brian Nakamura, Curtis McGinity

A model was created for the USCG to maximize aircraft fleet operational performance subject to budgetary constraints or to minimize fleet operational costs subject to performance targets. The model determines optimal deployment assignments, operational levels and aircraft allocation among USCG Air Stations for current infrastructure. It can also demonstrate potential efficiencies of proposed infrastructural changes and can be generalized for different types of aircraft and performance.

3 - Comparing Patron Screening Procedures at Professional Sports Stadiums
Brian Ricks, CCICADA, Rutgers University, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, bcr50@scarletmail.rutgers.edu, Robert DeMarco, Brian Nakamura, Paul Kantor, Christie Nelson, Fred Roberts, Alisa Matlin, Cindy Hui, Holly Powell, Brian Thompson, Michael Tobia

Security officials balance difficult tradeoffs when choosing between patron screening methods. Together with NFL security personnel, we developed a novel patron screening model to contrast popular screening techniques, including walk-through magnetometers, wandings, and patdowns. We validated our model using ticket scan data and expert experience. The results helped guide the stadium in its future screen practices. Our approach is flexible enough to inform security personnel at any venue.

1 - Long Term Freight Network Planning for Northern Australia using Incremental Network Flow
Leorey Marquez, Research Scientist, CSIRO, Private Bag 10, Clayton South, 3169, Australia, leorey.marquez@csiro.au, Melanie Ayre, Asef Nazari, Simon Dunstall, Andreas Ernst

Mining, agricultural and other commercial operations often require the transport of large quantities of materials between remote locations in Australia. This talk looks at the problem of deciding on investments to upgrade transportation infrastructure to meet expected future demand. The talk will present a model using a multi-period incremental network flow design, describe a matheuristic approach for solving the problem and present results demonstrating the effectiveness of the approach.

2 - Dynamic Discrete Network Design Problem – Application to Road Maintenance Planning

Pirmin Fontaine, Technische Universitat München, Arcisstrafle 21, Munich, 80331, Germany, pirmin.fontaine@tum.de, Stefan Minner

The deterioration of streets decreases the quality of road networks. Therefore, streets need to be maintained from time to time. We introduce a bilevel formulation by extending the Discrete Network Design Problem over several periods. This model is solved by a terminated Benders Decomposition approach. A numerical study shows the efficiency of this method and the quality of heuristical solutions without reaching convergence.

3 - Joint Optimization of Various Pavement Management Actions with Non-Markovian Deterioration

Jinwoo Lee, University of California, Berkeley, Berkeley, CA, United States of Americajinwoolee@berkeley.edu, Samer Madanat

We present dynamic programming solutions for the joint optimization of pavement maintenance, resurfacing and reconstruction activities. The majority of the literature does not consider reconstruction in optimization. We show that this leads to suboptimal policies. We use a non-Markovian pavement deterioration model, which is more realistic than the memoryless models.

1 - A Deterministic Network Model for Global Thermal Coal Optimization

Ashly Arigoni, Colorado School of Mines, Golden, CO, UniteD States of America, aarigoni@mymail.mines.edu

Our objective is to minimize the cost to ship thermal coal from supply regions to fill demand while respecting import and export port capacities, ship size constraints, and coal specification requirements. The global thermal coal model allows demand nodes to incorporate different coal qualities from different sources to observe minimum heat content and maximum sulfur and ash content, as well as fulfill demand requirements, all while maintaining the overall goal of minimizing total cost.

2 - An Options-Based Pricing Scheme for a Highway Reservation System on Truck-only Lanes

Chiungryeol Lee, Purdue University, 550 Stadium Mall Drive, West Lafayette IN 47907, United States of America, lee1210@purdue.edu, Srinivas Peeta

This study explores an options-based pricing scheme for a highway reservation system for truck-only lanes that guarantees a threshold speed level. The risk for highway operators in failing to meet the promised speed is considered in the pricing process. Numerical experiments illustrate that the proposed approach can help improve reliability in the freight industry while reducing traffic congestion in the highway system.

3 - Train Dispatching Problem under Exact Travel Time Estimation

Maged Dessouky, University of Southern California, 3715 McClintock Ave, Los Angeles, CA, United States of America, luncefu@usc.edu, Maged Dessouky

We consider the problem of dispatching trains through the railway network. Different speed limits are applied to different track segments and junctions. Travel time is obtained by accounting for the train's dynamics. This is a complex problem since the travel time on an edge depends on the entering velocity and exiting velocity. Therefore Dijkstra's algorithm doesn't guarantee optimality. We explore other heuristics and simulation is conducted to compare the proposed algorithms with Dijkstra's algorithm.

4 - Time-Dependent Pickup and Delivery TSP with Time Windows, Profits and Transfers

Peng Sun, TU/e, Pav E 17, Eindhoven 5600MB, Netherlands, P.Sun@tue.nl, Said Dabia, Tom Van Woensel

This problem is defined on a graph containing both transfers nodes and requests vertices where it is not necessary to visit all of them. Moreover, it also captures road congestion by considering time-dependent travel times. The problem consists of determining a tour that simultaneously optimize the collected profits and the total route duration. Thus, we present a time-dependent labeling algorithm to tackle this problem. The new dominance criteria is also introduced.

5 - Multi-commodity vs. Single-commodity Routing

Claudia Archetti, University of Brescia, C.da S.Chiara 50, Brescia 25122, Italy, claudia.archetti@unibs, Ann M. Campbell, M. Grazia Speranza

We study a routing problem where multiple commodities are requested by customers. We analyze the impact on transportation cost from using vehicles dedicated to a single commodity compared with using flexible vehicles capable of carrying any set of commodities. If multiple vehicles can be used, we examine when deliveries of individual commodities can be split and when they may not be split. We use worst-case and computational analysis to compare these different models.

1 - Performance Observation in Privacy Ensured Connected Vehicle Environment using Vehicle Trajectories

Shayan Khoshmagham, University of Arizona, 1127 E. James E. Rogers, Tucson, AZ, 85721, United States of America, shkhoshmagham@email.arizona.edu, Larry Head, Mehdi Zamanipour, Yiheng Feng

This paper introduces an approach to observe the performance measures of a multi-modal transportation system in a connected vehicles environment. An Extended Tardiness Function (ETF) is deployed to guarantee that dynamic mobility applications ensure privacy. The primary purpose is to estimate performance from observations while not inferring vehicle identification.

2 - Signal Phase Allocation Algorithm in a Connected Vehicle Environment

Yiheng Feng, University of Arizona, 1127 E. James E. Rogers, Tucson, AZ, 85721, United States of America, yihengfeng@email.arizona.edu, Larry Head, Shayan Khoshmagham, Mehdi Zamanipour

A traffic signal phase allocation algorithm based on dynamic programming is proposed to optimize the signal timing in a connected vehicle (CV) environment. The algorithm considers a hierarchical structure with barriers on the upper level and phases on the lower level. Because of the low market penetration rate of CV, data from CV are processed to estimate location and speed of unequipped vehicles. Results show the proposed model has similar performance to well-tuned actuate signal control.

3 - Correcting Count-biases at Freeway Loop Detectors Based on Information from Probe Vehicles

Kwangho Kim, Postdoctoral Researcher, Institute of Transportation Studies, University of California, Berkeley, 416F McLaughlin Hall, UC Berkeley, Berkeley, 94720, United States of America, khkim@berkeley.edu

This paper proposes a new method to correct systematic biases in vehicle counts measured at freeway loop detectors by exploiting the conservation-of-vehicles principle. The proposed method is designed to compensate total count-biases, accumulated during a period, over each intervening time interval in proportion to a time-dependent correction factor, which is periodically adjusted by means of traffic information from probe vehicles. Outcomes from testing the proposed method turn out promising.

4 - An Asset Light Solution for Inter Terminal Transport at the Port of Rotterdam with Fairness

Qing Chuan Ye, PhD Candidate, Erasmus University Rotterdam, P.O. Box 1738, H8 Tinbergen Institute, room H7-26, Rotterdam, 3000DR, Netherlands, ye@ese.eur.nl, Yingqian Zhang, Rommert Dekker

Following the expansion of the Port of Rotterdam with Maasvlakte 2,there will be an increase in inter terminal transport.To accommodate this,we seek to take advantage of excess capacity of already available trucks in a so-called asset light solution by auctioning tasks to trucking companies.In order to avoid peak hours and maintain competition among companies,we do not want to have a mere optimal allocation in terms of costs,but in terms of fairness as well,which poses an interesting trade-off.

1 - Determining Hazardous Distractions for Teenage Drivers

Ali Mohammadhashemi, University of Tennessee-Knoxville, 1209 Clinch Avenue, Knoxville, TN, 37916, United States of America, amohamm7@utk.edu, Seyed Ahmad Niknam, Rapinder Sawhney, Robert Mee

In this research, the teenage drivers (16-19 years old) are driving in a simulation lab and the distractions are done by drivers and the severity of these distractions and their impacts on velocity, lane position , headway distance and safe headway distance is analysed. Finally the most dangerous distractions are identified and the reason why they are more important from other distractions is discussed.

2 - Regulating the Incoming Passenger Flow in Subway Systems during Emergency Situations

Qing Ye, Southwest Jiaotong University, 111 Erhuan Road Beiyiduan, Chengdu, China, qing.yeswjtu@gmail.com, Satish Ukkusuri, Qiyuan Peng

To mitigate the congestion problem in subway system during emergency situations, a control scheme for the incoming passenger flow is necessary and widely applied. In this research, a dynamic control scheme for the incoming passenger flow is proposed. A bi-level model and a sensitivity analysis-based algorithm are provided to regulate the incoming passenger flow. The effectiveness of the proposed approach has been demonstrated with a case study of Beijing subway.

3 - Optimizing the Menu of Travel Options for a Flexible Mobility on Demand System

Bilge Atasoy, Postdoctoral Associate, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, batasoy@mit.edu, Nathanael Cox, Moshe Ben-Akiva, Takuro Ikeda

We introduce a flexible mobility on demand system that provides a menu of options to passengers with the services of mini-bus, shared-taxi and taxi. For each request, a list of options is offered through an optimization framework. First, a myopic model is considered that optimizes the decisions for the current request. A set of experimental results is obtained for a network in Tokyo. Then, an extended model is studied that accounts for future demand in order to improve the quality of decisions.

4 - Stochastic ERU Allocation under Impacts of Secondary Incidents

Hyoshin Park, UMD, College Park, College Park, MD, United States of America, hyoshin0724@gmail.com

An optimal deployment of ERU depends on an incident rate and total delay as main indicators. Secondary-incident-induced delay can be estimated based on the reduced capacity considering primary and secondary incidents.The objective of the problem is to make location-allocation decisions in a way that the sum of the first-stage costs and the expected value of the second-stage costs are minimal.

5 - A Mixed Fleet Sizing Problem with the Green Alternative Fuel Vehicles

Ismail Capar, Texas A&M University, Industrial Distribution Program, College Station, United States of America, capar@tamu.edu, Mesut Yavuz

This research investigates a fleet sizing problem for an operation where a driver provides service to a number of customers at their sites. The operator would like to determine the optimal fleet mix consisting of alternative fuel vehicles (AFVs) with limited driving range and refueling capabilities and internal combustion vehicles without such limitations. We analyze the problem under a stochastic environment and evaluate the impact of route splitting and intraday refueling strategies for AFVs.

Vehicle Routing III

Contributed Session

Chair: Gu Pang, Newcastle University Business School, 5 Barrack Road, Newcastle upon Tyne, United Kingdom, gu.pang@ncl.ac.uk

1 - Multiple Visits Model for Ready Mixed Concrete Delivery

David Rey, The University of New South Wales, UNSW, Sydney, 2052, Australia, d.rey@unsw.edu.au, Mojtaba Maghrebi, Travis Waller

Unlike most vehicle routing formulations, the delivery of Ready Mixed Concrete (RMC) often requires that a customer be visited multiple times in a given time period. Therefore conventional vehicle routing approaches cannot be simply adapted to RMC delivery and new models are required to account for such routing patterns. We introduce a mathematical programming model for the RMC delivery problem that is able to account for multiple customer visits through integer variables.

2 - Inventory Routing and the Optimal Levels of Postponement

Gu Pang, Newcastle University Business School, 5 Barrack Road, Newcastle upon Tyne, United Kingdom, gu.pang@ncl.ac.uk, Luc Muyldermans

We study Inventory-Routing Problems (IRPs). Our aim is to determine the parameter-dependent 'optimal' level of postponement (or accumulation times) when both routing and inventory holding costs are minimised. We carry out the computational experiments by applying the Continuous Approximation models. Our results reveal the 'optimal' accumulation times are dependent on client demand rates, client locations, client service requirements, and service regions.

3 - An Column-Generation Approach to the Public Transit Routing and Network Design Problem

Ran Zhang, University of South Florida, 4202 E Fowler Ave, Tampa, FL, 33620, United States of America, ranzhang@mail.usf.edu

The paper aims to rerouting the passenger paths in an existing public transit network with large passenger flow in China, in order to minimize the total costs of both passengers and operator. A new multi-commodity flow model is proposed and the bus lines can be generated dynamically. A Column Generation algorithm is introduced to solve this problem more efficiently.

4 - Value of Spatial Decision Support in Operations Research

Avijit Sarkar, Associate Professor, University of Redlands, 1200 E. Colton Avenue, Redlands, CA, 92373, United States of America, avijit_sarkar@redlands.edu, Hindupur Ramakrishna

Spatial decision support systems combine operations research (OR) and geotechnology to obtain elegant, efficient solutions for complex problems in routing, location, supply chain and logistics optimization. We provide taxonomy of spatial decision support in OR with focus on the value added by integrating OR with geotechnology in a unified framework.

5 - Branch and Price for the Vehicle Routing Problem with Time Windows and Driving Regulations

Said Dabia, TU/e, Pav F 19, Eindhoven, Ne, 5600MB, Netherlands, s.dabia@tue.nl, Emrah Demir, Maryam SteadieSeifi, Nico Dellaert, Tom Van Woensel

In this presentation, we show an exact algorithm for the vehicle routing problem with time windows considering drivers working and driving hours regulations. The exact algorithm is based on branch and price. The master problem is a standard set partitioning that can be solved by means of column generation. We show how we can handle working and driving hours regulations in the pricing problem of the column generation.

Logistics 3

Contributed Session

Chair: Marcus Ang, Assistant Professor (Education), Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, marcusang@smu.edu.sg

1 - Truck Dispatch Optimization on a Large-Scale Logistics Network

Bo Zhang, Staff Researcher, IBM Research - China, Diamond Building 19-A, ZGC Software Park, Beijing, China, bozbo@cn.ibm.com, Yue Tong, Xin Shi, Hongbo Li

Timelessness of service is among the most important competencies of a logistics service provider nowadays. In our research, we propose a new method to optimize truck dispatching plan that reduces the freight transit times on a logistics network. Numerical experiments are conducted on real-world sized sample networks, the results of which demonstrate the effectiveness and efficiency of our method. Managerial insights are drawn for practitioners in transportation industry.

2 - Green Purchasing: A Mathematical Programming Perspective

Xin Ma, PhD Candidate, Hong Kong Polytechnic University, EF403, Hung Hom, Kowloon, Hong Kong - PRC, maxinstu@gmail.com, Ping JI, Cheng-hu Yang

Game processes between suppliers and manufacturers are presented by using a mathematical programming model. This model not only focuses on the issue of green supplier selection, but also solves the lot sizing issue based on capabilities of selected suppliers. Environmental factors are integrated into the model to study green purchasing.

3 - A Distribution Center where Robots" Pick Orders

Nima Zaerpour, Assistant Professor, VU University Amsterdam, De Boelelaan 1105, Rotterdam, 1081 HV, Netherlands, nzaerpour@rsm.nl

We consider a distribution center, which uses mobile-robotic fulfillment system eliminating walking. In such a system, the robots pick up an entire storage pod and bring it to a pick station, from where the products on the pod are distributed over customer bins. We study the retrieval sequencing and location assignment of storage pods leading to minimum robot's travel time. We propose a simple heuristic, which can substantially reduce the retrieval time.

4 - Optimizing Storage-Class Formation in Unit-Load Warehouses

Marcus Ang, Assistant Professor (Education), Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, marcusang@smu.edu.sg, Yun Fong Lim

We propose a new approach to form optimal storage classes for a unit-load warehouse. Under this approach, we determine the frequency of visits to each storage location based on a linear programming model that considers the warehouse's layout and the arrivals and mean demands of products. We use this frequency of visits to evaluate the "attractiveness" of each storage location. We compare our frequency-based class formation method with a cost-based method and a grid-based method.

Measuring and Managing Delay through Trajectory Analysis

Sponsor: Aviation Applications

Sponsored Session

Chair: Heng Chen, Isenberg School of Management, University of Massachusetts, Amherst, MA, 01003, United States of America, heng@som.umass.edu

1 - Design and Analysis of a Large-Scale Database for Assessing Weather Impact on Passenger Aviation

Brian Lemay, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor MI 48109-2117, United States of America, blemay@umich.edu, Amy Cohn, Ji Wang

To better understand the system-based and propagating impacts of weather-based disruptions, we have developed a large scale database of roughly 70 million flight records and 50 million weather records. We present insights from the design of this database and preliminary analysis.

2 - Optimal Airline Actions during Collaborative Trajectory Options Programs

John-Paul Clarke, Associate Professor, Georgia Institute of Technology, 270 Ferst Drive, Atlanta, GA, 30332, United States of America, johnpaul@gatech.edu, Tim Niznik, Billy Wang, Balaji Nagarajan, Bosung Kim

Collaborative Trajectory Options Programs are designed to reduce en route congestion by rationing capacity. Optimal airline actions during CTOPs are determined via a two-stage algorithm. In stage one, the optimal set of trajectory options to submit is determined given available capacity, FAA rules, and possible actions by other airlines. In stage two, flights are optimally re-assigned to the slots obtained in stage one. Numerical results indicate significant reductions in operations costs.

3 - Optimal Metering Point Locations for Optimized Profile Descent Operations at Airports

Heng Chen, Isenberg School of Management, University of Massachusetts, Amherst, MA, 01003, United States of America, heng@som.umass.edu, Senay Solak

We consider Optimized Profile Descent (OPD) implementations at airports, and develop models to increase potential savings through optimal metering policies, which include identification of the number and locations for metering points. We present an algorithmic framework based on a stochastic dynamic program and a nonlinear stochastic integer program to identify best metering point configurations, and present some numerical results based on actual traffic information at a major U.S. airport.

4 - Vertical Trajectory Optimization to Minimize the Environmental Impact of Terminal Area Operations

Sang Gyun Park, Georgia Institute of Technology, 270 Ferst Drive, Atlanta, GA, 30332, United States of America, sanggyun.park@gatech.edu, John-Paul Clarke

En route descent from a point along the cruise segment to a metering fix at a lower altitude is optimized in the presence of altitude dependent winds. The optimal control problem is formulated with both mixed and pure state inequality constraints for flight envelope protection and passenger comfort, and timing constraints at meter fixes for capacity constraints. The vertical area navigation mode sequence that minimizes the environmental impact is derived from the optimal solution.

Manufacturing 3

Contributed Session

Chair: Paolo Letizia, Assistant Professor of Operations Management, Rotterdam School of Management/Erasmus University, Burgemeester Oudlaan 50, Rotterdam, 3062PA, Netherlands, letizia@rsm.nl

1 - Two Types of Learning Effects on Maintenance Activities

Hakan Tarakci, Assistant Professor, University of North Texas, Box 305249, Denton, 76203, United States of America, hakan.tarakci@unt.edu

In this paper, we study a manufacturing system which is prone to failure. We consider two types of maintenance activities: Preventive (PM) and Corrective (CM). We assume that the repetitive nature of PM enables learning to occur and subsequent PMs take less time and cost less. In addition, the system is also able to learn from its failures in such a fashion that the number of failures in a previous cycle decreases the failure rate in the next cycle.

2 - On the Economic Lot-Size Scheduling and Pricing for Multiple Products

Alireza Kabirian, Case Western Reserve University, 10900 Euclid Avenue, Cleveland, OH, 44106, United States of America, akabirian@csun.edu

In this paper, the economic production quantity problem for multiple products on a single-machine system is extended. It is assumed that annual demands of the products are functions of prices set by manufacturer. This extension considers an objective function comprised of sales revenues, inventory and setup costs as well as the costs of production. Non-linear programming methods are investigated for solving the models obtained.

3 - Achieving Zero Accident Facility

Mohammad Ali Asudegi, RA, University of Tennessee, 301 Woodlawn Pike Apt C6, Knoxville, TN, 37920, United States of America, aliasudegi@gmail.com, Rapinder Sawhney

Achieving Zero Accident approach has been the focus of many manufacturing companies for a while. The ultimate goal of this study is to develop a structure for a medium size manufacturing company to become a Zero Accident facility using statistical methods. Implementing the proposed guideline is found to be beneficial in preventing incidents in the workplaces.

4 - Quality Control in an Export Processing System
Paolo Letizia, Assistant Professor of Operations Management, Rotterdam School of Management/Erasmus University, Burgemeester Oudlaan 50, Rotterdam, 3062PA, Netherlands, letizia@rsm.nl, Long Gao

Export-processing is offshored production from developed countries. The majority of procurement contracts that are adopted for export-processing are flexible and do not specify product quality. Through contract theory we show that flexible contracts are preferred by the manufacturer when the product quality cannot be effectively communicated between the parties.

Operations Management/Marketing Interface III

Contributed Session

Chair: Abhishek Shinde, Doctoral Student, Indian Institute of Management Calcutta, India, Room No C 203 Lake View Hostel, IIM Calcutta, Joka, DH Road, Kolkata, Wb, 700104, India, abhishekjs11@iimcal.ac.in

1 - Cash Conversion Cycle Consideration in Resource Constrained Supply Chain
Abhishek Shinde, Doctoral Student, Indian Institute of Management Calcutta, India, Room No C 203 Lake View Hostel, IIM Calcutta, Joka, DH Road, Kolkata, Wb, 700104, India, abhishekjs11@iimcal.ac.in, Nishant Kumar Verma

Often in marketing 'cash-to-cash-cycle' - ability of an organization to handle operating capital and meet operating expenses-is ignored, which can ultimately result in series of payment crisis and question the survivability of the organization . In our research paper we have discussed the importance of 'cash-to-cash-cycle' consideration in cash strapped channel partner and developed a model to prioritize the products to optimize cash-to-cash-cycle period.

2 - Channel Strategy Considering Store Brand Introduction: The Robinson-Patman Act Actually Helps
Yannan Jin, School of Management, Fudan University, No. 670, Guoshun Road, Yangpu District, Shanghai, China, jinyannan61@gmail.com, Xiaole Wu, Qiying Hu

Motivated by the prevalent phenomenon of store brand entry in the retailing market, this paper studies a manufacturer's channel strategy taking into account retailers' potential store brand introduction under two scenarios: in the presence and absence of the Robinson-Patman Act. The impacts of three factors on firms' decisions are investigated: the store brand base demand, the competition between national brand and store brand, and the cross-store national brand competition.

3 - Production and Sales Management for Successive Generations of New Products under Supply Constraints
Ashkan Negahban, PhD Student, Auburn University, 3301 Shelby Center, Auburn, AL, 36849, United States of America, anegahban@auburn.edu, Jeffrey Smith

Various real-world case studies show that an incorrect production and sales plan for the launch of a new product can lead to huge financial losses for companies. In this work, we study how a firm should manage its production and inventory before launching a new generation of a new product into the market. We use optimal control theory to establish the optimal sales policy and derive closed-form expressions for the demand and sales dynamics of the second generation of the product.

4 - Optimal Inventory and Demand Management through Dynamic Bundling and Pricing
Sang Jo Kim, PhD Candidate, MIT-Zaragoza International Logistics Program, Calle Bari 55, Edificio Nayade 5, Zaragoza, 50197, Spain, sjkim@zlc.edu.es, Youyi Feng

We investigate an optimal decision-making for a manufacturer that makes and sells two distinguishable products. To maximize its revenue, the firm often bundles products for stimulating sales. Optimal joint decisions on inventory replenishment, bundling/unbundling and pricing of the products show certain effective structures and draw significant managerial insights.

5 - Should Marketing Care About Supply Chain Management? On the Moderating Role of SCM on Advertising
Kristoph Ullrich, Ph.D. Candidate Supply Chain and Operations Management, Kuehne Logistics University - The KLU, Grofler Grasbrook 17, Hamburg, HH, 20457, Germany, kristoph.ullrich@the-klu.org, Sandra Transchel

Based on COMPUSTAT data we empirically investigate the impact of supply chain management capabilities on the association between advertise spending and stock returns. To capture the implications of complex feedback loops we employ vector autoregressive models and reveal (among other things) that the effect of advertise spending on abnormal stock returns depends on supply chain competencies.

Incorporated Models in Business Processes Optimization

Sponsor: Service Science

Sponsored Session

Chair: Tulia Plumettaz, Xerox Corporation, 800 Phillips Rd, Bldg 128-257F, Webster, 14580, United States of America, Tulia.Plumettaz@xerox.com

1 - Planning Inventories in a Multi-Echelon On-line Retail Fulfillment System
Juan Li, Research Scientist, Xerox Corporation, 800 Phillips Road, Webster, NY, 14580, United States of America, Juan.Li@xerox.com, John Muckstadt

When designing and operating an order fulfillment system for an on-line retailer, many factors must be taken into account. We present a model and a computationally tractable method for planning procurements and allocating stock among warehouses. Our model is based on taking advantage of the length of time between when a customer places an order and when it must be fulfilled. We will demonstrate the effect of the percentage of demand that must be filled immediately on the total system inventories.

2 - A Multidisciplinary Approach to Model Child Support Services Business Processes
Bo Hu, Research Scientist, Xerox Corporation, 128/29E, 800 Phillips Road, Webster, NY, 14580, United States of America, bo.hu@xerox.com, Bryan Dolan, Patricia Wall, Maryann Fuhrmann, Kirk Ocke, Yasmine Charif

A multidisciplinary team of ethnographic researchers, business process modelers and data analysts was formed to study the processes and practices of several Child Support Services departments across the U.S. We will describe our methodology for collecting data and modeling key work processes. We will also discuss our recommendations for improving workflow, including new opportunities to increase stipulated child support orders and compliance.

3 - Optimization Models in Advertising: Paid Search
Aya Wallwater, PhD Candidate, Columbia University, Rm. 329, School of Engineering, 500 West 120th Street, New York, NY, 10027, United States of America, aw2589@columbia.edu

Modern advertising is heavily based on digital media. It consists with different marketing channel and typically the channel that drives the most traffic to a vendor's website is called Paid or Sponsored Search. Paid search is auction-based method to place online advertisements on webpages that shows results from search engine queries. Motivated by the importance of paid search within a digital campaign we will describe an optimal decision process to determine the daily bids on search keywords.

4 - Instability of Sharing Systems in the Presence of Retransmissions
Evangelia Skiani, PhD Candidate, Columbia University, New York, NY, es3009@columbia.edu, Predrag Jelenkovic

Retransmissions represent a primary failure recovery mechanism on all layers of communication network architecture. Similarly, fair sharing, e.g. Processor Sharing (PS), is a widely accepted approach to resource allocation among multiple users. Recent work has shown that retransmissions in failure-prone systems can lead to heavy-tailed delays. Here, we discover that PS-based scheduling induces complete instability in the presence of retransmissions regardless of the job size or the traffic load.

Supply Chain, Game Theory & Combinatorial Auctions

Contributed Session

Chair: Ahmet Camci, Yasar University, Universite Caddesi, No:35-37, Agacli Yol, Izmir, 35100, Turkey, ahmet.camci@yasar.edu.tr

1 - On Group-Buying Pricing in B2B Systems
Wenxi Gu, PhD candidate, The Chinese University of Hong Kong, Dept of Systems Engineering, CUHK, Shatin, N.T., Hong Kong, Hong Kong - PRC, wxgu@se.cuhk.edu.hk, Xiaoqiang Cai

We explore the feasibility of group-buying pricing for a monopolist supplier who sells a single product to multiple independent Newsvendor-type retailers. The problem is analyzed as a Stackelberg game in which the supplier acts as the leader by announcing its pricing scheme first and the retailers act as followers by choosing their order quantities accordingly. We argue that group-buying pricing, if designed properly, can be a win-win solution for B2B systems.

2 - The Role of Transaction-specific Investment and Switching Costs in Customer Involvement

Yi Li, Xi'an Jiaotong University, School of Management, Xianning West Road No.28, Xi'an, 710049, China, yiyifirst@foxmail.com, Taiwen Feng, Gang Li

First, the empirical study demonstrates that trust and commitment have positive effects on customer involvement. Second, trust would indirectly impact on commitment through transaction-specific investment. Moreover, switching costs play widely distinct roles in different stages of customer relationship. Switching costs negatively moderate the relationship between trust and customer involvement, while positively moderate the relation of commitment to customer involvement.

3 - Solving the Wine Bottling Plant Lot-sizing Problem under Uncertainty and using Postponement

Sergio Maturana, Professor, Pontificia Universidad Catölica de Chile, Industrial and Systems Engineering Dept, Santiago, Chile, smaturan@ing.puc.cl, Mauricio Varas

Planning the wine bottling and labeling operations is difficult, especially if labeling postponement is allowed. We present a MIP model for lot sizing multiple production lines with decoupled bottling and labeling stages. This capacitated lot sizing model with set-up times was tested on a rolling horizon framework with error-prone demand forecasts against a benchmark model. We developed lagrangian decomposition and fix-and-relax heuristics using commercial solvers. The results are presented.

4 - Robust Optimization Model for Scheduling the Bottling Line of a Large Winery

Alejandro Mac Cawley, Assitant Profesor, Pontificia Universidad Catolica de Chile, Vicuna Mackenna 4860, Santiago, Chile, amac@uc.cl

We present a model that produces solutions for the wine bottling lot sizing and scheduling problem with sequence dependent setup times, in an adequate time-frame, which can be implemented by large wineries. The model incorporates particular aspects of the problem such as: major/minor setups, sequence dependent setup times, crewing limitations and finally, sanitation and traceability constraints. We introduce a robust schedule approach and we implemented an effective decomposition algorithm.

1 - A SA-based Approach for the Feedback-length Minimization Problem

Weihao Huang, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, China, h.w.h.1989@stu.xjtu.edu.cn, Yanjun Qian, Jun Lin

Finding an appropriate sequence of many interrelated activities becomes a key issue. One important objective of scheduling is to find an activity sequence with minimum total feedback length. This study first proposes two rules for reducing total feedback lengths. Then we combine these two rules with simulated annealing (SA) to provide a heuristic algorithm.

2 - A Framework Based on Quasi-Jackson Network for Evaluating the Complex Collaborative Design

Wen Su, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, China, suw12@mails.tsinghua.edu.cn, Li Zheng

This paper presents a queueing network model to evaluate complex collaborative design (CCD) performance. The network based on quasi-Jackson theorem considers multiple design teams, stochastic task duration, rework and some other characteristics of design process. Using this model, we are able to analyze throughput, iteration times, and time delay of CCD. Some numerical examples are used to illustrate the proposed framework.

3 - Identifying SMEs-Oriented Technology using Patent Bibliographic Information

Keeeun Lee, Dongguk university-Seoul, E440, 26, Pil-dong 3-ga, Chung-gu, Seoul, Korea, Republic of, kelee@dongguk.edu, Byungun Yoon, Daeun Go, Inchae Park

This research aims to propose a systematic method that identifies SMEs-oriented technology in win-win innovation on the SMEs and Large firms. These technology fields are identified by factors, such as a difference in technology cycle time, applying a Hidden markov model based approach and value chains regarding technology. For this, patent bibliographic data is collected and then, considering innovation factors, technologies are matched to each firm type: large and small-sized enterprises.

4 - Spare Parts Demand under Fleet Expansion with Uncertain Product Customization

Tongdan Jin, Associate Professor, Texas State University, 601 University Drive, San Marcos, TX, 78666, United States of America, tj17@txstate.edu

Prior studies on after-sales service often assume the demand for spare parts is stationary. We analyze a spares inventory system confronted with a non-stationary demand process due to a growing installed base upon the new product introduction. The spare parts forecasting becomes more involved when the configuration of shipped products randomly changes. We synthesize renewal theory with computational analytics to tackle this challenging, yet quite realistic issue.

1 - De-Risking Business Decisions through Experimentation

Callyn Giese, Marketing Coordinator, Applied Predictive Technologies, 901 North Stuart Street, Suite 1000, Arlington, VA, 22203, United States of America, cgiese@predictiveTechnologies.com

APT is the world's largest purely cloud-based predictive analytics software company. APT's Test & Learn software is revolutionizing the way Global 2000 companies harness their Big Data to accurately measure the profit impact of advertising, marketing, pricing, merchandising, operations and capital initiatives, tailoring investments in these areas to maximize ROI.

2 - An Empirical Examination: Leadership and Dynamic Capabilities Influence on Performance

Zhe Yu Zhang, University of Science and Technology of China, School of Management, Hefei, China, zhufeng@mail.ustc.edu.cn

The article elaborates the process influence mechanism of firm performance output and sum up the regularity, which based on the two perspectives of dynamic capabilities and leadership. Though factorial analysis and structural equation modeling test the relationship among leadership, dynamic capabilities and firm performance; multiple group structural equation modeling verify life cycle and dynamic environment have controlling and moderating effects between these path relationships.

3 - Applied Activity-Based Budgeting Model for a University Department within Decentralized Budgeting

Ekaterina Koromyslova, Assistant Professor, South Dakota State University, Box 2223, Solberg Hall 206, Brookings, SD, 57007, United States of America, Ekaterina.Koromyslova@sdstate.edu, Gary Hatfield

Nowadays, universities strive to remain cost effective in the face of increasing expenses and diminishing support. An applied activity-based budgeting and cost management model for budgeting, strategic planning, and operational analytics allows administrators to be better informed about the effectiveness of the department's business activities while decreasing time and effort in transition towards a new decentralized budgeting and cost management system.

4 - Predictive Cost Analysis Model for Buildings: A Decision-Making Tool

Basima Abdulrahman, Graduate Assistant, Auburn University, 238 Harbet Engineering Center, Auburn University, Auburn, AL, 36849, United States of America, haa0003@auburn.edu, Haitham Eletrabi

The bills of quantities of the construction materials and the related budget have been a major headache for Civil Engineers for a long time. In this paper, we offer an innovative and simple technique for civil engineers and house owners to accurately estimate the construction costs. The proposed model use specific demographics and design related factors to calculate a detailed bill of quantities and construction budget that streamlines the decision making process in the construction industry.

5 - A Game Theoretical Approach to Modeling Energy Consumption with Consumer Preference

Guangyang Xu, University of Louisville, 2727 Riedling Dr Apt 7, Louisville, KY, 40206, United States of America, guangyang.xu@louisville.edu, Lihui Bai, Qipeng Zheng

We propose a new game theoretical equilibrium model to analyze residential users' electricity consumption behavior in smart grid where energy usage and price data are exchanged between users and utilities via advanced communication. Consideration is given to users' possible preference on convenience over cost-saving under the real-time pricing in smart grid, and each user is assumed to have a preferred time window for using a particular appliance.

1 - A Stochastic Approach for Modeling Wildfire Propagation

Mohammad Hajian, Northeastern University, Dept. of Mechanical and Industrial Eng., Northeastern University, Boston, MA, 02115, United States of America, mhajian@coe.neu.edu, Peter Kubat, Emanuel Melachrinoudis

Wildfires can have significant economic and social impact. Predicting the fire propagation enables fighting the fire effectively and in a timely manner. In this research, a stochastic approach for modeling surface wildfire propagation is presented. Two different methodologies are developed to (a) find the probability distribution of the fire arrival time to a point of interest and (b) find the fire forefront stochastic contours.

2 - Allocation Models for Competition among Ambulance Services

Lavanya Marla, University of Illinois at Urbana- Champaign, Champaign, IL, United States of Americalavanyam@illinois.edu, Praveen Tumuluri

We consider a setting where multiple ambulance services compete to serve a population. Such settings have been observed in emerging economies where 911-type services are just being set up, which compete with existing ad-hoc services; as well as in cities like New York, where multiple EMS services exist. We demonstrate the opportunity costs occurring due to competition, and discuss game-theoretic models for better ambulance utilization. We conclude with results from a real-world case study.

3 - Spatial Analysis of Cardiac Arrests

Derya Demirtas, University of Toronto, 5 King's College Rd., Toronto, On, M5S 3G9, Canada, demirtas@mie.utoronto.ca, Roy H. Kwon, Timothy C. Y. Chan

Sudden cardiac arrest is a major public health problem. In this talk, we discuss statistical approaches such as intra-class correlation and kernel density estimation to analyze the stability of cardiac arrests in time and space, and estimate a spatial distribution of cardiac arrests. The resulting risk map provides insights on resource allocation decisions such as identifying the most appropriate areas for community CPR training or determining the placement of AEDs.

4 - A Budgeted Maximal Covering Problem for Reducing Cyber-security Vulnerabilities

Kaiyue Zheng, University of Wisconsin-Madison, Madison, Wi, 53706, United States of America, kzheng23@wisc.edu, Laura McLay

This talk will discuss a cyber-security planning application for securing global information technology (IT) supply chain from the myriad of cyber-security risks and vulnerabilities that exist. We propose a budgeted maximal covering problem for selecting cyber-security mitigations and will introduce integer programming models and greedy approximation algorithms for identifying optimal and near-optimal solutions.

1 - Model of Supply Chain Vulnerability for Fresh Produce

Cameron MacKenzie, Assistant Professor, Naval Postgraduate School, 699 Dyer Rd., Bldg 234, Monterey, CA, 93940, United States of America, camacken@nps.edu, Aruna Apte

Fresh produce supply chains are highly vulnerable to contamination. Factors that influence the vulnerability of these supply chains include the perishability of the product, the supply chain structure, possible exposure to contamination, the ability to trace the source of contamination within the supply chain, and communication. We model these factors to explore how the interplay of these factors impacts vulnerability.

2 - Decision Model for Planning of Pilot Training Supply Chain

Uday Apte, Professor, Naval Postgraduate School, GSBPP, 555 Dyer Road, Monterey, CA, 93943, United States of America, umapte@nps.edu, John Khawam, Murat Mise

The pilot training process in the U.S. Department of Defense is structurally similar to a physical supply chain: each step serves as the supplier of partially trained pilots to the next step. By combining a LP model, a Markovian forecast and a new performance metric, we develop a decision model that balances cost with readiness in planning for pilot training supply Chain. We illustrate the proposed decision model using the training supply chain for F-16 pilots.

3 - The Self-sufficient Marine Problem

Aruna Apte, Associate Professor, Naval Postgraduate School, 555 Dyer Road, Monterey, CA, 93940, United States of America, auapte@nps.edu, Jay Simon, Eva Regnier

Marines engage in a wide variety of expeditionary operations, and must function without logistical support for long stretches of time. They face many constraints, including the amount they can physically carry, mission requirements, resources needed for sustainment, and the extent to which resources can be shared. In this work, we develop an optimization model for the self-sufficient Marine problem and examine the impacts of reducing the needed amounts of certain resources.

4 - Avoiding Tropical Cyclones in Automated Naval Logistics Planning

Walt DeGrange, CDR, Naval Postgraduate School, wcdegran@nps.edu, Steven Lantz, Eva Regnier

The US Navy's Combat Logistics Force (CLF) provides at-sea resupply to US and allied vessels throughout the world. The CLF scheduling system anticipates demand and schedules 45 days in advance to meet demand. Tropical cyclones (TCs) frequently disrupt these plans, requiring diversions, and inefficient steaming speeds. We evaluate the impact of using TC forecasts in operational planning, and the best lead time and geographic extent of severe weather to use in optimizing CLF operational planning.

Chair: Christine Barnett, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, United States of America, clbarnet@umich.edu

1 - Developing Optimal Biomarker-Based Screening Policies using Reinforcement Learning

Christine Barnett, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, United States of America, clbarnet@umich.edu, Scott Tomlins, Todd Morgan, James Montie, John Wei, Brian Denton

Recent advances in the development of new biomarker tests, which physicians use for the early detection of cancer, have the potential to improve patient survival by catching cancer at an early stage. Q-learning methods were used to develop optimal screening policies, in terms of patient outcomes, for new prostate cancer biomarker tests. Numerical results based on a large clinical dataset will be used to draw insights about optimal screening policies.

2 - Health and Economic Outcomes of Alternative Follow-up Strategies in Lung Cancer Screening

Ayca Erdogan, University of Southern California, Los Angeles, CA, United States of Americaserdogan@usc.edu

USPSTF recently recommended that heavy-smokers between ages 55 and 80 to be screened annually with CT for lung cancer early detection. However, there are no guidelines on decisions to be made following a positive screening exam. Previous guidelines on nodule follow-up strategies were made before the screening recommendations, thus, need to be renewed. Using a validated micro-simulation model, we aim to analyze the impact of different follow-up strategies on health and economic outcomes.

3 - Individualized Decision Analysis for Prostate Cancer Treatments in the Genomic Era

Jennifer Mason, Assistant Professor, University of Virginia, 1300 Jefferson Park Avenue, Charlottesville, VA, 22908, United States of America, jem4yb@virginia.edu, Timothy Showalter

We present a decision analysis model to evaluate the effectiveness of a genomic classifier of risk of cancer progression as a determinant of decisions for post-prostatectomy prostate cancer treatments, compared to decisions in the absence of the genomic test. We use Monte Carlo simulation to estimate life years, quality-adjusted life years, and 5 and 10 year estimates of cancer progression outcomes for a cohort of patients using individual genomics-based cancer progression risk estimates.

4 - Optimizing Public Health Spending for Cancer Screening with a Focus on Health Outcomes

David Cornejo, North Carolina State University, Raleigh, NC, United States of America, dacornej@ncsu.edu, Maria Mayorga, Kristen Hassmiller Lich

For colorectal cancer and other chronic diseases, health outcomes may be improved through improved screening behavior. Health officials need to choose how to allocate limited public health budget to interventions that change individuals' choice to screen. We develop methods to optimize the allocation of a fixed public health budget across individuals' life course. This allocation accounts for the time-varying dynamics of disease as represented by a simulation model of colorectal cancer.

New Models of Health Care Delivery: Reengineering for Efficient, Effective Care

Sponsor: Health Applications

Sponsored Session

Chair: David Hopkins, Senior Advisor, Pacific Business Group on Health, 575 Market St., Suite 600, San Francisco, CA, 94105, United States of America, dhopkins@pbgh.org

Co-Chair: Feryal Erhun, Stanford University, CERC, Stanford, CA, United States of America, ferhun@stanford.edu

1 - Transforming Ambulatory Surgical Care: Triple-R Model

Feryal Erhun, Stanford University, CERC, Stanford, CA, United States of America, ferhun@stanford.edu, Kimberly Brayton, Maziyar Kalani, Christine Nguyen

We present our Triple-R ambulatory surgical care model, which is designed to lower costs associated with ambulatory surgery in the United States, a sector experiencing one of the fastest growth rates and accounting for 8% of the 2.3 Trillion in domestic healthcare spending. We outline the current challenges that contribute to excessive spending, suggest our solutions to those challenges, and report our cost impact projections of these solutions.

2 - Reducing Wait Times for New Patient Chemotherapy Consults

Martin Puterman, Sauder School of Business, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T 1Z2, Canada, martin.puterman@sauder.ubc.ca, Scott Tyldesley, Emma Liu, Claire Ma, Leah Weber, Antoine Sauré, Marianne Taylor

We describe our study of the impact of scheduling rules and oncologist capacity on wait times for new patient consults. We show that in a highly capacitated system scheduling rules have little impact on service levels. In view of this, we determine the number of additional new patient consults needed by specialty to achieve target service levels. Furthermore, we describe models for investigating the impact of new patient consults on downstream oncologist workload and panel size.

3 - Surgical Care in United States vs. India

Dhruv Kazi, UCSF. University of California, San Francisco, CA, United States of Americakazi@ucsf.edu

Coronary Artery Bypass Grafting (CABG) is believed to cost the most efficient U.S. hospitals about $30,000 to produce. The same operation reportedly costs Narayana Hospital in India under $2,000. In this talk, we discuss the underlying reasons of this cost difference. We also share how learnings from India can be used to develop new surgical care models to decrease U.S. health spending and improve surgical outcomes.

Supply Chain Management IV

Contributed Session

Chair: Kurt Masten, PhD Candidate, Drexel University, Gerri C Lebow Hall, 3220 Market Street, Philadelphia, PA, 19104, United States of America, kam478@drexel.edu

1 - Exploration versus Exploitation of Trust: Strategic Behavior in Cooperative Relationships

Maryam Razeghian Jahromi, Doctoral Assistant, EPFL, EPFL CDM MTEI OES, ODY 4 16 (Odyssea) Station 5, Lausanne, 1015, Switzerland, maryam.razeghianjahromi@epfl.ch, Thomas Weber

This paper sheds light on the dynamics of trust in repeated bilateral interactions. At each time period, a decision maker learns about the cooperative behavior of a business partner and decides whether or not to continue the relationship based on her updated beliefs about the counterparty's objectives. We analyze how the duration of the relationship changes when the business partner anticipates and strategically distorts the informational consequences of his actions.

2 - Supply Chain Coordination under Asymmetric Information and Demand Updates

James Cao, University of Saskatchewan, 215 209 Willis Crescent, Saskatoon, SK, S7T0L8, Canada, cao@edwards.usask.ca

We explore the role of forecast updating in a supply chain with asymmetric demand information. A supplier sells to a downstream retailer who benefits from demand updates each period. Although the supplier is higher up on the supply chain and therefore unable to observe demand in each period, it is possible for the supplier to infer the state of demand through the retailer's ordering activity. We show that it is in the best interests of the retailer to not share her information.

3 - An Inventory-Production System Subject to Production Constraints and Variable Target Inventory

Mohammadreza Parsanejad, PhD Candidate, Keio University, Department of Administration Engineering, 3-14-1 Hiyoshi, Kohoku-ku, Yokohama, Kanagawa, Yokohama, 223-8522, Japan, parsanejad2011@gmail.com, Hiroaki Matsukawa

In Inventory and Order Based Production Control System (IOBPCS) there is no limitation for manufacturing line to produce items while in the real world there are production constraints. The extended version of IOBPCS subject to production constraints with fixed target inventory has been analyzed in recent years. In this paper we aim to analyze the nonlinear IOBPCS which is called NIOBPCS with production constraints for variable target inventory levels.

4 - The Value of Dual-sourcing in a Supply Chain

Isik Bicer, Mr., University of Lausanne, Quartier UNIL-Dorigny, Batiment Anthropole, Lausanne, 1015, Switzerland, isik.bicer@unil.ch, Suzanne De Treville, Valerie Chavez

We consider a dual-sourcing model where a buyer purchases its products from two different suppliers. We apply extreme-value theory and analyze the effects of tail behavior of demand distribution on the optimal sourcing policy. Combining product-flexibility and dual-sourcing models, we develop a framework that shows effective sourcing strategies for different product characteristics.

5 - The Case for 3rd Party Supply Chain Coordination

Kurt Masten, PhD Candidate, Drexel University, Gerri C Lebow Hall, 3220 Market Street, Philadelphia, PA, 19104, United States of America, kam478@drexel.edu, Seung-Lae Kim

Supply chain coordination (SCC) has been an area of intense interest from multiple perspectives. Some focus on coordination mechanisms while others explore methodology and experience. Little research has attempted to bridge these separate streams of research in a meaningful way. A proposal is made to use an independent and neutral third party to address the low application rates of the many techniques available in the literature. A model is developed and payment options explored.

Constraint Programming

Sponsor: Computing Society

Sponsored Session

Chair: Willem-Jan van Hoeve, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, vanhoeve@andrew.cmu.edu

1 - Scheduling Home Health Care with Separating Benders Cuts in Decision Diagrams

John Hooker, Carnegie Mellon University, Tepper School of Business, Pittsburgh, United States of America, jh38@andrew.cmu.edu, Andre Augusto Cire

We schedule home health care delivery with a logic-based Benders method in which the master problem is a decision diagram and the subproblem is a constraint programming problem. Benders cuts are implemented with a novel separation algorithm for the decision diagram.

2 - Insights into Parallelism with Intensive Knowledge Sharing

Horst Samulowitz, IBM Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, samulowitz@us.ibm.com, Ashish Sabharwal

Novel search space splitting techniques have recently been successfully exploited in parallelizing Constraint Programming and MIP solvers. We use universal hashing to extend existing approaches to a generalized setting. We show that such static splitting approaches are not as effective when intensively sharing knowledge. Finally, there exists a surprising tradeoff between communication cost for knowledge sharing across nodes and cost incurred by the computational load per node.

3 - A CP-Based Branch-and-Price-and-Cut Approach for Operating Room Planning and Scheduling

Louis-Martin Rousseau, Professor, CIRRELT - Polytechnique Montréal, CP 6079 Succ Centre-Ville, Montréal, QC, H3C 3A7, Canada, Louis-Martin.rousseau@polymtl.ca, Seyed Hossein Hashemi Doulabi, Gilles Pesant

We study integrated planning and scheduling of operating rooms. The problem is formulated as a mathematical programming model and a branch-and-price-and-cut algorithm is developed based on a constraint programming model to solve the subproblem. Some dominance rules and a fast infeasibility checking criterion based on a multidimensional knapsack problem are also developed which effectively improve the efficiency of the constraint programming model.

4 - Integrating CP, MIP and Decision Diagrams for the Time-Dependent TSP

Joris Kinable, KU Leuven, Gebroeders de Smetstraat 1, Gent, 9000, Belgium, joris.kinable@kuleuven.be, Andre Cire, Willem-Jan van Hoeve

The Time-Dependent Traveling Salesman Problem (TD-TSP), is a generalization of the well-known TSP where the travel times between cities are dependent on the order or time the cities are visited. This work presents an integrated solution procedure for the TD-TSP, thereby unifying Constraint Programming (CP), Mixed Integer Programming (MIP) and Decision Diagrams into a single framework. Experimental results indicate significant performance improvements over dedicated MIP or CP approaches.

1 - What Drives Quality Academic Exchanges in the Online Classroom?

Aravinda Garimella, PhD Student, University of Washington, 350 Mackenzie Hall, Seattle, WA, 98105, United States of America, aravinda@uw.edu, Ming Fan

The pedagogical benefits of academic dialogue amongst students have long been acknowledged in the collaborative learning literature. With the advent of massive open online courses (MOOCs), there has been debate on whether MOOCs can achieve deep and meaningful interaction as effectively as brick-and-mortar classrooms do. We empirically investigate the mechanics of academic exchange between students learning mathematics via micro-lectures on one of the pioneer websites in the K-12 MOOC space.

2 - Adverse Drug Effects and Drug Effectiveness: Mining Social Media to Predict Perceived Effectiveness

Michael Lee, Doctoral student, University of Utah, 1182 West 200 North, Unit #b415, Centerville, UT, 84014, United States of America, michael.lee@business.utah.edu, Olivia Sheng

Each year, Adverse Drug Events (ADEs) cause thousands of fatalities and billions of dollars costs. Research suggests that patient education is key. The most accessible way for patients to get drug and ADE information is social media / online drug review sites. Social media can provide insights to patients' perceptions of ADEs and drug effectiveness. This research evaluates patients' perceptions of drug effectiveness using text mining, and sentiment analysis techniques of social media posts.

3 - Investments-adjusted Cost Sensitive Learning for Medical Decision Making

Yuanyuan Gao, Doctoral student, University of Utah, 131 South 1000 East, Apt 18, Salt Lake City, UT, 84102, United States of America, yuanyuan.gao@business.utah.edu, Xiao Fang, Paul Hu

This study designed an Investment adjusted cost sensitive learning (IACSL) method to reduce the total misclassification costs. We tested our method empirically on the weaning problem. The weaning has been proven to be a very challenging problem in ICU intensive care.Our results demonstrated that integrated with appropriate investments and reasonable reduction in costs, IACSL could achieve a better classification solution with lower costs.

Chair: Jeannette Brosig-Koch, Universitat Duisburg-Essen, Universitatsstrafle 12, Essen, 45117, Germany, jeannette.brosig-koch@ibes.uni-due.de

1 - Promises and Social Distance in Buyer-Determined Procurement Auctions

Timo Heinrich, Universitat Duisburg-Essen, Forsthausweg 2, Duisburg, 47057, Germany, timo.heinrich@ibes.uni-due.de, Jeannette Brosig-Koch

This study explores the effects of communication and its interaction with reputation information in buyer-determined procurement auctions with moral hazard. The results of our laboratory experiment demonstrate that ñ in contrast to reputation information ñ communication only slightly increases market efficiency. Buyers' choice of a bidder is influenced by both, reputation information and communication. In the field we find a choice pattern that is consistent with our lab data.

2 - Running Behavioral Operations Experiments in Online Labor Markets

Yong Won Seo, Associate Professor, Chung-Ang University, 84 Heukseok-Ro, Dongjak-Gu, Seoul, Korea, Republic of, seoyw@cau.ac.kr, Yun Shin Lee

Online labor markets provide an ideal platform for conducting behavioral experiments because experimental results can be produced more quickly, cheaply, and easily. We review recent research about online labor markets and demonstrate the validity of online experiments in the field of behavioral operations. To this end, we replicate the seminal newsvendor experiment using Amazon's Mechanical Turk (MTurk) and show that online subjects on MTurk behave similarly to subjects in physical laboratories.

3 - Cognition versus Computational Power in High-volume Store Replenishment Decisions

Antti Tenhiala, IE Business School, Calle de Maria de Molina 12, 5, Madrid, 28006, Spain, antti.tenhiala@ie.edu, Shivom Aggarwal

Using longitudinal data from a multi-site implementation of automatic store replenishment (ASR) software in a retail supply chain, this study investigates the factors that explain the performance effects of human decisions to deviate from the recommendations of the ASR software. For practitioners, the results show when to restrain and when to encourage deviations. For the theory, the results elaborate the relative strengths and weaknesses of cognition and computational power in decision making.

4 - An Experimental Study of Posted Prices

Seungbeom Kim, University of Southern California, 950 South Flower Street #706, Los angeles, CA, 90015, United States of America, seungbek@usc.edu, Sriram Dasu

We use laboratory experiments to gain insights into how customers make purchase decisions. We find that the quantal response model provides a more accurate description of customers' decisions. If decision making is consistent with our experimental findings, then pricing models that are based on the assumption that customers are rational expected utility maximizers can result in significant loss in profitability. We also study how customers learn in these types of settings.

Advances in Theory and Computation of Integer Programming

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Kiavash Kianfar, Texas A&M University, College Station, TX, United States of America, kianfar@iemail.tamu.edu

1 - Power Grid Visualization by Means of Optimization

Mingyang Di, Northwestern University, 2145 Sheridan Road, C210, Evanston, IL, 60208, United States of America, mingyangdi2012@u.northwestern.edu, Diego Klabjan, Esa Rantanen

The operators in electric power system control centers play a crucial role in ensuring the integrity of the nation's electric grid. Thus, the task to optimize the layout of visual elements on the display interface is of vital importance. To this end, algorithms using several optimization techniques are proposed to make the interface less cluttered subject to human perceptual and cognitive capabilities. We report our findings based on a real-world power grid in US.

2 - A Few Strong Knapsack Facets

Sangho Shim, Research Associate, Kellogg School of Management, 2001 Sheridan Road, Suite 548, Evanston, IL, 60208, United States of America, shim@kellogg.northwestern.edu, Sunil Chopra, Wenwei Cao

We perform the worst case analysis for the knapsack facets with coefficients equal to multiples of 1/k. The worst case analysis shows that a few facets of small k are strongest and facets of larger k are weaker. We define the 1/k-facets up to k equal to 4.

3 - Continuous n-mixing: A Unified Framework for Lot-sizing, Facility Location & Network Design Problems

Manish Bansal, Ph.D. Candidate, Department of Industrial and Systems Engineering, Texas A&M University, 3131 TAMU, Texas A&M University, College Station, TX, 77843-3131, United States of America, bansal@tamu.edu, Kiavash Kianfar

We present facets of continuous n-mixing set with(out) bounded integer variables which we then utilize to develop new valid inequalities for multi-module lot-sizing, facility location, and network design problems. This research generalizes several existing concepts in cutting plane theory along with various well-known families of cuts for the aforementioned problems. We also present our computational results which show that our cuts (applied using our separation algorithm) are very effective.

4 - Improving the Tractability of a Nuclear Waste Disposal Optimization Problem

Benjamin Johnson, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, bebjohns@mines.edu, Alexandra M. Newman, Jeffrey King

We formulate an integer program that determines a methodical way to dispose of nuclear waste within a repository, using Yucca Mountain as a case study. We exploit the underlying network structure of the problem, address symmetry concerns, and eliminate unnecessary variables to expedite solutions for the objective: minimize the total weighted heat load of all 3x3 waste packages. We present results for this objective and extensions for two other objectives to reduce heat load hot spots.

Stochastic Optimization in a Data-Driven Context

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Ruiwei Jiang, University of Arizona, Engineering Building 310, University of Arizona, Tucson, AZ, 85721, United States of America, ruiweijiang@email.arizona.edu

1 - Robust SAA

Nathan Kallus, MIT, 77 Massachusetts Ave., E40-149, Cambridge, MA, 02139, United States of America, kallus@mit.edu, Dimitris Bertsimas, Vishal Gupta

We propose a tractable methodology for data-driven optimization, which enjoys strong asymptotic as well as finite-sample performance guarantees. The key to this is new theory that links sample average approximation of stochastic optimization, distributionally robust optimization, and statistical hypothesis testing. This also characterizes the asymptotic and finite-sample guarantees of existing data-driven procedures. We demonstrate numerically that our approach outperforms existing approaches.

2 - Distributionally Robust Discrete Optimization with Entropic Value-at-Risk

Daniel Zhuoyu Long, The Chinese University of Hong Kong, The CUHK, Hong Kong, Hong Kong - PRC, zylong@se.cuhk.edu.hk, Jin Qi

We study the discrete optimization problem under the distributionally robust framework. We optimize the Entropic Value-at-Risk, which is a coherent risk measure and is also known as Bernstein approximation for the chance constraint. We propose an efficient approximation algorithm to resolve the problem via solving a sequence of nominal problems. The computational results show that the number of nominal problems required to be solved is small under various distributional information sets.

3 - A Practically Efficient Framework for Distributional Robust Linear Optimization

Melvyn Sim, Professor, National University of Singapore, Singapore, Singapore, melvynsim@nus.edu.sg, Dimitris Bertsimas, Melin Zhang

We developed a modular framework to obtain exact and approximate solutions to a class of linear optimization problems with recourse with the goal to minimize the worst-case expected objective over a probability distributions or ambiguity set. We propose an approach to lift the original ambiguity set to an extended one by introducing additional auxiliary random variables.

4 - Risk-averse Two-Stage Stochastic Program with Distributional Ambiguity

Ruiwei Jiang, University of Arizona, Engineering Building 310, University of Arizona, Tucson, AZ, 85721, United States of America, ruiweijiang@email.arizona.edu, Yongpei Guan

We develop a risk-averse two-stage stochastic program (RTSP) taking into account the distributional ambiguity. We derive an equivalent reformulation for RTSP that applies to both discrete and continuous distributions. Also, the reformulation reflects its linkage with a full spectrum of coherent risk measures under varying data availability.

1 - Optimal Policy for Attracting FDI: Investment Cost Subsidy versus Tax Rate Reduction

Yuan Tian, Ryukoku University, 67 Tsukamoto-cho, Fukakusa, Fushimi-ku, Kyoto, Japan, tian@econ.ryukoku.ac.jp

We examine two policies for a host government to attract FDI: investment cost subsidy and tax rate reduction. Taking into consideration the strategic interaction between foreign firms and the host government through value functions, we demonstrate that there exists a critical level of the growth rate (or volatility) of the profits: when the growth rate (or volatility) of the profits is lower than the critical level, investment cost subsidy is optimal; otherwise, tax rate reduction is optimal.

2 - A Stochastic Programming Approach to Satellite Ground Station Placement

Aaron Hoskins, Graduate Student, Mississippi State University, Industrial & Systems Engineering, Starkville, MS, United States of America, abh318@msstate.edu

Ground stations are needed for satellites to be able to download data. If the satellite's mission is to collect data after a natural disaster, then the optimal ground station location(s) will not be known before the disaster occurs. A stochastic programming approach is applied to find the optimal ground station placement when the ground stations must be built before the disaster site is known.

3 - Resolving MDP Problems with Misspecified Transition Matrices

Hao Jiang, University of Illinois at Urbana-Champaign, 117 TB 104 S. Mathews Ave., Urbana, United States of America, jiang23@illinois.edu, Uday Shanbhag

We consider a Markov decision process with no knowledge of the transition matrix. Our goal is to obtain the optimal value function and policy while simultaneously learning the misspecified transition matrix. Learning-enhanced value and policy iteration schemes are shown to be convergent. Finite-time error statements and preliminary comparisons are provided with Q-learning.

4 - Single Resource Stochastic Capacity Expansion with Multiple Sources of Capacity

Majid Taghavi, McMaster University, 1280 Main St. W, Hamilton, L8S 4L8, Canada, taghavm@mcmaster.ca, Kai Huang

We consider the multi-period single resource stochastic capacity expansion problem with spot market and permanent capacity available to the decision maker. The problem is modeled as a multi-stage stochastic integer program. We show the totally unimodularity property of the model and develop polynomial-time primal and dual algorithms to solve it.

Co-Chair: Brian Lunday, Assistant Professor, Graduate School of Engineering & Management, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, brian.lunday@afit.edu

1 - Applying Ranking and Selection Procedures to Mitigation for Improved Infrastructure Restoration

Emily Heath, Rennselaer Polytechnic Institute, Department of Mathematical Sciences, Troy, NY, United States of America, heathe@rpi.edu, Thomas Sharkey, John Mitchell

We seek to determine for a network the single arc mitigation plan that contributes the most to the expected restoration of the network over different damage scenarios using ranking and selection (R&S) procedures. We find that R&S procedures are competitive with standard statistical tests in terms of the level of confidence achieved and often reduce the required computational effort. Current and future research examines how these methods can be scaled for multiple-arc plans.

2 - Risk-based Decision Support for Mass Casualty Incident Response

Behrooz Kamali, PhD Candidate, Virginia Tech, 250 Durham Hall (0118), Blacksburg, VA, 24061, United States of America, kamali@vt.edu, Douglas Bish

In this research, we systematically coordinate the response to a mass-casualty incident using optimization. Using our optimization models, we analyze the structure of the optimal response. We then structure the model to allow large problems to be solved in an operational timescale. The solutions we develop are response plans that reduce casualty risk by effectively using regional resources (e.g., emergency vehicles and hospitals) to transport and treat casualties.

3 - Information-Sharing in Interdependent Network Restoration

Thomas Sharkey, Assistant Professor, Rensselaer Polytechnic Instittute, 110 8th Street CII 5108, Troy, NY, 12180, United States of America, sharkt@rpi.edu, Burak Cavdaroglu, Huy Nguyen, Jon Holman, John Mitchell, William Wallace

We consider the problem of restoring multiple disrupted infrastructure networks after an extreme event. Each network has its own restoration resources that will repair damage done to its components in order to bring services back online. This work analyzes the loss in restoration effectiveness resulting from decentralized restoration efforts across networks and how information-sharing can reduce this loss. Computational results based on realistic damage scenarios to networks are presented.

4 - The Aircraft Network Routing Problem with Aerial Refueling Requirements

Brian Lunday, Assistant Professor, Graduate School of Engineering & Management, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, brian.lunday@afit.edu, Sarah Nurre, Tanya Kannon, Raymond Hill

We present three formulations to solve the aircraft routing problem with aerial refueling: two MINLPs and an MILP. We discuss the formulations' equivalence using transformations to the underlying network structure and/or a separation of routing decisions via their temporal sequence, as well as the formulations' relative sizes, and we analyze their performance in solving a battery of tests instances representing combinations of network size and frequency of aerial refueling point availability.

Optimization, Integer 3

Contributed Session

Chair: Marco Luebbecke, Professor, RWTH Aachen University, Operations Research, Kackertstrafle 7, Aachen, 52072, Germany, marco.luebbecke@rwth-aachen.de

1 - A New Metric for Parental Selection in Plant Breeding

Ye Han, Iowa State University, 235 Sinclair Ave, Unit 211, Ames, IA, 50014, United States of America, yeh@iastate.edu, William D. Beavis, John N Cameron, Lizhi Wang

With the application of operations research, we developed a new metric, parental breeding value (PBV), based on application of conditional probability distribution and integer programming to help to solve the parental selection problem to accelerate the process of plant breeding and save resources at the same time. From the results of simulations, the PBV metric is demonstrated to shorten the plant breeding process and decrease the resources costs.

2 - Multi Objective Branch and Bound Algorithm

Ozgu Turgut, OR Scientist, Wayne State Uni., 1230 Wisteria Drive Apt 321, A321, Ann Arbor, MI, 48104, United States of America, ozgu.turgut@gmail.com, Alper Murat

This algorithm can be used in order to obtain full Pareto front as well as a representative set generation algorithm for multi-objective integer optimization type of problems(MOIP). Branching is performed on solution points on objective space. Standard concepts of B&B has been investigated and explained within the multi objective optimization context such as fathoming, node selection, heuristics, as well as MOIP specific concepts like filtering, non-domination probability, parallel running.

3 - Separation of Generic Cutting Planes in Branch-and-Price using a Basis

Marco Luebbecke, Professor, RWTH Aachen University, Operations Research, Kackertstrafle 7, Aachen, 52072, Germany, marco.luebbecke@rwth-aachen.de, Jonas Witt

Dantzig-Wolfe reformulation on an integer program may lead to stronger relaxations. A fractional solution to the reformulated program translates to the original program, but usually does not constitute a basic solution. This hinders us from separating cutting planes like Gomory mixed integer cuts which rely on a basis. We check what the literature offers for this defect and propose remedies. We give computational experience with our implementation, which is the first of this kind.

4 - Bilevel Optimization for Capacity Expansion with Rational Markets
Pablo Garcia-Herreros, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America, pgarciah@andrew.cmu.edu, Pratik Misra, Erdem Arslan, Sanjay Mehta, Ignacio E. Grossmann

Capacity expansion is usually formulated without considering the influence of markets or the role of providers. We formulate the problem as a mixed-integer bilevel LP that models the rational behavior of markets. The upper level maximizes profit by establishing the expansion plan; the lower level is an LP that minimizes total market cost. A single-level reformulation is obtained using strong duality of the lower level LP. An example from the industrial gas industry is used for illustration.

1 - Co-development of Tests for New Drugs with Risk Averse and Risk Seeking Agents
Jianbo Qian, Ivey, Western University, London, Canada, jqian42@uwo.ca

We study optimal contract structures between a pharmaceutical company and a companion diagnostics company to co-develop a new test. We use a principal/agent framework, where the pharmaceutical company is the principal and invest in the development, and the companion diagnostics company is the agent and supplies effort. We use a general form for the utility function to investigate the cases risk-neutral/averse/seeking agents.

2 - Strategic Behavior in Limited Price Auctions
Xiaodong Zhang, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong - PRC, xzhangas@ust.hk, Qi Qi, Zhou Chen

Vickrey auction has been a favourite among market makers for its simplicity and truthfulness. There are, however, other considerations in various markets that change the requirements. We discuss fairness and equilibrium in those markets beyond the simple setting of an auction.

3 - Dual-licensing Strategy for Software Companies
Ying Liu, Xi'an Jiaotong University, No. 28, Xianning Road, Beiling District, Xi'an, China, liuyingleyna@stu.xjtu.edu.cn, Xiuwu Liao

Open source software brings new business models while posing a great threat to commercial software. To leverage innovation benefits from community and make profits at the same time, some companies adopt dual-licensing strategy which means software is licensed under both open source and commercial license. When the software is used for profit, users have to pay for the commercial license; otherwise they don't. The paper studies when it's profitable to adopt this strategy and how to employ it.

4 - Consistent Conjectures in Oligopoly are Optimal Cournot-Nash Strategies in the Upper Level Game
Vyacheslav V. Kalashnikov, Associate Professor, Dr., Tecnologico de Monterrey (ITESM), Campus Monterrey, 2501 Av, Eugenio Garza Sada South, Monterrey, NL, 64849, Mexico, slavkamx@gmail.com, Vladimir A. Bulavsky, Nataliya I. Kalashnykova

Properties of consistent conjectural variations equilibrium developed for oligopolistic markets of a single commodity are examined. In general, consistent conjectures are distinct from those of Cournot-Nash. Now define an upper level game with the same agents as in the original oligopoly but with the conjectures playing the role of the agents' strategies. Then the consistent conjectures of the lower level (original) game provide for the Cournot-Nash optimal strategies for the upper level game.

Optimization, Linear Programming 1

Contributed Session

Chair: Davood Shamsi, Stanford University, 469 Ruthven Ave, Apt B, Palo Alto, CA, 94301, United States of America, davood@stanford.edu

1 - A Parametric Programming Approach to Consensus Clustering Gene Expression Profile Data
Victoria Ellison, Ph.D. Student, North Carolina State University, 2500 Stinson Drive, Raleigh, NC, 27695, United States of America, vmelliso@ncsu.edu, Yahya Fathi, Amy Langville

A new method of consensus clustering is proposed and applied to gene expression analysis. Resembling hierarchical clustering methods and based on parametric linear programming and sensitivity analysis, the approach offers a method for discovering clustering results of different cluster sizes. It also provides a metric of closeness between objects and clusters. A new algorithm is also proposed to more efficiently solve problems parametric programming problems with redundant constraints.

2 - Online Resource Allocation in Display Advertising
Davood Shamsi, Stanford University, 469 Ruthven Ave, Apt B, Palo Alto, CA, 94301, United States of America, davood@stanford.edu, Yinyu Ye

We study online impression allocation in display advertising using a real data set. At the first step, allocation algorithm is guided by the estimated dual prices. Next, we propose a risk minimization framework for updating dual prices on the fly. As impressions arrive, they are allocated to advertisers such that a risk measure is minimized. Using a real data set with 700 advertisers and millions of impressions, we show enforcing an exponential penalty function results in a higher revenue.

3 - The Unit Commitment Model for Power Interruption Contracts
Lakshmi Palaparambil Dinesh, Graduate Assitant, The University of Cincinnati, 2925 Campus Green Dr, Cincinnati, OH, 45221, United States of America, lakshmi603@gmail.com, Jeffrey Camm

The term unit commitment implies which generating units within an electric power plant should be operational during a particular time period. One of the costs involved in power generation and distribution is the cost the supplier will have to incur by signing up for an interruption contract with the customers. The model aims to understand when the power interruption contacts should be executed by the supplier and how they could lead to overall cost minimization.

4 - Production Scheduling Considering Energy Consumption
Mostafa Ghafoorivarzaneh, Student, University of Tennessee - Department of Industrial and Systems Eng., 610 Sutherland View Way, Apt# 735, Knoxville, Te, 37919, United States of America, mghafoor@utk.edu, Rapinder Sawhney

A considerable part in production cost is energy cost, but in most of production scheduling optimizations this part has been disregarded. In this study in addition to traditional scheduling terms, the following energy parts have been considered: Energy consumption for producing each item, Energy consumption for start-up, Idle energy consumption, Energy consumption for changing setup between production types. The cost has been minimized considering hourly fluctuations of electricity cost.

5 - Optimizing Boat Hull and Deck Mold Storage Scheduling with Linear Programming Based on the Production
Tron Dareing, Student, University of Tennessee - Department of Industrial and Systems Eng., 512 John D. Tickle Building, 851 Neyland Drive, Knoxville, Te, 37996, United States of America, tdareing@utk.edu, Rapinder Sawhney, Mostafa Ghafoorivarzaneh

This research has been done on linking the production schedule with hull and deck mold storing using bi-level optimization. In this case, there was a limited amount of space to store boat molds inside. Outside storage will result in more damages and more frequent repair times. In order to decrease the non-value added time of the maintenance and transportation, a linear model was developed which synced the mold storage with the production schedule.

Finance

Contributed Session

Chair: Sandeep Juneja, Professor, Tata Institute of Fundamental Research, HB Road, Colaba, Mumbai, 400005, India, juneja@tifr.res.in

1 - Financial Market Risk over a Period of Time and its Indicator
Chunhui Xu, Professor, Chiba Institute of Technology, Tsudanuma 2-17-1, Narashino, 275-0016, Japan, joh.haruki@gmail.com

Risk indicators for financial market risk had been focused on the risk at a certain future time spot, the risk over a period of time has not been reflected. This talk will introduce our study aiming at filling this gap. I will introduce the notion of period value at risk(PVaR), which was proposed for measuring the risk during a period of time, and the methods we proposed for computing PVaR of an investment.

2 - Multi Armed Bandit Sampling in Nested Portfolio Risk Measurement
Sandeep Juneja, Professor, Tata Institute of Fundamental Research, HB Road, Colaba, Mumbai, 400005, India, juneja@tifr.res.in, Ankush Agarwal, Nahum Shimkin

We consider estimating probability that portfolio loss exceeds a large threshold within a time horizon when the portfolio comprises of diverse financial securities and its value at any state-time is a conditional expectation that needs simulation estimation. We develop a multi armed bandit based sampling method to determine whether at any time loss exceeds specified threshold. For this we also develop computation lower bounds and show that proposed method matches them up to the first order.

3 - Nonparametric Models for Predicting Credit Default Swap Prices: Empirical Study
Youngdoo Son, Dept. of Industrial Eng./Seoul National University, 1 Gwanak-ro, Gwanak-gu, Seoul, 151-744, Korea, Republic of, hand02@snu.ac.kr, Jaewook Lee, HyeongMin Byun

In this study, we investigate the out-of-sample prediction performance of non-parametric machine learning models for credit default swap (CDS) prices. The comparisons were performed on the real market CDS prices including the period of global financial crisis. Also to verify the statistical performance of various models, we compared the statistical differences between the compared methods and tested the predictive performance of several time step ahead forecasting of time series.

4 - Discrete-Event Simulation of Financial Market Dynamics
Vitali Volovoi, Independent Contractor, 505 Birchington Close, Alpharetta, GA, 30022, United States of America, vitali@volovoi.com

Quality of the financial markets is analyzed by means of discrete-event simulations. Model construction and visualization is performed using a new framework, Abridged Petri Nets (APNs). The focus of the presented models is on understanding the underlying market dynamics and on the relationship among the various market quality measures. In particular, impacts of various types of traders on the market liquidity and the market's resilience to external shocks are investigated.

Financial Regulation and Risk Management

Sponsor: Financial Services Section

Sponsored Session

Chair: Xianhua Peng, Assistant Professor, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, maxhpeng@ust.hk

1 - Network Effects on Risk and Asset Prices
John Birge, Jerry W. and Carol Lee Levin Professor of Operations Management, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu, Jing Wu

The structure of firm connections has direct effects on their exposure to systematic risk. This talk will present a model of this form of risk propagation in supply chain networks and show how this impacts asset prices.

2 - Rank Dependent Utility and Risk Taking in Complete Markets
Xuedong He, Assistant Professor, Columbia University, 316 Mudd, 500 W. 120th street, New York, NY, 10027, United States of America, xh2140@columbia.edu, Xunyu Zhou, Roy Kouwenberg

We analyze the portfolio choice problem of investors who maximize rank dependent utility in a single-period complete market. We propose a new notion of less risk taking: choosing optimal terminal wealth that pays off more in bad states and less in good states of the economy. We prove that investors with a less risk averse preference relation in general choose more risky terminal wealth, receiving a risk premium in return for accepting conditional-zero-mean noise (more risk).

3 - Risk Analysis and Hedging of Parisian Options
Kyoung-Kuk Kim, Associate Professor, Korean Advanced Institute of Science and Technology, 291 Daehak-ro, Yuseong-gu, Industrial and Systems Engineering,KAIST, Daejeon, Ch, 305-701, Korea, Republic of, catenoid@kaist.ac.kr, Dong-Young Lim

A Parisian option is an option such that a specified amount of time below/above a barrier is a trigger. We study its greeks via Laplace transform and conduct risk analysis, showing that theta is important to understand the behaviors of Parisian options and how it can make dynamic hedging fail. Instead, we propose a quasi-static hedging strategy by decomposing the option into other derivatives that are statically hedged. Numerical comparisons of dynamic and static hedging are reported.

4 - On the Measurement of Economic Tail Risk
Xianhua Peng, Assistant Professor, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, maxhpeng@ust.hk

We show that the only tail risk measure that satisfies a set of economic axioms proposed by Schmeidler (Econometrica, 1989) and the statistical property of elicitability (i.e. there exists an objective function such that minimizing the expected objective function yields the risk measure; see Gneiting (J. Amer. Stat. Assoc., 2011)) is median shortfall, the median of tail loss distribution. Elicitability is important for backtesting. We also extend the result to incorporate multiple scenarios.

Global Optimization in Graphs/Networks

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Sergiy Butenko, Texas A&M University, 4037 ETB, TAMU-3131, College Station, TX, 77843, United States of America, butenko@tamu.edu

1 - A Global Optimization Approach for the Maximum Quasi-clique Problem
Zhuqi Miao, PhD Student, Oklahoma State University, 322 Engineering North, Oklahoma State Un, Stillwater, OK, 74078, United States of America, zhuqi.miao@okstate.edu, Baski Balasundaram, Eduardo Pasiliao

The maximum quasi-clique problem (MQCP) can be formulated as a {0,1}-program with a linear objective function and a single quadratic constraint. Motivated by the MQCP, this research investigates Lagrangian based upper-bound, and embeds this upper-bound in a branch-and-bound algorithm for the MQCP. The effectiveness of this approach is studied by solving the MQCP on DIMACS benchmark instances.

2 - Optimization Approach for Analysis of Neuronal Connectivity Network
Alla Kammerdiner, Assistant Professor, New Mexico State University, PO Box 30001, MSC 4230, Las Cruces, NM, 88003, United States of America, alla@nmsu.edu

We present a new approach for analyzing integrity of white matter in the brain. First the network model is constructed from a diffusion tensor image by single linkage clustering to signify the integrity of fiber bundles. The nodes into specified regions of interests denote the sink and source nodes of our model. By solving the maximum flow problem, the maximum flow is obtained for a given image. Finally, the solutions are used in image comparisons. Our approach is illustrated on simulated data.

3 - Metaheuristic Framework for Detecting Robust Cliques in Networks Subject to Uncertain Edge Failures
Oleksandra Yezerska, Texas A&M University, College Station, TX, United States of America, yaleksa@tamu.edu, Sergiy Butenko, Vladimir Boginski

We develop and compare several heuristic approaches for detecting robust cliques in graphs subject to uncertain edge failures. A clique is robust if it satisfies certain risk requirements modeled using the CVaR concept. The proposed heuristics employ techniques borrowed from the well-known tabu search and GRASP metaheuristics.

Academic Projects and Cases Using Real-world Data and Scenarios to Prepare Students for the Workforce

Sponsor: INFORM-ED

Sponsored Session

Chair: Wendy Swenson-Roth, Associate Professor, Georgia State University, 6230 Forest Park Dr, Signal Mountain, TN, 37377, United States of America, wroth@gsu.edu

1 - Industry and Academia Partner to Provide Real-World Data and Issues to Learn Complex Systems Design

Michael Ogle, Assistant Professor and Undergraduate Director, UNC Charlotte, 9201 University City Blvd., CARC 220, Charlotte, NC, 28223, United States of America, Mike.Ogle@uncc.edu

An industry trade association and its college-industry council organization have partnered for twenty years to offer an annual design competition focused on real-world data and marketplace challenges, creating an intensive five-week design experience. This session focuses on how that industry-university collaboration is structured and how it can provide a model for other industries to partner with academia to grow the next generation of educated customers and solution providers.

2 - Teaching Sustainability from an Optimization and Analytics Perspective

Iddrisu Awudu, NDSU, 26 University Village, Fargo, ND, United States of America, Iddrisu.Awudu@my.ndsu.edu

This paper presents a discussion on teaching sustainability by considering optimization and analytics methods. A decision for corporate social responsibility is made by combining a stochastic optimization model using Sample Average Approximation (SAA) algorithm and principal component analysis. A case study is presented based on an ethanol plant in the mid-west.

3 - Mathematical Modeling to Reduce Waste of Compounded Sterile Products in Hospital Pharmacies

Vera Tilson, Simon School, University of Rochester, Rochester, NY, United States of Americavera.tilson@simon.rochester.edu, Greg Dobson

In recent years, many U.S. hospitals embarked on lean" projects to reduce waste. Thoughtful analysis of the data captured by operational systems allows the modeling of many potential process options. Such models permit the evaluation of likely waste reductions and financial savings before actual process changes are made. We present an operations management case based on a student project.

4 - Methods of using the Internet and Laptops in the Classroom with the Goal of Improving Student's Preparation for the Workforce

Wendy Swenson-Roth, Associate Professor, Georgia State University, 6230 Forest Park Dr, Signal Mountain, TN, 37377, United States of America, wroth@gsu.edu

The information students will need and the problems they will receive when they enter the workforce are different from what they are exposed to in many courses. Students receive a substantial amount of course Information through lectures and textbooks. In addition, problems often come with a well-organized data set and a clearly defined problem. Methods are presented to help prepare students to transition from homework problems, where the data and model are clearly laid out, to an end of the semester group project where students are responsible for the entire Decision Making Process.

Scheduling IV

Contributed Session

Chair: Cong Zhao, University of Wisconsin Madison, 1513 University Ave, Room 3235, Madison, WI, 53706, United States of America, czhao27@wisc.edu

1 - Analysis of Multi-product Manufacturing Systems with Setup States

Cong Zhao, University of Wisconsin Madison, 1513 University Ave, Room 3235, Madison, WI, 53706, United States of America, czhao27@wisc.edu, Jingshan Li, Ningjian Huang

An analytic model for manufacturing systems with unreliable machines, finite buffers and setup states is developed. Solutions for two-machine are derived and aggregation procedure for longer lines are proposed. Extensive simulation shows this method has high accuracy. This provides a quantitative tool to study the impact of flexibility of manufacturing operations and derive managerial insights.

2 - Scheduling: Agreement Graph vs Resource Constraints

Mourad Boudhar, USTHB University, BP 32, El-Alia, Algiers, Algeria, mboudhar@yahoo.fr, Mohamed Bendraouche, Ammar Oulamara

We consider two problems. The first is scheduling with agreements (SWA) that consists in scheduling jobs non-preemptively on identical machines in a minimum time, subject to constraints that only some specific jobs can be scheduled concurrently. These constraints are represented by a graph. We definitely close the complexity status of SWA on 2 machines with 2 fixed processing times. The second problem is the resource-constrained scheduling. We deduce new complexity results for the latter.

3 - A Subcubic Algorithm to Propagate the Energy Reasoning for the Cumulative Constraint

Nicolas Bonifas, École Polytechnique & IBM, Route de Saclay, Palaiseau, 91128, France, nicolas.bonifas@polytechnique.edu

In the field of constraint-based scheduling, we present an algorithm to propagate the energy reasoning of Lopez in subcubic time, compared to the cubic time needed for the original algorithm. This is a result of great practical significance since energy reasoning is stronger than both timetabling and edge-finding to propagate the cumulative constraint. This new result is based on new properties of the energy reasoning and on new data structures.

4 - Particle Swarm Optimization for Scheduling Flexible Flow Line

Parastoo Amiri, Clemson University, 250 Elm St. # 423, Clemson, SC, 29631, United States of America, pamiri@clemson.edu, Mary Elizabeth Kurz

Previous research on scheduling flexible flow lines (FFL) to minimize makespan has utilized approaches such as branch and bound, integer programming, or heuristics. Particle swarm optimization (PSO) is a population-based metaheuristic method which finds a solution based on the analogy of sharing useful information among individuals. The effectiveness of a discrete PSO in FFL scheduling is compared to genetic algorithms. Methods to avoid premature convergence are evaluated.

1 - Role of Communication in a Collaborative Supply Chain: An Empirical Analysis

Qingyu Zhang, Professor, Shenzhen University, College of Management, Shenzhen, China, q.yu.zhang@gmail.com, Mei Cao

The objective of the study is to explore the mediating role of communications in the relationships among collectivism, goal congruence, and process efficiency in a supply chain. Data was collected through a Web survey of U.S. manufacturing firms. The results and implications are discussed.

2 - Optimality of Base Stock List Price Policy for Dynamic and Nonstationary Inventory-Pricing Control

Sirong Luo, Associate Professor, Shanghai University of Finance and Economics, School of Statistics and Managment, Guoding Road 777, Yan, Shanghai, 200433, China, luo.sirong@mail.shufe.edu.cn

We study a dynamic inventory-pricing control problem. Demand are two parameter nonlinear, nonstationary and nonadditive model. Using a decision variable transformation approach, we show that the BSLP policy is optimal and the optimality conditions depend only on the location and scale parameters of demand as functions of price. Our results complement the existing results for both backorder and lost sale models in this area.

3 - Applying Cuscore Statistic to Process Control

Maria Emilia Camargo, Professor, University of Santa Cruz do Sul, Av. João Machado Soares, 3199, Santa Maria, Brazil, kamargo@terra.com.br, Suzana Russo, Ivonne Maria Gassen, Marcia Adriana de Oliveira Cerezer

This paper present the study about the statistics CuScore, using the real data (Textile Industry Oeste Ltda in the State of Santa Catarina, Brazil) to investigate the behaviour this statistics in decteting the changes in the process. Also present the comparation between the statistics CuScore with the technics of Exponentially Weighted Moving Average (EWMA). The combination of the ajustament system (EPC) with to monitoring system (SPC) showed best results than only the ajustament system.

4 - Data-Driven Modeling to Improve Elementary School External Resource Acquisition

Samantha Meyer, Graduate Student, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, samanthameyer2011@u.northwestern.edu

Using interview and survey data we collected from nine urban elementary schools, we develop a series of optimization models to improve school resource acquisition. We explore trade-offs across multiple resource dimensions (knowledge, human, and financial resources) and objectives (equity, effectiveness, and efficiency). Lastly, we discuss implications of this study for organizations that wish to strategically form external partnerships to improve access to scarce resources.

Inventory Management VII

Contributed Session

Chair: Kemal Gursoy, Instructor, Rutgers University, 100 Rockafeller Road, Room 5146, Dept. of MSIS, Piscataway, NJ, 08854, United States of America, kgursoy@rci.rutgers.edu

1 - Optimal Procurement: Case of a Cost Conscious Manufacturer

Kemal Gursoy, Instructor, Rutgers University, 100 Rockafeller Road, Room 5146, Dept. of MSIS, Piscataway, NJ, 08854, United States of America, kgursoy@rci.rutgers.edu, Melike Baykal-Gursoy, Sicong Hou

We consider a manufacturer who uses an expensive raw material to produce products for a stable market. The raw material price is subject to unknown market conditions, and thus it is random and may not be stationary. There are opportunities to make profitable spot purchases, or making long term purchasing commitments. The objective of procurement policy is to minimize mainly the purchasing cost and secondarily the inventory holding costs. We also present a case study.

2 - The Profit and Pricing Effect of Item-level Inventory Management

Fang Fang, Associate Professor, California State University at San Marcos, 333 S Twin Oaks Valley Rd, San Marcos, CA, 92127, United States of America, fangfang@csusm.edu, Xiaohui Xu

This research studies the strategic decisions when online retailers are able to dynamically track item-level inventories. The decision is on whether to release the inventory level to the consumers, especially when the inventory is low; and how the prices can be dynamically adjusted to improve profitability. Our preliminary results show that the online retailers shall be able to improve profits by adopting a contingency inventory-revealing plan when inventory drops to a certain threshold.

3 - The Stochastic Lot Sizing Problem with Remanufacturing

Onur A. Kilic, Hacettepe University, Institute of Population Studies, Ankara, Turkey, onuralp@hacettepe.edu.tr, Huseyin Tunc, S. Armagan Tarim

We study the stochastic lot sizing problem with remanufacturing under customer service level constraints. The problem is a stochastic extension of the classical lot sizing problem where demand can be met via two alternative sources: manufacturing new products and remanufacturing returned products. It is known that even the deterministic version of this problem is NP-hard. We propose a mixed integer programming based heuristic for the problem building on the static-dynamic uncertainty strategy.

4 - Multi-period Inventory Management with Bounds on Cumulative Commitment and Demand Forecast

Na Zhang, Student, Huazhong University of Science and Technology, School of Management, Wuhan, Hubei, 430074, China, m201373374@hust.edu.cn, Zhe Yin, Fei Lv

We propose a retailer's inventory replenishment policy to cooperate with a supplier in a periodic review. The retailer shares an advanced replenishment plan based on demand forecast with the supplier and commits total order quantity of several periods within range of a lower and upper percentage of the planned quantity. Using a year sales data from a retail chain store in China, we examine the effects of this policy on retailer's inventory turnover performance by the method of simulation.

5 - Fixed-Interval Order-up-to Policies for Serial Systems

Guangyu Wan, PhD candidate, Nanyang Business School, NBS PhD Office, Block S3-01B-73, Nanyang Technological University, Singapore, 639798, Singapore, wang0699@e.ntu.edu.sg, Qinan Wang

This paper studies an echelon fixed-interval order-up-to policy for a serial system, in which related cost are evaluated continuously. We provide:(1) a simple recursive approach to evaluate the exact system cost;(2) a complete characterization of an optimal ordering policy by equating the marginal echelon inventory related cost to the inventory holding cost at the upstream stage. An optimal ordering policy for a given replenishment schedule can be identified by a simple bottom-up procedure.

Military Application 2

Contributed Session

Chair: Ramzi Mirshak, Defence R&D Canada, 101 Colonel By Drive, Ottawa, ON, Canada, ramzi.mirshak@drdc-rddc.gc.ca

1 - Multi-objective Crew and Fleet Scheduling using an GA/IP Hybrid

Ramzi Mirshak, Defence R&D Canada, 101 Colonel By Drive, Ottawa, ON, Canada, ramzi.mirshak@drdc-rddc.gc.ca, Matt Smart

We present a problem that involves scheduling fleets and crews that are dispatched from two bases and must fulfill three distinct mission sets. We optimize crew and fleet objective functions through a hybrid GA/IP, where aspects of the fleet maintenance profile are pre-allocated in the GA. This approach permits us to estimate the Pareto front for the multi-objective problem of optimizing fleet maintenance and minimizing the crew-swaps between assets while meeting the mission sets.

2 - Mitigation Methods and Techniques for Enhancing Sonar Operational Confidence

Mark Gammon, Defence Scientist, Defence R&D Canada - Atlantic, 9 Grove Street, Dartmouth, NS, B2Y 3Z7, Canada, mark.gammon@drdc-rddc.gc.ca

There are numerous challenges to effectively model sonar performance given variability in ocean acoustic parameters. It is well recognized by the operational community that it is challenging to accurately predict the performance of a sonar system. Numerous initiatives are required to harmoniously provide a level of confidence to operators for sonar prediction. Simulation tools that are being utilized include the NATO Multi-Static Tactical Planning Aid and the Environmental Modelling Manager.

3 - A Continuous-Time Model for Airlift Scheduling at the United States Transportation Command

Allison Chang, Technical Staff, MIT Lincoln Laboratory, 244 Wood Street, Lexington, MA, 02420, United States of America, aachang@mit.edu

USTRANSCOM is responsible for providing the Department of Defense with global mobility. Current research efforts to assign resources to requirements typically discretize time into intervals. This type of model scales with the granularity of the time horizon, and thus becomes prohibitively large. We introduce a continuous-time scheduling model that removes the dependence of the model size on how finely the horizon is divided. We demonstrate the performance of this model on several test datasets.

4 - Time-Dependent Portfolio of Systems Optimization using GAs with Gradient-Directed Mutations

Stephen Henry, Senior Member Technical Staff, Sandia National Labs, 1515 Eubank Ave, Albuquerque, NM, 87123, United States of America, smhenry@sandia.gov, John Eddy, Mark Smith

Long-range business or military planning often requires portfolio optimization of integer system counts over many time periods. Genetic Algorithms (GAs) are an attractive approach due to their ability to optimize over multiple non-linear objectives. However, random GA mutations have difficulty with the inherent coordination in year-to-year investment levels. This work uses objective function gradients to direct mutations in a coordinated fashion, giving impressive speedups over zeroth-order GAs.

Chair: Daniel Faissol, Group Leader, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA, 94550, United States of America, faissol1@llnl.gov

1 - Modeling, Simulation and Optimization to Guide Radiological and Nuclear Searches

Daniel Faissol, Group Leader, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA, 94550, United States of America, faissol1@llnl.gov, Richard Wheeler, Thomas Edmunds, Claudio Santiago

We present a prototype modeling, simulation, and optimization tool to support operational planning of radiological or nuclear search missions in an urban environment. The tool includes a 3-dimensional simulation model of an urban scene to estimate the expected background radiation and attenuation of the radiation through building walls. We then solve a non-linear optimization problem and demonstrate that optimized searches can perform 3-30 better than unguided strategies.

2 - DDDAMS-based System for Surveillance and Crowd Control via UAVs and UGVs

Amirreza M. Khaleghi, Research Assistant, University of Arizona, 1127 James E. Rogers Way, Tucson, AZ, 85721, United States of America, amirreza@email.arizona.edu, Dong Xu, Mingyang Li, Jyh-Ming Lien, Sara Minaeian, Yifei Yuan, Christopher Vo, Arsalan Mousavian, Jian Liu, Young-Jun Son

A dynamic data driven adaptive multi-scale simulation (DDDAMS) based planning and control framework is presented for surveillance and crowd control via teams of UAVs and UGVs. Various issues are discussed such as enabling algorithms (detection, tracking, motion planning), control architectures, and team formation/coordination policies. An agent-based hardware-in-the-loop simulation testbed is constructed, where the modeling fidelity can be adjusted according to the observations and performance.

3 - Quantifying Difficulty in Transporting Illicit Radiological and Nuclear Materials

Samrat Chatterjee, Pacific Northwest National Laboratory, 902 Battelle Blvd, Richland, WA, 99354, United States of America, samrat.chatterjee@pnnl.gov, Robert Brigantic, Casey Perkins

Varying levels of information may be available to an analyst for the quantification of illicit radiological and nuclear transport difficulty along a path. In this study, the characterization of difficulty is explored using ordinal rankings, probability distributions, and intervals. A systems-approach is then adopted to investigate the propagation of difficulty.

4 - Modeling the National Oceanic and Atmospheric Administration's (NOAA) Observing Portfolio

David Helms, National Oceanic and Atmospheric Administration (NOAA), 1335 East West Hwy, Silver Spring, MD, 20910, United States of America, David.helms@noaa.gov

Since 2005, NOAA has developed a large-scale portfolio analysis (PA) model to support investment decisions across its complex mission-space and portfolio of 100+ observing systems (e.g. satellites, ships, aircraft, and surface-based). The model is very large and detailed, employs advanced data elicitation and modeling capabilities; and informs NOAA's investment decisions. It is also a PA proving ground for other federal agencies involved in planning and conducting national earth observations.

Decision Analysis 3

Contributed Session

Chair: Shital Thekdi, Assistant Professor, University of Richmond, 1 Gateway Rd., Richmond, VA, 23103, United States of America, sthekdi@richmond.edu

1 - Scenario-Based Input-Output Inoperability Modeling for Risk Management of Port Disruptions

Shital Thekdi, Assistant Professor, University of Richmond, 1 Gateway Rd., Richmond, VA, 23103, United States of America, sthekdi@richmond.edu, Joost Santos

Disruptions to maritime port operations have potential to propagate economic losses across supply chains. Risk management should anticipate the impact of disruptions and guide protective investments. This presentation will: (1) Describe a scenario-based interdependency model to identify sectors vulnerable to disruptions, and (2) Prioritize risk management policy investments. The methods will be demonstrated on a United States port responsible for handling $36.1 billion of cargo annually.

2 - Enhanced Techno-economic Analysis for Advanced Biofuel Production

Qi Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50010, United States of America, qili@iastate.edu, Guiping Hu

We will increase the complexity of the traditional techno-economic analysis of commercial biorefinery by considering the practical logistic settings and constraints. At the same time, new uncertainty analysis such as Monte-Carlo simulation and regression analysis could be performed to test the uncertainty in technical data (e.g., reactor performance, product yields), facility size, and capital costs.

3 - Understanding the Channels of Contagion: A Game between Borrower and Lender Countries

Jonathan Welburn, PhD Student, University of Wisconsin - Madison, 1513 University Ave, 3237 Mechanical Engineering Building, Madison, WI, 53706, United States of America, welburn@wisc.edu, Vicki Bier, Kjell Hausken

The process by which crises spread across countries and regions, known as contagion, causes risk to economic stability. We use a multi-agent model of borrower and lender countries to capture the transmission of shocks through trade and debt channels of contagion by strategic interaction. We also explore the possibility of common-cause shocks that lead to crises without propagation. Simulation and sensitivity analysis explain how negative events in trade and debt can lead to a crisis.

4 - Decision-Making under Uncertainty: A Decision-Analytic Typology of Emotion, Logic and Dynamics

Ursula Ott, Associate Professor, Loughborough University, School of Business and Economics, Ashby Road, Loughborough, LE11 3TU, United Kingdom, U.F.Ott@lboro.ac.uk

We use a decision-analytic mechanism to show the impact of emotion, logic and dynamics for managerial players. In a complex globalized world, managers have adapted to their organizations and have learnt to make decisions in an uncertain environment. The dynamics of their behavior is driven by emotion, logic and dynamics. We show the paths of decision-making from three angles and come up with a typology of ELD for managerial decision-making.

5 - How to Use Regression Correctly

Syed Shahabuddin, Professor, Central Michigan University, Smith 203C, Mt Pleasant, MI, 48858, United States of America, shaha1s@cmich.edu

Forecasting is a critical tool for making sound futuristic decisions. Forecasters can use timeseries or regression to forecast. Using a method, one must follow the required rules of the method to make an accurate forecast. Some forecasters do not know the rules, ignore the rules, or implement them partially. Thus, most forecasts are inaccurate. My paper discusses the required rules associated with regression and shows the consequences of ignoring, violating, or partially implementing them.

Chair: Alessandro Arlotto, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, alessandro.arlotto@duke.edu

1 - When Exactly is Long Chain Optimal?

Antoine Desir, PhD Candidate, Columbia University, New York, NY, United States of America, ad2918@columbia.edu, Yehua Wei, Vineet Goyal, Jiawei Zhang

The long chain process flexibility design has been an important concept in the design of flexible sparse configurations. We show that in a system with n supply and n demand nodes, long chain is optimal among the class of connected networks with at most 2n arcs. Our proof is based on a combinatorial analysis of the structure of augmenting paths and maximum flow in directed graphs. Surprisingly, the result does not hold for disconnected networks and we present a counterexample.

2 - Incorporating Correlation in Rounding LP Relaxations

Arash Asadpour, New York University, 44 W 4th St, New York NY aasadpou@stern.nyu.edu

We investigate linear optimization problems in the presence of combinatorial structures. We show how one can incorporate appropriate concentration inequalities in order to round the solution of the LP relaxation of the problem.

3 - Online Stochastic Bin Packing

Varun Gupta, Assistant Professor, University of Chicago, 5807 S Woodlawn Avenue, Chicago, IL, 60637, United States of America, varun.gupta@chicagobooth.edu, Ana Radovanovic

In one-dimensional online stochastic bin packing, n items with sizes sampled i.i.d. from an unknown distribution arrive as a stream and must be packed on arrival to minimize the number of non-empty bins. We present the first truly distribution-agnostic bin packing heuristic that achieves additive O(sqrt(n)) waste compared to OPT for all discrete distributions. We also present results on stochastic online bin packing with item departures for which are heuristic extends as-is.

4 - Beardwood-Halton-Hammersley Theorem for Stationary Ergodic Sequences: A Counterexample

J. Michael Steele, University of Pennsylvania, Philadelphia, PA, United States of America, steele@wharton.upenn.edu, Alessandro Arlotto

We construct a stationary ergodic process { X_1, X_2, X_3, ... } such that each X_t, has the uniform distribution on the unit square and the length of the shortest path through { X_1, X_2, ...,X_n } is not asymptotic to a constant times the square root of n. In other words, we show that the Beardwood-Halton-Hammersley theorem does not extend from the case of independent uniformly distributed random variables to the case of stationary ergodic sequences with the uniform stationary distribution.

1 - Diffusion Approximation for Multidimensional Reflecting Processes via their Stationary Equations

Masakiyo Miyazawa, Professor, Tokyo University of Science, Yamazaki 2641, Noda, 278-8510, Japan, miyazawa@is.noda.tus.ac.jp

We consider diffusion approximations of the stationary distributions of multidimensional reflecting processes. Such a diffusion limit is usually studied through a scaling limit of processes. We here directly consider a limit of stationary equations. This may not guarantee the weak convergence of the stationary distributions. Nevertheless, it will be useful when charcateristics are obtainable from the stationary equations and when a process limit is hard to get. We present such examples.

2 - Optimal Stock Allocation for Production-Inventory Systems with Multiple Impatient Customer Classes

Yasar Levent Kocaga, Assistant Professor of Operations Management, Yeshiva University, Belfer Hall 403/A, 2495 Amsterdam Avenue, New York, NY, 10033, United States of America, kocaga@yu.edu, Yen-Ming Lee

We address the production and inventory control of a make-to-stock system with multiple impatient customer classes. We assume Poisson demand and exponential production times. Demand not satisfied immediately is backordered; but waits only up to an exponentially distributed amount of time, and is cancelled if not satisfied within this time. We show that the threshold inventory rationing policy is still optimal under certain conditions including a requirement on the order of abandonment rates.

3 - Staffing Service Systems with Unknown Arrival Rates Restricted by Partial Distributional Information

Ying Chen, The University of Texas at Austin, 1 University Station, Austin, TX, 78712, United States of America, lesleycy@utexas.edu, John Hasenbein

We study the staffing level minimization problem in a large-scale queueing system with a QoS constraint on the probability that a customer waits in a queue. We consider an Erlang-C model where the arrival rates follow an uncertain discrete distribution with partial information. We explore two cases: in the first one, the constraint has to be satisfied by every possible distribution, while in the second case, the constraint is enforced only on the overall delay probability.

4 - Routing and Scheduling in a Gurvich Network

Arda Sisbot, Graduate Research Assistant, University of Texas at Austin, Department of Mechanical Engineering, Austin, TX, 78712-1063, United States of America, arda@utexas.edu, John Hasenbein

We focus on a two-class parallel queueing network with a flexible server having a faster rate of service for the class with higher holding cost. Under Poisson arrivals, our model jointly considers incoming job routing and flexible server assignment to one of the classes. Through the associated fluid model we determine a near-optimal discrete policy. The asymptotic behavior of the policy is then analyzed. Numerical experiments are performed to assess the performance of the proposed policy.

1 - Evaluating the Microstructure of A206 Metal Matrix Nanocomposites using Ultrasonic Attenuation

Jianguo Wu, University of Wisconsin-Madison, 1513 University Ave, Industrial and Systems Engineering, Madison, WI, 53706, United States of America, wu45@wisc.edu, Shiyu Zhou, Xiaochun Li

A206-Al2O3 MMNCs are promising high performance materials with potential applications in various industries. The Al2O3 nanoparticles dispersed using ultrasonic cavitation technique can enhance the nucleation of intermetallic phases and reduce grain sizes.This paper investigated the relationship between the ultrasonic attenuation and the microstructures. The results provide useful guidelines on the developmemt of the new quality inspection technique for A206-Al2O3 nanocomposites.

2 - Estimating Length of Nanorods using Dynamic Light Scattering Data

Xin Li, Florida State University, 2525 Pottsdamer Street, Tallahassee, FL, United States of America, xl12d@my.fsu.edu, Chiwoo Park

We present a new approach for estimating length distribution of nanorods with dynamic light scattering (DLS) data. The conventional approach uses the CONTIN procedure and it involves numerical inverse Laplace transform which has some numerical issues and is computationally expensive. Our method avoids the numerical inversion by reformulating the problem into a regression setting with physics-based basis functions. Our method outperforms the CONTIN in terms of accuracy and computation.

3 - Joint Modeling of Quantitative and Qualitative Responses in Additive Manufacturing

Hongyue Sun, Virginia Tech, Virginia Polytechnic Institute and State, University, 112 Durham Hall,, Blacksburg, VA, 24061, United States of America, hongyue@vt.edu, Prahalad Rao, Ran Jin, Xinwei Deng, Zhenyu Kong

This paper focuses on modeling the product quality in a fused deposition modeling (FDM) additive manufacturing process. During such a process, both quantitative and qualitative (QQ) types of responses are used to quantify the product quality. The in situ process variables are also included in the QQ model to predict the QQ responses with functional predictors. Both numerical simulations and experimental studies are conducted to evaluate the modeling performance.

4 - Weighted-Likelihood Based Control Chart for Monitoring Censored Weibull Lifetimes

Chi Zhang, PhD Candidate, HKUST, Room 4223, Academic Building, HKUST,, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, czhangaf@ust.hk, Fugee Tsung

Lifetime experiments are widely seen in modern industrial/medical applications. And process monitoring for lifetime observations has received increasing attention in recent years. This work applies the recent developed weighted likelihood scheme to monitor lifetime data. The proposed control chart is not only able to present desirable In Control (IC) performance, but also robust under various scenarios. Numerical simulations have demonstrated the effectiveness of our method.

5 - Heterogeneous Recurrence Monitoring and Control of Nonlinear Stochastic Processes

Yun Chen, USF, 14219 Les Palms Circle, Apt. 101, Tampa, FL, 33613, United States of America, yunchen@mail.usf.edu, Hui Yang

Process monitoring of dynamic transitions in complex systems is more concerned with heterogeneous recurrence variations. However, little has been done to investigate heterogeneous recurrence variations and link with process monitoring. This paper presents a novel approach of heterogeneous recurrence analysis of nonlinear stochastic processes. Experimental results show that this research provides an effective scheme for monitoring and control of nonlinear dynamic transitions of complex systems.

1 - Imbalanced Classification by Hidden Structure Learning

Yang Zhao, PhD Student, City University of Hong Kong, 83 Tat Chee Ave, Kowloon, Hong Kong - PRC, yangzhao9-c@my.cityu.edu.hk, Kwok Leung Tsui, Abhishek Shrivastava

We propose a decomposition based approach to two-class imbalanced classification problem. This approach works by first decomposing the majority class using an unsupervised learning algorithm. The base classifier is then constructed on each sub-problem. The ensemble is tuned to increase the sensitivity towards the minority class. We also provide a metric for estimating the stability of the decomposition. We demonstrate the performance of the proposed approach through various real datasets.

2 - Phasor Measurement Uncertainty Quantification in Voltage Stability Analysis

Jianhui Wang, Decision and Information Sciences Division/Argonne National Laboratory, 9700 S. Cass Avenue, Bldg. 221, Argoone, IL, 60439, United States of America, jianhui.wang@anl.gov, Chen Chen

We present an uncertainty quantification method for phasor measurement units (PMUs) in voltage stability assessment. The effect of local phasor measurement uncertainty on the bus impedance and the Thevenin equivalent impedance used for voltage stability analysis is quantified analytically.

3 - Online Steady-State Detection using Sequential Monte Carlo Methods

Yuxing Hou, University of Iowa, Ames, IA, United States of America, yuxing-hou@uiowa.edu, Yong Chen

We propose an efficient on-line steady-state detection algorithm using a multiple change-point model and sequential Monte Carlo methods. The proposed algorithm is a Rao-Blackwellized version of the particle filter change-point detection algorithm.

4 - An Automatic Nonlinear Profile Monitoring Method using RP in Progressive Stamping Processes

Xi Zhang, Assistant Professor, Peking University, Haidian, Beijing, China, xi.zhang@pku.edu.cn, Kaibo Liu, Cheng Zhou

This research proposed a nonlinear profile monitoring method by using the recurrence plot for monitoring the progressive stamping processes. We investigated the relationship between the faulty patterns in RP and the changes in nonlinear profiles due to missing parts. A parameter learning algorithm was developed to determine the critical parameters involved in RP, and the selected features from RP were embedded into the support vector machine to identify those faulty process conditions.

1 - Capacity Management in a Pre-Admission Testing Center

Sal Agnihothri, Professor, Binghamton University, SUNY, School of Management, Binghamton, NY, 13902-6000, United States of America, agni@binghamton.edu, Anu Banerjee

A Pre-Admission Testing Center (PATC) is a hospital unit to gather important patient information and perform procedure-specific tests to get the patients ready for surgery in the Operating Room (OR) on the surgery date. We consider a PATC where patients can either walk-in or schedule an appointment in advance to get the service. In this talk, we explain the efforts to determine the bottleneck and increase capacity to reduce patient waiting time. We analyze the system using a simulation model.

2 - A Simulation Approach to Modeling Lumpiness in Spare Parts Demands

Frank Ciarallo, Associate Professor, Wright State University, 3640 Col Glenn Hwy, Dayton, OH, 45435, United States of America, frank.ciarallo@wright.edu, Albert Lowas

Demand for spare parts in many supply chains has been characterized as lumpy: having the characteristic of high quantity variability as well as high timing variability. Using a simulation-based methodology, this talk explores the underlying characteristics that drive lumpy demand for spare parts from fleets of aircraft. These findings demonstrate that a significant portion of variability that has historically been considered random can be accounted for by deterministic patterns.

3 - A Simulation Analysis of Collection and Processing of End-of-Life Garments

Kai Huang, Dr., McMaster University, 1280 Main St. W, Hamilton, ON, L8S 4L8, Canada, khuang@mcmaster.ca, Suman Niranjan

We analyze a collection and sorting process of end-of-life garments, which can be re-manufactured or recycled. The supply of the garments and the demand for re-manufactured items are stochastic and price-sensitive. We develop a discrete-event simulation to determine the near-optimal acquisition price of garments and selling prices of re-manufactured items.

4 - Optimal Queue Length Based Server Sharing Decisions in Field Services

Suman Niranjan, Assistant Professor for Operations Management, Savannah State University, 209 Jordan Bldg,COBA,Savannah State Univ, 3219 College St, Savannah, GA, 31404, United States of America, niranjans@savannahstate.edu, Sal Agnihothri

We consider a field service system with equipment located in a geographic area. The area is divided into two territories, each with a single server who provides onsite service. The objective of this paper is to investigate the conditions for server sharing between the two service territories. In particular, we use simulation to explore the impact of additional travel time and server utilization on server sharing decisions between two territories.

1 - An Elicitation of Expert Assessments of Current and Future Li-ion Battery Costs and Designs for EVs

Apurba Sakti, Massachusetts Institute of Technology, Cambridge, MA, United States of America, sakti@mit.edu

In this elicitation, battery manufacturers, car OEMs, and consultants assessed Li-ion battery cost and design developments for a PHEV10, a PHEV40, a BEV100 as well as for specific designs similar to the Ford C-Max Energi and the Nissan Leaf in 2013 and 2018.

2 - Consumer Cost Effectiveness of CO2 Mitigation Policies in Restructured Electricity Markets

Jared Moore, PhD Candidate, Carnegie Mellon University, 5620 Hempstead Rd., #10, Pittsburgh, PA, 15217, United States of America, jaredmoo@andrew.cmu.edu, Jay Apt

We examine the cost to consumers per tonne of carbon offset of a carbon price and renewable portfolio standards in the restructured markets of PJM, ERCOT, and MISO. We find consumers' costs are strongly dependent on the price of natural gas and on the characteristics of the generators in the dispatch stack. We find that both policies have consequences in capacity markets and that the RPS can only be more cost effective if existing capacity supply remains adequate and gas prices increase.

3 - The Value of Integrated Production Planning in Aluminum Recycling

Jiyoun Chang, Student, MIT, 77 Massachusetts Ave., E38-435, Cambridge, MA, 02139, United States of America, jiyoun@mit.edu, Elsa Olivetti, Randolph Kirchain

Recycling low-quality scrap and byproducts is of great interest in the aluminum industry due to its economic and environmental benefit but requires two stage processing. This work includes developing models for two-stage blending operations to maximize incorporation of secondary raw materials. The analysis quantifies the opportunities associated with integrated production planning given a complex operational environment including variation in demand and raw materials availability.

1 - understanding the Effects of Policy Designs for the Future of the US Light-duty Vehicle Fleet

Alan Jenn, PhD, Carnegie Mellon University, 3621 Childs Street, Pittsburgh, PA, 15213, United States of America, ajenn@andrew.cmu.edu, Ines Azevedo

We assess the effects of vehicle policies on the design/composition of the US fleet. We incorporate consumer demand by measuring responsiveness to changes in vehicle attributes by calibrating a logit model to sales of vehicles. We maximize the profits of manufacturers in an iterative NLP, by changing design decisions of vehicles sold (fuel economy and vehicle prices). We find that manufacturers face higher incremental costs and have dynamic pricing strategies in the presence of policies.

2 - Do Government R&D Subsidies Serve as a Signal for External Investors? Evidence from China

Yanhui Gao, Xi'an Hi-tech Development Zone, 1 Jinye Road, Xi'an, China, yhgaoxjtu@aliyun.com

Using the data on China's high-tech industry during the period 1998-2008, we find that government subsidies have positive effect on external finance and it is more significant in non-state owned sectors and the areas with worse external market conditions. The results are very important for alleviating financial constraints of non-state owned industries and improving the efficiency of allocation of capital.

3 - Encouraging Long-Shot Investments: Regulatory Options for Orphan Drug Development

Anjali Nursimulu, Visiting Risk Fellow, International Risk Governance Council, EPFL IRGC CM 1516, CP 99, Lausanne, 1015, Switzerland, anjali.nursimulu@irgc.org, Thomas Weber

By granting market exclusivity for new orphan drugs a regulator can promote research on treatments for rare diseases. For given effectiveness thresholds and terms of exclusivity, as well as the structure of the disease spectrum and the various expected payoffs for successful drugs, firms can enter an R&D race head-on or diversify their efforts. In a game-theoretic setting, we identify regulatory policies that maximize welfare by both encouraging R&D investments and realizing treatment benefits.

4 - Impact of Insecurity on the Manufacturing Sector, Panel Data Model: Mexican Case

Lorena Berumen, Head of Academic Area in Operations Management, Universidad Panamericana, Augusto Rodin 498, Ciudad de México, Mexico, laberumen@up.edu.mx, Margarita Hurtado, Jen ai de la Cruz, Gilberto Gonzalez

Insecurity adversely affect economic development, particularly economic performance of enterprises and hinders the formation of value chains. In this work the impact of violence in Mexico on manufacturing activity was measured from a panel data model, which includes information from manufacturing of Mexico between 2007 and 2011. It was found that the main factors limiting the development of the manufacturing industry are insecurity conditions.

1 - Optimizing Maintenance & Operation Policies for Offshore Wind Farms with Stochastic Wind Conditions

Thomas Yeung, Associate Professor, Ecole des Mines de Nantes, 4 Rue Alfred Kastler, BP20722, Nantes, 44000, France, thomas.yeung@emn.fr, Bruno Castanier, Canan Pehlivan

Offshore wind power is an emerging source of sustainable energy via wind turbine farms located in bodies of water off coasts. They present maintenance challenges due to their harsh environment and accessibility issues. We propose a Markov decision process to determine the optimal subset of wind turbines to maintain as well as the braking speed to reduce deterioration while considering short and long term stochastic wind conditions. A numerical example and analysis is presented.

2 - Multi-criteria Decision Support for Transmission and Generation Expansion Planning in Power Systems

Valentin Bertsch, Karlsruhe Institute of Technology (KIT), Hertzstr. 16, Karlsruhe, 76187, Germany, Viktor Slednev, Wolf Fichtner

The energy sector continues to undergo substantial structural changes. Currently, the expansion of renewable energy sources and the decentralisation of energy supply lead to new players entering the market who pursue different objectives and have different preferences. Thus, multiple, conflicting targets need to be considered. As a result, decision processes grow more complex at all levels. We therefore propose an approach combining multi-criteria decision analysis and energy systems modelling.

3 - On the Use of Fritz-John Optimality Conditions to Represent Optimal Power Flow Solutions

Katia Almeida, Professor, Universidade Federal de Santa Catarina, Dep. de Engenharia Elétrica, UFSC, Florianöpolis, 88040-900, Brazil, katia@labspot.ufsc.br

Computer programs that solve the optimal power flow (OPF) problem are important tools for the analysis of electric power systems. They should provide the system optimal operating point for a variety of network topologies and consumption levels. Depending on the scenario being analyzed, OPF solutions are close to non regular points of the constraint set. This work investigates the use of normalized Fritz-John optimality conditions, together with interior point methods, to solve the OPF problem.

4 - Corrective Switching with AC Feasibility

Paula Lipka, UC Berkeley, 450 Sutardja Dai Hall, 2594 Hearst Ave, Berkeley, CA, United States of America, plipka@berkeley.edu, Richard O'Neill, Shmuel Oren

Corrective switching can be used to correct a voltage violation or line overload problem caused by a line or generator contingency. Here, we examine using corrective switching with a sequential linear program that approximates the alternating-current optimal power flow problem to quickly solve for a feasible switching sequence that minimizes load shed.

5 - California Assembly Bill 2514 Energy Storage Purchase Requirements: An Innovation-Diffusion Approach

Mohammed Osman, Dept. of Technology & Society, Stony Brook University, 16 Hessian Ct., Centereach, NE, 11720, United States of America, mohammed.osman@stonybrook.edu

California Assembly Bill 2514 is a first-in-the-nation policy requiring that utilities purchase energy storage technology. AB 2514 implements a buying schedule for grid scale electricity storage on the three largest California utilities by RPS 33% by 2020 deadline. It mandates 1,325 MW of storage capacity or ~2% of projected peak 2020 summer demand to be added to the grid. We look at the policy's assumptions, expectations, and critical response from utilities using Innovation-Diffusion theory.

Sponsored Session

Chair: Chen Chen, Argonne National Laboratory, 9700 S. Cass Avenue, Bldg. 221, Argonne, IL, 60439, United States of America, morningchen@anl.gov

1 - Enhancing Demand Bidding in Electricity Markets

Hamed Mohsenian-Rad, University of California at Riverside, 900 University Ave, Riverside, CA, United States of America, hamed@ee.ucr.edu

A brief analysis of existing electricity market data suggests that demand side market participation is not as efficient as supply side market participation. This can affect price competitiveness and potentially create concerns about market power and supplier collusion. Accordingly, in this talk, we examine different methods to exploit flexible loads and other resources to enhance demand biding in deregulating electricity markets.

2 - A Mixed-integer Nonlinear Program for the Optimal Design and Dispatch of Remote Hybrid Power Systems

Mike Scioletti, PhD Student, Colorado School of Mines, 1500 Illinois Street, Golden, CO, 80401, United States of America, mikescio@gmail.com, Alexandra M. Newman

We present a design and dispatch strategy for the integration of renewable energies, specifically solar photovoltaic cells combined with battery storage and diesel generators at Forward Operating Bases (FOBs). This problem is a non-convex, mixed-integer nonlinear programming (MINLP) problem. Given the difficulties associated with solving large, non-convex MINLPs to global optimality, we present convex underestimation and linearization techniques to bound and solve the problem.

3 - Demand Charge Reduction with Battery Energy Storage System

Fang Chen, Lehigh University, 200 West Packer Ave, Bethlehem, PA, 18015, United States of America, fac210@lehigh.edu, Lawrence V. Snyder

In an electricity network, large power consumers are charged for their peak demand. A battery energy storage systems (BESS) may be employed to perform peak shaving tasks in order to reduce the demand charge. We introduce two optimization algorithms to properly dispatch battery power assuming demand is stochastic. We then develop a real time planning algorithm, where the load forecast is obtained from a real time predictor. Simulation results show that the system can achieve substantial saving.

4 - Design and Control Decision Model for Distributed Green Energy Generation

Alireza Ghalebani, PhD Student in Industrial Engineering, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, alireza@mail.usf.edu, Tapas Das

We studied optimal design and control strategy customized for distributed green energy generation systems. A MIP decision model is developed for regions with net-metering policy and time varying price of electricity. It considers inputs such as characteristics of the power system components, micro-grid's demand pattern, reliability requirement, system maintenance, local incentives and regulations, and weather data.

1 - Energy Technology Allocation for Distributed Energy Resources: A Strategic Technology-Policy Model

Sreekanth Mallikarjun, Stony Brook University, Department of Technology and Society, Stony Brook, NE, United States of America, sreekanth.mallikarjun@stonybrook.edu, Herbert Lewis

We present a two-stage multi-objective strategic technology-policy framework. The first stage utilizes a production possibility frontier model to evaluate the performance of each energy technology based on economic, technical, and environmental objectives. The second stage incorporates factor efficiencies from the first stage, energy capacity limitations, dispatchability, and renewable energy penetration, and energy end-use demands into a bottleneck multi-criteria decision model.

2 - Grid Planning using Multistage Stochastic Programming: Benefits of Additional Decision Stages

Saamrat Kasina, Johns Hopkins University, Baltimore, MD, United States of America, bkasina1@jhu.edu, Pearl Donohoo-Vallett, Ben Hobbs

Planning models must accurately capture market forces, incentives, and planning time-lines while giving planners the maximum flexibility possible. We analyze how the number of times the operator is allowed to delay or modify investment decisions or exercise options i.e., the number of decision stages affects the timing and location of generation and transmission decisions, and expected system cost. Numerical test cases are used to quantify this effect.

3 - Game-theoretic Model for Electric Distribution Reliability from a Multiple Stakeholder Perspective

Frank Felder, Research Associate Professor, CEEEP at Rutgers University, 33 Livingston Ave, New Brunswick, NJ, United States of America, ffelder@rutgers.edu, David Coit, Xiaojun Shan

We build and solve two games where either factory or utility decides first on whether to buy Combined heat power plant or harden. We also study government intervention (eg, mandating utility not to harden its distribution and factory to buy a Combined Heat Power with blackstart capability). We illustrate with notional data and show that under some conditions, investing in a Combined Heat Power Plant with blackstart capability could be optimal while the utility does not harden its distribution.

1 - Comparison of Perceptions and Behavior in Ticket and Physical Queues

Kaan Kuzu, University of Wisconsin-Milwaukee, 3202 N. Maryland Ave, Milwaukee, WI, 53201, United States of America, kuzu@uwm.edu

We designed an empirical study to obtain insights into participant perceptions of and behavior within different queuing arrangements. We specifically focused on the decision making process before and during waits in ticket and physical queue arrangements, and examined how participants adjust their willingness to wait. Using the empirical study results, we tested the impact of changes in customers' willingness to wait on system performance measures.

2 - Internal versus External Complexity: How Organizations React

Bizhan Jamshidnezhad, Lecturer, APIC, 55 Regent St., Chippendale, Sydney, NS, 2008, Australia, bizhan@apicollege.edu.au

This paper investigates the effects of environmental complexity on organizational performance by means of computational modeling. The results of the model show counter-intuitively that the complexity of environmental requirements has positive effects on performance. Also, the results demonstrate that the internal complexity is detrimental to the organizational performance. As regards learning memory, it is seen that shorter memory cycles as defined in this work improve organizational learning.

3 - A Simulation Approach to Airline Maintenance Cost
Massoud Bazargan, Professor, Embry Riddle Aeronautical University, College of Business, 600 S. Clyde - Morris Blvd., Daytona Beach, FL, 32114, United States of America, bazargam@erau.edu

In the past few years airlines in the United States have been using third party companies to do their maintenance operations. This study introduces a simulation approach to help airlines decide if they need to conduct maintenance of their aircraft in-house or outsourced purely from financial aspects. The simulation models incorporate the exciting fleet of an airline and attempt to determine the costs associated with each strategy.

4 - A System for Teaching Simulation to College Students
Ingolf Stahl, Professor Emeritus, Stockholm School of Economics, Box 6501, Stockholm, SE 11383, Sweden, ingolf.stahl@hhs.se

The paper discusses what system is most suitable to use in a one-semester course in simulation in which the focus is on modeling of business decisions and having the students do a simulation project of value in a company. Less than twenty class room hours can be spent on teaching the software. The paper is based on the experience from teaching over ten thousand business students during three decades.

Multi-Channel Attribution Modeling

Sponsor: The Practice Track

Sponsored Session

Chair: George Roumeliotis, Senior Data Scientist, Intuit, 2623 Marine Way, Mountain View, CA, 94043, United States of America, George_Roumeliotis@intuit.com

1 - B2B Marketing Multi-touch Attribution/close Loop of Attribution and Contribution
May Xu, LinkedIn, 2029 Stierlin Court, Mountain View, CA, 94043, United States of America, mxu@linkedin.com, Neethi Thomas

Attribution is a process that links marketing activities with an outcome and to determine which activities receive credit for a sale which ensures proper budget allocation for ROI. A weighting technique (based on effectiveness of each campaign and recency) is discussed. In addition, we will discuss how to close the loop of marketing attribution and contribution, the two distinctive questions facing CMOs.

2 - Marketing Attribution on the Front Line
Kevin Potcner, Principal, Exsilon Analytics, 149A Hartford Street, Sasn Francisco, CA, 94114, United States of America, kevin.potcner@exsilondata.com

Implementing a marketing attribution initiative is complex and met with myriad challenges. The effort requires alignment from teams within and outside the organization, each bringing differing expectations, needs, and biases. Influencing marketing leaders to provide the models" with an important seat-at-the-table begins long before the models are built. The presenter will outline specific steps that the project team can take to facilitate important buy-in, support, and credibility.

3 - Current State of Attribution Modeling
George Roumeliotis, Senior Data Scientist, Intuit, 2623 Marine Way, Mountain View, CA, 94043, United States of America, George_Roumeliotis@intuit.com

This talk will review the state-of-the-art of attribution modeling, comparing the performance of various methodologies on a real-world data set.

4 - Digital Attribution is Only a Down Payment
John Wallace, DataSong, 234 Front St, San Francisco, United States of America, jwallace@datasong.com

Most attribution exercises begin with a focus on understanding the effects of digital marketing. Yet for most large advertisers, digital spend is only a fraction of their overall budget, and as difficult as it is for some marketers to accept, there are other, outside factors that explain why their customers buy. Attribution models need to incorporate a variety of non-marketing data such as loyalty program information, service events, and product reviews.

Theory and Applications of Analytics and Big Data

Sponsor: Analytics

Sponsored Session

Chair: Felipe Aros-Vera, Rensselaer Polytechnic Institute, 110 8th St, Troy, NY, 12180, United States of America, arosvm@rpi.edu

1 - A Survey on the Big Data Analytics and its Applications
Amir Gandomi, Ryerson University, 350 Victoria Street, Toronto, ON, M5B 2K3, Canada, agandomi@ryerson.ca, Murtaza Haider

This study establishes a definition for the term "big data". Big data analytics is discussed as one of the two sub-processes of extracting insights from big data. Specifically, a literature review is presented on text analytics, audio analytics, video analytics, social media analytics and predictive analytics.

2 - Surveying Predictive Models for Diabetes Disease Complications
Saeed Piri, PhD Student, Oklahoma State University, IEM department, 322 Engineering North, Stillwater, OK, 74078, United States of America, saeed.piri@okstate.edu, Tieming Liu

One of the most important applications of analytics is in healthcare. Diabetes is a chronic illness requiring continuous care with multifactorial risk reduction strategies beyond glycemic control. Diabetes has several complications including heart disease, neuropathy, nephropathy, etc. In this study we try to survey predictive models that predict the diabetes complications ahead of time and as result patients can apply intervention strategies to stop or even reverse the progress of the disease.

3 - Hawkes Point Processes as a Big Data Analytics Tool for Social Media Management
Amir Hassan Zadeh, PhD Student, Oklahoma State University, Spears School of Business, Stillwater, OK, 74078, United States of America, amir.zadeh@okstate.edu, Ramesh Sharda

Online social networks (OSNs) generate a huge volume of content and clickstream data over time as a result of continuous social interactions between users. Because these interactions are not fully observable, the mining of such social streams is more challenging than traditional data streams. Point processes as a promising approach can be used to unravel latent network structure of OSNs and particularly understand human interactions and collective behavior within the social networks.

Decision Support Systems 1

Contributed Session

Chair: Dilek Onkal, Bilkent University, Faculty of Business Administration, Ankara, 06800, Turkey, dilekon@gmail.com

1 - Does Acceptance of Forecast Advice Depend on Scenario Optimism?
Dilek Onkal, Bilkent University, Faculty of Business Administration, Ankara, 06800, Turkey, dilekon@gmail.com, K.Zeynep Sayim, M.Sinan Gonul

Scenarios constitute effective tools for information sharing by depicting alternative storylines of possible futures.Recent research suggests that decision makers effectively utilize optimistic/pessimistic scenarios as channels of forecasting advice.However, the scenarios used in these studies are not only optimistic/pessimistic in tone and content, but are also labeled as such.Current work focuses on exploring whether the effects of scenarios originate from their content or from framing.

2 - Risk-informed Regulatory Compliance Enforcement Model for Technical Systems and Products
Lency Mulamootil, Decision Analysis Advisor, Technical Standards and Safety Authority, 3300 Bloor Street West, Toronto, ON, M8X 2X4, Canada, lmulamootil@tssa.org, Srikanth Mangalam, Arun Veeramany, David Witt, Rene Karavas

A typical mandate of regulatory authorities that have oversight of public safety is to identify non-compliances with regulated systems and products. A key parameter in this critical process is the determination of a permissible time duration within which a non-compliance must be rectified. This paper proposes a risk-informed decision process to assign a time duration for a given regulatory non-compliance and describes how it can be adapted and implemented for a given regulated sector.

3 - A Context Representation Model for Real-time Vehicle Routing in the Distribution of Product Oil

Lijun Sun, Dalian University of Technology, Linggong Road, Ganjingzi District, Dalian, China, slj@dlut.edu.cn, Xiangpei Hu

In China, the urban distribution of product oil is realized by multi-compartment vehicles of several types. Moreover, the types of sources of urban demands vary greatly, including gas stations and some third-industry companies. Constructing a mathematical model for real-time vehicle routing cannot totally reflect and solve this complicated distribution problem, a context representation model is presented to complement it.

4 - Appraising Investments in Integrated and Interdependent Complex Systems: The Case of Smart Cities

Sebastian Maier, Imperial College London, Skempton Building - South Kensington Cam, London, SW7 2AZ, United Kingdom, s.maier13@imperial.ac.uk, John Polak, David Gann, Aruna Sivakumar

Cities require massive capital investment in new infrastructures and services. However, traditional methods of investment appraisal are widely considered as inadequate. To overcome their limitations, this research presents a new appraisal framework that aims at valuing smart city investments while taking into account multiple interdependencies among different investments and the major uncertainties inherent in the investments' underlying technologies, thus supporting long term strategic planning.

OR Models in Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Victor Richmond Jose, Georgetown University, McDonough School of Business, 544 Hariri Building, Washington, DC, 20057, United States of America, vrj2@georgetown.edu

1 - When to Issue an Offer and What Deadline to Set When Both Parties Have Outside Options

Sasa Zorc, PhD Student, INSEAD, Ayer Rajah Avenue 1, Singapore, 138676, Singapore, sasa.zorc@insead.edu, Ilia Tsetlin

We model a finite-horizon setting where two agents could make a deal but also are searching for other alternatives. Key decision variables are time to make an offer and the deadline. We explore different settings and show, in particular, that a) issuing all offers as exploding offers is the dominant strategy and b) revealing information about your own search improves equilibrium outcomes for all agents.

2 - Impact of Bayesian Learning and Externality on Strategic Investment

Wenxin Xu, University of Illinois, Chicago, IL, United States of America, wxu9@illinois.edu, Dharma Kwon, Anupam Agrawal, Suresh Muthulingam

We investigate the impact of the interplay between learning effects and externalities on competitive investments with uncertain returns. Our model reduces to a war of attrition under certain conditions, and the interplay between externality and learning has counter- intuitive effects on investment strategies and payoffs.

3 - Inequity-averse Optimization in Operational Research

Ozlem Karsu, Bilkent University, Bilkent, Ankara, Turkey, ozlemkarsu@yahoo.co.uk, Alec Morton

In this paper we review the operational research (OR) literature on inequity-averse optimisation. We discuss two equity related concerns, namely equitability and balance, which are distinguished based on whether anonymity holds. We review applications involving these concerns and discuss alternative ways to incorporate such concerns into OR models. We discuss the pros and cons of different approaches and provide some future research directions.

4 - Expert Elicitation for Production Planning: Theory and Implementation

Saurabh Bansal, The Pennsylvania State University, Business Building, University Park, PA, United States of America, sub32@psu.edu, Genaro Gutierrez

We first present some new results for the determination of probability distributions from subjectively elicited limited information from an expert, and then discuss the application of results at a large firm for a $800 million decision. The technical development specifically allows for incorporating expert's biases and inconsistencies during the deduction of distribution parameters.

Joint Session DAS/ENRE: Energy Infrastructure: Decisions and Models

Sponsor: Decision Analysis & Energy Natural Resources and the Environment

Sponsored Session

Chair: Seth Guikema, Assistant Professor, Johns Hopkins University, 313 Ames Hall, Department of Geog & Env. Engineering, Baltimore, MD, 21218, United States of America, sguikema@jhu.edu

1 - Robust Portfolio Planning of Offshore Wind Farms

Alexana Cranmer, University of Massachusetts, 120B Marston, 160 Governors Drive, Amherst, MA, 01002, United States of America, acranmer@umass.edu, Erin Baker

We apply a spatial version of robust portfolio analysis to wind siting, to help us better understand the value of each project in the context of the full portfolio of projects. Wind farm sites are generally considered one at a time and current approaches do not account for any interactions between the qualities of the sites. Sites may interact with each other through wake effects, profit potential, and wildlife impacts.

2 - Long-Term Hurricane Impact on U.S. Power Systems

Andrea Staid, PhD Student, Johns Hopkins University, 313 Ames Hall, Department of Geog & Env. Engineering, Baltimore, MD, 21218, United States of America, astaid@gmail.com, Seth Guikema, Roshanak Nateghi, Steven Quiring, Michael Gao

Climate change may impact hurricane behavior. The electric power distribution system is particularly vulnerable to hurricane damage. Hurricanes may change in intensity, annual frequency, or geographical location. We simulate the hurricane impact to power systems under plausible climate scenarios. We assess the long-term impacts of hurricanes on U.S. power system infrastructure, and the results can be used to inform decisions regarding improvements in grid reliability, resilience, and robustness.

3 - Evaluating Risk Mitigation Investments in Coastal Power Systems that are Prone to Hurricane Impacts

Roshanak Nateghi, NSF SEES Postdoctoral Fellow, Johns Hopkins University, 313 Ames Hall, Department of Geog & Env. Engineering, Baltimore, MD, 21218, United States of America, roshanak.nateghi@gmail.com, Seth Guikema

The US power systems are repeatedly stressed by hurricanes. They cause widespread outages that lead to huge economic losses. Research shows that tree-trimming practices of utility companies are an important factor in the extent of hurricane damage. In this talk, we describe the results of our decision analysis model used to assess the costs and benefits associated with investing in vegetation management for power networks and discuss further studies needed to address this research question.

4 - Manipulation of Day-ahead Electricity Prices through Virtual Bidding in the U.S.

Chiara Lo Prete, Assistant Professor of Energy Economics, The Pennsylvania State University, John and Willie Leone Family Department, of Energy and Mineral Engineering, University Park PA 16802, United States of America, chiaraloprete@psu.edu, William Hogan

Enforcement actions of the Federal Energy Regulatory Commission in regard to allegations of price manipulation in electricity markets have recently been in the spotlight. We focus on one type of market manipulation strategy considered by FERC (placing unprofitable virtual bids to enhance the value of related FTR positions) and construct examples of equilibrium manipulation in the context of Kumar and Seppi (1992).

Data Mining 6

Contributed Session

Chair: Qi Zhang, Carnegie Mellon University, Department of Chemical Engineering, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, qz@andrew.cmu.edu

1 - Data-driven Construction of Convex Region Surrogate Models

Qi Zhang, Carnegie Mellon University, Department of Chemical Engineering, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, qz@andrew.cmu.edu, Ignacio E. Grossmann, Arul Sundaramoorthy, Jose M. Pinto

There is an increasing demand for process models that are sufficiently accurate as well as computationally efficient. In this work, we develop an algorithm for the

data-driven construction of a type of surrogate models that can be formulated as MILPs yet still provide good approximations of nonlinearities and nonconvexities. In the surrogate model, the feasible region is given by the union of polytopes and for each region, the objective function can be approximated by a linear function.

2 - Patent Pool Analysis in Bibliometrics
Hiroko Nakamura, The University of Tokyo, 7-3-1 Hongo, Bunkyoku, Tokyo, Japan, techhn@mail.ecc.u-tokyo.ac.jp, Yuya Kajikawa

Taking statistics and bibliometrics approach, we investigate charactoristcs of patents in the patent pools managed by Mpeg LA. While previous research compare patents in a patent pool and patents, which is not in a patent pool but applied by the same applicant and in the same IPC category, we compare patents in a patent pool with patents, which cited same patents.

3 - A Hybrid Generating Rules Method for Identifying Financial Distress
Ching-Hsue Cheng, Professor, National Yunlin University of Sci. & Tech., 123 University Road, Section 3,Douliou, Yunlin, Taiwan - ROC

This study employed six attribute selection methods to reduce high dimension data. After attribute selection, this study utilized rough set classifier to find the rules of financial distress. In verification, the TEJ dataset was employed as experimental data in Type I, Type II error, and accuracy criteria. The experimental results show that the logistic regression and chi- square attribute selection method combined with rough set classifier outperform the listing methods.

4 - Temporal Analysis of Origin-destination Matrices Estimation based on Passenger Cars Traffic Counts
Carlos Gonzalez-Calderon, Postdoctoral Research Associate, Rensselaer Polytechnic Institute, 110 8th St, JEC 4037, Troy, NY, 12180, United States of America, gonzac8@rpi.edu, Susana Restrepo Morantes, John Jairo Posada Henao, Catalina Osorio

This research introduces an entropy maximization demand model to estimate origin-destination matrices for passenger vehicles on the basis of traffic counts for different years. The performing of the formulation for the different time periods (2001-2008) is tested in the Medellin, Colombia network.

Data Mining 3

Contributed Session

Chair: James Wilson, Department of Statistics and Operations Research, UNC Chapel Hill, Chapel Hill, NC, United States of America, jdwilson1212@gmail.com

1 - Extraction of Statistically Significant Communities in Multilayer Networks
James Wilson, Department of Statistics and Operations Research, UNC Chapel Hill, Chapel Hill, NC, United States of America, jdwilson1212@gmail.com

Community detection is an important problem in the study of complex networks. We consider community detection in the context of multilayer networks where the observed data is a collection of networks on the same vertex set. We propose and investigate a novel testing based community extraction procedure that identifies statistically significant community-layer pairs. We investigate the potential use of our method through analysis of a gene expression dataset from the cancer genome atlas.

2 - Feature Selection in Relational Data Mining
Michele Samorani, University of Alberta, Edmonton, AB, Canada samorani@ualberta.ca, Ivor Cribben

Traditional data mining and statistical techniques require a single table as input; by contrast, we tackle the problem of findings patterns in a relational database. This is possible by automatically exploring the database and generating new attributes using information from all tables. However, doing so results in a large set of attributes that may be correlated with one another. In this talk, we show the benefits of this approach and discuss how to select the most important features.

3 - Study on City-Production Integration of High-tech Industrial Park Based on Fuzzy AHP
Lin Su, PhD, Tongji University, School of Economic and Management, Siping Road, Yangpu District, Shanghai, China, yjshsl@163.com, Xia Wang, Bing Guo, Xin Zheng

City-production integration is fully interpreted but barely evaluated. In this paper, the building of Evaluation Index System comprehensively evaluates the degree of city-production integration of Shanghai High-tech industrial park by applying the fuzzy AHP to that case. We finally found certain factors actively promoting the integration of city-production and put forward policy recommendations.

4 - Longitudinal Service Repurchasing Models and Their Financial Effects
Yoko Norose, University of Tsukuba, 1-1-1 Tennodai, Tsukuba, 305-8573, Japan, norose@aclab.esys.tsukuba.ac.jp, Yukihiko Okada, Yukie Sano, Yuji Takano

The purpose of this research is to build longitudinal service repurchasing models for estimating their long-term revenue contributions empirically. We identify remarkable step-up / step-down repurchasing behaviors based on 2.9 million purchasing records (about 1 million individuals) for the past 18 years of TAC school, a biggest educational service company in Japan.

5 - Temporal Skeletonization on Sequential Data: Patterns, Categorization, and Visualization
Chuanren Liu, PhD Student, Rutgers Business School, 1 Washington Street, Room 1003C, Newark, NJ, 07102, United States of America, chuanren.liu@rutgers.edu

We propose "temporal skeletonization" to proactively reduce the representation of sequences to uncover hidden temporal structures. The key idea is to summarize the temporal correlations in an undirected graph. Then, the embedding topology of the graph allows us to translate the rich temporal content into a metric space. This opens up new possibilities to explore, quantify, and visualize sequential data. Our approach can effectively discover critical buying paths from noisy customer event data.

Wednesday, 2:45pm - 4:15pm

MAS Tutorial Session. The State of Operations Research in the US Military: A 75th Anniversary Perspective

Sponsor: Military Applications Society

Sponsored Session

Chair: Greg Parlier, Past President, MAS of INFORMS, 255 Avian Lane, Madison, AL, 35758, United States of America, gparlier@knology.net

1 - The State of Operations Research in the US Military: A 75th Anniversary Perspective
Greg Parlier, Past President, MAS of INFORMS, 255 Avian Lane, Madison, AL, 35758, United States of America, gparlier@knology.net

This extended presentation offers perspectives on the past, present, and future of Operations Research in the US Department of Defense with emphasis on the Army. The need for a critical review is argued, and a framework for a comprehensive assessment is developed. Enduring principles are suggested, and new concepts are presented, including both strategic and transformational analytics.

■ WD02

Hilton- Golden Gate 7

Product Development and Process Development in Pharmaceutical Industry

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Zhili Tian, Assistant Professor, Florida International University, 11200 SW 8th Street, Miami, FL, 33199, United States of America, ztian@fiu.edu

1 - Production Planning Models for Biopharmaceutical Perfusion Production
Phil Kaminsky, Professor, University of California, Berkeley, IEOR Dept., 4141 Etcheverry Hall, Berkeley, Ca, 94720-1777, United States of America, kaminsky@ieor.berkeley.edu, Dan Bu

Perfusion production technologies are increasingly used in Biopharmaceutical production, and introduce a variety of scheduling and planning challenges. Motivated by these challenges, we introduce several novel lot-sizing and planning models, analyze these models, and develop heuristic approaches to solving them.

2 - Technology Investment on Improving Environmental Performance
Derek Wang, McGill University, Montreal, QC, Canada derek.wang@mcgill.ca, Shanling Li, Toshiyuki Sueyoshi

We investigate empirically the linkage between firms' environmental technology adoption decisions and firms' characteristics using data from U.S. companies in

2011-2013. This study shows the determinants that lead companies to invest in different types of technologies, and how the choice of technology affects the companies' market performance.

3 - Optimal Investment in Phase II and III New Drug Development

Zhili Tian, Assistant Professor, Florida International University, 11200 SW 8th Street, Miami, FL, 33199, United States of America, ztian@fiu.edu

Firms conduct Phase II and/or III drug trials by enrolling and treating thousands of patients. Finding these patients is expensive and time consuming, with uncertainty. We consider how firms should determine their investment policy. This must be done recognizing that there is also uncertainty in the outcome of a trial.

4 - Financing Drug Discovery for Orphan Diseases

David Fagnan, PhD Candidate, MIT, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, dfagnan@mit.edu, Andrew Lo, Roger Stein

Recently proposed 'megafund' financing methods for funding translational medicine require billions of dollars in capital to de-risk the drug discovery process enough to issue long-term bonds. We demonstrate that the same financing methods can be applied to orphan drug development but, because of the unique nature of orphan diseases and therapeutics (lower development costs, faster FDA approval times, and lower failure rates) the amount of capital needed to de-risk such portfolios is much lower.

Electronic Markets and Mechanisms

Sponsor: eBusiness

Sponsored Session

Chair: Yifan Dou, Assistant Professor, Beihang University, 37# Xueyuan Road, Haidian District, Beijing, China, dou@buaa.edu.cn

1 - Online Reputation and Pricing Strategies in E-markets

Min Xu, Harbin Institute of Technology, 92 Xidazhi street, School of Management,, Harbin, He, 150001, China, xuminivy@gmail.com, Wen Shi, Qiang Ye

This paper explores the relationship of sellers' online reputation and their pricing strategies in E-markets. Empirical results suggest that sellers' reputation has a positive impact on price. Meanwhile, the number of competitors will moderate the relationship between reputation and price. Generally, sellers with higher reputation will charge higher price, but their positive correlation will be weakened when there are more competitors in the E-markets.

2 - Dual-sourcing Auctions under Supply Risks

He Huang, School of Economics and Business Administration, Chongqing University, Chongqing, China, huanghecqu@gmail.com, Hongyan Xu

This paper examines unit-price dual-sourcing auctions when the buyer faces multiple suppliers with random yields and privately informed costs. We analyze and compare three widely used auction mechanisms: i) a generalized second-price (GSP) open auction; ii) a generalized first-price (GFP) sealed-bid auction with quantity commitments; and iii) a hybrid auction which selects two winners with an open-descending auction and then allocates quantities with a simplified version of ii).

Topics in Supply Chain Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: S. Alex Yang, Assistant Professor, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, sayang@london.edu

1 - Inventory Pooling under Heavy-Tailed Demand

Mihalis Markakis, Assistant Professor, Universitat Pompeu Fabra, Ramon Trias Fargas, 25-27, Barcelona, Spain, mihalis.markakis@upf.edu, Kostas Bimpikis

We consider a single-period multi-location newsvendor model with independent demands. We show both analytically and numerically that the benefits to inventory pooling (in terms of both the inventory levels and the expected costs) in the presence of "heavy-tailed" demand uncertainty are much more modest than what Eppen's celebrated result predicts (for the case of Normal distributions). We also discuss various extensions of these results.

2 - Financial Pooling in Supply Chain

Qu Qian, Assistant Professor, Shanghai University of Finance and Econo, School of International Business Adminis, 100 Wudong Road, Shanghai, China, qian.qu@mail.shufe.edu.cn, Ming Hu, S. Alex Yang

We show that one possible role trade credit plays is to pool the liquidity buffers between suppliers and retailers. Due to this pooling effect, even as the supplier's cost of capital is high, the retailer should still demand for trade credit. However, this role is not without costs. As an innovative financial scheme, supply chain finance increases the efficiency of this pooling effect, and as a result reduces the overall supply chain financing cost.

3 - The Impact of Supplier Competition on Supply Chain Responsiveness

Ruixue Guo, Stanford University, 63 Abrams Ct, Apt 313, Stanford, CA, 94305, United States of America, rguo@stanford.edu, Robert Swinney

We study a model with two types of suppliers "efficient and responsive" competing for the business of a single manufacturer. We find that competition between the suppliers reduces the advantage of responsive supplier, compared to a model exogenous procurement costs from the two suppliers. We also demonstrate how the manufacturer's power in establishing contract price affects its incentives to source from a responsive supplier.

4 - Integrative Management of Transfer Pricing and Global Sourcing Decision in a Multinational Firm

Vernon Hsu, Professor, The Chinese University of Hong Kong, Room 1502, Cheng Yu Tung Building,CUHK, Hong Kong, Hong Kong - PRC, vhsu@cuhk.edu.hk, Kaijie Zhu, Xiaopeng Zhang

We exam integrative management of a multinational firm's transfer pricing (TP) and global sourcing decisions to take advantage of different tax rates across subsidiaries and to maximize the firm's global after-tax profits. With various decision timelines (ex-ante and ex-post TP decisions) and structures (centralized and decentralized sourcing decisions), we characterize optimal TP and sourcing decisions in various scenarios. Several new and important managerial insights are derived.

Multichannel Retailing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH, 03755, United States of America, santiago.gallino@tuck.dartmouth.edu

1 - The Drivers of Consumer Latency in Online Retailing

Vishal Gaur, Cornell University, Johnson School, Ithaca, NY, United States of America, vg77@cornell.edu, Nikolay Osadchiy

Consumer latency is the time from the first click by a customer on a website until the time to purchase. We develop an econometric model to assess the drivers of consumer latency using data from an online retailer.

2 - Channel Integration & Sales Concentration: Empirical Evidence

Ioannis Stamatopoulos, PhD Student, Northwestern University, 829 Foster St, Evanston, IL, 60201, United States of America, i-stamatopoulos@kellogg.northwestern.edu, Santiago Gallino, Antonio Moreno-Garcia

Competing for an increasingly demanding customer pool, retailers progressively integrate their B&M and Online channels. In this paper, using a proprietory dataset coming from the implementation of a Ship to Store (StS) capability of a large US housewares retailer, we find that StS causes a statistically and economically significant drop in sales concentration.

3 - Need for Speed: The Value of Delivery Lead-Time in Online Retailing

Jiaqi (Joseph) Xu, PhD Student, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Suite 500, Phialdelphia, PA, 19104, United States of America, jiaqixu@wharton.upenn.edu, Marshall Fisher, Santiago Gallino

We explore the relationship between online retail sales and service quality in terms of delivery speed by analyzing a quasi-natural experiment from an apparel retailer. The retailer improved service quality for a subpopulation of its customers by opening a new distribution center (DC) in western US. We establish a causal link between delivery time reduction and sales, and show that sales was 3.88% higher in western US compared to eastern US after opening of the new DC.

4 - How Can I Help You? Improving Retail Store Execution through Online Learning

Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH, 03755, United States of America, santiago.gallino@tuck.dartmouth.edu, Marshall Fisher, Serguei Netessine

Converting demand into sales in today's retail environment is not a trivial task. When retailers fail on their store execution, customers walking into the store will leave empty-handed or carrying fewer bags than they might have otherwise. But, is it true that more-engaged associates perform better? Is it the case that employees who became more knowledgeable about the products they are selling improve their sales performance? And if so, by how much?

Humanitarian-Driven Inventory Management: Pre-positioning and Responses

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Fang Liu, Nanyang Technological University, 50 Nanyang Drive, Singapore, Singapore, Liu_Fang@ntu.edu.sg

Co-Chair: Yulan Wang, Asst Prof, Hong Kong Polytechnic University, Kowloon, Hong Kong, Hong Kong - PRC, yulan.wang@polyu.edu.hk

1 - A Stochastic Location-Routing Model for Prepositioning and Distributing Emergency Supplies

Xiaofeng Nie, Assistant Professor, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, xiaofengnie@ntu.edu.sg, Yidong Zhang, Aakil Caunhye, Mingzhe Li

We model post-disaster situations as scenarios and propose a two-stage stochastic programming model to preposition and distribute emergency supplies. In the first stage, the model decides where to locate warehouses and how many quantities to stock for prepositioning purposes. In the second stage, the model decides how many quantities to transport to demand sites and the corresponding routing. Furthermore, the issue of equitability is taken into consideration when distributing emergency supplies.

2 - An Integrated Inventory Management Framework for Emergency Operations

Eren Ozguven, Assistant Professor, Florida State University, 2525 Pottsdamer Street, Tallahassee, FL, 32310, United States of America, eozguven@fsu.edu, Kaan Ozbay

This research describes the steps required to develop a novel and comprehensive framework for the development of a humanitarian emergency inventory management framework that enables the real-time tracking of emergency supplies/demands through the integration of emerging technologies such as Radio Frequency Identification Devices (RFID) for commodity tracking and logistics.

3 - Optimal Allocation of Resources Bases on Social Costs

Jose Holguin-Veras, William H. Hart Professor, RPI, 110 8th St JEC 4030, Troy, NY, United States of America, jhv@rpi.edu

This talk discusses the policy implications of allocating scarce resources under post-disaster conditions using the concept of social cost.

4 - Optimal Deployment of Emergency Supply Inventory with a Humanitarian Relief Objective

Yulan Wang, Asst Prof, Hong Kong Polytechnic University, Kowloon, Hong Kong, Hong Kong - PRC, yulan.wang@polyu.edu.hk, Fang Liu, Pengfei Guo

We consider the optimal pre-positioning of emergency supply inventory (ESI) that are used for recurring disasters with an objective of minimizing the total expected number of casualties. We derive the expected casualty number and develop two algorithms to find the optimal ESI allocation. We extend the problem to the scenario where the pre-positioned ESI may be partially destroyed, the transportation infrastructure may be destroyed, and the disaster may occur at more than one location.

Supply Chain Management VII

Contributed Session

Chair: Sunantha Teyarachakul, Dr., MacEwan University, 10700-104 Avenue NW, Edmonton, AB, T5J 4S2, Canada, teyarachukals@macewan.ca

1 - Commodity Hedging in a Competitive Supply Chain

Ehsan Bolandifar, Assistant Professor, Chinese University of Hong Kong, 1 Chak Cheung Street, Cheng Yu Tung Bld. R 922, Hong Kong, Hong Kong - ROC, ehsan@baf.cuhk.edu.hk

We study optimal hedging policy in a competitive market where a retailer procures two substitutable commodities from two processors. We show that how market competition and commodity price correlation affect optimal hedging policies of the producers in a supply chain setting.

2 - Optimality of Operations and Marketing Coordination Mechanisms in a Two-level Supply Chain

Chirag Surti, Assitant Professor, UOIT, 2000 Simcoe Street North, Oshawa, ON, L1H7K4, Canada, chirag.surti@uoit.ca, Salma Karray

Research on supply chain coordination relies on the assumption that manufacturers incentivize the retailer by offering a single coordination mechanism. Most manufacturers offer multiple incentives to the retailer in order to coordinate the channel. This paper relaxes this central assumption and investigates the optimal mix of manufacturer's coordination mechanisms. The main finding suggests that the preference for the type(s) of coordination depends on the demand and marketing effort parameters.

3 - Financing the Capital-Constrained Newsvendor with Trade Credit in the Presence of Bankruptcy Cost

Shuang Xiao, Huazhong University of Science and Technology, Luoyu Road 1037, Hongshan District, Wuhan, China, 996719696@qq.com

We consider a two-level supply chain with a supplier and a capital-constrained retailer. The retailer is facing bankruptcy risks and failure of loan repayment leads to a costly bankruptcy. We model the interaction between the supplier and retailer as a Stackelberg game with the supplier as the leader, and try to find the best financing structure among the bank, supplier and retailer, from different perspectives.

Supply Chain Management VII

Contributed Session

Chair: Jinfeng Yue, Professor at MTSU, Dean and Professor at SHUFE, Middle Tennessee State University (MTSU) and, Shanghai University of Finance and Econ, Murfreesboro, TN, 37132, United States of America, jinfeng.yue@mtsu.edu

1 - Optimal Inventory Policy and Disposition Decision for Supply Chain with Stochastic Returned Products

Sajjad Farahani, University of Wisconsin, Milwaukee, Industrial Engineering Department, Milwaukee, WI, 53211, United States of America, farahani@uwm.edu, Farshid Zandi

This paper consider an analytical queuing model for a two echelon supply chain; including inventory system and remanufacturing system with stochastic returns. High congestion of return product at remanufacturing facility causes considerable delays and consequently remarketing value losses for time-sensitive products and high-tech products with short life cycles. We propose a model for admission decision that decides about acceptance of return products and maximum capacity of inventory system.

2 - The Effects of Knowledge Management, Cooperative Norms and Joint-action on Supplier's Innovation

Zainab Al Balushi, Assistant Professor, Sultan Qaboos University, College of Economics PO BOX 20, Operations Mangement, AL Khoudh, 123, Oman, zainab.albalushi@gmail.com, Asma Al Zaidi

Inter-firm knowledge management enables effective utilization of competencies. This paper examines the effects of inter-firm knowledge absorptive capacity on supplier's innovation and how joint action between exchange partners fosters this outcome. Also it examines the moderating role of cooperative norms that exists in the exchange relation. Dynamic capability view was used as theoretical lens. A survey was conducted on manufacturing firms in the Arabian Gulf countries and analyzed using SEM

3 - Coordination Conditions in Supply Chain Contracts
Jinfeng Yue, Professor at MTSU, Dean and Professor at SHUFE, Middle Tennessee State University (MTSU) and, Shanghai University of Finance and Econ, Murfreesboro, TN, 37132, United States of America, jinfeng.yue@mtsu.edu

This research uses distribution free approach to study the coordination conditions in different supply chain contracts. It is shown that coordination is achievable for any supply chain contract if some general conditions can be satisfied. The managerial insights are discussed with recommended managerial approaches which provide practical solutions to coordinate supply chain by any preferred contract.

4 - Impact of Customization Postponement on Delivery Lead Time Agreement
Xiao Zhang, UT Dallas, 5657 Amesbury Dr, Apt 1402, Dallas, TX, 75206, United States of America, xiao.zhang@utdallas.edu, Ozalp Ozer, Holly Lutze

A manufacturer (M) produces a batch of common intermediate products, customizes into multiple end products, and delivers them to two retailers (Rs) with different cost parameters. Delivery lead times determine three parties' inventory levels and costs. M minimizes its cost by offering a portfolio of lead times and corresponding payments, from which Rs choose their best options. We derive the explicit form of the optimal lead time agreement. Customization postponement leads to faster delivery.

E-Business/ Commerce 2

Contributed Session

Chair: Rajhans Mishra, Assistant Professor, Indian Institute of Management Indore, Faculty Block B First Floor, IIM Indore, Rau, Indore, 453331, India, rajhans111@gmail.com

1 - Web Analytics for Customer Profiling and Segmentation for e-Commerce using Sequential Information
Rajhans Mishra, Assistant Professor, Indian Institute of Management Indore, Faculty Block B First Floor, IIM Indore, Rau, Indore, 453331, India, rajhans111@gmail.com, Siddhartha Rastogi

Web analytics can be used to suggest right products to right customers at right time. It will help e-commerce organizations to increase the probability of purchase of products. We propose a scheme of customer profiling and segmentation using a web recommendation system, which considers sequential navigational information of users for the generation of recommendations.

2 - A Restaurant Recommendation System using Collaborative Filtering
Brian Piper, Data Scientist, Forio, 1159 Howard Street, San Francisco, CA, 94103, United States of America, bpiper@forio.com

A recommendation system with a web-based UI is demonstrated that allows users to explore items and their relationships. Strength of similarity among items is displayed as an interactive visualization. The visualization enables users to understand how recommendations are obtained and explore alternatives and select between different items. The approach is demonstrated using restaurant data provided by Yelp for Phoenix, AZ.

3 - The Power of the Like Button Social Media Effect on Internet Financing
Chao Ding, Assistant Professor, University of Hong Kong, School of Business, Pokfulam Rd, Hong Kong, Hong Kong - PRC, chaoding@hku.hk, Yang Duan, Yong Jin

Using data collected from Kickstarter and Facebook, this paper examines the power of the "like" button on Internet financing. Our empirical results show that the social media has a significantly positive impact. One more click of the Facebook "like" button leads to a 0.15% greater chance of success for Kickstater projects. Surprisingly, it has little influence on expediting the fundraising process. We also find the crowdfunding contributors have a stronger preference for technology projects.

4 - Understanding the Virtual Activities in an Online Game and their Impacts on Real Money Spending
Gwangjae Jung, Singapore Management University, 80 Stamford Road, Singapore, 178902, Singapore, gwangjaejung@smu.edu.sg, Youngsoo Kim

We examine the relationship between online activities and real money spending in an online game. We collected users' log data in an online game from February to August 2010. Our analyses show that virtual money and real money basically complement each other in playing an online game. Another interesting finding is that users can save real money by accomplishing a task with other users together. We also find the impacts of virtual activities vary depending on the purpose of real money spending.

Hilton- Continental 8

Supply Chain, Managing Disruptions I

Contributed Session

Chair: Amirhossein Khosrojerdi, University of Oklahoma, 1021 East Brooks St Apt F, Norman, Ok, 73071, United States of America, akhosrojerdi@ou.edu

1 - A Location-inventory Model under the Risk of Supply Disruptions with Facility Fortifications
Ehsan Jafari Shirazi, West Virginia University, Moprgantown, WV, United States of America, ejafaris@mix.wvu.edu, Wafik Iskander

The interest in reliable facility location models has recently been growing fast, triggered by recent high-profile disruptions. It has also been shown in the literature that failing to incorporate long term decisions on location and short term decisions on inventory may result in suboptimality (Daskin et al. 2002, Shen et al. 2003). In this study, a location-inventory model with facility fortifications for improving the reliability of facilities is proposed.

2 - Coordinated Selection of Supply Portfolio and Scheduling of Customer Orders under Major Disruptions
Tadeusz Sawik, Professor and Chair, AGH University of Science and Technology, Al. Mickiewicza 30, Krakow, Poland, ghsawik@cyf-kr.edu.pl

Coordinated supplier selection and customer order scheduling under major disruptions is studied for different sourcing strategies. The suppliers are located in different regions and the supplies are subject to local and regional disruptions. New MIP formulations are proposed to minimize expected worst-case cost or maximize expected worst-case customer service level.

3 - Supply Chain Disruption and Quality
Rebecca Clemons, Doctoral Candidate, Cleveland State University, Monte Ahuja College of Business, 1860 E. 18th Street, Cleveland, OH, 44115, United States of America, clemonsbec@gmail.com, Walter Rom, Susan A. Slotnick

A manufacturer has two suppliers. The old supplier experiences random disruption with acceptable quality. The new supplier is reliable with unacceptable quality. A simulation study examines the impact of policy decisions for a given level of disruption while considering cost of supplier development, appraisal, purchasing, holding and backorder costs.

4 - An Assessment of Disruption Mitigation Strategies: Inventory, Backup Suppliers and Supplier Protect
Masoud Kamalahmadi, Student, North Carolina A&T State University, 1601 E Market Street, Greensboro, NC, 27411, United States of America, Mkamalah@aggies.ncat.edu, Mahour Parast

The purpose of this paper is to develop an assessment to examine the impacts of three disruption mitigation strategies (Pre-positioning Inventory, Backup Suppliers, Suppliers Protection) on supplier selection and allocation. A two stage mixed integer programming model with three extensions are developed. Each model suggests contingency plans for each scenario and provides proper supplier selection and allocation to meet customer demand during disruptions in suppliers and/or regions.

5 - A Controllable Structural Network Design for a Resilient Supply Chain
Amirhossein Khosrojerdi, University of Oklahoma, 1021 East Brooks St Apt F, Norman, Ok, 73071, United States of America, akhosrojerdi@ou.edu, Janet Allen, Krishnaiya Thulasiraman, Farrokh Mistree

A method is proposed for designing expandable supply chains that are resilient to natural or human induced extreme events. The proposed method is based on designing controllable structures for supply chains when locating control nodes in the network structure brings flexible restoration plans. Our focus is also on the development of efficient restoration strategies that aid the supply chain in recovering from a disruption, thereby limiting the impact on its customers.

Hilton- Continental 9

Supply Chain Optimization II

Contributed Session

Chair: Jian Zhang, Postdoc Fellow, McGill University, Frank Dawson Adams Building, Room 110, 3450 University Street, Montreal, QC, H3A0E8, Canada, jian.zhang9@mail.mcgill.ca

1 - Mining Supply Chain Planning with Dynamic Recovery Rate and Market Uncertainty

Jian Zhang, Postdoc Fellow, McGill University, Frank Dawson Adams Building, Room 110, 3450 University Street, Montreal, QC, H3A0E8, Canada, jian.zhang9@mail.mcgill.ca, Roussos Dimitrakopoulos

A mining complex's strategic and tactical plans for production and transportation are optimized using a stochastic mixed-integer-nonlinear program in consideration of both contracted customers and the spot market. A heuristic is developed to deal with the complexity caused by the dynamic recovery rate in each processing plant. The proposed model and heuristic can be employed before signing a long-period sales contract to reduce risk due to the resource and market uncertainties.

2 - The Two-Phase Stochastic Lotsizing Problem with Optimal Timing of Additional Review

Dina Smirnov, Technion - Israel Institute of Technology, Faculty of Industrial Engineering, Haifa, 32000, Israel, kadina7@gmail.com, Yale T. Herer

We study a single-location problem with Poisson demand and a finite planning horizon. Additional inventory review and production are allowed during the period. The additional review timing is a decision variable whose value is selected before the sales period starts. We use analytical tools to develop algorithms for finding the optimal initial production quantity, the optimal timing of the additional review, and the optimal decision at the time of the additional review.

3 - The Impact of Information Visibility on Supply Chain Coordination in a Food Industry

Wenbo Zhang, Xi'an Jiaotong University, No. 28 at Xianning West Road, Xi'an, China, wenbozhang@stu.xjtu.edu.cn

With various food safety crisis worldwide especially in China recently, supply chains involved have attracted much closer attentions than food manufacturers. Information visibility(IV) is believed a most effective safety practice. We study a food supply chain consisting of one supplier and one manufacturer. IV is derived from both players, and the market demand is price and IV sensitive. Models and examples are used to illustrate how IV influence the supply chain coordination strategies.

Imperial B

Retail Management I

Contributed Session

Chair: Ameera Ibrahim, University of Massachusetts Amherst, Isenberg School Of Management, 121 Presidents Drive, Amherst, MA, 01003, United States of America, ameera@som.umass.edu

1 - Assortment Planning in the Presence of Variety Seeking

Yanzhi David Li, Department of Manament Science, City University of Hong Kong, Tat Chee Avenue, Kowloon, Hong Kong, Hong Kong, Hong Kong - PRC, yanzhili@cityu.edu.hk, Di Xu, Zhaowei Miao, Huiqiang Mao

This paper explores the optimal assortment planning when the customers have the variety seeking preference, i.e., the utility of a customer is decreased for the product purchased on the previous purchase occasion. Through myopic and strategic planning, we show how the assortment planning under this context can be different.

2 - New Science of Retail - Digitized Offline Store Case Study

Shin Woong Sung, PhD Candidate, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, sw.sung@kaist.ac.kr, Juyeong Lee, Young Jae Jang

We introduce the concept of the digital offline store that utilizes various advanced digital technologies to sense the customer behaviors in selecting and buying products in the store. The case study conducted with the biggest sports outdoor brand in Korea is introduced to illustrate the concept and to show how the concept is applied to the actual distribution and inventory management.

3 - Distribution Center Design to Support Business Processes Involved in the Management of Retail Store

Germ·n Klee Rebolledo, Universidad de La Frontera- MGSIC Programm, Ir'n 01830, Temuco, Chile, german.klee.r@gmail.com, Jaime Bustos

A model of joint procurement processes and delivery to showroom, enabling substantial improvements in commercial operation and sales targets of the company is presented. Sales targets in retail management materialize through selling products to achieve the highest volume, margin and frequency in order to ensure profitability, while promoting sustainability. Linking procurement processes, offices and shop supplies give the starting point for a successful sales process.

4 - A Multi-category Assortment Packing Problem under Cross-Selling and Cannibalization Effects

Ameera Ibrahim, University of Massachusetts Amherst, Isenberg School Of Management, 121 Presidents Drive, Amherst, MA, 01003, United States of America, ameera@som.umass.edu, Ahmed Ghoniem, Bacel Maddah

We examine the problem of optimizing the release times of substitutable and complementary products that belong to different categories over a multi-period horizon. Products have a longevity over which their attractiveness decays (e.g., electronics or fashion products), while being positively or negatively impacted by the specific mix of products that have been introduced. Using a 0-1 fractional program with an attraction demand model, we discuss managerial insights from our computational study.

Hilton- Exec. Boardroom

Procurement and Purchasing Management 1

Contributed Session

Chair: Vahid Ganji, University of tennessee, 511A John D. Tickle Engineering Building, 851 Neyland Drive, Knoxville, TN, 37996-2315, United States of America, vganjili@utk.edu

1 - Combined Method for Buyer-Supplier Negotiations – Qualitative and Quantitative Data

Vahid Ganji, University of Tennessee, 511A John D. Tickle Engineering Building, 851 Neyland Drive, Knoxville, TN, 37996-2315, United States of America, vganjili@utk.edu, John E. Bell, Rapinder Sawhney

To model buyer-supplier negotiations and identify effective negotiation strategies in changing business conditions, an integrated model using fuzzy AHP, fuzzy TOPSIS (Technique for Order Preference by Similarity to Ideal Solution) and inverse DEA (data envelopment analysis) methods is proposed. The model handles multi-inputs (values offered by buyer) and multi-outputs (values offered by suppliers) and both quantitative and qualitative data forms.

2 - Integrated Spot and Auction Procurement of Wheat Millers

Wenhao Li, Tsinghua University, Room 408, Apartment #14, Tsinghua University, Beijing, 100084, China, wenhaoli111@gmail.com, Ruoran Chen, Simin Huang

This paper analyzes the optimal procurement and production of wheat millers with two procurement options—spot and auction. The objective is to satisfy demand and quality requirements at minimum costs under spot price and auction uncertainty. Compared with the current sequential decision making, our proposed model significantly increases expected profit. Moreover, it effectively hedges procurement risks. This paper elucidates for the first time the value of auction for wheat millers.

3 - Procurement Negotiation with Two-sided Private Information

Cheng Qian, University of Sydney, 11/115 Garden Street, Maroubra, NS, 2035, Australia, c.qian@econ.usyd.edu.au

We consider a procurement negotiation process where a buyer and a supplier negotiate on price and quality under two-sided uncertainty. The buyer has private information on valuation, and the supplier has private cost information. We characterize the equilibrium outcome and analyse the amount of information each player should reveal.

4 - Supply Contract Competition: The Role of Subcontracting and Single-Sourcing Commitment

Lusheng Shao, University of Sydney, 91 Darlington Road, Sydney, Australia, l.shao@econ.usyd.edu.au

We consider a situation where two suppliers compete for a buyer's purchase business. Two procurement mechanisms are studied: Splitting Mechanism where the suppliers each bid a supply function which maps quantities to payments and the buyer may split her order; Commitment Mechanism where the buyer commits to sole-source before bidding and the winning supplier can subcontract with the losing supplier after bidding. We characterize equilibrium for each mechanism and make a comparison between them.

5 - Joint Emergency Procurement under Supply Disruptions and Price Competition

Sobhan Asian, Nanyang Technological University, 50 Nanyang Avenue, Singapore, 639798, Singapore, sobhan1@e.ntu.edu.sg, Xiaofeng Nie

We study two competing retailers who differ in their market bases, each basically sourcing from its main supplier that is subject to disruptions. To cope with supply risk, the retailers use a common emergency source, which is perfectly reliable but more expensive. The retailers' equilibrium solutions are obtained under different emergency strategies, separate buying (SB) and joint procurement (JP). We show that the higher the main sources' disruption risks, the higher the attractiveness of JP.

Joint Session RMP/BOM: New Results on Strategic Consumer Behavior in RM

Sponsor: Revenue Management & Pricing & Behavioral Operations Management

Sponsored Session

Chair: Anton Ovchinnikov, Assistant Professor, University of Virginia, 100 Darden Blvd, Charlottesville, VA, United States of America, AOvchinnikov@darden.virginia.edu

1 - Experimental Studies on Purchasing Scarce Products under Dynamic Pricing

Vincent Mak, Cambridge Judge Business School, University of Cambridge, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, v.mak@jbs.cam.ac.uk, Jiaojie Han, Eyran Gisches, Amnon Rapoport

We experimentally tested a two-period dynamic pricing model in which a firm sells a good under exogenous inventory constraints to a market of buyers. In one experiment, human buyers purchased from an automated seller; in another, both seller and buyers were human subjects. Equilibrium predictions assuming fully strategic buyers largely accounted for aggregate behavior in both experiments, but there were also nuanced deviations from equilibrium that had profit and pricing implications.

2 - Strategic Consumers, Myopic Retailers

Anton Ovchinnikov, Assistant Professor, University of Virginia, 100 Darden Blvd, Charlottesville, VA, United States of America, AOvchinnikov@darden.virginia.edu, Mirko Kremer, Benny Mantin

We investigate the behavior of retailers who sell a fixed inventory of products over a two period horizon (main selling season followed by a markdown period) to a mixture of myopic and strategic consumers. We present a stylized model and an experimental study. Our main result is that retailers exhibit a significant degree of myopia when facing consumers who are strategic. We quantify the degree of myopia and explore how it depends on various demand and supply factors.

3 - Behavioral Anomalies in Consumer Wait-or-Buy Decisions and Their Implications for Revenue Management

Nikolay Osadchiy, Assistant Professor, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30309, United States of America, nikolay.osadchiy@emory.edu, Manel Baucells, Anton Ovchinnikov

We propose a model that incorporates behavioral anomalies in consumer wait or buy decisions, and analytically solve the consumer wait-or-buy problem in a retail markdown setting. Through a behavioral study we estimate the model parameters and numerically show that accounting for the behavioral anomalies a firm would offer larger markdowns yet generate higher revenue compared to the current literature's predictions.

Customer Differentiation in Services

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Mojtaba Araghi, Rotman School of Management, University of Toronto, 105 St. George Street,, Toronto, ON, Canada, Mojtaba.Araghi08@Rotman.Utoronto.Ca

1 - Multi-period Lead Time and Stocking Decisions for a Dual-channel Retailer

Nevin Mutlu, PhD Candidate, Virginia Tech, 607 Clay St. Apt 10., Blacksburg, VA, 24060, United States of America, nmutlu@vt.edu, Ebru Bish, Erick Wikum

As traditional brick-and-mortar retailers expand their sales channels to online, mobile, and catalog orders, the consumer adoption rates of these emerging channels is increasing as a function of time. The dynamic change of demand across channels has important implications for retailers' operational decisions. We develop a novel, dynamic demand model, and show that the retailers' optimal decisions in this dynamic environment differ significantly from those under static demand.

2 - Customer Acquisition and Service Quality for a Call Center with Time-Varying Demand Response

Mojtaba Araghi, Rotman School of Management, University of Toronto, 105 St. George Street,, Toronto, ON, Canada, Mojtaba.Araghi08@Rotman.Utoronto.Ca, Philipp Aféche, Opher Baron

This paper proposes and analyzes a novel call center model that accounts for customer lifetime value and the impact of service quality on customer acquisition and retention under time-varying demand response. We provide prescriptions on the optimal ad-hoc and periodic advertisement policies, along with the optimal staffing and priority plans for managing the call center operations.

3 - Threshold Policy for Call Centers with Time Dependent Arrival Rate

Benjamin Legros, Ecole Centrale Paris, Grande Voie des Vignes, Chatenay Malabry, France, belegros@laposte.net, Ger Koole, Oualid Jouini

In the context of multi-channel call centers with inbound calls and emails, we consider a threshold policy on the reservation of agents for the inbound calls. The optimization problem consists of maximizing the throughput of emails under a constraint on the waiting time of calls. We propose an efficient adaptive threshold policy). This scheduling policy is evaluated both in the stationary and the non-stationary case.

4 - Staffing Shift Planning for a Hospital Call Center with Inbound and Outbound Calls Blending

Yanli Zhao, Wayne State University, 630 Merrick St Apt 810, Detroit, Mi, 48202, United States of America, ee0086@wayne.edu, Susan Yu, Kai Yang

This research considers the staffing shift planning for a hospital call center with a single kind of inbound calls and multiple kinds of outbound calls. A mathematical programming model is developed with the objective of minimizing the labor cost, by deciding the shift setting and workload allocation. The service level and staffing utilization are taken into consideration in the constraints. Numerical experiments based on actual operational data are included to show the optimization results.

New Topics in RM: Demand Learning, Strategic Consumers, and Behavioral Issues

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Bora Keskin, The University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, bora.keskin@chicagobooth.edu

1 - Price Differentiation: A Machine Learning Approach

David Simchi-Levi, Professor, MIT, 77 Massachusetts Ave, Room 1-171, Cambridge, MA, 02139, United States of America, dslevi@mit.edu, Clark Pixton, Zachary Owen

We propose the use of machine learning classifiers for the task of consumer segmentation for price discrimination. We quantify the effect of classification errors on expected revenue, and we develop lower bounds on the performance of

machine learning revenue management policies for worst-case demand functions. These bounds show that such policies can outperform single-price policies even with significant classification error. We also formulate price selection as a tractable integer program.

2 - Revenue Management using Thompson Sampling

David Simchi-Levi, Professor, MIT, 77 Massachusetts Ave, Room 1-171, Cambridge, MA, 02139, United States of America, dslevi@mit.edu, Kris Johnson, He Wang

We consider the dynamic pricing problem of a retailer facing limited inventory. The retailer has no prior assumption of demand and must learn expected demand for each price throughout the season. Thompson sampling is a randomized strategy that balances exploration to learn demand and exploitation to maximize revenue. We use Thompson sampling to develop a dynamic pricing strategy and compare the algorithm's revenue to the optimal revenue given known demand.

3 - Innovative Dynamic Pricing: The Potential Benefits of Early-Purchase Reward Programs

Mike Wei, Assistant Professor, University at Buffalo, 326 Jacobs Hall, Buffalo, NY, 14260, United States of America, mcwei@buffalo.edu, Yossi Aviv

To mitigate the negative influence of strategic consumer behavior, we use stylized scientific model to seek for the optimal form of a reward program that should be offered to strategic consumers if they made early purchase decisions. Such program is identified among all possible functional forms that specify a reward to consumers that is contingent of future markdowns and sales realizations. We will share our findings in this presentation.

4 - Consistency between Prospect Theory and the Newsvendor Pull-to-Center Effect

Bhavani Shanker Uppari, PhD Student, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, BhavaniShanker.UPPARI@insead.edu, Sameer Hasija

This paper revisits the role of Prospect Theory (PT) in explaining the newsvendor Pull-to-Center (PTC) effect. Our results contrast with the existing literature that uses zero profit as a reference point in the PT model. We use the extant literature to establish the saliency of the mean demand as a decision and show that, with the outcome associated with this decision as the reference point, PT cannot be ruled out as a potential explanation for the PTC effect.

Revenue Optimization in Retail and Services II

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Thunyarat Amornpetchkul, Lecturer, NIDA Business School, Boonchana-Autthakorn Bldg., 8th fl, 118 Seri-Thai Rd. Khlong Chan, Bangkapi, Bangkok, Thailand, thunyarat.a@nida.ac.th

1 - Pricing Strategy for Theater Seats with Various Quality Levels in the Movie Industry

Ling-Chieh Kung, Assistant Professor, National Taiwan University, No. 1, Sec. 4, Roosevelt Road, Taipei, 10617, Taiwan - ROC, lckung@ntu.edu.tw, Chia-Yin Hsieh

Nowadays, seats in a cinema hall are typically charged the same price regardless of their locations. This uniform pricing strategy not only deviates from the common practice for most performance goods but also conflicts with the screening literature for revenue maximization. With a stylized model, we find that uniform pricing intensifies the competition among consumers, induce early purchase, and thus may be revenue-maximizing in several scenarios.

2 - Strategic Use of Uncertainty through Mystery Discounts

Thunyarat Amornpetchkul, Lecturer, NIDA Business School, Boonchana-Autthakorn Bldg., 8th fl, 118 Seri-Thai Rd. Khlong Chan, Bangkapi, Bangkok, Thailand, thunyarat.a@nida.ac.th

Recently, several retailers have experimented with offering mystery discount" where multiple discount levels are distributed among consumers. Under a mystery discount, consumers may discover the acquired discount prior to making purchase decisions, or at the point of purchase. Furthermore, consumers may or may not be informed about the actual distribution of different discount levels. This paper investigates how mystery discounts affect consumer purchase behavior and the seller's profitability.

3 - Effect of Cyclic Pricing on Inventory Costs

Yifan Feng, PhD Student, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, fengx233@umn.edu, Zizhuo Wang

We consider a monopolist selling a product to patient customers. Cyclic pricing policy has been shown to achieve optimal revenue in several studies. However, as price affects the demands, inventory costs are also changed when one uses a cyclic pricing policy. In this talk, we study the inventory cost of cyclic pricing policies compared to static ones. We identify two opposite effects ñ a pooling effect and a cost accumulation effect and give conditions under which each strategy has a lower cost.

4 - The Influence of Risk Preferences on Rebate Effectiveness

Ozgun Caliskan Demirag, Penn State Erie, 5101 Jordan Road Burke 259, Erie, PA, 16563, United States of America, ozc1@psu.edu

We study how the performance of rebate promotions is affected by the risk preferences of end customers and firms offering the rebates. Focusing on risk-averse and risk-neutral behaviors, we analyze the optimal values of production/order quantity, retail price, and rebate amount in a channel facing demand uncertainty and price sensitivity.

Chair: Zhaodong Wang, University of Illinois, Urbana, IL, United States of America, zwang137@illinois.edu

1 - Coordinated Inventory Replenishment and Outsourced Transportation Operations

Osman Alp, TED University, Endustri Muhendisligi Bolumu, TED Universitesi, Ankara, 06440, Turkey, osman.alp@tedu.edu.tr, Ulku Gurler, Nasuh Cagdas Buyukkaramikli

We consider a one-warehouse-N-retailer supply chain with stochastic demand. Inventory is managed in-house whereas transportation is outsourced to a 3PL provider. We develop operating characteristics under periodic and continuous joint replenishment policies. We identify settings where a periodic review policy is comparable to a continuous review one. We compare the overall performance of the outsourced transportation strategy under a contract to that of operating with in-house fleet of vehicles.

2 - Modeling the Petroleum Supply Chain under Disruption and Mitigation Strategies

Yasaman Kazemi, North Dakota State University, 1225 10th St, N, Apt 1, Fargo, ND, 58102, United States of America, yasaman.kazemi@ndsu.edu, Joseph Szmerekovsky

In this research, a three echelon supply chain model for the downstream petroleum industry is proposed to study the problem of facility failures due to a specific disruption and select appropriate mitigation and coping strategies to handle the effects of the disruptive event. A two stage stochastic mixed integer linear programming model (SMILP) is developed, and Geographic Information Systems (GIS) was used to locate facilities, obtain realistic transportation data, and to visualize the process.

3 - Bullwhip Effect in Supply Chains under Nonlinear Ordering Policies

Zhaodong Wang, University of Illinois, Urbana, IL, United States of America, zwang137@illinois.edu, Yanfeng Ouyang

This paper analyzes the bullwhip effect in multi-echelon supply chains under nonlinear ordering policies (such as base-stock policies). A describing-function approach is used to derive closed-form formulas to predict amplification of order fluctuations. The analytical results are verified by simulations and hold promise to explain empirical observations.

4 - The Well of the Past: The Historical Boundedness of Absorptive Capacity, University of Arizona
Eugene Paik

Most research on absorptive capacity suggests that more of it is universally better for organizations. Breaking from that tradition, this study examines that organizations' absorptive capacity can mislead them to avoid new technology despite its potential opportunities. I specifically argue that the adoption may be delayed when absorptive capacity is shaped by negative experience with prior, then-new technologies. I test this proposition by examining the record-labels' album releases in MP3 format as a function of the extent to which their earlier releases suffered from piracy.

5 - Spinning Off onto Shaky Ground: Executive Mobility in an Uncertain Task Environment, University of Texas at Austin
Y. Sekou Bermiss

Traffic Management I

Contributed Session

Chair: Masoud Hamedi, Research Scientist, University of Maryland, Department of Civil & Environmental Eng, 1173 Glenn L. Martin Hall, College Park, MD, 20742, United States of America, masoud@umd.edu

1 - Dynamic Structural Learning of a Bayesian Network for Drivers' Behaviors
Sojung Kim, The University of Arizona, 1127 E. James E. Rogers Way Room 162, Tucson, AZ, United States of America, sojungkim@email.arizona.edu, Sung Joong Kim, Young-Jun Son

The goal of this work is to introduce a dynamic structural learning approach for a Bayesian network to represent evolution of drivers' reasoning behaviors at an intersection. The proposed approach considers three assumptions: 1) a limited memory of a driver, 2) partial observation of the road environment, and 3) non-stationary road environment. The proposed approach is demonstrated with real drivers' behavioral responses obtained from experiments conducted in a virtual reality driving simulator.

2 - A Pattern Recognition Approach for Measuring Performance of High Occupancy Vehicle Lanes
Masoud Hamedi, Research Scientist, University of Maryland, Department of Civil & Environmental Eng, 1173 Glenn L. Martin Hall, College Park, MD, 20742, United States of America, masoud@umd.edu, Ali Haghani, yanru zhang

Making more efficient use of existing road system through HOV lanes is a cost-effective solution to improve mobility.Continuous monitoring of the system performance is key to a success implementation. A framework for fusing traffic data from several sources to estimate key HOV indicators is introduced. Motivated by advancements in travel time measurement technologies, a pattern recognition algorithm for separating travel time on HOV and regular lanes collected by Bluetooth sensors is developed.

3 - A Traffic Signal Priority Control Model for Multi-Modal Users
Mehdi Zamanipour, Research Assistant, University of Arizona, 1127 E. James E. Rogers, Tucson, AZ, 85721, United States of America, zamanipour@email.arizona.edu, Yiheng Feng, Shayan Khoshmagham, Larry Head

The opportunity to manage multi-modal transportation systems has become possible with the advent of connected vehicle systems. We present a mathematical model to implement traffic signal control for multiple traffic modes based on an N-level importance hierarchy. The model allows decision makers to establish a priority policy for different modes.

4 - Dynamic Origin-Destination Demand Estimation for Congested Traffic Networks
Ala Alnawaiseh, Post Doctor, Southern Methodist University, 3101 Dyer St, Room 203, Dallas, TX, 75205, United States of America, aalnawai@smu.edu, Hossein Hashemi, Khaled Abdelghany

A methodology for time-dependent origin-destination demand estimation in congested urban transportation networks is presented. The methodology utilizes time-varying traffic density and flow observations to estimate a demand pattern that replicates the observed flow breakdown at bottleneck locations. The problem is formulated in the form of a linear mathematical program. The results of experiments that illustrate the performance of the new methodology are presented.

Disaster and Emergency Management 1

Contributed Session

Chair: Reza Zanjirani Farahani, Kingston University London, KHBS 215, Kingston Business School, Kingston Hill, Kingston Upon Thames, United Kingdom, zanjiranireza@gmail.com

1 - A Study on the Arrangement Method of Relief Supplies in a Depot Immediately after a Disaster
Zhao Jie, Tokyo University of Marine Science and Technology, 2-1-6, Etchujima, Koto-ku, Tokyo, Japan, zhaojie6111@gmail.com, Kurokawa Hisayuki

Relief supplies were sent to the depot from all over the country soon after The Great East Japan Earthquake. However, the problem is that the many of relief supplies still have not reached the victim after the natural disaster occurred. One of the reasons of the cause was delayed sorting process of the material. Consequently, in this study, we report the result of the arrangement method of relief supplies in a depot by "operations research (OR)".

2 - Quantifying Resilience in Cyber-Physical Systems
Igor Linkov, Risk and Decision Science Focus Area Lead, US Army Corps of Engineers, 696 Virginia Rd, Concord, MA, 01742, United States of America, Igor.Linkov@usace.army.mil

Security in the face of increasingly pervasive and costly cyber attacks has prompted the call for enhanced resilience. We argue that resilience can be understood as a property of a networked system, and two approaches are discussed in which to develop resilience metrics: a MCDA matrix-based approach, and network science tools. The use of these approaches for strengthening system resilience and ensuring the continuity of the critical functions of cyber-physical systems will be discussed.

3 - An Empirical Analysis of Disaster Operations Management and a Research Agenda
Niratcha Grace Tungtisanont, PhD Student, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634, United States of America, ntungti@g.clemson.edu, Aleda Roth, Yann Ferrand

We first motivate the need for a humanitarian operations agenda, describing the operations management gaps and future research directions. We then conceptualize humanitarian and disaster operations in multiple ways, including the four phases of the disaster cycle, a typology of natural disasters, the stakeholders in disaster management, and the magnitude, frequency, and time duration of disasters. Finally, we perform an econometrics analysis to study the losses resulting from natural disasters.

4 - Identifying Points of Supply Consolidation for Relief Provision using Uncongested Transport Links
Guven Ince, UMass Amherst, 990 N Pleasant St, Apt E14, Amherst, MA, 01002, United States of America, gince@som.umass.edu, Agha Iqbal Ali

We make use of optimization methodology to reveal the dependence of timely provision of relief to populations in rehabilitation sites on the selection of points of supply consolidation. The optimization framework is demonstrated for the provision of supplies to affected populations in the aftermath of a catastrophic earthquake in Istanbul.

5 - Rapid Flow Path Network Design: Properties and Two Exact Algorithms

Reza Zanjirani Farahani, Kingston University London, KHBS 215, Kingston Business School, Kingston Hill, Kingston Upon Thames, United Kingdom, zanjiranireza@gmail.com

I introduce rapid flow path network design problem (RFPNDP) which has applications such police patrolling and quick and temporary road network repair after disasters. RFPNDP makes decisions which are made rapidly as there is not sufficient time, generates many feasible solutions rather than only one optimal and consider handmade solutions as computer systems may have already been collapsed. We extract some properties of RFPNDP analytically and develop two algorithms to solve it in special cases.

Transportation, Operations II

Contributed Session

Chair: Mesut Yavuz, University of Alabama at Tuscaloosa, Tuscaloosa, Tuscaloosa, AL, United States of America, myavuz@cba.ua.edu

1 - LNG Inventory Routing with Pickup Contracts and Origin-destination Clauses

Marielle Christiansen, Professor, Norwegian University of Science and Technology, Alfred Getz vei 3, Trondheim, Norway, marielle.christiansen@iot.ntnu.no, Sondre Thorvaldsen, Henrik Andersson, Kristian Emanuelsen

We consider an LNG supply chain problem where an energy actor is responsible for the routing and scheduling of LNG ships and the inventory management at the regasification terminals. At the liquefaction plants there exist purchase agreements with upstream suppliers containing issues regarding the total pickup volume, prices, loading regularity and origin-destination restrictions. Three models are developed and compared. Computational studies based on real-world instances show promising results.

2 - Balance vs. Efficiency Trade-off in Mixed-fleet Green Vehicle Routing

Mesut Yavuz, University of Alabama at Tuscaloosa, Tuscaloosa, Tuscaloosa, AL, United States of America, myavuz@cba.ua.edu, Ismail Capar

Minimization of total vehicle miles traveled (VMT) is commonly adopted as the objective function in vehicle routing. When a mixed-fleet consisting of gasoline or diesel and alternative-fuel vehicles is considered, a weighted VMT objective better represents efficiency. Balance among vehicle routes is measured in terms of total tardiness and maximum tardiness. In this talk we present trade-offs between efficiency and balance via a computational experiment in a mixed-fleet setting.

3 - Dynamic Traffic Control Interventions for Enhanced Mobility

SeyedBehzad Aghdashi, Post-Doc, ITRE, 803 Essex Forest Dr #, Cary, NC, 27518, United States of America, saghdas@ncsu.edu

This research is intended to develop efficient (optimized) methods that dynamically evaluate the current traffic system performance, propose interventions that can ameliorate the performance as needed, and implement and re-evaluate the effectiveness of the intervention. To enable real progress in this arena, the focus will be on active traffic management techniques and their application on freeway facilities.

4 - Parcel Distribution Timetabling Problem with Incomplete Hub Network

Omar Ben-Ayed, Professor, Qatar University, College of Business and Economics, PO Box 2713, Doha, 2713, Qatar, omar.benayed@qu.edu.qa, Salem Hamzaoui, Faiza Zalila, Belaid Aouni

Parcel distribution timetabling problem optimizes the movements of parcels in their journey from their pickup to their delivery. The minimization of the time spent in this journey is a common objective for this problem. We provide a comprehensive presentation of this problem that emphasizes its practical aspects. The proposed mixed integer program addresses the common case of incomplete hub network where the volume between two hubs is not large enough to justify the use of a dedicated transport.

Vehicle Routing IV

Contributed Session

Chair: Mohammad Yousef Maknoon, Ecole Polytechnique Montreal, 2900 Boulevard Edouard-Montpetit, Montreal, Canada, mohammad-yousef.maknoon@polymtl.ca

1 - A Parallel Route Construction Algorithm for the Vehicle Routing Problem with Soft Time Windows

Sezgin Kaplan, Asst. Professor, Turkish Air Force Academy, Hava Harp Okulu, Yesilyurt, Istanbul, 34149, Turkey, skaplan@hho.edu.tr, Ahmet Herekoglu

A novel parallel route construction algorithm is developed for the vehicle routing problem with soft time windows (VRPSTW). The Apparent Tardiness Cost rule, which is a good composite dispatching rule for the parallel machine scheduling problem with total weighted tardiness, is adapted to the VRPSTW by considering the slack factors for the time windows. Computational results are compared with the alternative heuristic algorithms for the set of benchmark problems by Balakrishnan (1993).

2 - Vehicle Routing with Cross-dock Selection

Mohammad Yousef Maknoon, Ecole Polytechnique Montreal, 2900 Boulevard Edouard-Montpetit, Montreal, Canada, mohammad-yousef.maknoon@polymtl.ca, Gilbert Laporte, Pierre Baptiste

Vehicle routing problem with cross-dock selection is a variant of the vehicle routing problem containing spatial and load synchronization constraints by which products are transferred and processed via at least one cross-dock. In this presentation, we investigate this problem and demonstrate the challenges in finding the optimal solution. Finally, we represent a heuristic methodology to handle practical problems.

3 - Multiple Partial Dominance for the Elementary Shortest Path Problem with Resource Constraints

Troels Martin Range, Associate Professor, Department of Business and Economics, University of Southern Denmark, Campusvej 55, Odense, 5230, Denmark, tra@sam.sdu.dk

We present a new dominance criterion for dynamic programming used in the Elementary Shortest Path Problem with Resource Constraints. The criterion is based on the observation that a state can be partially dominated by another state and that we can combine the partial dominance of several states to fully dominate a given state. By using this criterion we can eliminate states earlier in the solution process which may be worthwhile, when the problems become difficult.

4 - A Study on Indian Rice and Wheat Food Supply Chain – Select Modeling Insights

Lohithaksha M Maiyar, Research Scholar, Indian Institute of Technology Kharagpur, Industrial and Systems Engineering Dept., IIT Kharagpur, Kharagpur, WB, 721302, India, lohit10.maiyar@gmail.com, Jitesh J Thakkar

Over the recent times the major global concern is to ensure food security to the growing population. In line with this concern, this paper discusses the issues and challenges faced in efficient supply of rice and wheat in Indian context with the help of a specific network diagram. Finally few mathematical models for the rice and wheat distribution system have been presented which can be taken as an input for further analyzing and improving the current state of Indian food distribution system.

5 - Minimum Cost Path Problem for Plug-in Hybrid Electric Vehicles

Okan Arslan, PhD Candidate, Bilkent University, Department of Industrial Engineering, Bilkent University, Ankara, 06800, Turkey, okan.arslan@bilkent.edu.tr, Baris Yildiz, Oya Karasan

We investigate the minimum-cost path problem for plug-in hybrid electric vehicles. The objective is to find a minimum-cost path between given departure and destination points in a transportation network and to determine the refueling and battery switching policies. We show that the problem is NP-complete and propose two solution techniques: a mixed integer quadratically constrained program and a dynamic programming based heuristic.

Co-Chair: Alexander Yemelyanov, Professor, Georgia Southwestern State University, 800 GSW University Drive, Americus, GA, 31709, United States of America, alexander.yemelyanov@gsw.edu

1 - A Data Mining Approach for Early Identification of Potential Disruptive Scenarios

Rodrigo Scarpel, Instituto Tecnológico de Aeronautica, Praca Marechal Eduardo Gomes, 50, ITA - IEM , sala 2311, São José dos Campos, SP, 12228900, Brazil, rodrigo@ita.br

On disruption management, the philosophy of robust optimization is to generate an operational plan that is "good" for most scenarios and acceptable for the worst scenario. Thus, in oder to employ the robust optimization all potential disruptive scenarios must be specified. The objective of this work is to make use of a data mining approach for early identification of such disruptive scenarios for the São Paulo International Airport (Brazil).

2 - Global Air Jet Medical Network Design

Wei Chen, University of Pittsburgh, 241 Mevis Hall, Pittsburgh, PA, 15260, United States of America, raul.weichen@gmail.com, Jennifer Shang

Given current international health care demand unbalance situation and considering all air medical transport's characteristics, this research designs a global network structure for an air medical transport firm. The objective of the research is to maximize firm's global service coverage in a cost effective way.

3 - Optimization of Performance Shaping Factors Analysis in Safety Databases

Alexander Yemelyanov, Professor, Georgia Southwestern State University, 800 GSW University Drive, Americus, GA, 31709, United States of America, alexander.yemelyanov@gsw.edu, Alla Yemelyanov

The existing databases on accident/incident reports such as NTSB, NASA-ASRS, etc. are suitable mostly for statistical analysis of predetermined error categories rather than for the analysis of underlying causal factors. We present an error modeling method with classification algorithms and verbal decision analysis that allow to collect cognitive PSFs at the stage of accident investigation and provide further analysis of these data to determine repeated factors and error-provoking situations.

4 - Optimizing AMAN-SMAN-DMAN at Hamburg and Arlanda Airport

Carlo Mannino, Professor, SINTEF ICT, Forskningsveien 1, OSLO, Norway, carlo.mannino@sintef.no, Dag Kjenstad, Patrick Schittekat

Air Traffic Management controls movement of airplanes at airports, a complex task divided into Arrival, Surface and Departure Management problems. Airports handle them independently preventing good solutions to be found. We developed an integrated optimization approach that showed remarkable improvements compared to expert controllers for Hamburg airport. Embedded in an ATM system developed with SAAB and THALES, it will be officially validated by the Swedish air traffic control in October 2014.

1 - Multimodal Impact Analysis of an Airside Catastrophic Event

Alexandre Bayen, University of California at Berkeley, Berkeley, CA, United States of America, bayen@berkeley.edu, Aude Marzuoli, Eric Feron, Emmanuel Boidot, Alexis Ucko, Mark Hansen, Paul van Erp

The present project aims at performing a data-driven analysis of multimodal (air, rail, road) transportation efficiency through the case study of a large-scale disruption in the San Francisco Bay Area. The study provides an overview of the impact of the disruption on the air side and the ground side, and highlights the coupling between transportation modes. This analysis stresses the importance of further data-driven research on interdependent infrastructure networks to improve their resilience.

2 - Regression Models of Aircraft Engine Fuel Burn and Emissions

Yashovardhan Chati, MIT, Boston, MA, United States of America yschati@mit.edu, Hamsa Balakrishnan

The Flight Data Recorder collects aircraft and engine parameters during the course of a flight. In this talk, we propose statistical models for different aircraft types that predict engine fuel flow rates, total fuel burn and emissions of various pollutant species, given observations of trajectory variables (such as position and speed). The results can be used to refine fuel burn and emissions inventories, in order to better reflect the impacts of actual aircraft operations.

3 - Airport Ground Delay Planning using Markov Decision Processes

Jonathan Cox, Stanford, 496 Lomita Mall, Stanford, CA, United States of America, joncox@stanford.edu, Mykel Kochenderfer

We present a solution to the single airport ground hold problem that outperforms existing solution techniques by a considerable margin. The approach uses Monte Carlo tree search to find an approximate solution to a Markov decision process model of the system dynamics. Performance is demonstrated by comparison to existing techniques using historical data from San Francisco International Airport.

4 - Message Clustering and Targeting for Throughput-Limited Communication

Joseph Rios, Research Aerospace Engineer, NASA, Ames Research Center, Mail Stop 210-15, Moffett Field, CA, 94035, United States of America, joseph.l.rios@nasa.gov, Avijit Mukherjee

In certain communication environments, efficient use of throughput is paramount. For example, sending messages via satellite wherein the cost is related to the target area of the broadcast and the message length, one needs to efficiently compose and bundle messages based on their payloads. We developed models for clustering multiple payloads with varying target locations that minimize the total broadcast cost. We demonstrate the utility of the model with an aviation application for Alaska.

Chair: Kai Luo, Kedge Business School, France, Toulon, France, kai.luo@kedgebs.com

1 - Tacit Knowledge Management Methods

Kai Luo, Kedge Business School, France, Toulon, France, kai.luo@kedgebs.com

In the knowledge economy, knowledge is the strategic resource for enhancing competitive advantage of organizations. This paper addresses two different strategies based on the distinction between tacit and explicit knowledge. We provide theoretical results for both linear and non-linear models. Managerial insights are also provided via numerical examples.

2 - Critical Influencing Factors and Paths of Leader's Global Mindset

Haixin Zhang, University of Science and Technology of China, Jin Zhai Road 96, Hefei, China, z_h_x606@139.com

Based on literature research and grounded theory, explore the deep-seated factors that affect the leader's global mindset.

3 - Inspection, Traceability and Recall Cost Sharing Contracts

Shengnan Sun, Southeast University, School of Economics and Management, Sipailou 2, Nanjing, 210096, China, sun.shengnan@seu.edu.cn, Xinping Wang

Traceability and inspection are different policy mechanisms for firms to improve food quality and safety with their supply chain. The two mechanisms are not independent in terms of their influence on firm behavior and food safety. In this paper, we discuss contractual agreements by which food product recall costs can be shared between a manufacture and a supplier to induce traceability improvement effort, and analyze the impact of inspection policy on contracts.

Chair: Changseung Yoo, UT Austin, 2110 Speedway Stop B6500, CBA 5.202, Austin, TX, 78712-1277, United States of America, Changseung.Yoo@phd.mccombs.utexas.edu

1 - On Pricing and Composition of Multiple Bundles offered in Multiple Market Segments

Juan-Carlos Ferrer, Associate Professor, P. Universidad Catölica de Chile, Casilla 306 Correo 22 Santiago Chile, Santiago, Chile, jferrer@ing.puc.cl, Alejandro Cataldo

We study the problem facing a company that should determine the optimal composition and price for multiple bundles offering across multiple market segments, where it will compete with other bundles offered by the competition. We consider that competitors will not react in the short term, and we assume that consumers are rational (maximize their utility function). The problem is modeled as a mixed nonlinear program, and we propose heuristic methods to solve it.

2 - A Two-product Inventory System with a Probabilistic Good

Xiaoya Xu, University of Macau, Macau, Taipa, China, yb27003@umac.mo, QI FU, Zhaotong Lian

We investigate the impact of offering a probabilistic good in a single period two-item inventory planning system. The optimal inventory decisions for the two regular products are analyzed. This probabilistic selling strategy can help firms effectively pool the excess stocks to better match supply with demand and thus enhance profitability. We also explore the pricing decision of the probabilistic good using both additive and multiplicative demand functions when there is demand cannibalization.

3 - Price, Quality and Advertising Decisions Considering Reference Price Effects

Qinglong Gou, Associate Professor, University of Science and Technology of China, Jinzhai Road 96, Hefei, 230026, China, tslg@ustc.edu.cn, Zhimin Huang, Yanyan He

A change from the B2C e-commerce is that a consumer cannot observe a product's quality directly. Thus, an online consumer makes his decision mainly based on his own expectation, i.e., the reference quality. In this paper we incorporate reference effect into a firm's joint decision on quality, advertising and pricing under a dual channel framework. Our study provides a new perspective of investigating the influence of B2C e-commerce.

4 - Consumer Intention to Purchase Remanufactured Product: An Experimental Analysis of Product Knowledge

Yacan Wang, Beijing Jiaotong University, No.3 Shangyuan Road, Xizhimen Wai, Haidian District, Beijing, China, ycwang@bjtu.edu.cn, Benjamin Hazen

This paper develops a research model to describe consumers' intention to purchase remanufactured products. Using a 2x2x2 inter-group experiment, we examine how knowledge of remanufactured products in terms of cost, quality, and green benefits affects consumers' perception of both risk and value associated with purchasing remanufactured products, and how these perceptions subsequently affect consumers' purchase intentions.

5 - Competitive Pricing and Advertising in Dynamic Oligopoly Markets

Changseung Yoo, UT Austin, 2110 Speedway Stop B6500, CBA 5.202, Austin, TX, 78712-1277, United States of America, Changseung.Yoo@phd.mccombs.utexas.edu, Genaro Gutierrez

We analyze a multi-firms pricing and advertising model in a dynamic oligopoly market. We show that, under mild assumptions, the value functions of the firms in equilibrium exhibit strategic complementarities and that the equilibrium is increasing in brand awareness. To this end, we compare existing dynamic advertising models by designing a Kalman filter to estimate the models with actual market data, and show that there are many models that satisfy our assumptions. For those that violate our assumptions, we show that our choice of advertising models perform just as good as them.

Sponsored Session

Chair: Nilanjan Chattopadhyay, Dean Executive Education, Manipal University, Dubai International Academic City, Dubai, United Arab Emirates, nchattopadhyay@gmail.com

1 - An Investigation of Firm Performance and Country-of-Origin Effect in Adoption of Innovation

Jiyoon An, Texas Tech University, Rawls College of Business, Lubbock, TX, 79409, United States of America, jiyoon.an@ttu.edu

This paper examines the influence of a supplier firm's performance and country-of-origin effect on a buyer firm's willingness to adopt a supplier firm's product innovation. Specifically, a buyer firm's perceived importance of purchasing product and entrepreneurial orientation affect their willingness to accept a product innovation, which is moderated by a supplier firm's performance and country-of-origin effect from a network innovation perspective.

2 - Incentives for Quantitative and Qualitative Quality in Service Outsourcing Contracts

Zhi Ouyang, School of Management, Xi'an Jiaotong University, No. 28 at Xianning West Road of Xi'an, Xi'an, China, ouyangzhi1987@stu.xjtu.edu.cn

As to the poor service quality in outsourcing practice, we introduce qualitative quality into conventional outsourcing contacting. Based on the contract theory, we analyze the optimal quality for service outsourcing and investigate the reward and punishment mechanism for qualitative quality changes. We show optimal quantitative quality need to be modified to fit with feasible qualitative one; thus, service requirements with modified quality metrics can improve the outsourcing performance.

3 - Eco-labels and Their Contribution to Company Profit

Xu Yang, Assistant Professor, San Jose State University, Dept of Marketing and Decision Sciences, San Jose State University, San Jose, CA, United States of America, xu.yang@sjsu.edu, Amy Xia

In this research we study how an industry designs the eco-label to promote green products in the market. The research questions we address include: how to design the eco-labeling mechanism, does it bring any profit to pursue the eco-label, how to price the green product to stay profitable? The main contribution of the research is to prove the positive effect of eco-label to company profit.

4 - Shipping Cost Optimization for an E commerce Retail Company

Mrinalini Shah, Professor, Institute of Management Technology, Raj Nagar, Hapur Road, Ghaziabad, 201001, India, shahmrinalini@gmail.com, Nilanjan Chattopadhyay

An Indian online sports equipment retail company was facing huge loss due to fixed shipping charge of Rs 70 from its customers whereas courier companies were charging on the basis of volumetric weight. The challenge was 10,000+ products and 150+ cities as destination.The objectives was to decide the shipping charge from customers which should not exceed 15% of the price of the product and should be at least higher then what courier company charge to them while earning 7% overall profit margin.

5 - The Role of E-service Offerings, Customer Ratings, and Reviews in Enhancing Customer Demand

Xun Xu, PhD Candidate, Washington State University, Department of Finance and Management, Science, Washington State University, Pullman, WA, 99163, United States of America, xun.xu@email.wsu.edu, Charles Munson

Using the largest C2C online shopping website in China, we collected data for 200 online sellers for each of 40 products (8000 observations) pertaining to the sellers' respective customer ratings and reviews, relative popularity, history, price, and e-service offerings (e.g., fast shipping, refund opportunities, and purchase security). We examine the extent to which these activities and characteristics influence customer demand. Implications for online selling strategies are discussed.

6 - Strategic Balancing between Service Quality and Innovation: Evidence from Banking Industry

Nilanjan Chattopadhyay, Dean Executive Education, Manipal University, Dubai International Academic City, Dubai, United Arab Emirates, nchattopadhyay@gmail.com, Mrinalini Shah

Objective of this paper is to discuss the eternal problem faced by service providers while adopting a sustainable strategy to balance service quality and innovation, and therefore, cost. Analysis of data on multiple firms operating in different geographies lead to conclusion that fostering inter-functional collaboration can lead to service enhancement and quality through innovation.

Supply Chain/Competition

Contributed Session

Chair: Dong Xu, Research Assistant, University of Arizona, 1127 E. James E. Rogers Way, Rm 111, Old Engr Bldg, Tucson, AZ, 85721, United States of America, dongxu@email.arizona.edu

1 - Is Online Channel a Counterstrategy to the Store Brand by the National Brand?

Xiaomeng Luo, PhD candidate, Department of Marketing, City University of Hong Kong, Rm 709, Hall 7, Student Residence, Kowloon, Hong Kong, Hong Kong - PRC, xiaomeng.sissi.luo@gmail.com, Jianbin Li, Ling Ge, Liwen Chen

We consider a supply chain with a national brand manufacturer distributing his products both through a retailer and an online channel. The retailer is also capable of introducing her own store brand. We use a two-stage game-theoretic model to capture the strategic interaction between the online channel and the store brand.

2 - Vertical Competiton in a Decentralized Supply Chain under Supply Uncertainty

Shaoxuan Liu, Associate Professor, Shanghai Jiao Tong University, ACEM, Shanghai, China, liusx@sjtu.edu.cn, Rick So, Fuqiang Zhang

We study a two-stage decentralized supply chain in which a manufacturer sells a product to a retailer who in turn sells the product to consumers.The supply process of the supply chain is uncertain and customer demand is determined by the retailer's endogenous sales effort decision. We study the impacts of supply uncertainty on the firms' optimal decisions, their profits and the supply chain efficiency.

3 - Pollution Control, Bilateral Duopoly, Double Marginalization, Dynamic Games

Fouad el Ouardighi, Professor, ESSEC Business School, Bp 105, Cergy Pontoise, 95021, France, elouardighi@essec.fr, Bowon Kim

The literature on pollution control has pointed out the improper internalization of pollution externalities in a horizontal setting (i.e., with two producers) involving no price competition. We design a bilateral duopolistic price competition differential game and compare whether supply chain coordination would be more efficient than horizontal coordination to reduce pollution.

4 - An Integrated Simulation and Game Theoretic Framework for Analysis of Supply Chain Competitions

Dong Xu, Research Assistant, University of Arizona, 1127 E. James E. Rogers Way, Rm 111, Old Engr Bldg, Tucson, AZ, 85721, United States of America, dongxu@email.arizona.edu, Young-Jun Son

An integrated simulation and game-theoretic approach is presented to study the multi-echelon, multi-period newsvendor competition. We will first discuss an innovative simulation-based game platform involving agent-based and systems dynamics modeling, which can be utilized in both the repeated matrix game and stochastic game settings. The game solving procedures are further developed, with the equilibrium existence, uniqueness, and algorithm convergence in the considered supply chain experiments.

1 - Effect of R&D Diversification on Alliance Outcomes

Xiang He, University of Cambridge, Emmanuel College, Saint Andrews Street, Cambridge, CB2 3AP, United Kingdom, xh232@cam.ac.uk

We examine the effect of R&D alliance choices on innovation quality and innovation output. In particular, We find that a firms' existing R&D diversification is a strong moderating variable, in that it affects a firm's tendency to commit to any particular R&D alliance. We use a novel instrumental variable to remove endogeneities rising from partner selection.

2 - Best Practices using the CPLEX Python API

Ryan Kersh, Software Developer, IBM, 355 Goodpasture Island Rd., Eugene, OR, 97405, United States of America, rkersh@us.ibm.com

Python is a popular programming language that has been gaining traction in the scientific community. The CPLEX Python API allows users to access the CPLEX optimization engine from Python. When writing programs to solve LP problems using the CPLEX Python API there are several best practices which can prevent errors, improve performance, and enhance readability. Using real examples, a tour of the CPLEX Python API, and best practices for writing programs in this environment will be given.

3 - Integrated Pricing Strategies of Remanufactured Products with Replacement Purchase

Lei Jing, National University of Singapore, E1-07-26, Computing Lab, Kent Ridget 10, Singapore, 117576, Singapore, jinglei@nus.edu.sg, Boray Huang

For remanufacturing business in highly saturated markets, many product sales come from replacement purchase. Pricing strategies are usually adopted by remanufacturing companies to balance supply and demand. In this study, the joint decision of acquisition, trade-in and selling price is considered. It is shown that a remanufacturing firm should offer higher rebates to replacement customers when this customer segment has high return quality and high price sensitivity.

4 - The Influence of Dr. Deming's Philosophy in Quality Improvement

Mohammad Quasem, mohammadquasem@gmail.com

PDSA (plan-do-study-act cycle), also known as the Deming Wheel, is an important factor of processes and systems development, which are the keys to improving quality. This along with his famous 14 points is a critical element in organizational development, leading him to be granted the title as the father of quality improvement. Deming believed that defective products were produced due to the carelessness of management. Over the last 60 years Dr. Deming has been the most important contributor in improving quality. This study has shown how his philosophy of quality improvement has influenced nearly every field.

Hilton- Union Sq 14

Performance Measurement 2

Contributed Session

Chair: Arne S. Drud, ARKI Consulting & Development, Bagsvaerdvej 246A, Bagsvaerd, 2880, Denmark, adrud@arki.dk

1 - A Study on Connectivity-Electrical Conductivity Relationship of Carbon Nanotube Networks

Min-Yang Li, Florida State University/High-Performance Materials Institute, 2005 Levy Ave, Tallahassee, FL, 32310, United States of America, minyangli@gmail.com, Richard Liang, Andrew Moench, Brian Wiesner

Although experimental and theoretical studies have identified some factors that affect the electrical conductivity of CNT films, the effect of CNT network topology on the electrical conductivity remains unclear. We present an image analysis approach to extract the CNT network topology information directly from a scanning electron microscope (SEM) image of a CNT film, and use the result to study the relationship between the network topology and the electrical conductivity.

2 - Performance Impacts of Plant Level Production Improvement Programs

Markku Kuula, Professor, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, Finland, Markku.Kuula@aalto.fi, Katri Kauppi

With increased competition, manufacturing organizations are forced to launch new activities to develop their operations. The aim of this paper is to analyze how production improvement activities and product development efforts affect plants' performance. The analyses are made using data from the International Manufacturing Strategy Survey 6th edition. The data set consist of manufacturing five industry sectors and over 800 responses across 15 countries.

3 - From CONOPT3 to CONOPT4

Arne S. Drud, ARKI Consulting & Development, Bagsvaerdvej 246A, Bagsvaerd, 2880, Denmark, adrud@arki.dk

The presentation gives an overview over the major changes in CONOPT between version 3 and 4: Improved preprocessor; Separation between user model and various internal sub-models; Improved sub-algorithms with selection based on up-to-date model information; Stability improving basis selection. Emphasis is on reliability and large scale. Efficiency comparison of old vs. new version will be provided.

4 - Mining Process Metrics from Project Tracking Tools for Software Development Teams

Ryan Panos, Arizona State University, 3243 Guillermo Pl, Hayward, CA, 94542, United States of America, rpanos@asu.edu

I have pursued statistical relationships between policy choices and environmental factors in software development teams by mining time related data from project tracking tools. Ideally, these dependent and independent variables will also be correlated with indicators of productivity levels. In support of the movement to agile methodologies, we also are attempting to measure how agile a team might be relative to others and in contrast to traditional waterfall based teams.

5 - Contextual Managment in China's Local NGOs and Social Enterprises

Husheng Xu, University of Science and Technology of China, School of Public Affairs, Hefei, China, hsxu@mail.ustc.edu.cn, Liang Gao

NGOs and Social Enterprises management in China context are attracting increasing attention. Theory and practice of this field are creating social value to improve societal development. 54 and 47 non profit organizations and potential social enterprises were fully surveyed in 2011 and 2013. All these groups were local grass organizations from inner area of central China which acquire specific attention. With respect, China's unique contextual management characters were considered in this study.

Hilton- Union Sq 15

Dynamic and Stochastic Models in Emergency Response and Preparedness

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Sibel Salman, Associate Professor, Koc University, Rumelifeneri Yolu, Sariyer, Istanbul, Turkey, ssalman@ku.edu.tr

1 - Modeling for Pre-planning of Resources for Emergency Situations

Shaligram Pokharel, Professor, Qatar University, P.O. Box 2713, Doha, Qatar, shaligram@qu.edu.qa, Rojee Pradhananga, Fatih Mutlu, Jose Holguin-Veras

A two-stage stochastic resource allocation and distribution model is presented for prepositioning of resources to meet demand at an emergency (post-disaster stage) situation. Supply deficit in the post disaster stage is met with shipments from the suppliers. The problem is to obtain optimal resource allocations and choice of suppliers and distribution centers for pre and post disaster situation. Application of the model on a case study and analysis of cost and service trade-off are discussed. (This research is funded through Qatar/QNRF/NPRP Project: 5-200-5-027)

2 - A Heterogeneous Fleet of Vehicles for Automated Humanitarian Missions

Enes Bilgin, Advanced Micro Devices, 13509 Lamplight Village Ave, Austin, TX, 78727, United States of America, enes1988@gmail.com, David Escobar Sanabria, Pieter Mosterman, Kun Zhang, Justyna Zander

An automated emergency response system responds to dynamic and heterogeneous pick-up and delivery requests submitted in the aftermath of a disaster. Autonomous fixed wing aircraft is used for reconnaissance, autonomous trucks serve as depots and the requested items are delivered via autonomous quadcopters. The system aims to respond to high priority requests in minimum time, for which p-median and tabu search algorithms are utilized.

3 - Dynamic Vehicle Routing by Incorporating Social Data in Disaster Relief

Emre Kirac, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, ekirac@uark.edu, Ashlea Milburn

Decision makers in disaster response community have faced challenges whether to take social data streams into consideration to identify needs in a shorter amount of time. However, needs identified through social media initially have not been verified. Confidence in requests changes with time based on verification inputs. A wide variety of decision policies are defined to represent a broad range of emergency manager preferences. These policies are compared across a variety of demand scenarios.

4 - Impact of Information Sharing on Relief Distribution During Disasters

Huguette Tran, University of North Texas, 1155 Union Circle, 311396, Denton, TX, 76203, United States of America, huguette.tran@unt.edu, Cigdem Kochan, David R. Nowicki

This study evaluates the impact of demand information sharing on relief distribution during a disaster. A mathematical model is developed to determine the optimal relief quantities when there is full and partial information sharing. The results show that full information sharing improves the accuracy of the relief quantities.

Hilton- Union Sq 16

Sports & Entertainment I

Contributed Session

Chair: Stephen Hill, Assistant Professor, UNC Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States of America, hills@uncw.edu

1 - Building Perfect Tournament Brackets with Data Analytics

Christopher Hagmann, Purdue University, 480 Stadium Mall Dr., West Lafayette, IN. United States of America, chagmann@purdue.edu, Nan Kong

The NCAA men's basketball tournament highlights data analytics to the everyday person as they look for help building their brackets. In this talk, a k-Nearest Neighbors algorithm is proposed to compare new opponents to previously played teams. A distance between teams is calculated to determine the most similar teams and to weight the value of each win or loss to the teams. The value of k is determined from previous years and applied to 2014. Results are compared to other predictions for 2014.

2 - Down - Set - Punt? Evaluating a Late-Game Strategy in Canadian Football

Keith Willoughby, University of Saskatchewan, 25 Campus Drive, Saskatoon, SK, S7N 5A7, Canada, willoughby@edwards.usask.ca, Kent Kostuk

In several respects, Canadian football is unlike the American version of the sport. One particular difference involves kicking strategies. Canadian teams can earn a single point by punting the ball through the end zone. During the final moments of a tied game, a team may prefer punting for a single point rather than attempting a field goal. We build a decision analysis model for this scenario and use it to evaluate actual decisions made during a 2010 Canadian football game

3 - Learning to Dance: Conference Tournament Design for Maximum Financial Benefit

Stephen Hill, Assistant Professor, UNC Wilmington, 601 South College Road, Wilmington, NC, 28403-5611, United States of America, hills@uncw.edu

NCAA basketball conferences hold tournaments to determine their champions. The champions then receive automatic bids to the NCAA Tournament. For some conferences, the tournament champion is likely to be the conference's only participant in the NCAA Tournament. We analyze whether it is in a conference's financial interest to ensure that its best team receives the automatic bid. We discuss the implications that this analysis could have on the structuring of tournaments.

4 - Analyzing and Forecasting Attendance at FIFA Soccer World Cups

Ghaith Rabadi, Associate Professor, Engineering Management and Systems Engineering, 5115 Hampton Blvd, Old Dominion University, Norfolk, VA, 23529, United States of America, grabadi@odu.edu, Ahmed Ghoniem, Agha Iqbal Ali, Mohammed Al-Salem

Abstract: The FIFA World Cup is among the most popular international sport events. This paper analyzes historical data on attendance at FIFA World Cups over the last two decades. Key factors that influence attendance are identified and their relative importance is discussed. This analysis can be used within a forecasting framework to predict attendance at future events.

Marketing 1

Contributed Session

Chair: Shaobo Li, University of Cincinnati, 2925 Campus Green Dr., Cincinnati, OH, 45221, United States of America, lishaobo413@gmail.com

1 - Product Strategy under Smartphone Competition

Siddhartha Sharma, Indian School of Business, AC 6121, Gachibowli, Hyderbad, AP, 500032, India, siddhartha_sharma@isb.edu, Amit Mehra

We observe an unusual phenomenon of Nexus 5 having a much lower price tag than other phones of comparable quality like iPhone 5S and Galaxy S4. Using a game-theoretic model, we show that the usual result of high quality-high price can be overturned in the case of smartphone competition. This happens because introduction of Nexus allows for increased revenue for Google since it does not share the ad and app revenue from Android phones as it has to do on the earnings from iPhones.

2 - Non-Monetary and Monetary Rewards for Product Review Contribution in a Connected Community

Xiaojing Dong, Santa Clara University, 500 El Camino Real, Lucas Hall, Marketing, Santa Clara, CA, 95053, United States of America, xdong1@scu.edu, Yacheng Sun

We empirically demonstrate that monetary reward can sometimes decrease product review contributions in a community. Using a HB model, we examine individual-level contributions before/after the introduction of monetary reward. We find that with the reward, consumers with more friends decreased their contributions by 90%; while those with fewer or no friends increased their contributions by 1400%. They suggest that there is a significant conflict between monetary rewards and non-monetary rewards.

3 - The Pricing Strategy of Multinational Enterprises

Mei-Wen Chao, Assistant Professor, Kao-Yuan University, No. 1821, Chung-Shan Rd, Lu-Chu district, Kaohsiung, Taiwan - ROC, t80149@cc.kyu.edu.tw

Multinational Enterprise (MNE) has been studied extensively across countries and companies. While the emerging globalization of market pressures MNEs to consolidate operations, price always remains a key point of international differentiation for most products. This paper consider the pricing strategy by taking into consideration of entry mode, product life cycle and outsourcing. Salient results and practical issues involved in this unique problem are discussed in detail in this paper.

4 - In Search of Models for Stock Return Forecasts

Shaobo Li, University of Cincinnati, 2925 Campus Green Dr., Cincinnati, OH, 45221, United States of America, lishaobo413@gmail.com, Yan Yu

We attempt to investigate forecastability of US stock market return by using a set of information. Given the high dynamicity of stock return, we propose to develop Bayesian Dynamic Linear Model (DLMs), which assumes model coefficients to be time-varying. Model Averaging technique is applied to improve the forecasting accuracy. We compare our developed DLMs model with previously established models in terms of out-of-sample R square.

5 - Causality and Time: A Longitudinal Model for the Impact of Digital Advertising

Daniel Hill, Senior Data Scientist, Integral Ad Science, 95 Morton St., Floor 8, New York, NY, 10014, United States of America, dhill@integralads.com, Gijs Joost Brouwer, Kiril Tsemekhman, Alan Hubbard

Ad networks target people who are inclined to buy the product being advertised. Do their ads cause users to convert or would they have converted regardless? Previous studies have applied the tools of causal analysis to address this question. However, their static models did not capture the dynamic interplay between user and advertiser. We developed a longitudinal event-driven causal framework for the analysis of ad campaigns. Our method generalizes to any intervention on online behavior.

Health Care, Process 1

Contributed Session

Chair: Anu Banerjee, PhD Student, Binghamton University, SUNY, Vestal Parkway East, Binghamton, NY, 13902, United States of America, banerjee@binghamton.edu

1 - Correcting Systematic Errors in Clinical Laboratories

Chin Hon Tan, National University of Singapore, 1 Engineering Drive 2, Singapore, Singapore, isetch@nus.edu.sg

Analyzers in clinical laboratories are tested periodically to ensure that readings are within acceptable levels of accuracy. When a systematic error (e.g., contamination of reagent) occurs, readings may deviate significantly from their true values. Therefore, the laboratory should retest all affected patient samples. However, the onset of error is often unknown. We propose a Bayesian approach, which sequentially updates the distribution for the time of error, in tackling this problem.

2 - EHR and its Impact on Healthcare

Anu Banerjee, Ph.D. Student, Binghamton University, SUNY, Vestal Parkway East, Binghamton, NY, 13902, United States of America, banerjee@binghamton.edu, Sal Agnihothri

An Electronic Health Record (EHR) is a systematic collection of health information in digital format to capture a patient health status. It allows patient history to be viewed and shared across different healthcare settings. Implementing EHR system could reduce costs and increase quality of care. Recently the U.S. Govt. provided incentives to drive adoption of EHRs. The objective of this paper is to examine EHR and its impact on healthcare operations in general and patient health in particular.

3 - The Effect of Organizational Practices on Outcomes of Cardiothoracic Surgery

Jingyun Li, PhD Student, The University of Texas at Dallas, 7740 McCallum Blvd. Apt. 321, Dallas, TX, 75252, United States of America, jxl097620@utdallas.edu, Indranil Bardhan, Steve Ring

Coronary Bypass Artery Grafting (CABG) patients experience significant variations in healthcare outcomes after surgery. We study hospital- and surgeon-specific organizational practices related to cardiac surgeries on a large panel of CABG patients, using archival and survey data collected across 26 hospitals in North Texas, and their impact on patient outcomes.

4 - Process Issues of Patient Safety and Home Care for Healthcare Delivery Systems in Japan

Masato Takanokura, Kanagawa University, 3-27-1 Rokkakubashi, Kanagawa-ku, Yokohama, Japan, takanokura@kanagawa-u.ac.jp, Masaru Kawakami, Keiou Ishiguro, Tomokazu Muto, Seiko Taki, Tetsuo Yamada

Healthcare delivery systems in Japan should be improved urgently to enhance their quality of service and to reduce social security costs simultaneously. The consumption tax increased this spring in Japan to supplement the lack of social security costs. The aim of this study is to identify processes in healthcare delivery systems especially for patient safety and home care in hospitals and nursing homes in Japan. Possible alternative solutions are discussed under the constraints in Japan.

5 - Supply and Demand Alignment at Primary Care Facilities

Sina Faridimehr, Graduate Research Assistant, Wayne State University, Wayne State University, Detroit, MI, United States of America, fb1562@wayne.edu, Seung Yup Lee, Azade Tabaie, Alper Murat, Qingyu Yang, Ratna Babu Chinnam, Evrim Dalkiran, Hakimuddin Neemuchwala, Michael Lederle

We propose statistical models to improve timely access for patients while maintaining clinic capacity utilization in primary care facilities. The models leverage correlations between scheduling practice, panel size management, appointment slot grid design and access performance. Results from VA facilities are promising.

Optimization in Radiation Therapy

Sponsor: Health Applications

Sponsored Session

Chair: Jagdish Ramakrishnan, Post-doctoral Scholar, University of Wisconsin-Madison, Wisconsin Institute for Discovery, Madison, WI, 53715, United States of America, jramakrishn2@wisc.edu

1 - Spatio-temporally Optimized Radiation Therapy

Minsun Kim, University of Washington, Radiation Oncology, Seattle, WA, 98195, United States of America, mk688@uw.edu, Fatemeh Saberian, Archis Ghate

Adaptive radiotherapy utilizes mid-treatment, anatomical images to re-evaluate tumor volume to modify treatment plans accordingly. We propose a stochastic control formalism framework for spatio-temporally optimized radiotherapy, where mid-treatment functional images provide clinicians with a chance to adapt the plan to biological changes of tumors in response to radiation. Potential benefits of spatio-temporal approach over current adaptive therapy will be demonstrated by numerical simulations.

2 - Optimization Problems in Proton Therapy Treatment Planning

Gino Lim, Department Chair, Hari and Anjali Agrawal Faculty Fellow, Associate Professor, University of Houston, E206 Engineering Building 2, Houston, TX, 77204, United States of America, ginolim@uh.edu, Wenhua Cao

Radiation therapy treatment planning for cancer patients provides many challenging optimization problems. Unlike conventional photon based radiation therapies, the new intensity modulated proton therapy (IMPT) is highly sensitive to uncertainties and its optimization involves very large data sets. Therefore, we will present uncertainty incorporated models and efficient solution algorithms for choosing IMPT treatment beam angles, selecting proton energy levels, and determining intensity profiles.

3 - Simultaneous Beam Sampling and Aperture Shape Optimization for SPORT

Masoud Zarepisheh, Stanford University, Department of Radiation Oncology, Stanford, CA, United States of America, masoudzp@stanford.edu, Ruijiang Li, Yinyu Ye, Lei Xing

We build a mathematical model whose decision variables are beam angles and aperture shapes. We solve the resulting large scale optimization problem by integrating three optimization techniques: column generation, the subgradient method, and pattern search. Column generation adds the most beneficial stations (aperture shapes, beam angles, and corresponding intensities) sequentially. Then, the subgradient method and pattern search improve the selected stations locally and globally.

4 - Biological Planning for High-dose Rate (HDR) Brachytherapy and Applications to Cervical Cancer

Eva Lee, Professor & Director, Georgia Institute of Technology, Ctr for OR in Medicine & Healthcare, Atlanta, GA, 30332, United States of America, eva.lee@gatech.edu

This work is joint with Rush University. HDR treatment preserves organ functionalities. Major challenges involve determining the best seed type, their spatial configuration, and dwell time. PET imaging facilitates design of treatment that target at cancer cells. We present an advanced planning system to simultaneously optimize the radiation source while at the same time escalating dose to the PET-identified cancer pockets. Results for cervical cancer patients treated will be discussed.

Center for Systems Engineering in Health

Sponsor: Health Applications

Sponsored Session

Chair: Sean Barnes, Assistant Professor, University of Maryland, 4352 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, sbarnes@rhsmith.umd.edu

1 - A Multiobjective Optimization Technique for CRNA Staffing

Sauleh Siddiqui, Assistant Professor, Johns Hopkins University, 3400 N Charles St, Baltimore, MD, 21218, United States of America, siddiqui@jhu.edu, Robert Greenberg, Scott Levin, Claro Pio Roda

Staffing in hospital operating rooms (OR) require scheduling Certified Registered Nurse Anesthetists (CRNAs). Due to uncertainty in patient demand, creating an efficient schedule is not straightforward, and requires balancing surgical caseload, staff satisfaction, and costs. We present a multiobjective optimization technique that takes operating room patient flow data as input and creates a CRNA scheduling tool. As a case study, we implement this technique at the OR at Johns Hopkins Hospital.

2 - Outcomes-Based Emergency Department Triage

Scott Levin, Associate Professor, Johns Hopkins School of Medicine, 5801 Smith Ave, Baltimore, MD, 21209, United States of America, slevin33@jhmi.edu, Andrea Dugas, Matthew Toerper, Tom Kirsch

Our novel emergency department (ED) triage tool, HopScore, aims to support outcomes-based differentiation of patients addressing deficiencies in the current standard, Emergency Severity Index (ESI). The tool uses easily obtained patient demographic and clinical information commonly collected at triage to predict patients' risk for critical outcomes.

3 - PACER Surge Application

Matthew Toerper, Senior Software Engineer, Johns Hopkins University, 5801 Smith Avenue, Baltimore, MD, 21209, United States of America, mtoerper@jhu.edu, Gabe Kelen, Scott Levin, Lauren Sauer, Jamil Bayram, Christina Catlett

The National Center for the Study of Preparedness and Catastrophic Event Response (PACER) Surge application is a scalable, internet-based tool that allows hospital planners to simulate strategies in response to heightened population care needs during disasters. The tool determines the effects of these strategies on hospital surge capacity.

4 - Application of Supervised Machine Learning Methods to Predict Daily Hospital Discharges

Sean Barnes, Assistant Professor, University of Maryland, 4352 Van Munching Hall, College Park, MD, 20742, United States of America, sbarnes@rhsmith.umd.edu, Eric Hamrock, Matthew Toerper, Sauleh Siddiqui, Scott Levin

We apply supervised machine learning methods to predict patients likely to be discharged each day in a single hospital unit. We compare the predictive performance for logistic regression, decision trees, and ensemble learning approaches, and compare these results to clinician predictions.

Supply Chain Management VI

Contributed Session

Chair: Byeong-Yun Chang, Ajou University, San 5, Woncheon-dong, Yeongtong-gu, Suwon, Korea, Republic of, bychang@ajou.ac.kr

1 - The Impact of Supply Chain and Business Process Managements on Firm Performance

Byeong-Yun Chang, Ajou University, San 5, Woncheon-dong, Yeongtong-gu, Suwon, Korea, Republic of, bychang@ajou.ac.kr

This research is to develop an integrated framework of SCM and BPM and to test their joint impact on firms' competitive advantage as well as economic and operational performance. In doing so, this paper will be a pioneer for both researchers and practitioners by giving empirical evidence on how SCM and BPM are interrelated each other and how they contribute to firms' effort in building their competitiveness and economic achievement.

2 - Effects of Demand Information Sharing on Service Level in Supplier Collaboration

Ki-Seok Choi, Hankuk University of Foreign Studies, 81 Oedae-ro, Yongin, 449-791, Korea, Republic of, kchoi@hufs.ac.kr, Kyungsik Lee

Buyer and supplier can benefit from collaboration in which buyer shares customer demand information with supplier. Shared demand information helps supplier reduce backorders and improve service level. We analyze the impact supplier collaboration has on service level by focusing on how early demand information is shared.

3 - A Study of Factor and Measurement of Supply Chain Resilience on the Buyer's and Seller's Perspective

Xiaowei Ji, Huazhong University of Science & Technology, Luo Yu Road No. 1037, Wuhan, 730074, China, Jixw@hust.edu.cn

Through empirical research, we identify the elements of supply chain resilience, analyze their influence on the competitiveness of supply chain and the mechanism of this course.On this basis, we use empirical methods to analyze the measurement of an enterprise's supply chain resilience.

4 - Blood Distribution Game

Harshal Lowalekar, Assistant Professor, Indian Institute of Management Indore, Prabandh-Shikhar, Rau-Pithampur Road, Indore, MP, 453331, India, harshal@iimidr.ac.in, Raghu Santanam, Ajay Vinze

We present a business game which models the problem of blood distribution from a regional blood bank to hospital blood banks. The computer-based multi-player game demonstrates the effects of constrained supply and stochastic demand on the performance of various stakeholders in the supply-chain of perishables like blood.

5 - Outsourced Parts Clustering for Supplier Quality Assurance

Venkat Venkateswaran, Professor of Practice, Rensselaer Polytechnic Institute, Room 725, 275 Windsor Street, Hartford, CT, 06120, United States of America, venkav3@rpi.edu, Steven Webster, Daniel Dillon

A supplier for the aerospace industry may be responsible for several hundred complex parts of small runs each. The quality protocol at the contracting aerospace company requires that process capability for each part manufactured at the supplier be certified, audited and continually monitored. A natural way to attack this complexity is to group parts into clusters and treat them as blocks. We describe our special purpose clustering algorithm to accomplish this.

Network Flow Optimization

Sponsor: Computing Society

Sponsored Session

Chair: Martin Takac, Lehigh University, 27 Memorial Drive West, Bethlehem, PA, United States of America, martin.taki@gmail.com

1 - Moment-Based Relaxations of Optimal Power Flow Problems

Daniel Molzahn, Dow Postdoctoral Fellow, University of Michigan, 1301 Beal Avenue, Room 4234A, Ann Arbor, MI, 48109, United States of America, dan.molzahn@gmail.com, Ian Hiskens

Optimal power flow (OPF) is the key problem in operating electric power systems. A hierarchy of moment-based" convex relaxations globally solves many non-convex OPF problems for which existing relaxations fail. Comparing the feasible spaces of the low-order relaxations illustrates the capabilities of the moment relaxations. Exploiting sparsity and selectively applying the higher-order relaxation enables global solution of larger problems.

2 - Elementary Estimators for High-Dimensional Statistical Models

Pradeep Ravikumar, University of Texas at Austin, 2317 Speedway, Stop D9500, Austin, TX, 78712, United States of America, pradeepr@cs.utexas.edu, Eunho Yang, Aurelie Lozano

State of the art statistical estimators of structurally constrained high-dimensional statistical models are based on solving regularized convex programs, which are typically non-smooth non-strongly convex programs. An ongoing but strong line of research has focused on developing efficient and scalable optimization methods to solve these programs. Here, we address this scaling issue at the source, and develop *closed-form statistical estimators*, that yet come with strong statistical guarantees.

Strategy/Strategic Planning I

Contributed Session

Chair: Jiulin Teng, HEC Paris, 1 Rue de la Liberation, Dept of Strategy and Business Policy, Jouy-en-Josas, 78350, France, jiulin.teng@hec.edu

1 - Empirical Study on the Relationships between Manufacturing Strategy and Competitive Performance

James Ang, Associate Professor of Decision Sciences, National University of Singapore, Mochtar Riady Building, BIZ 1, 15 Kent Ridge Drive, Singapore, 119245, Singapore, bizangsk@nus.edu.sg, Tomoaki Shimada, Eugene Lim, Ser-Aik Quek

We conducted non-linear regression analysis on the relationships between manufacturing strategy and competitive performance using data from the High Performance Manufacturing Project. We showed that data on established and emerging manufacturing countries should not be mixed for the purpose of data analysis, and found different characteristics in established and emerging manufacturing countries.

2 - Analysis of Prefabricated Urban Housing Constructions on Freight Transport Systems

Panagiotis Angeloudis, Lecturer, Imperial College London, Department of Civil & Environmental Eng, South Kensington Campus, London, SW7 2AZ, United Kingdom, p.angeloudis@imperial.ac.uk, Bani Anvari, Washington Y. Ochieng

Prefabricated buildings have become the choice of many construction teams as they offer time, cost, quality and environmental benefits compared to traditional on-site construction. We have explored the effects of prefabricated urban constructions on freight transport systems and identified cost-efficient logistics strategies using genetic algorithm. Our results will be beneficial for the Construction Method Selection Model which advises to what extent building components should be prefabricated.

3 - Contractual Negotiation and Ex Ante Economizing

Jiulin Teng, HEC Paris, 1 rue de la Liberation, Dept of Strategy and Business Policy, Jouy-en-Josas, 78350, France, jiulin.teng@hec.edu

We enrich the study of contracts with the ex ante cost aspect. Using a bargaining theoretic model with strategic reaction, we provide a view of contractual negotiation as a means to economizing bargaining cost, information cost, and monitoring cost. We thereby extend the lens of contract beyond the dichotomy of ex ante incentive alignment and ex post economizing. Further, we show ex ante cost aspect is both theoretical and practical antecedents of ex post cost and ex ante incentive aspects.

4 - Myopia in Strategy Making: Evidence from a Laboratory Study

Daniella Laureiro-Martinez, Senior Fellow, ETH Zurich, Weinbergstrasse 56-58, Zurich, Pl, 8092, Switzerland, dlaureiro@ethz.ch, Stefano Brusoni, Maurizio Zollo, Amulya Tata

This study explains differences in decision making performance on the basis of the choice patterns implemented by individuals while playing a four armed bandit task. We develop a procedure to identify and cluster strategies. We observe the emergence of strategies which differ in terms of content, myopia and performance. Our results extend current research by operationalizing the concept of myopia, and showing that the different levels of myopia in choice strategies reliably predict performance.

5 - Alignment between Business Strategy and Operations: Implications for Managerial Decisions

Kalinga Jagoda, Associate Professor, Mount Royal University, 4825 Mount Royal Gate SW, Calgary, T3E 7N9, Canada, kjagoda@mtroyal.ca, Senevi Kiridena

The current research on operations strategy has almost exclusively focused on businesses operating in the manufacturing sector. Using the empirical data collected from more than 400 firms in the Canadian oil and gas industry, this paper examines the linkages between the alternative forms operations strategy and organizational performance.

Behavioral Operations 2

Contributed Session

Chair: Nico Laya, University of Auckland Business School, Private Bag 92019, Auckland, 1142, New Zealand, nhio001@aucklanduni.ac.nz

1 - Using the Newsvendor Game as a New Research Environment for Behavioral OM and Marketing

Tong Wu, University of Rochester, 201 Conant Road, Apt B, Rochester, NY, 14623, United States of America, tong.wu@simon.rochester.edu, Abraham Seidmann

The newsvendor problem represents a fundamental question in supply chain management. There is a growing body of empirical research that points at the various cognitive biases that misdirect managers under uncertainty. In this talk, we will discuss the research and teaching role of a new experimental system called the Newsvendor game, and present some preliminary research results of those newsvendor games under the tournament competitive environment. Significantly gender difference is observed.

2 - Team Decision-making and Individual Learning in the Newsvendor Problem

Valery Pavlov, University of Auckland Business School, Private Bag 92019, Auckland, 1142, New Zealand, v.pavlov@auckland.ac.nz, Nico Laya

The study investigates group decision-making in the Newsvendor problem using a laboratory experiment. The key observations are (i) that flat teams (as opposed to hierarchical) promote better individual performance at the post-team stage, and (ii) exposure to working with an expert on team may not remove decision biases of non-experts but is likely to replace them with other biases.

3 - Behavioral Study of Supplier Switching Decision Making

Hyejeong Gwon, PhD Candidate, Korea University, 408 LG-Posco Hall, KUBS, 145 Anam-ro Seongbuk-ku, Seoul, Korea, Republic of, 11ku11@korea.ac.kr, Daeki Kim

According to psychological theories, humans use heuristics rather than logical thinking especially when the decision is complicated. The firm level's decision maker is a human being and the decision is usually associated with plenty of factors. This study proposes a behavioral model of supplier switching decision making. Regulatory focus theory is implied to reflect the effect of individual characteristics on decision making process.

4 - Imprecise Skill Level Affecting Dynamic Operator Assignment

Corey Kiassat, Assistant Professor of Industrial Engineering, Quinnipiac University, 275 Mt. Carmel Avenue, Hamden, CT, 06518, United States of America, corey.kiassat@quinnipiac.edu, Nima Safaei

Our novel methodology measures skill level in a dynamic operator assignment problem under an imprecise environment. Operator skill is assessed by an expert whose belief reflects environmental, personal, and social effects. Expert belief is characterized using Accuracy (skill level with highest degree of belief) and Confidence (the spread of belief degrees on skill levels around accuracy). Fuzzy logic's membership function is used to model confidence and accuracy as dimensions of expert knowledge

1 - How Good Are Sparse Cutting-Planes?

Marco Molinaro, Georgia Tech, Ferst Drive, Atlanta, GA, United States of America, marco.molinaro@isye.gatech.edu, Qianyi Wang, Santanu Dey

Sparse cutting-planes are often the ones used in MIP solving. But how well do they approximate the IP hull? We abstract this question as the approximation of arbitrary polytopes (e.g. the IP hull) by sparse valid inequalities. We will discuss recent results, such as matching upper/lower bounds on the approximation error, and an analysis showing that for a class of hard packing IPs, sparse cutting-planes do not approximate the integer hull well.

2 - Recent Developments on the Oracle Complexity of Convex Optimization

Cristobal Guzman, Georgia Tech, 755 Ferst Drive NW, Atlanta, United States of America, cguzman@gatech.edu, Sebastian Pokutta, Gabor Braun, Arkadi Nemirovski

We study lower bounds for oracle-based algorithms in convex optimization. First, we prove new lower bounds for smooth optimization over non-Euclidean domains, deriving nearly-optimal lower bounds for ell^p balls, where $p\in[1,\infty]$. Second, we extend oracle complexity to the distributional setting, where the distribution of instances is part of the algorithm input. This model can be analyzed by information-theoretic arguments, unifying known lower bounds for the nonsmooth case.

3 - Reverse Split Rank

Alberto Del Pia, Assistant Professor, University of Wisconsin-Madison, Madison, WI, United States of America, delpia@wisc.edu, Michele Conforti, Marco Di Summa, Yuri Faenza

The reverse split rank" of an integral polyhedron P is defined as the supremum of the split ranks of all rational polyhedra whose integer hull is P. Already in R^3 there exist polyhedra with infinite reverse split rank. We give a geometric characterization of the integral polyhedra in R^n with infinite reverse split rank.

4 - Submodular Knapsack Polytope

Avinash Bhardwaj, University of California at Berkeley, 450/60 Sutardja Dai Hall, University of California Berkeley, Berkeley, CA, 94720-1758, United States of America, avinash.bhardwaj@berkeley.edu, Alper Atamturk

We define new inequalities for the level set of of an arbitrary submodular function. This work generalizes earlier studies on monotone submodular functions. Application to stochastic network design with correlations is provided.

Chair: Yongpei Guan, University of Florida, Weil 413, Gainesville, FL, 32611, United States of America, guan@ise.ufl.edu

1 - Data-Driven Risk-Averse Two-Stage Stochastic Program

Chaoyue Zhao, University of Florida, Weil 413, Gainesville, FL, United States of Americacherryzhao09@ufl.edu, Yongpei Guan

In this project, we investigate the data-driven risk-averse two-stage stochastic program with a new class of probability metrics. We reformulate the problem as a traditional two-stage robust optimization problem for the discrete distribution case and develop a sampling approach for the continuous distribution case. We prove that the risk-averse problem converges to the risk-neutral problem with an exponential rate.

2 - A Stochastic Trust Region Algorithm for Mixed Logit and Latent Class Logit Type Problems

Anton Kleywegt, Georgia Institute of Technology, School of Industrial and Systems Enginee, Atlanta, GA, 30332-0205, United States of America, anton@isye.gatech.edu

We consider mixed logit and latent class logit type problems. We propose a trust region type algorithm that controls sampling from the set of observations as well as the sample size for each observation. We provide convergence results, and demonstrate the algorithm with numerical results for the estimation of mixed logit and latent class logit discrete choice models, using airline data.

3 - Two-stage Portfolio Optimization with Higher-order Conditional Measures of Risk

Sitki Gulten, Rutgers University, 1 Washington Park, Newark, NJ, 07102, United States of America, sgulten@business.rutgers.edu, Andrzej Ruszczynski

We describe a study of novel risk modeling and optimization techniques to daily portfolio management. First, we develop specialized methods for scenario generation and scenario tree construction. Second, we construct a two-stage stochastic program with conditional measures of risk, which is used to re-balance the portfolio on a rolling horizon basis, transaction costs included in the model. Third, we present an extensive simulation study with different risk measures on real world data.

4 - Recent Progress on Stochastic Unit Commitment Problems

Yongpei Guan, University of Florida, Weil 413, Gainesville, FL, 32611, United States of America, guan@ise.ufl.edu

In this talk, we review the research progress on recent studies for stochastic unit commitment problems. We discuss the motivation, algorithm developments, and computational experiment results.

1 - A Two-stage Stochastic PDE-constrained Optimization Model for Control of Smart Mechanical Structures

Dmitry Chernikov, The University of Iowa, 418 Brown St. Apt 19, Iowa City, IA, 52245, United States of America, dmitry-chernikov@uiowa.edu, Pavlo Krokhmal, Olesya Zhupanska

We consider the problem of optimization of "smart", or "multifunctional" mechanical structures under uncertainty. In particular, a PDE-constrained optimization model for vibration control of a composite plate due to an impact load through an application of electromagnetic field is presented. To account for uncertainty in the impact load, a two-stage stochastic PDE-constrained programming problem is formulated. A solution method is presented, and the results of computational study are discussed.

2 - Doubly Stochastic Sequential Assignment Problem

Khatibi Arash, University of Illinois, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, khatibi2@illinois.edu, Golshid Baharian, Sheldon Jacobson

This paper introduces the Doubly Stochastic Sequential Assignment Problem (DSSAP), an extension of the Sequential Stochastic Assignment Problem where sequentially arriving tasks are assigned to workers with random success rates. The best secretary problem is used to find the optimal policy for the DSSAP with IID random success rates. An optimal assignment algorithm is presented that achieves the maximum total expected reward for the DSSAP with any given success rate distribution.

Chair: Sangho Shim, Research Associate, Kellogg School of Management, 2001 Sheridan Road, Suite 548, Evanston, IL, 60208, United States of America, shim@kellogg.northwestern.edu

1 - Steiner Tree Inequalities for Clustering Problems

Kangbok Lee, Assistant Professor, York College, CUNY, 94-20 Guy Brewer Bldv., Jamaica, NY, 11451, United States of America, klee5@york.cuny.edu, Sangho Shim, Sunil Chopra

Inequalities from node minimum Steiner trees are strong valid inequalities for constrained partition into connected components. They are added to Chopra-Rao system for the partition problem which is completely described in tree case by Lee, Chopra and Shim (2013) and speed up branch-and-cut for constrained tree partitioning into sub-trees.

2 - Tabu Search for Solving the Black-and-White Travelling Salesman Problem

Haitao Li, Associate Professor, College of Business Administration, 229 ESH, One University Blvd, St. Louis, MO, 63121-4400, United States of America, lihait@umsl.edu, Bahram Alidaee

The black-and-white traveling salesman problem (BWTSP) is an extension to the well-known TSP and has various applications in logistics and telecommunication networks design. We develop several tabu search (TS) heuristics for solving the BWTSP. Extensive computational experiment on both benchmark and randomly generated instances shows effectiveness and efficiency of our algorithms.

3 - New Heuristic Approaches for Parts Clustering and Layout Design

Mohammad Moshref-Javadi, Purdue University, 315 N. Grant St., Purdue University, West Lafayette, IN, 47907, United States of America, moshref@purdue.edu, Mark Lehto

This paper considers minimization of transportation in warehouses. To achieve this, parts which are more frequently ordered together are grouped together. Then family groups are located in the layout. In addition, interactions between parts in different groups are also taken into account. We used Principal Component Analysis to group parts into part families. Also, several heuristics were used to locate part families. The results indicate 40% reduction in transportation.

4 - Large Scale Mixed Integer Programming for Feature Selection

Younghoon Kim, PhD Student, Korea University, Anam-Dong, Seongbuk-Gu, Seoul 136-713, Seoul, Korea, Republic of, younghoon.kim11@gmail.com, Sangho Shim, Seoung Bum Kim

We propose a feature selection algorithm based on a large-scale mixed integer programming. The proposed method minimizes the least square error subject to the number of selected feature being equal to a constant integer specified by users. Consequently, the number of features selected can be equal to the constant value that users specified. We will present the formulation and algorithm to solve this model.

1 - A Traveling Salesman Problem with Budget and Time Constraints

Elham Kookhahi, Wichita State University, Wichita, KS, 67220, United States of America, exkookhahi@wichita.edu, M Bayram Yildirim

In this paper, a mathematical model is presented for a travelling salesman problem in which a sub tour of a set of cities can be visited to maximize the number of customers that can be served with a limited budget and time. The problem is solved using a genetic algorithm and numerical results are presented.

2 - An Iterative Algorithm for Two-stage Time Minimization Assignment Problem

Kalpana Dahiya, Senior Assistant Professor, Panjab University, UIET, Chandigarh, 160014, India, kalpanas@pu.ac.in

An iterative algorithm has been proposed to solve a two-stage bottleneck assignment problem, in which jobs are performed in two-stages. The objective is to find that set of m agents performing the primary jobs in Stage-I for which the sum of the overall completion times of jobs in Stage-I and the corresponding optimal completion time of the secondary jobs in Stage-II by the remaining (n-m) agents is the minimum.

3 - Benders Decomposition for Coils Allocation and Shuffling Problem

Yuan Yuan, The Logistics Institute, Northeastern University of China, NO. 3-11, Wenhua Road, Heping District, Shenyang, China, yyuan.tli@gmail.com, Lixin Tang

We propose a hybrid approach combining Benders decomposition and cut generation to solve a coil allocation and shuffling problem. The problem is formulated as a 0-1 linear model. In the approach Benders decomposition acts as the main frame and employs cut generation to deal with its integer subproblem. Numerical experiments show the competitiveness of the approach.

4 - Optimization Models and Methods for University Course Timetabling

Antony Phillips, Department of Engineering Science, University of Auckland, Auckland, New Zealand, aphi038@aucklanduni.ac.nz, Cameron Walker, Matthias Ehrgott, David Ryan

University course timetabling is a large resource allocation problem, in which both times and rooms are determined for each class meeting. We present a novel approach for course timetabling based on mathematical optimisation. By decomposing the problem into a timetable generation, followed by a room assignment, integer programming becomes viable even for large practical problems. Computational results on data from the University of Auckland will be presented.

Game Theory 2

Contributed Session

Chair: Nelson Uhan, Mathematics Department, United States Naval Academy, Chauvenet Hall, Annapolis, MD, 21402, United States of America, uhan@usna.edu

1 - Impacts of Human Behaviors' Diffusion in an Epidemic Model Based on Spatial Game

Songnian Zhao, PhD Candidate, Kansas State University, 1600 Hillcrest Drive APT 4, Manhattan, KS, 66502, United States of America, songnian@ksu.edu, Yan Kuang, David Ben-Arieh, Chih-Hang Wu

In this paper, a new behavior-based SIR model using spatial evolutionary game is constructed to predict the spread of infectious disease. Information transmission, contact structure and changes of human behaviors are emphasized in modeling the dynamics of infectious diseases,and people make decisions based on the information available to them during the game, by balancing their own benefits and costs. Equilibrium analysis and numerical simulation results will be shown in the end.

2 - The Strategic Effect of In-Store Medium under Product Line Competition

Haruki Kobayashi, Keio University, 3-14-1 Hiyoshi Kohokuku, Yokohama, Japan, 151e0423@gmail.com, Nobuo Matsubayashi

Manufacturer's competitive actions of enhancing their product lines result in increasing consumers' burden of selecting products. In particular, communicating to consumers about the product differences from the rival's products is a harder task for manufacturers. We consider a retailer's service model of in-store advertising, where the retailer neutrality provides product information to consumers for free, whereas he charges manufacturers. We explore the optimal tariff design for this service.

3 - A Game-theoretic Procedure for Bridge Construction Cost Allocation

Saurav Kumar Dubey, PhD Student-Department of Industrial and Systems Engineering, University of Tennessee at Knoxville, 1615 Laurel Avenue, Knoxville, TN, 37916, United States of America, skumardu@utk.edu, Dongju Lee, Alberto Garcia-Diaz

The proposed method integrates traffic capacity and load requirements to allocate bridge costs among vehicle classes, using two game-theoretic criteria known as Aumann-Shapley value and Shapley value, and an incremental allocation procedure.Players are defined as vehicle classes, axle load applications, or lanes.The gross-weight based incremental procedure determines marginal costs.

4 - Dynamic Allocations for Cooperative Games under Uncertainty with Risk-averse Players

Nelson Uhan, Mathematics Department, United States Naval Academy, Chauvenet Hall, Annapolis, MD, 21402, United States of America, uhan@usna.edu, Alejandro Toriello

We consider a class of cooperative games in which the costs of cooperation are uncertain and evolve over time, and the players are risk averse. These games generalize the classic linear production game, and as a result, model a variety of cooperative settings. We give sufficient conditions for the existence of an allocation in the strong sequential core - the set of allocations that distribute costs as they are incurred and are stable against coalitional defections at any point in time.

Chair: Gene Coffman, Technical Leader, Ford Motor Company, Manufacturing Development Center, 6100 Mercury Drive, Dearborn, MI, 48126, United States of America, gcoffman@ford.com

1 - The New Approach to Diet Problem

Fariborz Partovi, Professor, Drexel University, Gerri Lebow Hall. Room 726, 3220 Market Street, Philadelphia, PA, 19104, United States of America, Partovi@drexel.edu

Over the years many researchers have contributed to updating, extension, and new methodologies for solving the diet problem. However the problem with the classical models is based on lack of proper presentation of food preferences. For many people, especially when they are eating outside their home, the taste of the food may be as important as the nutrition values. In this paper we propose a new method for designing foods that are more desirable to customers and cost less to the producers.

2 - Fuzzification of the Special Simplex Method for the Transportation Problem

Gene Coffman, Technical Leader, Ford Motor Company, Manufacturing Development Center, 6100 Mercury Drive, Dearborn, MI, 48126, United States of America, gcoffman@ford.com, Stephany Coffman-Wolph

The framework for the fuzzification of algorithms can be applied to a wide variety of problems including the widely recognized transportation problem from the field of Linear Programming. This deterministic transportation problem algorithm will undergo the fuzzification process to become a fuzzy algorithm (i.e., fuzzified transportation problem). It will be demonstrated that an optimal solution to the original problem is contained within the alternative optima of the fuzzified problem.

3 - Polyhedral Results for 2-sided Stable Matchings and Ordinal Transportation

Pavlos Eirinakis, Athens University of Economics and Business, Patission 76, Athens, 10434, Greece, peir@aueb.gr, Ioannis Mourtos, Dimitrios Magos

We establish the dimension of the many-to-many stable matching (MM) polytope and its minimal equation system and facets. We utilize this analysis to provide a minimal description of the Stable Admissions (SA) polytope and the polyhedral correspondence of the known MM and SA constraints. Further, we derive an upper and a lower bound for the diameter of the Stable Marriage polytope. Finally, we provide an implicit linear representation for the ordinal transportation problem.

4 - Accounting for Risk and Pillar Recovery in MILP Room and Pillar Production Sequencing Models

Angelina Anani, Missouri University of Science and Technology, 407 E12th Street, Rolla, MO, 65401, United States of America, akakc2@mail.mst.edu, Kwame Awuah-Offei

The goal of this work is to formulate a mixed integer linear programming (MILP) model of room and pillar production sequencing that incorporates pillar recovery and project risks. The model maximizes the project's net present value and minimizing project risks while meeting all constraints.The model is solved with CPLEX using the MATLAB API. The model has been validated with a realistic mine sequencing problem. Future work will use branch-and-bound solution algorithms to solve this problem.

5 - Analytically Solving a Customer Scheduling Problem with Customer Mix Restrictions

Ridvan Gedik, Visiting Assistant Professor, Mississippi State University, 260 McCain Hall, Mississippi State, MS, 39762, United States of America, gedik@ise.msstate.edu, Chase Rainwater, Edwin Romeijn

This research examines the impact of incorporating long term customer mix preferences and operational capacity constraints on customer scheduling decisions in a facility. We propose an algorithm which generates efficient frontiers by utilizing the key concepts of post-optimality sensitivity analysis and parametric right hand side perturbation principles.

Finance Theory and Empirics

Contributed Session

Chair: Fernando Moreira, Assistant Professor, University of Edinburgh, 29 Buccleuch Place, Edinburgh, United Kingdom, fernando.moreira@ed.ac.uk

1 - SEO Returns and the Japanese Law Reforms

Yasunori Katsurayama, Waseda University, 1-6-1 Nishi-Waseda, shinjuku-ku, Tokyo, Japan, yasunori@cf.socs.waseda.ac.jp, Keiji Abe

After 2000, book building became a familiar pricing tool for the SEO in the Japanese Market. The SEO price is determined in two weeks after the SEO announcement. Investors might be able to make profit by selling short the SEO shares in this period. As they can close their short position, after SEO, using SEO stock whose price was got cheaper by short selling. Closing of the short position using the SEO shares was prohibited in 2011. We report the CAR around the law reforms.

2 - Regulatory Capital Charges for Too-connected-to-fail Institutions: A Copula Approach

Fernando Moreira, Assistant Professor, University of Edinburgh, 29 Buccleuch Place, Edinburgh, United Kingdom, fernando.moreira@ed.ac.uk

We propose two copula-based approaches to support the calculation of regulatory capital concerning systemic risk. The main advantage of our methods over some traditional approaches is the possibility of capturing potential asymmetric and/or tail dependence across the performance of institutions. We illustrate the application of our models in the case of the largest UK financial institutions (in terms of assets) by using daily data from 2008 to 2012.

3 - Optimal Stopping Of A Credit Lending Process With Multiple Disorders

Xiaoxuan Zhang, JP Morgan, 277 Park Ave, New York, NY, 10172, United States of America, zhangxiaoxuan@live.com

We study an optimal stopping time problem that arises from the risk management of a credit lending process. The loss is driven by the borrower's credit status where multiple disorder is possible. The goal of the lender is to find a stopping strategy to maximize the expected profit, which are at risk of no payment recovery when the borrower defaults. We show that optimal stopping times forms a threshold type policy. Application in responsive energy load scheduling is also discussed.

4 - Market Adoption of Reverse Factoring

Matthew Reindorp, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, M.J.Reindorp@tue.nl, Nico Dellaert, Umberto Dello Iacono

Existing research on Supply Chain Finance (SCF) arrangements such as reverse factoring almost exclusively considers a static context, where market factors take fixed, known values. Our study links the direct benefits of reverse factoring to dynamic, interacting market factors: competition, interest rates, receivables volumes, and firms' working capital goals. We utilize System Dynamics to show that a comprehensive assessment of reverse factoring cannot neglect the evolutionary perspective.

5 - Binomial and Multinomial Tree Monte Carlo Methods for Pricing Options on Multiple Assets

Dirk Sierag, CWI, Science Park 123, Amsterdam, Netherlands, D.D.Sierag@cwi.nl, Bernard Hanzon

We propose an effective method for pricing multi-asset options by combining the efficiency of Monte Carlo simulation with the accuracy of multinomial trees. The latter are generalised from binomial trees in two directions: 1) the structure of the tree, from Pascal's triangle to Pascal's simplex; 2) the probability vector of the successor-nodes, this is a free parameter. We evaluate accurate multi-asset option prices by generating random probability vectors and corresponding multinomial trees.

1 - Lifecycle Consumption and Investment with Illiquid Housing and Voluntary Retirement

Min Dai, National University of Singapore, Singapore, 117546, Singapore, matdm@nus.edu.sg, Hong Liu, Yingshan Chen

We consider the joint decisions of housing, stock investment, daily consumption, and voluntary retirement. We show that the investor is more aggressive in investing in both stock and house before retirement than after retirement. In the presence of shortsale constraints for stocks, our model can help explain the well known stock market nonparticipation puzzle. Furthermore our model predicts that stock investment, daily consumption rate and housing choice all jump at retirement date.

2 - The Pricing of European-type Options under Time-inhomogeneous Diffusion Processes

Yingda Song, National University of Singapore, Centre for Quantitative Finance, Block S16, 6 Science Drive 2, Singapore, 117546, Singapore, matsy@nus.edu.sg

This paper proposes a series expansion formula for European-type options under time-inhomogeneous diffusion processes. Its convergence is proved rigorously under some regularity conditions. Numerical results demonstrate that our series representation method is accurate and efficient.

3 - Optimal VWAP Tracking

Daniel Mitchell, Assistant Professor, Singapore University of Technology and Design, 20 Dover Drive, Singapore, Singapore, dan.mitchell@utexas.edu, Jedrzej Bialkowski, Stathis Tompaidis

We consider the problem of finding a strategy that tracks the volume weighted average price (VWAP) of a stock, a key measure of execution quality for large orders used by institutional investors. We obtain the optimal, dynamic, VWAP tracking strategy in closed form in a model with general price and volume dynamics. We build a model of intraday volume using the Trade and Quote dataset to empirically test the strategy.

4 - Central Bank's Intervention of Interest Rates: An Impulse Control Approach

Haolin Feng, Assistant Professor, Lingnan College, Sun Yat-sen University, 135 Xin Gang Xi Road, Sun Yat-sen University, Guangzhou, 510275, China, fenghaol@mail.sysu.edu.cn, Daniel Mitchell, Kumar Muthuraman

We model the central bank's intervention of short rate as a stochastic control problem on a general class of processes. We consider fixed as well as variable intervention costs, and we develop an algorithm to numerically solve the resulted impulse control problem. We then study the effect of the intervention on longer term interest rate securities. The method developed here can be applied to a very wide range of impulse control problems beyond the realm of interest rate models.

1 - An Improved Lagrangian Relaxation Approach for Nonconvex Two-stage Stochastic Programs with Recourse

Paul Barton, Lammot du Pont Professor of Chemical Engineering, Massachusetts Institute of Technology, 77 Massachusetts Ave, 66-470b, Cambridge, MA, 02139, United States of America, pib@mit.edu, Rohit Kannan

In this work, an improved Lagrangian relaxation approach, which dualizes the non-anticipativity constraints of only the continuous first-stage variables and solves the corresponding Lagrangian dual problems using nonconvex generalized Benders decomposition in a branch-and-bound framework, is proposed. An efficient implementation is outlined, and the effectiveness of the proposed decomposition approach is demonstrated through case studies.

2 - MINLP Problems in Inference of Chemical Reaction Networks

Emilio Carrizosa, Universidad de Sevilla, F. Matem-ticas, Avd. Reina Mercedes s/n, Sevilla, 41012, Spain, ecarrizosa@us.es, M Asuncion Jimenez-Cordero, Bogl·rka G Töth, Rafael Blanquero

We address the problem of finding the stoichiometric matrix and the reaction rates that best fit to the empirical concentrations given. The coefficients of the matrix are integer numbers, and the reaction rates are non negative continuous values, so the proposed optimization program is a MINLP with linear constraints, whose objective function is nonconvex and contains an ordinary differential equation term.

3 - Tight Relaxations of Non-Convex Quadratic Programs in Robust Sensitivity Analysis

Guanglin Xu, PhD Candidate, University of Iowa, S221 John Pappajohn Business Building, Iowa CIty, IA, 52242-1994, United States of America, guanglin-xu@uiowa.edu, Samuel Burer

Abstract: We study robust sensitivity analysis in LP problems where general perturbations in parameters including objective coefficients, right-hand sides, and constraint matrix entries are considered. This generality leads to non-convex quadratic programs (QPs) that are NP-hard in general. We investigate tight convex relaxations of these QPs and present preliminary computational results.

1 - Balancing Assembly Lines with Material Handling Robots

Hakan Gultekin, TOBB University of Economics and Technology, Sogutozu Cad. No:43, Sogutozu, Ankara, Turkey, hgultekin@etu.edu.tr, Burak Can Yildiz

An assembly line in which the loading/unloading of the machines and the material transportation are carried out by a single robot is considered. Each part requires a number of operations to be processed on the machines. The problem is to determine the assignment of the operations to the machines, and also to determine the sequence of robot moves that jointly minimize the cycle time. An integer programming formulation and a heuristic are developed. The effectiveness of the heuristic is tested.

2 - Significant Influential Factors in Flow Shop Research

Milton Smith, Professor, Texas Tech University, Dept. of Industrial Engineering, Mail Stop 3061, Lubbock, TX, 79409, United States of America, milton.smith@ttu.edu, Shrikant Panwalkar, Christos Koulamas

Flow shop sequencing research has been affected by several developments; no review of developments causing major impacts on research exists. NP theory, computing technology, optimizing and heuristic procedures are examined. We look at our discussion from a paper on lessons of flow shop scheduling research.

3 - Assignment and Sequencing of Multipass Assembly & Test Operations in Semiconductor Manufacturing

Zhufeng Gao, The University of Texas at Austin, 1 University Station C2200, Austin, TX, 78712-0292, United States of America, gaozhufeng@gmail.com, Jonathan Bard

We present a three-phase methodology for assigning and sequencing assembly and test operations for semiconductors. The facility in which these operations are performed is similar to a reentrant flow shop. The chips follow a specific route through the facility where each step in the route is referred to as a pass. In phase 1 lots are assigned to machines; in phase 2 they are sequenced; in phase 3 changeovers are performed. The methodology was tested using data provide by a leading manufacturer.

4 - Integrated Production and Distribution Scheduling for Fresh Agri-food Supply Chain in China

Mu Du, Dalian University of Technology, Institute of Systems Engineering, School of Management, Dalian, 116023, China, dumu.dlut@gmail.com, Xiangpei Hu, Nan Kong

Farm-to-home online retail is a fast-growing supply chain mode for fresh produce in China. Makespan, one of the most important metrics in such a make-to-order process, is highly sensitive to the production and distribution decisions. We introduce an integrated production and distribution scheduling model that minimizes the total make-span. We propose a heuristic method to solving the problem efficiently. We report a case study based on real-world business practice in China.

5 - Randomized On-line Algorithms for Throughput Maximization with Advance Informat

Ishwar Murthy, Professor, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore, 560076, India, ishwar@iimb.ernet.in, Sumit Sarkar

We consider the problem of equal length jobs that arrive at random. Further, the scheduler has advance knowledge of all jobs that will arrive over a finite horizon Ta, but no information beyond. We first present lower bounds on the competitive ratio of any randomized on-line algorithm as a function of Ta. We then present a randomized on-line algorithm that matches the lower bound.

1 - Sequential Exploration with Geological Dependencies and Uncertainty in Oil Prices

Babak Jafarizadeh, Statoil, Forusbeen 50, Stavanger, Ro, 4034, Norway, bajaf@statoil.com

Oil & gas prospects in vicinity are likely to share geologic features. Using these relationships, an optimal sequential drilling program can be devised. Because It takes up to a year to interpret the outcomes of a well, the variations in the forward curve may change the economics of the upcoming wells. We introduce a framework for evaluating sequential exploration strategies where prospects are geologically dependent and the uncertainty in prices is described as a meanñreverting process.

2 - Resolving Expected Utility Paradoxes with a Moving Target Partial Moments Model

Mark Schneider, University of Connecticut, 2100 Hillside Road #1041, Storrs, CT, 06269, United States of America, mark.schneider@business.uconn.edu, Robert Day, Robert Garfinkel

A model of skewness preference relative to an endogenous target is shown to explain the Allais paradoxes, favorite-longshot bias, and fourfold pattern of risk attitudes without requiring nonlinear probability transformations. The maximin payoff is shown to be a simple and natural specification for the target return in a choice set. An implication of the model is that the decision maker is risk-seeking toward upside risk and risk-averse to downside risk, relative to the target.

3 - Developing a Decision Support Tool for Evaluating Partnerships in Forest Products Value Chains

Mehdi Piltan, PhD Candidate, University of British Columbia, Department of Wood Science, Main Mall Univ, Vancouver, BC, V6T1Z4, Canada, mehdi.piltan@alumni.ubc.ca, Taraneh Sowlati

In this study we investigated the correlation between companies' characteristics and their partnering practices (types and drivers) in the context of forest product industry in Canada. Then we studied the factors contributing to the successful partnership using regression. In the second phase, we focused on one partnership to evaluate the success factors and the performance of the partnership using Analytical Network Process and Interpretive Structuring Modeling.

4 - Zero-Inflated Transformation Hazard Modeling for Corporate Bankruptcy Prediction

Shaonan Tian, Assistant Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States of America, Aidong Ding, Yan Yu

A main challenge for modeling corporate bankruptcy prediction is the so-called "excess-zeros", that is, the number of defaults is extremely small comparing to the number of non-defaults. We propose to introduce a zero-inflated transformation hazard modeling to predict corporate default. In particular, we propose to build a mixture model framework with certain likelihood that a firm will almost surely stay at the non-bankruptcy state but otherwise follow the hazard-model framework.

Algorithms on Graphs and Trees

Sponsor: Applied Probability Society

Sponsored Session

Chair: Mariana Olvera, Columbia University, 500 W 120th Street, Suite 306, New York, NY, 10027, United States of America, molvera@ieor.columbia.edu

1 - Quick Detection of High-degree Entities in Large Directed Networks

Nelly Litvak, Associate Professor, University of Twente, PO Box 217, Enschede, 7500AE, Netherlands, N.Litvak@utwente.nl, Konstantin Avrachenkov, Liudmila Ostroumova

We suggest an efficient randomized algorithm for quick detection of high-degree entities in large online networks. Practical importance is attested by the many companies that maintain networks' statistics. Our algorithm significantly outperforms existing methods. For instance, we find the top-100 most followed users in Twitter with 92% precision using only one thousand API requests. We derive predictions for the algorithm's performance and show that its complexity is sublinear in network size.

2 - Stability of the Stochastic Matching Model

Pascal Moyal, Associate Professor, UTC, LMAC - Rue Roger Couttolenc, CS 60319, Compiégne, 60203, France, pascal.moyal@utc.fr, Jean Mairesse

We introduce what we call the 'stochastic matching model': items arrive one by one in a buffer and depart from it as soon as possible, by pairs. There is a finite set V of classes of items, and the allowed matchings by pairs depend on the classes, according to a matching graph on V. We investigate the stability of the underlying Markov chain. We show in particular that the model may be stable if and only if the matching graph is non-bipartite.

3 - Queues with Synchronization

Mariana Olvera, Columbia University, 500 W 120th Street, Suite 306, New York, NY, 10027, United States of America, molvera@ieor.columbia.edu

We study a queueing network with synchronization requirements such as those found in cloud computing implementations. When the number of servers is large, we show that the distribution of the waiting time of a job can be approximated by the solution to a branching stochastic fixed point equation. This solution can be analyzed via weighted branching processes.

4 - Ranking Algorithms on the Directed Configuration Model

Ningyuan Chen, Columbia University, 321 S. W. Mudd Building, 500 W. 120th Street, New York, NY, 100275811, United States of America, nc2462@columbia.edu

We study a family of generalized PageRank algorithms on the directed configuration model with prescribed degree distributions. We show that as the number of nodes in the graph goes to infinity, the rank of a randomly chosen node converges in distribution to the solution of a stochastic fixed point equation whose asymptotic behavior is explicit. The main tool in our analysis is a coupling of the graph with a weighted branching process whose growth is determined by the in-degree distribution.

Performance Evaluation and Optimal Policies

Sponsor: Applied Probability Society

Sponsored Session

Chair: Ananth Krishnamurthy, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, ananth@engr.wisc.edu

1 - On the Inter-departure, Inter-start, and Cycle Time Distribution of Closed Queueing Networks

Svenja Lagershausen, Dr., Leibniz Universitaet Hannover, Koenigsworther Platz 1, Hannover, 30167, Germany, svenja.lagershausen@prod.uni-hannover.de, Baris Tan

We present a method to determine the exact inter-departure, inter-start and cycle time of closed queueing networks that can be modeled as Continuous-Time Markov Chains with finite state space. The method is based on extending the state space to determine the transitions that lead to a departure or an arrival of a part on a station using a first passage time analysis. We consider closed-loop production lines with phase-type service time distributions and finite buffers.

2 - Optimal Service Rate & Servers in Closed Finite Queueing Networks

James MacGregor Smith, Professor, University of Massachusetts, 874 North Pleasant Street, Amherst, MA, 01002, United States of America, jmsmith@ecs.umass.edu

Many manufacturing and service systems service rates & servers require care in determining their optimal values. Because of blocking in closed finite queueing systems, this service rate & server allocation issue is a challenging nonlinear optimization problem. A new decomposition method together with a nonlinear sequential quadratic optimization algorithm is demonstrated for solving this problem in series, merge, and split topologies.

3 - Optimal Purification Strategies Based on Quality-Yield Tradeoffs in Biomanufacturing Operations

Tugce Martagan, University of Wisconsin-Madison, Engineering Centers Building, Madison, WI, 53705, United States of America, martagan@wisc.edu, Ananth Krishnamurthy

We develop an infinite horizon Markov decision model to minimize costs of purification operations in biomanufacturing. The model considers quality-yield tradeoffs, and identifies the best equipment selection (chromatographic technique) and operating policy (pooling window) to minimize purification costs, and penalty costs for not meeting the demand or quality requirements.

4 - Score Based Anticipative Transfer Requests in the Intensive Care Units

Guodong Pang, Penn State University, College of Engineering, University Park, PA, United States of America, gup3@engr.psu.edu, Yasin Ulukus, Andrew Schaefer, Gilles Clermont

The efficient operation and management of ICUs is critical to providing high quality of care while managing costs. We construct a new Transfer Score to estimate readmission and death probabilities. We further show that an anticipative transfer request policy combined with effective use of clinical markers can significantly decrease transfer delays without increasing the capacity. We present a Markov Decision Process (MDP) model for the transfer request problem and solve it via approximations.

Sponsored Session

Chair: Zhenyu Kong, Associate Professor, Virginia Tech, 1145 Perry Street, Blacksburg, VA, 24061, United States of America, zkong@vt.edu

1 - A Novel Method for Monitoring of Image Sequences

Kamran Paynabar, Georgia Institute of Technology, 765 Ferst Drive, Atlanta, GA, 30327, United States of America, kamran.paynabar@isye.gatech.edu, Hao Yan, Jianjun Shi

We present a novel monitoring method for monitoring and anomaly detection in image sequences and videos using the sparse-smooth decomposition (SSD). SSD significantly reduces the dimensions of images leading to more effective process monitoring. Using empirical data, we show the efficacy of the proposed method in terms of the detection power and computational speed.

2 - Prediction of Tissue-engineered Scaffold Degradation using Constrained Gaussian Processes

Li Zeng, Assistant Professor, University of Texas - Arlington, 500 West First Street, P.O. Box 19017, 4, Arlington, TX, 76019, lzeng@uta.edu, Xinwei Deng

Degradation prediction is a critical problem in tissue-engineered scaffold fabrication to produce products with desirable properties for the development of engineered tissues/organs. This research develops a constrained Gaussian Process approach for scaffold degradation prediction.

3 - Robust Predictive Modeling through Self-organized Variable Clustering

Gang Liu, Graduate Student, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, gliu@mail.usf.edu, Hui Yang

In the literature, the problem of variable clustering was not well-addressed especially when nonlinear and unsymmetrical dependence involved. In this paper, we propose a novel self-organizing algorithm to cluster variables with nonlinear and unsymmetrical dependence. The experimental results show that our method outperforms the previous methods. Further, the self-organized clusters of variables will be utilized in the predictive models to have a robust performance.

4 - Heterogeneous Sensor Data Fusion for Real-time Monitoring in Additive Manufacturing (AM) Process

Prahalad Rao, Assistant Professor, The State University of New York at Binghamton, Binghamton, NY, United States of America, prahalad.k.rao@gmail.com, Zhenyu Kong

In this talk, we present a non-parametric Bayesian analysis, namely, Dirichlet Process (DP)-based evidence theoretic decision-making approach for real-time process monitoring in Fused Deposition Modeling (FDM) Additive Manufacturing (AM) process using data from multiple, heterogeneous sensors.

1 - Penalized Quantile Asymmetric Laplace Process Model for Computer Experiments

Yufan Liu, Dun & Bradstreet, Short Hills, NJ, 07078, United States of America, liuyuf@dnb.com, Ying Hung

Despite numerous research on computer experiment modeling, how to model conditional quantiles of the response and identify the corresponding important variables remain unresolved. In this talk, we present a new framework to address these issues.

2 - Spatial Data Classification in Biomedical Thermal Images

Xinwei Deng, Assistant Professor, Virginia Tech, 250 Drillfield Drive, 211 Hutcheson Hall, Blacksburg, VA, 24061, United States of America, xdeng@vt.edu, Ran Jin

In biomedical thermal image analysis, feature extractions and selections are widely used for image classification. However, useful information can be lost due to improper feature generations and selections. In this work, we present a novel method to perform image classification through spatial modeling. The proposed method not only provides good prediction, but also gives meaningful interpretation. The performance of the proposed method is evaluated by using organ thermal images.

3 - Statistical Surface Monitoring by Spatial-Structure Modeling

Andi Wang, HKUST, Academic Bldg 4223, HKUST, Hong Kong, Hong Kong - PRC, awangab@ust.hk, Kaibo Wang, Fugee Tsung

Surface data occurs frequently in manufacturing processes, but existing control charts in profile monitoring are not suitable for monitoring surfaces. In this research we propose a new chart based on the Gaussian-Kriging model that considers several surface patterns. We compare performance of this chart with that of an existing profile monitoring method through simulation.

4 - Profile Modeling for Geometric Shapes with Spatially Correlated Errors

Sobambo Sosina, Harvard University, Cambridge, MA, United States of Amaerica, sosina@fas.harvard.edu, Arman Sabbaghi, Qiang Huang, Tirthankar Dasgupta

We consider the problem of modeling profiles of geometric shapes which have spatially correlated error terms. We propose a maximum likelihood estimation procedure under a spatial autoregressive error model and demonstrate the procedure with applications from graphene synthesis and 3D-printing.

Agent-Based Computational Models of Economic and Financial Processes

Sponsor: Simulation

Sponsored Session

Chair: Robert Axtell, Chair, Department of Computational Social Science, George Mason University, 4400 University Drive, Fairfax, VA, 22102, United States of America, rax222@gmu.edu

1 - Alternatives to Ideal Rationality

Steve Kimbrough, Professor, Department of Operations and Information Management, The Wharton School, 565 Huntsman Hall, Philadelphia, PA, 19104, United States of America, kimbrough@wharton.upenn.edu, Frederic Murphy

Ideal rationality models pervade economics and game theory. Such models have always been considered to be unrealistic in their assumptions regarding agent capabilities, except in special circumstances. A main reason that has been expressed for their continued use, even their continued prominence, is the lack of attractive alternatives. We review the scene and present a number of attractive minimal rationality" alternatives for modeling in economics and game theory.

2 - Agent-based Models of Microstructure for Order-driven Markets

Andrew Todd, PhD Candidate, University of Virginia, Dep't. of Systems and Info Engineering, 151 Engineer's Way, Charlottesville, VA, 22904, United States of America, aetodd@gmail.com, Matt Burkett, Roy Hayes, Peter Beling, William Scherer

Regulators and policy makers, facing a complicated, fast-paced and quickly evolving marketplace, require new tools and decision aides to inform policy. Agent-based models, which are capable of capturing the intricacies of market mechanisms and the heterogeneity of market participants, offer a powerful method for understanding the financial marketplace. We improve an existing statistical microstructure model by systematically introducing deterministic strategic behavior.

3 - A Multi-factor Model of Heterogeneous Traders in a Dynamic Stock Market

Dong-Jin Pyo, PhD Candidate, Iowa State University, Department of Economics, Ames, IA, 50011, United States of America, djpyo@iastate.edu

This study develops a computational stock market model in which each trader's buying and selling decisions are endogenously determined by multiple factors: namely, firm profitability, past stock price movement, and imitation of other traders. Each trader can switch from being a buyer to a seller, and vice versa, depending on market conditions. Simulation findings demonstrate that this model can generate many stylized facts regarding stock returns and volume of trade.

4 - The U.S. Housing Market Bubble: Why it Happened and How it Could Have Been Avoided

Robert Axtell, Chair, Department of Computational Social Science, George Mason University, 4400 University Drive, Fairfax, VA, 22102, United States of America, rax222@gmu.edu

An agent-based model of a city has been built, consisting of a large population of households and a corresponding stock of housing, in order to study house price bubbles. We have instantiated the model for the Baltimore-Washington, D.C. metro area. We demonstrate that low interest rates had little to do with the bubble but rather relaxed lending were the proximate cause of the take off phase of the bubble, and later responsible for its bursting.

Pollution Regulation and Abatement

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Francois Giraud-Carrier, Assistant Professor, University of Illinois Springfield, College of Business and Management, One University Plaza, UHB MS 4021, Springfield, IL, 62703, United States of America, fgira2@uis.edu

1 - Pollutant Abatement Investment under Ambiguity in a Two-Period Model

Motoh Tsujimura, Associate Professor, Doshisha University, Kamigyo-ku, Kyoto, 602-8580, Japan, mtsujimu@mail.doshisha.ac.jp

This paper investigates a pollutant abatement investment under ambiguity in a two-period setting. We consider there are representative consumer and firm in an economy and formulate the social welfare maximization problem. Then we derive the optimal level of abatement investment. Furthermore, we analyze the comparative static effects of the model's parameters.

2 - Model Design and Environmental Study on Radiative Forcing and Climate Change

Cheng-Marshal Wang, Cheng-Marshal.Wang@ec.gc.ca

I will introduce some primary study on how to model the economic impacts of Polar Vortex. First we will review what has happened of extreme cold in North American last winter. Is this a counter example of global warming? Then we will review our primary studies on modelling RCP scenarios in the climate module of our Integrated Assessment Model (IAM). The four RCPs are named after a possible range of Radiative forcing values in the year 2100 relative to pre-industrial values.

3 - Does Cap-and-Trade Enable Collusion?

Francois Giraud-Carrier, Assistant Professor, University of Illinois Springfield, College of Business and Management, One University Plaza, UHB MS 4021, Springfield, IL, 62703, United States of America, fgira2@uis.edu, Krishnan Anand

Carbon Taxes and Cap-and-Trade are the two leading approaches for pollution regulation. Proponents of Taxes have argued that Cap-and-Trade could facilitate collusion among firms via the trading mechanism, leading to suboptimal welfare outcomes. We examine this claim using a rigorous yet rich model of production and pollution under competition that allows for the possibility of collusion among firms via a market exchange for emission allowances.

4 - Incentives to Invest in Pollution Abatement Innovations

Krishnan Anand, Associate Professor, University of Utah, 1655 E Center Campus Dr, Salt Lake City, UT, 84112, United States of America, k.anand@utah.edu, Francois Giraud-Carrier

We analyze and compare three popular pollution control mechanismsóa strict pollution cap, a cap-and-trade system, and an emission taxóin a two-stage model in which the regulated firms first choose between two abatement technologies, and then produce a good or service with pollution as a byproduct. We find that the emission tax is a superior mechanism for many important performance measures.

Forecasting 1

Contributed Session

Chair: Murat Fadiloglu, Professor, Yasar University, Department of Industrial Engineering, Yasar University Bornova, Izmir, 35100, Turkey, murat.fadiloglu@yasar.edu.tr

1 - Probabilistic Forecasting of Wind Power Ramps using Autoregressive Models

James Taylor, Professor, University of Oxford, Said Business School, Park End Street, Oxford, OX1 1HP, United Kingdom, james.taylor@sbs.ox.ac.uk

A challenge for the efficient operation of a wind farm is the occurrence of ramps, which are sudden large changes in generated power. We consider the probabilistic forecasting of a ramp, which we define as exceedance, beyond a chosen threshold, of hourly changes. We fit new autoregressive logit models, including a multinomial logit model that simultaneously estimates the ramp probabilities for different thresholds, and another that jointly models the ramp probability at more than one wind farm.

2 - The Influence of Weather in Online Retailing – An Empirical Analysis

Sebastian Steinker, Kühne Logistics University, Grofler Grasbrook 17, Hamburg, HH, 20457, Germany, Sebastian.Steinker@the-klu.org, Kai Hoberg

We incorporate weather data into the sales forecasting of the largest European online fashion retailer. Using weather forecasts we are able to improve the sales forecasting accuracy (measured as the mean absolute percentage error (MAPE)) by an incremental 62.4% on summer weekends. These considerable improvements in forecast accuracy may have an important impact on logistics and warehousing operations.

3 - A Close Investigation on Spare Parts Demand Patterns and Their Inventory Implications

Laura Turrini, PhD Student, Kühne Logistics University, Grofler Grasbrook 17, Hamburg, Germany, Laura.Turrini@the-klu.org, Joern Meissner

Spare parts are essential for many companies, but an effective management of their inventories is often very challenging due to their slow-moving and erratic demand,that almost never follows the commonly used Normal distribution. We study the case of a German worldwide leader in the wind-turbines market and analyze their weekly demand patterns in the last three years.We focus on testing the right tails of the distribution, a crucial element to implement a successful inventory management system.

Energy VII

Contributed Session

Chair: Khashayar Mahan, Rutgers University, 1507 Azalea Drive, North Brunswick, NJ 08902, United States of America, mahani.khashayar@gmail.com

1 - Renewable Energy Export Planning under Uncertainty

Ebisa Wollega, Doctoral Candidate, University of Oklahoma, 202 W. Boyd St., Norman, OK, 73019, United States of America, ebisa@ou.edu, Soumyadip Ghosh, Ali Koc, Mark Squillante

In this presentation, we address a wind-hydro integrated energy that is exported as part of a day-ahead plan under stochastic demand and various wind supply scenarios. A profit maximization planning problem is formulated and its solution is computed via a stochastic gradient algorithm. From a practical perspective, renewable energy industry stakeholders can use the techniques we present to make optimal export planning decisions under uncertainty.

2 - Fast Pyrolysis Facility Investment Valuation via A Real Options Approach

Yihua Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50011, United States of America, yihuali@iastate.edu, Chung-Li Tseng, Guiping Hu

The valuation of a fast pyrolysis facility investment at a predetermined location is studied under the consideration of multiple uncertainty factors. A real options approach takes into account the managerial options, e.g. optimal investment timing and optimal operating decisions, and maximizes expected gross present value of the project.

3 - Robustness of Renewable Energy Support Schemes Facing Operational and Regulatory Uncertainty

Ingmar Ritzenhofen, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, ingmar.ritzenhofen@whu.edu, Stefan Spinler, John Birge

Renewable portfolio standards and feed-in-tariffs are widely used policy instruments to promote investments in renewable energy sources. Regulators continuously evaluate these instruments along the main electricity policy objectives ñ affordability, reliability, and sustainability. We quantitatively assess these policies along these dimensions using a long-term electricity capacity expansion model and compare their robustness in the light of uncertain renewable feed-in and future regulation.

4 - Comparison of Modeled and Actual Power Interchanges for the Eastern U.S.

Emily Fisher, Lawrence Berkeley National Lab, One Cyclotron Rd, MS 90R4000, Berkeley, CA, 94720, United States of America, esfisher@lbl.gov, Alan H. Sanstad

Planning models used in the electricity industry employ a variety of simplifications in order to make representations of the complex electricity system more tractable. One way to examine the impact of these simplifications is to compare the model results to actual data. In this talk we present a comparison of regional interchanges resulting from a resource expansion planning model to scheduled and actual system flows in the Eastern United States.

5 - Heuristic Optimization Technique for Storage Control with High Penetration of Renewables

Khashayar Mahan, Rutgers University, 1507 Azalea Drive, North Brunswick, NJ 08902, United States of America, mahani.khashayar@gmail.com,Mohsen Jafari

Finding near-optimal control schemes for energy storage units has always been a challenge for power utilities. We consider a microgrid with high penetration of renewable resources, such that renewable output may exceed system load from time to time. The reverse flow of renewable output could cause damage to distribution infrastructure. Energy storage can be used in such systems to not only absorb the excessive power from renewable but also reduce energy purchase from the grid during peak hours.

Integrating High Resolution Spatial Data and Optimization Models for Energy Production/distribution Analysis

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: T. Edward Yu, Assistant Professor, University of Tennessee, 2621 Morgan Circle, 314A Morgan Hall, Knoxville, TN, 37996-4518, United States of America, tyu1@utk.edu

1 - Economic Impact of a Renewable Fuels Biorefinery Expansion: A Case Study in Mississippi

Burton English, Professor, The University of Tennessee, 2621 Morgan Circle, Knoxville, TN, 37996-4518, United States of America, benglish@utk.edu, Lixia He, T. Edward Yu, Brad Wilson, R. Jamey Menard

An advanced renewable fuels company has developed a proprietary technology platform to convert biomass into renewable oil used for gasoline, diesel and fuel oil blendstocks. The company now plans to double the production of its cellulosic fuel facility. This study aims to locate the residues from existing softwoods to meet expanding feedstock demand and to estimate feedstock harvesting costs. The regional economic impact from the transactions of softwood residues will also be assessed.

2 - Optimizing Economic and Environmental Performance of Advanced Biofuel Supply Chains in Tennessee

T. Edward Yu, Assistant Professor, University of Tennessee, 2621 Morgan Circle, 314A Morgan Hall, Knoxville, TN, 37996-4518, United States of America, tyu1@utk.edu, Lixia He, Burton English, James Larson

Given the surging pressure of making advanced biofuels empirically feasible in the US, a growing number of studies have integrated decision models with spatial data in the recent literature of biofuel supply chains. The present study identifies the crucial factors affecting the profit and greenhouse gas of switchgrass biofuel supply chains in Tennessee using a high-resolution GIS-based optimization model. The optimal location of feedstock area, refineries and blending sites are also determined.

3 - Renewable Energy and Carbon Capture and Storage: A Cost-Benefit Analysis of Technologies

Andrew Arnette, Assistant Professor, University of Wyoming, Laramie, Wyoming, United States of America aarnette@uwyo.edu

Built on a framework that combines GIS and a multi-objective optimization modeling that has been used to analyze costs and benefits of renewable energy sources (wind farms, solar farms, biomass co-fire, rooftop solar), this research introduces the potential for carbon capture at coal plants and the potential for storage of carbon in underground locations. The aim of this research is to provide a model that can allow for the comparison of greenhouse gas emission-reducing technologies.

4 - Refining the Economic Potential of Biofuel Production with CCS using Spatially-explicit Modeling

Nathan Parker, Postdoctoral Researcher, Institute of Transportation Studies, University of California, Davis, Institute of Transportation Studies, 1715 Tilia Street, Davis, CA, 95616, United States of America, ncparker@ucdavis.edu, Joan Ogden, Nils Johnson

To limit global warming to 2 degrees C, it is likely that net anthropogenic CO2 emissions will eventually need to go negative. One of the most promising options for achieving negative emissions is the production of electricity or fuels using biomass with carbon capture and storage. This project combines a spatially-explicit biorefinery siting model with a spatially-explicit CO2 transport and disposal model to optimize the deployment of biofuel production with CCS in the United States.

Modern Optimization Techniques for Fundamental Computation Problems in Power Systems

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - Spatial Branch-and-Bound for the Alternating Current Optimal Power Flow Problem

Chen Chen, University of California, Berkeley, 1561 Arch St., Berkeley, CA, 94708, United States of America, chenchen@berkeley.edu, Alper Atamturk, Shmuel Oren

Optimal Power Flow (ACOPF) is a problem of finding minimum-cost electric generation dispatch subject to network constraints. We develop a novel spatial branch-and-bound approach for ACOPF. We derive valid inequalities to strengthen the typical SDP relaxation, and introduce bound-tightening procedures based on the convex hull of certain nonconvex constraints. Experiments on IEEE test cases up to 118 buses help establish some intuition regarding conditions that may cause duality gap.

2 - Convex Relaxation for Optimal Power Flow Problem: Mesh Networks

Javad Lavaei, Assistant Professor, Columbia University, 120th St, New York, NY, 10027, United States of America, lavaei@ee.columbia.edu, Somayeh Sojoudi, Ramtin Madani

This talk is concerned with the optimal power floow (OPF) problem. We have recently shown that a semidefinite programming (SDP) relaxation is able to find a global solution of OPF over acyclic networks. The present work proposes a penalized SDP relaxation to find a near-global solution for mesh networks. The remarkable performance of this technique will be demonstrated on IEEE systems with more than 7000 different cost functions.

3 - New SOCP Relaxations for ACOPF Problem

Burak Kocuk, Georgia Institute of Technology, 765 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, burak.kocuk@gatech.edu, Santanu Dey, Andy Sun

In this work, we first present several examples where existing methods fail to solve ACOPF to global optimality even in the case of radial networks. Then, we propose two SOCP relaxations for ACOPF problem, which are targeted to solve radial and mesh networks. We come up with some heuristics to construct feasible solutions and give an MISOCP formulation, which can approximate a global optimal solution to arbitrary accuracy. Finally, extensive numerical analysis is provided.

4 - Large-scale Decentralized Unit Commitment

Mohammad Javad Feizollahi, Phd Candidate, Georgia Institute of Technology, 765 Ferst Drive NW, Suite 439 (main building), Atlanta, GA, 30332-0205, United States of America, feizollahi@gatech.edu, Santiago Grijalva, Mitch Costley, Shabbir Ahmed

A method for formulating and solving a decentralized unit commitment problem is presented in this work. The method, which extends the ADMM, is presented along with several heuristics to mitigate nonconvexity challenges, oscillations and traps in local solutions. We present the promising results from testing the method on large-scale power systems. The results suggest that this method is a practical option for use with large systems and may provide a significant benefit for computational speed.

Parc- Mission III

Simulation II

Contributed Session

Chair: Diana Pfeil, OptTek Systems, Inc, 2241 Seventeenth Street, Boulder, CO, United States of America, pfeil@opttek.com

1 - Comparison and Validation for Twospotted Spider Mites System

Yan Kuang, PhD Candidate, Kansas State University, 2020 Tunstall Cr, Apt. 31, Manhattan, KS, 66502, United States of America, ykuang@ksu.edu

The twospotted spider mite, Tetranychus urticae, is one of the most serious pests that cause damage to crops. Its predator, a mite of the family Phytoseiulus persimilis, plays an important role in keeping the spider mites population under control. There are many mathematical models for their system. The purpose of the work is to validate the models by fitting experimental data. The results are discussed from both the mathematical and the epidemiological perspective.

2 - Machine Learning Methods for Insightful Simulation Optimization

Diana Pfeil, OptTek Systems, Inc, 2241 Seventeenth Street, Boulder, CO, United States of America, pfeil@opttek.com

Simulation optimization is used to automatically find optimal or near-optimal parameter settings for a simulation model. Typically, these optimal settings do not yield insight into the simulation model or the parameter space. We introduce OptAnalysis, a suite of machine learning and analysis tools to automate the discovery of influential variables, to identify and characterize multiple good and bad regions of the model tradespace, and to classify the robustness of point solutions and regions.

3 - Health Care Supply Chain Coordination – Service Improvement and Cost Saving through Collaboration

Eike Nohdurft, WHU - Otto Beisheim School of Management, Burgstrasse 2, Vallendar, 56179, Germany, eike.nohdurft@whu.edu, Stefan Spinler

Facing enduring cost pressure, the health care industry has not yet applied supply chain (SC) management methods like collaborative forecasting and planning which improved SC performance in other industries. A model quantifying the impact of such an application in the health care sector is missing. This paper aims to close this gap through quantifying the corresponding impact on SC performance in health care. The study is based on a 3-tier downstream SC simulation using patient demand data.

1 - Analytics for Monitoring and Evaluation of Water Supply Sanitation and Hygiene (WASH)

Darshan Desai, Professor, Larry L. Luing School of Business, New York, NY, 10017, United States of America, darshudesai@gmail.com

In the world of business, analytics and "big data" have created huge hype. However, the field of international development, more specifically, the water supply sanitation and hygiene (WASH) sector lagged behind in applying analytics. Billions of poor people still lack access to the basic water and sanitation services. The WASH sector has chronically faced a wide range of diverse and complex challenges. In such scenarios, we'll discuss ways of applying analytics to create better future.

2 - The Five Minute Analyst
Harrison Schramm, Campaign Analysis Deputy, OPNAV N81, 1507 22nd Street South, Arlington, VA, 22202, United States of America, Harrison.Schramm@gmail.com

The Five Minute Analyst, appearing in INFORMS/Analytics Magazine, has, for the past 3 1/2 years looked at everyday, bite-sized problems through an Analytics lens. This presentation consists of 5-minute long vignettes, representing the 'best of'. How many Legos fit in a Brickbox? What's the best line position for airline seating? How can you tell if a long-running sports rivalry is fair? What were the odds of winning Buffet's Billions? Important note: There will be Zombies.

3 - Predicting Patent Litigations
Papis Wongchaisuwat, IEMS, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, papiswongchaisuwat2013@u.northwestern.edu, John Oldham McGinnis, Diego Klabjan

Patents form the backbone of intellectual property and as such are a common target of litigations. By using patents, court documents of litigations, and additional external data sources we develop a prediction model. Its accuracy for several keywords is approximately 75%.

4 - Large-scale Optimization with MapReduce
Alexandros Nathan, Northwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States of America, alexandrosnathan2012@u.northwestern.edu, Diego Klabjan

In the age of Big Data, the need to train massive statistical models is ever-increasing. Parallel computing is arguably the most efficient way to train such models. In this work we use MapReduce, the popular programming paradigm, to develop parallel optimization algorithms for solving linear regression and binary classification problems. We conduct numerical experiments for different optimization methods and analyze their performance.

Decision Support Systems 2

Contributed Session

Chair: Sara Nourazari, PhD Candidate, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States of America, s.nourazari@neu.edu

1 - Engineering Control of Appointment Access with Capacity Adjustment Time Delays
Sara Nourazari, PhD Candidate, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States of America, s.nourazari@neu.edu, James Benneyan, Rifat Sipahi

Long waits to receive care plagues many patients and healthcare systems. While access delay is a quality care measure for timely service, it is also an indication of how well a healthcare system synchronizes utilization of resources and its patients' demands. This work proposes a semi-real time queue management approach for health systems with inherent time delays in service capacity adjustments.

2 - A Life Cycle-Based Framework to Support Energy Resource Use Decisions: Application to Oil Sands Coke
Jennifer McKellar, Assistant Professor, University of Ontario Institute of Technology, 2000 Simcoe Street North, Oshawa, ON, L1H 7K4, Canada, jennifer.mckellar@uoit.ca, Janne Kettunen, Heather MacLean, Joule Bergerson

A Decision-Support Framework is developed, combining two-stage life cycle assessment and life cycle costing analyses, feasibility screening and stakeholder preference analysis. As a case study, the Framework is applied to oil sands by-product coke. In the base case, selling coke to China for electricity generation performs best financially (NPV of $55/t coke). The Framework can inform strategic decisions on energy resource use and facilitate discussion internally and among stakeholders.

3 - Financial Decision Support in a Local Government
Armando Mendes, Professor, Azores University, Rua da Mae de Deus, Ponta Delgada, 9501-801, Portugal, amendes@uac.pt, Hugo Rego, Hélia Guerra

In a local government organization, management decisions are based on guidelines provided by areas of expertise. Thus, it is intended to create a Decision Support System for providing financial indicators to support management decisions. For this it is necessary to load the data for indicators creation from the IS in use on the organization. Then, tendencies and seasonality factors are identified by means of a forecasting model. These information will be accessible using an appropriate interface

Project Analytics

Sponsor: Decision Analysis

Sponsored Session

Chair: Janne Kettunen, Assistant Professor, The George Washington University School of Business, 2201 G Street, NW, Funger Hall 415, Washington, DC, 20052, United States of America, jkettune@gwu.edu

1 - Causal Network Methods for Project Risk-Based Decision Analysis
Paul Govan, PhD Candidate, Texas A&M University, 3136 TAMU, College Station, TX, 77843, United States of America, pgovan1@neo.tamu.edu, Ivan Damnjanovic

The goal of this research is to develop a hybrid causal network methodology for general project risk-based decision making. The network method identifies causal relationships among events and conditions and integrates opinions with the observed data. The causal model also helps identify risk-related dependencies given varying levels of information and promote organizational learning by identifying what data to collect in order to create value for the organization.

2 - Estimation and Mitigation of Downside Risk in Project Portfolio Selection
Janne Kettunen, Assistant Professor, The George Washington University School of Business, 2201 G Street, NW, Funger Hall 415, Washington, DC, 20052, United States of America, jkettune@gwu.edu, Ahti Salo

We show that uncertainties in project portfolio selection have major implications for the development of risk estimates about portfolio value. To improve the accuracy of risk estimates, we propose the use of calibration curves which can be derived by analyzing past selection processes or by simulating the portfolio selection process. We also consider the introduction of risk constraints, but show that this approach may yield risk estimates which are too optimistic.

3 - EDM, an Innovative Approach to Schedule and Duration Estimation, Management and Control
Homayoun Khamooshi, Chair Project Management Program, George Washington University, Room 408, Funger Hall, 2201 G Street, NW, Washington, DC, 20052, United States of America, hkh@gwu.edu

Schedule control in comparison to cost control has not been fully exploited in projects and project management environments (PMOs). In contrast to Earned Value and Earned Schedule, we have developed the Earned Duration Management (EDM) in which we have decoupled schedule and cost performance measures and developed a number of indices to measure efficacy and efficiency of the schedule and planned duration at any level of the project. These tools can be used by contractors and clients alike.

4 - Strategic Risk Management
Ernest Forman, Professor, George Washington University, Decision Sciences, Washington, DC, 20052, United States of America, forman@gwu.edu

A framework and methodology for strategic risk management, including risk identification, risk assessment, and risk treatment/mitigation/response will be presented. The process includes the derivation of ratio scale measures of the likelihood and impact of risk events, effectiveness of controls to reduce risks, and the allocation of resources to reduce risk.

Behavioral Decision Making

Sponsor: Decision Analysis

Sponsored Session

Chair: Matthias Seifert, Assistant Professor of Quantitative Methods, IE Business School, Maria de Molina 12 5∞, Madrid, 28006, Spain, Matthias.Seifert@ie.edu

1 - Research on Near Miss Events and Risky Choice: Challenges and Opportunities
Florian Federspiel, PhD Candidate, IE Business School, Maria de Molina 12, Bajo, Madrid, 28006, Spain, ffederspiel.phd2014@student.ie.edu, Matthias Seifert

We focus on the issues of definitional clarity and scope in defining near miss events and the ability to account for different kinds of near miss events in explaining differing risk perception and risky choice. We propose a new definition to bridge extant research from distinct fields and offer a conceptual framework that opens the way for further research on risk perception and risky choice following near miss events.

2 - Gender Bias in Hiring Decisions: The Role of Decoy Effects
Wenjie Tang, Assistant Professor, IE Business School, Calle de Maria de Molina 12, Piso 5, Madrid, 28006, Spain, Wenjie.Tang@ie.edu, Steffen Keck

Drawing on prior research on decoy effects, we suggest that a joint evaluation of candidates might introduce a new form of bias that could amplify the existing gender bias. In a laboratory experiment we find that the presence of asymmetrically dominated applicants in the choice set strongly increases the odds of a male applicant to be chosen, but does only have only very little positive effect for a female applicant and thus leads to a strong gender bias in participants' hiring decisions.

3 - Risky Business (for Women): understanding the Gender Gap in Risk-Taking Behavior
Susan Fisk, PhD Candidate, Stanford University Sociology Department, 450 Serra Mall, Building 120, Room 031, Stanford, CA, 94305, United States of America, sfisk@stanford.edu, Ross Shachter

It is a well-established fact that women take fewer risks than men, a disparity which has largely been attributed to gender differences in risk preferences. We explore the role that social forces play in women's and men's risk-taking decisions; specifically, we examine how gendered beliefs and expectations may cause women to experience greater sanctions when they take a risk and fail, and how these harsher consequences may cause women to experience greater negative affect in risky settings.

Data Mining in Renewable Energy

Sponsor: Data Mining

Sponsored Session

Chair: Zijun Zhang, Assistant Professor, City University of Hong Kong, SEEM Department, P6600, 6/F, Academic 1, Kowloon Tong, Hong Kong - PRC, zijzhang@cityu.edu.hk

1 - Wind Turbine Power Curve Monitoring and Clustering Analysis
Zhe Song, Associate Professor, Nanjing University, Business Adminstration Department, School of Business, Nanjing, China, zsong1@nju.edu.cn

The power curves are constructed using historical wind turbine data. Power curve models are developed by the least squares method or the other by the maximum likelihood estimation method. The models are solved by an evolutionary strategy algorithm. Power curve model is used for on-line monitoring of the power curve to identify abnormal data points. These abnormal data points are further analyzed by clustering algorithms to identify similar patterns which could be used for fault analysis.

2 - Plug-in Electric Vehicle (PEV) Load Pattern Analysis: A Data-mining Approach
Kai Yang, Director, Healthcare Systems Engineering Group, Wayne State University, 4815 4th Street, Detroit, MI, 48201, United States of America, kai.yang@wayne.edu, Anoop Verma, Satish Tyagi

The usage patterns of EVSE charging affects the overall electricity load and thus poses challenges to utility companies. There is a need to identify users with EVSE to better manage the load distribution. Analysis of load usage data with an aim to isolate the residential and aggregate usage patterns is targeted. The approach developed is tested and validated on real world data obtained from a regional utility company

3 - Optimization of Wind Power and Its Variability with a Computational Intelligence Approach
Zijun Zhang, Assistant Professor, City University of Hong Kong, SEEM Department, P6600, 6/F, Academic 1, Kowloon Tong, Hong Kong - PRC, zijzhang@cityu.edu.hk

An optimization model is presented for maximizing the generation of wind power while minimizing its variability. In the optimization model, data-driven approaches are used to model the wind-power generation process based on industrial data. A new constraint is developed for governing the data-driven wind-power generation model based on physics and statistical process control theory. Computational intelligence algorithms are utilized to solve the optimization model.

4 - Application of Computational Intelligence in Modeling and Optimization of HVAC Systems
Mingyang Li, University of Arizona, 1127 James E. Rogers Way, Tucson, AZ, 85721, United States of America, mingyangli@email.arizona.edu

HVAC (Heating Ventilating and Air-Conditioning) system is multivariate, nonlinear, and shares time-varying characteristics, posing challenges for both system modeling and optimization. In this research, computational intelligence methods are employed in modeling and optimization of HVAC systems. Energy savings are accomplished by minimizing the cooling output, reheating output or fan running time as well as on-line monitoring.

5 - Investigation of the Impact of Total Solids and pH on Biogas Production with a Data-driven Approach
Xiupeng Wei, Research Assistant, University of Iowa, 3131 Semans Center, Iowa City, IA, 52246, United States of America, xiupeng-wei@uiowa.edu

Biogas is a typical byproduct in wastewater treatment by anaerobic digestion the sludge. To improve biogas production, the impact of total solids and pH is investigated with a data-driven approach. Five data-mining algorithms have been used to build biogas production models. Based on the built production model, genetic algorithm is used to find the optimal control settings of total solids and pH value. The biogas production can be significantly increased with optimal settings.

Data Mining 7

Contributed Session

Chair: Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu

1 - Support Vector Machines Based on Convex Risk Functional and General Norms
Jun-ya Gotoh, Chuo University, 1-13-27 Kasuga, Bunkyo-ku, Tokyo, 112-8551, Japan, jgoto@indsys.chuo-u.ac.jp, Stan Uryasev

We revisit the formulations of support vector machines (SVMs) for binary classification on the basis of convex analysis. Interpretability of dual formulations is related to properties of the convex empirical risk functionals. Besides, we demonstrated how robust optimization modelings are easily incorporated. With regularizers based on new families of polyhedral norms (in place of the lp-norms), regularizer tuning can be efficiently incorporated via (possibly, parametric) linear programming.

2 - Generating Contextual Insights for the Social Enterprise
Ying Li, Research Staff Member, IBM T.J. Watson Research Center, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, yingli@us.ibm.com, Ashish Jagmohan, Yi-Min Chee, Krishna Ratakonda, Elham Khabiri

Social enterprise technology can enhance organizational productivity by surmounting knowledge silos and promoting collaboration. We present a social enterprise tool which uses natural language and machine learning algorithms to make sense of large enterprise data repositories. The tool extracts specialized knowledge from such repositories, and generates new contextual insights allowing users to leverage the organization's collective intelligence for problem-solving and collaboration.

3 - Quantitative Aggregation of Prior Statistical Findings
Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu, Hazhir Rahmandad, Kamran Paynabar

Taking stock of prior research requires combining previous findings yet current methods limit such quantitative aggregation to studies with very similar designs. We introduce Generalized Model Aggregation (GMA) that can consistently combine prior statistical findings of a phenomenon into a meta-model. Numerical and empirical examples demonstrate GMA's ability to extract the underlying data generating process from biased and incomplete prior studies.

4 - Global Bicycling Trends
Olufolajimi Oke, Johns Hopkins University, 3400 N Charles St, Baltimore, MD, United States of America, ooke1@jhu.edu, Sauleh Siddiqui, David Love, Kavi Bhalla

Over the past four decades, bicycle ownership has been tracked but not globally analyzed. We gather survey data from 155 countries, and assume ownership as a usage indicator. Performing cluster analysis, we identify five global trends cutting across geographical regions. We also observe relationships between bicycle usage and socio-economic indices. We determine a worldwide ownership trend and demonstrate a basis for understanding the global impact of cycling as a sustainable transit mode.

5 - eWOM Public Transportation Decision Making Variables
Benjamin George, University of North Texas, 1155 Union Circle, Denton, TX, 76203, United States of America, benjamin.george@unt.edu, Rebecca Scott

This research uses electronic word of mouth (eWOM) to identify public transportation decision-making factors. Text analytics techniques identify the frequency and strength of variables from end-user customer comments. Implications from the results address service issues and how to increase public transportation use.

Chair: Youqin Pan, Assistant Professor, Salem State University, 3 52 Lafayette Street, Salem, MA, 01970, United States of America, youqinpan@my.unt.edu

1 - File Classification Problem in Hybrid Cloud Storage Systems
Fan Liu, Kansai University, No. 306,1-17-13 Senriyamanishi, Suita, Osaka, 565-0851, Japan, liufan09006@gmail.com, Hiroyuki Ebara

In hybrid cloud storage system,it is important to solve the problem of file classification,in order to use effectively the storage space and improve security.In the classification process,we can analyze content of a file using machine learning,in addition to using the size and type of a file.

2 - What Drives Marketplace Effectiveness and Growth? An Empirical Investigation.
Pavel Izhutov, Stanford University, 736 Escondido Rd, Apt 203, Stanford, CA, 94305, United States of America, izhutov@stanford.edu, Haim Mendelson

Online marketplaces are becoming increasingly important mechanisms for matching supply and demand. This paper presents findings from a marketplace for services (in particular, a tutoring vertical). Using a rich data-set, we study the drivers of marketplace growth and the factors that lead to successful matching of supply and demand.

3 - A New Model for Binary Classification
Jian Luo, North Carolina State University, Daniels 443, North Carolina State University, Raleigh, NC, 27695, United States of America, jluo3@ncsu.edu, Zhibin Deng

In this study, a kernel-free soft quadratic surface support vector machine model is proposed for binary classification directly using a quadratic function for separation. We have also studied some properties of this proposed model such as the solvability, uniqueness of the solution and so on. Finally, our computational results on artificial data sets and four real-world benchmark data sets indicate that the proposed model outperforms Dagher's quadratic support vector machine model and soft support vector machine models with Gaussian or quadratic kernel.

4 - Predicting Stock Index Movement using Advanced Machine Learning Techniques
Youqin Pan, Assistant Professor, Salem State University, 352 Lafayette Street, Salem, MA, 01970, United States of America, youqinpan@my.unt.edu

In this study, advanced machine learning techniques are applied to predict the direction of stock market movement. Experimental results show that EMD transformation of original stock index into a time-frequency feature space improves the accuracy of the forecasting models commonly used in the literature. All models examined in this study generate an acceptable model performance, the EMD-Neural Network model seems to outperform other models in general.

5 - Mining Process Patterns from Noisy Audit Logs with Application to Electronic Medical Record Systems
He Zhang, Northwestern University, The Technological Institute, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States of America, hezhang2012@u.northwestern.edu, David Liebovitz, Carl Gunter, Bradley Malin, Sanjay Mehrotra

Mining the process patterns in the access logs from information systems can provide useful insights for the workflow patterns. One important issue in process mining is that the workflow is usually highly dynamic and the access logs are noisy. We present a four-step framework to analyze process models with noisy data at an abstract level. We implement our approach using several months of data from a large academic medical center. Empirical results show that our framework can work effectively.

Wednesday, 4:30pm - 6:00pm

Technology Management

Contributed Session

Chair: Paola Gonzalez, PhD candidate, Queen's University, PhD Office, Goodes Hall, Kingston, ON, K7L 3N6, Canada, pgonzalez@business.queensu.ca

1 - Supporting or Killing Platform Design? Towards New Contingent Criteria for Strategies Selection
Olga Kokshagina, Mines ParisTech, 60 Boulevard Saint-Michel, Paris, 75006, France, olga.kokshagina@mines-paristech.fr, Pascal Le Masson, Benoit Weil, Hassen Ahmed

The circumstances in which firms operate have moved towards unknown environments, thereby rendering planning approaches inadequate. In these situations companies have to adapt more flexible approaches. When technology and markets are unknown an interesting solution is highlighted: the design of technological platform creating value across many emerging markets. A study is carried out to clarify the criteria in which the exploration of multiple technologies and markets lead to platform design.

2 - Capability Changes at a Firm Due to Offshoring: Antecedent to the Commons Challenge
Anshuman Tripathy, Indian Institute of Management Bangalore, Bannerghatta Road, Bangalore, India, atripathy@iimb.ernet.in, Shilpa Jaiswal

We use SD to model a firm's decision to increasing its offshoring content. As capabilities at the offshored agent develop, we find that the firm's system development capabilities increase though part development keeps diminishing, more so when parts have higher modularity. This further motivates firms in broadly similar industries to replicate the offshoring process; and over time, this leads to the loss of certain collective capabilities that sustain innovation (industrial commons).

3 - An Economic Analysis of Platform Structure with Hierarchies
Sunghee Lee, Researcher, Korea E-Trade Research Institute, Chung-Ang Univ., Heukseok-ro, Dongjak-gu, Seoul, 136-701, Korea, Republic of, shedawa@gmail.com, Byung Cho Kim, Daeki Kim

We compare two distinct settings in two-sided markets: simple platform versus hierarchical platform. Grounded on an analytical model, we investigate the incentives of a platform provider to adopt a hierarchical structure. Our findings indicate that that the presence of network externality creates such an incentive, especially when there is a need for load-sharing. Consequently, a hierarchical structure acts as a beneficial existence to consumers under certain conditions.

4 - Innovation and Policy Support for Platform Providers under Competition
Dawoon Jung, PhD Student, Korea University Business School, LG-Posco Hall, KUBS, 145 Anam-ro Seoungbuk-gu, Seoul, Korea, Republic of, bogsil@korea.ac.kr, Byung Cho Kim, Myungsub Park, Detmar Straub

Technological innovation becomes even more complicated for platform businesses whose fate is heavily influenced by the network externality stemming from a two-sided market. We introduce a model of competing platforms to examine whether platform providers have an incentive for technological innovation, while the existing literature on the two-sided market focuses on platform providers' pricing strategies for network expansion without paying much attention to innovation decisions.

Remanufacturing

Contributed Session

Chair: Xiaoning Jin, Assistant Research Scientist, University of Michigan, 1031 H. H. Dow Building, 2350 Hayward Street, Ann Arbor, MI, 48109, United States of America, xnjin@umich.edu

1 - Admission Policies for End-of-Life Product Returns in a Remanufacturing System

Xiaoning Jin, Assistant Research Scientist, University of Michigan, 1031 H. H. Dow Building, 2350 Hayward Street, Ann Arbor, MI, 48109, United States of America, xnjin@umich.edu, S. Jack Hu, Jun Ni

This paper considers a reassemble-to-order system with admission control on product returns in a remanufacturing system. Warranty claims trigger orders for product replacement by new or remanufactured products and also generate returns of used products. The return process is a stochastic in terms of arriving time, quality and quantity. We develop a quasi-birth-and-death model to obtain the key performance measures of the system and provide managerial insights into decision-making.

2 - The Inter-Divisional Coordination of Manufacturing and Remanufacturing Operations in a CLSC

Tianqin Shi, University of Illinois at Urbana-Champaign, 350 Wohlers Hall, 1206 South Sixth Street, Champaign, IL, 61820, United States of America, tshi3@illinois.edu, Dilip Chhajed, Zhixi Wan

We consider a firm consisting of two divisions, one responsible for designing and manufacturing new products and the other responsible for remanufacturing operations. Both divisions operate independently and distribute through the same retailer. We show that divisional conflict can occur, which not only reduces sales and profit of the firm but also discourages remanufacturable product design. Thus, we propose an inter-divisional incentive scheme that facilitate divisional coordination.

3 - Remanufacturing with Competing Manufacturers

Kunpeng Li, Utah State University, 3555 Old Main Hill, Logan, UT, United States of America, kunpeng.li@usu.edu, Shaorui Li

Two manufacturers produce and sell substitute products through their respective retailers. Under such a setting, we study the optimal remanufacturing strategies with two competing manufacturers.

4 - Optimal Product Design in a Remanufacturing Setting

Mustafa Akturk, PhD Student, Texas A&M University, Mays Business School, 4113 TAMU 320 R, College Station, TX, 77845, United States of America, makturk@mays.tamu.edu

Benefits from remanufacturing do not come for free. The recovery of parts from returned products requires investment at the design stage. However, design for remanufacturing takes longer time to market than other design options. So, we model the optimal design philosophy at different market conditions both in a single-period and multi-period settings.

5 - A Fuzzy Linguistic Based Decision Support System for Evaluating Re-manufacturability of Products

Thomas Omwando, University of Wisconsin Milwaukee, 3200 N Cramer Street, EMS 503, Milwaukee, WI, 53211, United States of America, tomwando@uwm.edu, Wilkistar Otieno, Anthony Ross

Remanufacturing as an end of life disposal option faces challenges due to uncertainties associated with product attributes. This work presents a decision support system based on a 2-tuple fuzzy linguistic computing approach to integrate qualitative and quantitative product attributes in determining the remanufacturability of a product. The model is applied to assess the suitability of remanufacturing two products manufactured by a global industry based in the mid-west region of the USA.

Supply Chain/Closed Loop I

Contributed Session

Chair: Mostafa Sabbaghi, PhD Student, University at Buffalo, State University of New York, 437 Bell Hall, Buffalo, NY, 14260, United States of America, mostafas@buffalo.edu

1 - Trends in Used Electronics Return Flows: A Perspective on Consumer Behavior and Design Features

Mostafa Sabbaghi, PhD Student, University at Buffalo, State University of New York, 437 Bell Hall, Buffalo, NY, 14260, United States of America, mostafas@buffalo.edu, Ardeshir Raihanian, Sara Behdad, Willie Cade

Inspired by the large amount of electronic waste (e-waste) discarded every year in the US, this study aims to investigate consumer behavior aspects of return flows. Using a large dataset consisting of characteristics of 44000 used personal computers returned back to a remanufacturing company, the study examines the connection among design features and consumers' behavior towards products usage duration and time-in̶storage.

2 - Network Design for Commercial Returns under Time Value Consideration.

Sung Ook Hwang, Texas A&M University, ETB Building 101, Bizzell St, College Station, TX, United States of America, hwang1227@tamu.edu, Halit Uster

We consider logistics network design problem for commercial returns. The problem is formulated as a multi-period mixed integer linear program with time parameters introduced to express product residual value based on return channel selections. We present an efficient solution approach and an analysis of network design and channel selection strategies based on product characteristics.

3 - Application of Robust Optimization to Mechanism Design in Waste Recycling

Kazuaki Okubo, Assistant Professor, Saitama University, 255 Shimo-okubo, Sakura-ku, Saitama, 338-8570, Japan, okubo@dp.civil.saitama-u.ac.jp, Makoto Okumura

In Japan, some recyclable wastes are collected by local governments and delivered to a contracted recycler, who is a winner of auction. However, there is uncertainty in the quantity of waste collected. We show that if a recycler has advanced technology, it will be less likely to be assigned a contract because of its high initial cost. We propose a mechanism with minimum contract quantity and show that the mechanism can increase the probability that the advanced recycler will win in the auction.

4 - Consumer Returns Policies for a Price Setting Retailer

Necati Ertekin, PhD Student, Texas A&M University, 320 Wehner Bldg. TAMU, College Station, TX, United States of America, nertekin@mays.tamu.edu, Michael Ketzenberg

We study a retailer that offers customers both returned and new products side by side under a partial return policy as is very common in practice. The retailer segments the market for new products and open-box returns based on customer valuation and pricing and faces stochastic demands from price-sensitive customers.

1 - An Improved Reformulation for an Optimal Design Problem in Electronic Goods Recollection

Roger Rios-Mercado, Professor, Universidad Autonoma de Nuevo Leon, AP 111-F, CD. Universitaria, San Nicolas de los Garza, NL, 66450, Mexico, roger@yalma.fime.uanl.mx, Jonathan Bard

The problem addressed here is motivated by a real-world case arising in the recollection of waste electronic equipment in Europe. The process involves assigning recollection units to companies subject to some planning requirements. A new MILP model for this NP-hard districting problem is introduced. Empirical evidence illustrate the positive impact of the new model and the proposed algorithmic strategies resulting in dramatic speed-up of solution times when compared to existing approaches.

2 - Outsourcing Analysis in Closed-Loop Supply Chains for Hazardous Materials

Victor Manuel Rayas Carbajal, ITESM, Eduardo Monroy Cárdenas 2000, San Antonio Buenavista, Toluca, 50110, Mexico, victor.rayas@invitados.itesm.mx, Marco Antonio Serrato García

Environmental issues have become a main topic worldwide, forcing companies to satisfy specific requirements on their supply chain due to laws and policies to reduce the impact of their activity. This is why many companies consider outsourcing these functions. Through this research, a Markov decision models are developed to support outsourcing decisions in a closed-loop supply chain for hazardous materials. The models are based on the risk levels and sales behavior of the product considered.

3 - Procurement Maturity Model Reassures Contract System's Best Practices

Saroj Koul, Professor, OP Jindal Global University, Sonipat-Narela Road, NCR, 130001, India, skoul@jgu.edu.in

Procurement shares a significant responsibility towards ensuring organizational profitability and promoting organizational quality standards. In this research study, the Procurement Maturity Model was developed to assist procurement professionals in implementing procurement best practices as a means to improve the organizational performance and professional skills at a steel company.

4 - Decision Support Systems for Closed Loop Supply Chains under Uncertainties

Yohanes Kristianto, Postdoctoral Researcher, University of Vaasa, Yliopistonranta 10, Vaasa, 65101, Finland, ykristiantonugroho@gmail.com

This paper designs a decision support system to determine optimal poduct architecture modularity in closed loop supply chains. The objective is to investigate if remanufacturing and modular upgrading is appropriate at certain periods and in modules. The optimization model is tested under several production yield scenarios in order to determine manufacturing and remanufacturing capacity and production line scheduling under process yield uncertainty.

Supply Chain Management IX

Contributed Session

Chair: Babak Abbasi, Senior lecturer, RMIT University, Swanston St, Melbourne, Australia, babak.abbasi@rmit.edu.au

1 - Driving Design Innovation up the Supply Chain

Ali Inay, PhD Student, McGill University, 3458 Rue Sainte Famille, Montreal, QC, H2X 2K8, Canada, ali.inay@mail.mcgill.ca

We consider innovative OEMs that design competing products relying on a key component sourced from a supplier with technological capability. Suppliers' innovation efforts define their capabilities, but OEMs can engage to enhance them (with spillovers). We derive equilibrium design (quality), innovation and capability investment, and pricing decisions for alternative configurations.

2 - The Centralization Impacts on the Two-echelon Supply Chain

Babak Abbasi, Senior lecturer, RMIT University, Swanston St, Melbourne, Australia, babak.abbasi@rmit.edu.au

This talk provides insights on the impacts of centralization in the second echelon of a two-echelon supply chain with perishable items and uncontrollable replenishment. The centralization in the second location means that agents in the second echelon share the inventory. We find that centralization is a key factor in the blood supply chain. For instance we observed reducing the number of inventory locations from 5 to 2 will reduce the total cost by around 21%.

3 - Cooperative Procurement in the Presence of Intermediaries

Behzad Hezarkhani, Technical University of Eindhoven, OPAC, Department of Industrial Engineeri, Eindhoven, No, 5600 MB, Netherlands, b.hezarkhani@tue.nl, Marco Slikker, Tom Van Woensel

In complex supply chains, agents who procure individually often find it beneficial to replenish their required products indirectly from a local intermediary rather than from the original manufacturers directly. But the agents could collectively benefit from aggregating their demands and placing joint orders with the manufacturers of specific products. This talk addresses the possibilities for cooperation in these situations and the structure of associated cooperative games.

4 - Impacts of Counterfeiting on a Global Supply Chain Impacts of Counterfeiting on a Global Supply Chain

Zelong Yi, Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong - PRC, yizl@ust.hk, Ki Ling Cheung, Man Yu

We investigate how a global supply chain is influenced by counterfeits and how the supply chain should take anti-counterfeit actions. Specifically, we consider a supply chain consisting of a manufacturer and a local retailer, and examine who should counteract counterfeits. We also evaluate the impact of counterfeits on supply chain profit, consumer surplus, and social surplus.

Supply Chain Management X

Contributed Session

Chair: Shiqing Yao, PhD Candidate, Chinese University of Hong Kong, Rm 941, CYT Building, Shatin, Hong Kong - PRC, shiqing@baf.msmail.cuhk.edu.hk

1 - A Stochastic Programming Approach for Process Flexibility Design in Unbalanced Networks

Wancheng Feng, PhD Candidate, Tsinghua Univeristy, Dept. of Industrial Engineering, Beijing, 100084, China, fwc12@mails.tsinghua.edu.cn, Chen Wang, Jeffrey David Tew

This research proposes a stochastic programming model and an algorithm for solving process flexibility design problems in unbalanced networks. Our solution approach integrates the accelerated Benders decomposition algorithm in a Monte-Carlo Sampling approximation scheme, to quickly obtain high-quality solutions to SP models. Impacts of flexibility uniformity (e.g. plant uniformity and product similarity) when process flexibility is applied in real production system have been discussed as well.

2 - Concurrent Planning of Forward and After-sale Supply Chains Against Demand and Supply Side Uncertain

Shabnam Rezapour, Dr., University of Oklahoma, 2248 Houston Ave, Apt 2,, Norman, OK, 73071, United States of America, shabnam_rezapoor@yahoo.com, Farrokh Mistree, Janet Allen

A company supplying a product to its pre-markets through a forward supply chain (SC) is considered. Demand is a stochastic function of price, warranty time and service levels. Due of the warranty, returned defective products must be repaired or substituted. These parts are produced through an after-sale SC. Uncertainty in a) the demand of product and spare parts and b) qualified output of production facilities are considered. Nonlinear model of problem is linearized to be solvable globally.

3 - Traceability and Market Inspection

Shiqing Yao, PhD Candidate, Chinese University of Hong Kong, Rm 941, CYT Building, Shatin, Hong Kong - PRC, shiqing@baf.msmail.cuhk.edu.hk, Kaijie Zhu

We consider an industrial organization which assigns quality labels to its members in order to certify their products in the output market. By a desire of profits, its dishonest members may gain more through selling quality labels to an outside party. Traceable labels and market inspection might be advantageous to deter such under-the-table activity. However, under the leakage of market inspection, we show that this conventional wisdom may no longer be true.

4 - Evaluation and Selection of 3PL Provider using Taguchi Loss Functions and AHP

Sharon Ordoobadi, University of Massachusetts, 285 Old Westport Road, Dartmouth, MA, 02747, United States of America, sordoobadi@umassd.edu

The purpose of this study is to develop a model that helps manufacturers with decisions regarding the reverse supply chain. This is accomplished by using Taguchi loss functions and AHP methodology in the development of the model. Taguchi loss functions are used to calculate the loss scores based on the performances of the 3PL providers. AHP methodology is used to determine the relative importance of the criteria to the decision maker. The providers are ranked based on their loss scores.

Chair: Nikunj Kumar Jain, Mr., Indian Institute of Management, Indore, Room No. 310, FPM Block,Rau, Indian Institute of Management, Indore, Indore, MP, 453331, India, f11nikunjk@iimidr.ac.in

1 - An Efficient Multi-attribute Reverse Auction Mechanism to Support the Repeated Procurement

Na Yang, Xi'an Jiaotong University, No.28, Xianning West Road, Xi'an, Shaanxi, China, yang.na616@stu.xjtu.edu.cn, Xiuwu Liao

The actual supply of the winning supplier may be different with her committed offer. We propose a novel multi-attribute reverse auction mechanism in a repeated e-procurement setting to discourage such untruthful behavior of the suppliers. The simulation study shows that the dishonest suppliers have less opportunity to win and the buyer derives higher utility by using the proposed mechanism as compared to the existing mechanism.

2 - Exclusive outlets & E-tailing – Manufacturer's strategic instruments

Nishant Kumar Verma, Doctoral Student, Indian Institute of Management Calcutta, India, A201, Tagore Hostel, IIM Calcutta, Joka, DH Road, Kolkata, WB, 700104, India, nishantkv11@email.iimcal.ac.in, Abhishek Shinde

In the world of e-commerce, where manufacturing firms are making their presence felt on the click of a mouse, the same are increasingly opening a considerable number of exclusive outlets too. In this research we aim to develop a game theoretic model to study "how a manufacturing firm uses both e-tailing and exclusive outlets as strategic instruments to influence the pricing behavior of the traditional independent retailers".

3 - Alternative Payment Schemes on Micro-task Crowdsourcing Platforms

Mohammadmahdi Moqri, UF, 299 Diamond Village, Apt15, Gainesville, Fl, 32603, United States of America, mahdi.moqri@warrington.ufl.edu, Hsing Cheng, Subhajyoti Bandyopadhyay

This study focuses on two interrelated challenges in crowdsourcing, namely designing an efficient payment scheme and assuring quality of work. We develop an economic model to explain the relation between pay and quality under the commonly used piece-rate payment scheme. Recognizing the inefficiency of this common payment system, we then propose an alternative payment scheme. The results of our experiments show a significant improvement in the quality of work under the proposed payment scheme.

Supply Chain, Managing Disruptions II

Contributed Session

Chair: Abdulaziz Almaktoom, PhD Candidate, Wichita State University, 8488 E. Granite CT, Bel Aire, KS, 67226, United States of America, atalmaktoom@gmail.com

1 - An Evaluation of Supply Disruption Management Strategies using Mixed-Integer Programming

Mahour Parast, Assistant Professor of Technology Management, NC A&T State University, 4018 Smith Hall, 1601 E Market St, Greensboro, NC, 27411, United States of America, mahour@ncat.edu

The purpose of this paper is to develop a mathematical model to examine the impact of four disruption management strategies on supplier selection and allocation: Pre-positioning of emergency supplies, using back up supplier(s), protecting supplier(s) against disruption, and suppliers' production flexibility. We discuss contingency plans for each scenario, and provide the proper supplier selection and allocation to meet customer demand during disruptions.

2 - The Effect of Learning and Supply Disruptions under Dual Sourcing

Lena Silbermayr, Vienna University of Economics and Business, Welthandelsplatz 1, Vienna, 1020, Austria, lena.silbermayr@univie.ac.at, Stefan Minner

The suppliers face the risk of temporary supply disruptions and reduce future supply cost with cumulative productions, i.e. due to learning effects. Including these two factors we examine the buyer's optimal dual sourcing strategy. Hence, we study the interplay of learning and supply disruptions in the buyer's order allocation problem.

3 - Resilience Quantification of Complex Supply Chain Networks

Abdulaziz Almaktoom, PhD Candidate, Wichita State University, 8488 E. Granite Ct, Bel Aire, KS, 67226, United States of America, atalmaktoom@gmail.com, Krishna Krishnan, Pingfeng Wang, Samir Alsobhi

The objective of this research is to explore supply chain network resilience concept and introduce a novel measure to evaluate supply chain network resilience such that the design of a resilient supply chain becomes possible. The developed measure is able to evaluate the resilience of each entity in the network and the overall supply chain network. Case studies with multi-level complex supply chain networks are developed to demonstrate the proposed measure.

4 - Monitoring a Complex Supply Chain

Lei Liu, Arizona State University, 699 S. Mills Ave, Tempe, AZ, United States of America, lliu58@asu.edu, George Runger, Mani Janakiram, David Bayba

Supply chains (SC) performance is impacted by both supply and demand variability. A SC is complex in both the number of SKUs and dynamics, and agile detection of small-scale disruptions is important. We propose a quite robust, monitoring and visualization scheme for SCs that handle dynamic complexities. Diagnostic tools are embedded to analyze signals from the scheme.

5 - Joint Problem Solving and Planning Roles in Supply Chain Collaboration

Gopal Kumar, Postdoctoral Fellow, Dublin City University, Room SG24, School of Mechanical Engineering, Dublin, 9, Ireland, gopshal.kr@gmail.com, Ravindra Banerjee

This research uncovers joint problem solving and planning roles in developing culture in supply chain collaboration (SCC). Collaborative activities are viewed in terms of internal and external focused functional areas. The model was verified with data collected from industries. Joint problem solving and measurement found critical and affect core and non-core activities. Joint planning at operation level is very important in culture development which gives a platform for the SCC.

Supply Chain Optimization III

Contributed Session

Chair: Gang Wang, Assistant Professor, University of Massachusetts Dartmouth, 800 Pleasant Street, Apt 401, New Bedford, MA, 02747, United States of America, wang.gaby@gmail.com

1 - Capacitated Supply and Distribution Network Design with Stochastic Demand and Delivery Deadlines

Gang Wang, Assistant Professor, University of Massachusetts Dartmouth, 800 Pleasant Street, Apt 401, New Bedford, MA, 02747, United States of America, wang.gaby@gmail.com

This paper studies a make-to-order supply chain where stochastic customer demand and order delivery deadlines are both considered. After formulating the problem as a stochastic mixed integer nonlinear program, three different variations of this problem are investigated in terms of three distinct cost functions.

2 - Concurrent Supply Chain Network and Manufacturing System Design under Uncertain Demand

Bulent Erenay, PhD Candidate, Ohio University, 289 Stocker Center, Athens, OH, 45701, United States of America, be977209@ohio.edu, Gursel A. Suer

Traditionally supply chain network (SCND) and manufacturing system designs (MSD) are done in two phases using rough capacity requirements. In this study, MSD and SCND are made concurrently in an uncertain demand environment. First, a stochastic layered cellular design approach is used to handle uncertain demand, and then MSD and SCND are done simultaneously with the objective of cost minimization considering minimum capacity utilizations.

3 - Optimizing Performance Based Contracting in Multi-Part Multi-Mode Supply Support Systems

Rana Afzali Baghdadabadi, University of Missouri, E3437 Lafferre Hall, Columbia, MO, 65201, United States of America, ragh2@mail.missouri.edu, Wooseung Jang

After-sales support services are often provided by two different organizations, where each party is usually interested in their benefits. To observe the best contractual terms under different environmental assumptions, an optimization model is provided, where the supplier's decisions on resource allocation and transportation modes and the optimized terms of contracting are developed to minimize the total system's cost.?

4 - Optimal Policy for the Stochastic Inventory Control Problem with Unreliable Sourcing

Shuohao Wu, North Carolina State University, 3515 Ivy Commons Dr, Apt 302, Raleigh, NC, 27606, United States of America, swu6@ncsu.edu, Sha Luo, Russell King, Donald Warsing, S.Sebnem Ahiska

We study a single-product inventory system under periodic review in the presence of two suppliers. Both suppliers charge a fix ordering cost. One supplier is perfectly reliable, and the other one offers a better unit price but may encounter supply interruptions, which is modulated by a discrete-time Markov chain. Orders can be placed at both suppliers or only one of them. Optimality of a parameter-dependent (s,S)-like policy is addressed.

5 - Optimizing the Profit under Performance-Based Maintenance Support

Xiaolong Guo, University of Science and Technology of China, 96 Jinzhai Road, Hefei, 230026, China, gxl@ustc.edu.cn, Nishant Mishra, Yugang Yu

We study how customers using systems with varying levels of profitability, decide contract terms for their maintenance suppliers, and how the suppliers set the spare-parts inventories when facing multiple customers with different contract terms. Also, by considering multiple customers and suppliers in our model, we are able to study when suppliers are benefitted by lower spare-parts inventory due to inventory pooling, and when they need to keep dedicated inventories for customers.

■ WE14

Imperial B

Retail Management II

Contributed Session

Chair: Anurag Agarwal, Professor, University of South Florida, 8350 N Tamiami Trail, SMC-C263, Sarasota, FL, 34243, United States of America, agarwala@usf.edu

1 - Data Driven Optimization for Retail Shelf Space

Anurag Agarwal, Professor, University of South Florida, 8350 N Tamiami Trail, SMC-C263, Sarasota, FL, 34243, United States of America, agarwala@usf.edu, Ramakrishna Govindu, Jim Curran

Retailers these days are collecting a lot of data and trying to optimize limited shelf space. In this paper, we propose optimization models for the retail shelf space problem and propose ideas on how to use data to make these models work in practice.

2 - Assortment Planning 2.0

Matthew Lanham, Doctoral Candidate, Virginia Tech, Dept of Business Information Technology, Pamplin Hall (0235), Blacksburg, VA, 24060, United States of America, lanham@vt.edu, Ralph Badinelli

Assortment planning is regarded as one of the most important decisions faced by retailers. We provide a taxonomy of the assortment planning problem and highlight extensions of the conventional assortment planning model which capture more realistic customer behavior, multi-channel coordination, supply-chain performance measures and cross-category tradeoffs. Opportunities for supporting these extensions through big data analytics are investigated.

3 - Market Dominance or Cost Advantage? The Effect of Retail Power on Assortment Planning Decisions

Hedayat Alibeiki, Desautels Faculty of Management - McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, hedayat.alibeiki@mail.mcgill.ca, Ramnath Vaidyanathan, Shanling Li

Some mass retailers are known to reduce their assortment, in certain product categories, more than other retailers. Some believe this phenomenon is because of their retail power. In this study, we investigate the underlying effect of 'market dominance' and 'cost advantage', as two important sorts of retail power, on assortment decisions. Our results show that 'market dominance', i.e. the ability to manipulate market price, is a necessary condition for assortment reduction.

4 - Delivery Planning in Retail Chains

Heinrich Kuhn, Professor, Catholic University Eichstatt-Ingolstadt, Auf der Schanz 49, Ingolstadt, Germany, heinrich.kuhn@ku.de, Michael Sternbeck, Andreas Holzapfel, Alexander Huebner

In grocery retail weekly repetitive delivery patterns have to be selected to deliver the products from the DC to the outlets. An IP model is presented which contains the decision relevant costs and capacities at the DC, in transportation and instore. We propose a simultaneous and a sequential solution approach. Applying the model and the solution approach at a major European grocery retailer leads to significant cost savings.

Design Engineering

Contributed Session

Chair: Emrah Koksalmis, Teaching Assistant, Turkish Air Force Academy, Hava Harp Okulu Komutanligi Yesilyurt, Istanbul, 34149, Turkey, e.koksalmis@hho.edu.tr

1 - Health System Design Optimization using Taguchi Methods: A Necrotizing Enterocolitis Model

Emrah Koksalmis, Teaching Assistant, Turkish Air Force Academy, Hava Harp Okulu Komutanligi Yesilyurt, Istanbul, 34149, Turkey, e.koksalmis@hho.edu.tr, Gulsah Hancerliogullari

This study discusses the Taguchi method as an approach to design optimization and illustrates its application using a system optimization study for an experimental Necrotizing Enterocolitis (NEC) model, where NEC is one of the most common gastrointestinal emergencies in newborn infants. A series of parametric trade studies are conducted, and the results suggest that the Taguchi method is a systematic and efficient approach and its principal benefits include significant time and resource savings.

2 - Is Modeling Consideration Important to Product Strategy?

W. Ross Morrow, Assistant Professor, Iowa State University, 2104 Black Engineering Building, Ames, IA, 50011, United States of America, morrowwr@gmail.com, Minhua Long, Erin MacDonald

Operations researchers adopt marketing models of consumer choice to optimize decisions. Recent marketing research has shown that modeling non-compensatory consideration set formation improves model predictive power, but does not link this improvement to better strategic decisions. We compare decisions made using traditional compensatory choice models versus non-compensatory "consider-then-choose" models using a simulation based on a 2008 study of consideration in the new vehicle market.

3 - Linking Design and Engineering

Golnoosh Rasoulifar, Post Doctoral Research Fellow, University of Michigan, 3835 Green Brier Blvd 291B, Ann Arbor, MI, 48105, United States of America, golnoosh@umich.edu

Design of branded products involves consideration of both perceptual aspects of the product appearance (related to emotions and brand values) as well as the technical and engineering aspects. This research investigates the proposition and the evaluation of three potential approaches to support communication between product designers and engineering designers. An integration approach is also proposed following the three steps of modeling, transforming and integrating engineering and design.

4 - Estimating Expected Information Gain for Designing Calibration Experiments with Multiple Observables

Diane Villanueva, Research Engineer, Universal Technology Corporation, 1270 North Fairfield Rd, Dayton, OH, 45432, United States of America, diane.villanueva.ctr@us.af.mil, Benjamin Smarslok

The design of hypersonic air vehicles involves coupled interactions of physics, which are approximated by computational models and observed in a limited number of experiments. Global sensitivity analysis results are used with expected information gain for optimal design of an experiment for calibration of aerothermal models. The expected information gain will not only be used to compare specimen designs, but also the observables which provide the best trade-off with expected information gain.

Supply Chain, Design and Services

Contributed Session

Chair: Amir Masoumi, Assistant Professor, Manhattan College, 4513 Manhattan College Parkway, DLS 504, Riverdale, NY, 10471, United States of America, amir.masoumi@manhattan.edu

1 - A Supply Chain Network Model for Biological Medicinal Products

Amir Masoumi, Assistant Professor, Manhattan College, 4513 Manhattan College Parkway, DLS 504, Riverdale, NY, 10471, United States of America, amir.masoumi@manhattan.edu, Ashley Bowman

We develop a network model for the supply chain of "similar biological medicinal products". Often referred to as "biosimilars", these drugs have an active substance made by a living organism rather than being chemically synthesized. Our proposed multi-period framework captures inherent complexities in the manufacturing and inventory management of such sensitive products.

2 - Financing Contract For a Capital-constrained Newsvendor under Asymmetric Information

Kening Liu, Nanjing University of Science and Technology, Business School 624 Room, Xiaolingwei 200, Nanjing, 210094, China, kellyliu930@gmail.com, Huaming Song

This paper illustrates how a liquidity-constrained newvendor borrows funds from bank to procure the expect quantity. Since demand and selling price information is asymmetric to the bank, we design a screening model for both the bank to determine the interest rate and the retailer to optimize his procurement order. We uses Stackelberg game for newsvendor to make a strategic decision of how much to finance additional procurement.

3 - Integrated Optimization Model of Supply Chain Configuration for New Products with Two-Segment Market

Mehdi Amini, Professor, The University of Memphis, Fogelman College of Business & Economics, Department of Marketing & SCM, Memphis, TN, 38152, United States of America, mamini@memphis.edu, Haitao Li

We present an integrated optimization model to capture Supply Chain Configuration (SCC) for new products with the dual market. Computational comparison of one- versus two-segment market is offered based on 26 categories of consumer electronic products. We show that the dual-market consideration significantly improves the SCC profits over the single-market.

4 - Information Sharing in Two-stage Service Operations

Jin Kyung Kwak, Assistant Professor, Ewha Womans University, Ewhayeodaegil 52, Seoul, 120-750, Korea, Republic of, jkkwak@ewha.ac.kr

This study investigates a two-stage service operation to evaluate the value of information sharing between the stages. The demand observed at the first stage may be useful information to allocate labor capacity. By conducting extensive computational study, we can get some insights about information sharing in service operations.

5 - An Exploration of Industrial Vending Use within the Supply Chain

John Kros, Professor, East Carolina University, 3205 Bate, Greenville, NC, 27858, United States of America, krosj@ecu.edu, Jon Kirchoff

Industrial vending represents a very specific form of VMI that blends the benefits of point-of-need convenience, cost containment and control inherent to traditional consumer vending systems with the benefits of VMI in order to afford users access to real time information and the ability to assign costs more accurately. This study utilizes data obtained via a modified VMI survey instrument developed by Claassen in conjunction with transaction cost theory in order to test a proposed SEM model.

Optimal Pricing in E-commerce

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Wenbo (Selina) Cai, Assistant Professor, New Jersey Institute of Technology, MEC 308, University Heights, Newark, NJ, 07102, United States of America, cai@njit.edu

1 - Revenue-maximizing Pricing and Scheduling Strategies in Service Systems with Flexible Customers

Qiaochu He, University of California-Berkeley, Berkeley, CA, United States of Americaheqc0425@berkeley.edu, Ying-Ju Chen

Motivated by the presence of bilingual customers in the call centers, this paper investigates the design of service systems with flexible and dedicated customers. The service provider attempts to maximize revenue through jointly optimal pricing and scheduling. We analyze the system performances under different information structures and discriminatory service mechanisms, and illustrate the impacts of information asymmetry on the interplay between the flexible customers and the dedicated ones.

2 - Dynamic Pricing with Time-inconsistent Consumers

Xiangyu Gao, Department of Industrial and Enterprise Systems Engineering, University of Illinois at Urbana-Champaign, Room 04 Transportation Building, 104 S. Mathews, Urbana, Il, 61801, United States of America, xgao12@illinois.edu, Xin Chen, Ying-Ju Chen

We propose a dynamic pricing model in which consumers exhibit time-inconsistent behaviors, which is modeled by quasi-hyperbolic discounting, and may be partially aware of their self-control issues. We characterize the subgame perfect equilibrium for the full spectrum of consumers' naivete. Interestingly, consumers' time-inconsistent behaviors can actually boost the seller's profit. However, given time inconsistency, consumers' naivete may undermine the seller's profitability.

3 - New Product Pricing Strategy in the Social Media Era

Xiuli He, Associate Professor, UNC Charlotte, 9201 University City Blvd, BISOM Dept., Charlotte, NC, 28223, United States of America, xhe8@uncc.edu, Subodha Kumar, Qinglong Gou, Juzhi Zhang

With the popularity of various social media platforms, the impacts of the word of mouth effect and the reference price effect on a consumer's purchasing behavior have been significantly amplified in the current era. We incorporate these two effects into a two period pricing model to investigate whether and in which condition should a firm utilize a skimming or a penetration price strategy. Our results show how these two effects influence a firm's pricing strategy when he launches a new product.

4 - The Role of Social Planner in Closed-loop Supply Chain

Lan Wang, Student, University of Florida, 355B STZ, Gainesville, FL, 32603, United States of America, lan.wang@warrington.ufl.edu, Tharanga rajapakshe, Asoo Vakharia

Our paper studies the problem of legislation practices on who should be responsible for recycling, and compares the existing mechanisms on the efficiency of environmental protection. In particular, we compare three models, consumer-paid model(the social planner charges the consumer an electronic waste recycling fee), OEM-paid model(the social planner collects annual fees from OEM for recycling and disposal treatment) and OEM-recycling model(the OEM is responsible for recycling).

Sales Optimization Management System – A Combined Optimization and Statistical Approach to Proactively Managing Enterprise Sales Resource Requirements and Sales Forecasting & Funnel Management.

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: John Ryan, President, ORM Technologies, 4300 N. Central Expressway, Suite 365, Dallas, TX, 75206, United States of America, john.ryan@orm-tech.com

1 - Sales Headcount & Funnel Management Optimization – Quantifying the Risk in Sales Forecasting

John Ryan, President, ORM Technologies, 4300 N. Central Expressway, Suite 365, Dallas, TX, 75206, United States of America, john.ryan@orm-tech.com

This presentation outlines the design and actual implementation methodology of a Sales Headcount and Funnel Management Optimization System provided as a software as a service solution. The design approach is a unique combination of statistical cluster analysis and optimization to create a sales management system that defines the optimal headcount to achieve the company goals while also providing an optimal minimum sales deal flow required to the meet the company goals.

2 - Statistical Cluster Analysis as a Foundation for Estimating Future Revenues

Ryan Cooper, Vice President, ORM Technologies, 4300 N. Central Expressway, Suite 365, Dallas, TX, 75206, United States of America, ryan.cooper@orm-tech.com

This presentation documents the implementation approach to utilizing statistical cluster analysis to predict the revenue associated with a given sales funnel as recorded in Salesforce.com. The presentation will cover the methods utilized to not only predict the estimated revenue of categories of opportunities, it will also outline the methods used to determine the fallout" rate of opportunities and then outline the reporting process to quantify the risk vs. the planned revenue targets.

3 - Sales Optimization – Implementation Methods, Challenges and Outcomes

David Wagner, President, Entrust, 5430 LBJ Freeway, Suite 1250, Dallas, TX, 75240, United States of America, david.wagner@entrust.com

This presentation outlines the client experience of implementing a sales headcount optimization system combined with a sales opportunities statistical/optimization system. The presentation will outline the data input requirements and challenges. The system implementation lessons and the resulting benefits that resulted from implementing the system. The resulting benefits will include expected cost savings, revenue enhancements and the benefit of proactive identification of future revenue risks.

Sustainable Transportation/Logistics System Design

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Guangrui Ma, The Hong Kong University of Science and Technology, Room 3208, Dept. of IELM, Clear Water Bay, Kowloon, Hong Kong - PRC, magr@ust.hk

1 - Coping with Uncertainties in Biofuel Supply Chain Design: A Continuum Approximation Approach

Xin Wang, PhD Candidate, University of Illinois at Urbana-Champaign, 205 N. Mathews Ave, Urbana, Il, 61801, United States of America, wangxin1@illinois.edu, Michael Lim, Yanfeng Ouyang

Rapid growth of biofuel industry brings challenges to its supply chain design coping with yield and disruption uncertainties under large-scale land use competition with the incumbent food market. We develop a game-theoretical modeling framework based on a continuum approximation to address the problem. Hypothetical problems and a U.S. Midwest case study are provided to show the algorithm effectiveness and managerial insights.

2 - Selection of Suppliers under Yield Uncertainty

Yan Li, PhD Candidate, HKUST, 3208, HKUST, Clear Water Bay, Hong Kong, Hong Kong - PRC, yliaj@ust.hk, Ho-Yin Mak

The selection of suppliers is a critical decision faced by all supply chain managers. We study the procurement problem for a manufacturer under supply uncertainty, where data on supply yield is limited. Using a distributionally-robust optimization model, we draw insights on the firm's optimal supplier selection and ordering strategies.

3 - Flexible Urban Car Sharing System Design and Operations

Guangrui Ma, The Hong Kong University of Science and Technology, Room 3208, Dept. of IELM, Clear Water Bay, Kowloon, Hong Kong - PRC, magr@ust.hk, Ho-Yin Mak

Car sharing becomes a popular solution to balance individual mobility and sustainability. However the unbalanced vehicle flow makes it difficult to match driving demand and vehicle availability, and leads to low vehicle utilization. In this paper, we propose two methods from revenue management perspective: 1) implementation of dynamic surcharge fees; 2) controlling vehicle returning destination, to overcome the above challenge. Finally, we compare the efficiency of the two strategies.

4 - A Review of Stabilizing Grand Coalition in Unbalanced Cooperative Game

Lindong Liu, PhD Candidate, Hong Kong University of Science and Technology, Room 5567, Academic Building, Hong Kong, Hong Kong - PRC, ldliu@ust.hk, Xiangtong Qi

Recently, stabilizing grand coalitions in unbalanced cooperative games are receiving increased attention. In this talk, we focus on the so called operations research game whose characteristic function is defined by an optimization problem. To stabilize its grand coalition, we first survey several types of instruments, including subsidy, penalty, simultaneous subsidy and penalty, and restricted coalition. Then, we show some new instruments by modifying the parameters of the optimization problem.

Traffic Management II

Contributed Session

Chair: Regina Clewlow, Postdoctoral Scholar, Stanford University, Y2E2 Building, Room. 390C, 473 Via Ortega, Stanford, CA, 94305, United States of America, rclewlow@stanford.edu

1 - Forecasting Traffic Counts for High Tourism Areas

Joseph Wilck, East Carolina University, 204 Slay Building, Mail Stop 117, Greenville, NC, 27858, United States of America, joe.wilck@gmail.com

This presentation focuses on developing a method to predict tourist traffic. An implementation strategy for interpreting traffic counts in high tourism areas is provided to aid in the development of Comprehensive Transportation Plans (CTP). Because of the high variability of traffic counts in high tourism areas, it is unreasonable to apply the typical weekday traffic count as the baseline metric for developing the CTPs for these areas.

2 - Crash Prediction using Traffic Data

Kasun Wijayaratna, University of New South Wales, UNSW, Civil and Environmental Engineering, H20, CE111, Sydney, 2174, Australia, kasun.w@unsw.edu.au, Sisi Jian, Vinayak Dixit

Crash statistics and traffic flow data of four major motorways within the Sydney metropolitan area was used to develop a joint real time crash and severity prediction model. Statistical techniques were initially utilized to determine effects of various traffic flow parameters on the likelihood of crash involvement and the severity level. The predictions of these models were then evaluated over different time horizons. Finally, the models are cross validated between the motorways.

3 - using Analytics to Assess the Effect of Alcohol, Unemployment, and Education on Vehicle Fatalities

Hassan Marzoughi, Louisiana State University, 275 W. Roosevelt St., Apt # 2257, Baton Rouge, LA, 70802, United States of America, hmarzo2@tigers.lsu.edu, Helmut Schneider

This paper uses analytics to assess the relationship between alcohol uses, unemployment and education level of a state to predict motor vehicle fatalities. Employing descriptive and predictive analytics U.S. crash and census data are used to gain insight into factors that affect the vehicle fatalities in states.

4 - The Impact of Carsharing on Alternative Vehicle Ownership

Regina Clewlow, Postdoctoral Scholar, Stanford University, Y2E2 Building, Room. 390C, 473 Via Ortega, Stanford, CA, 94305, United States of America, rclewlow@stanford.edu

Over the past decade, carsharing has grown considerably, particularly in major metro areas. Utilizing California travel survey data, this paper presents an analysis of vehicle ownership among carshare adopters vs. non-adopters utilizing multinomial logit models. After controlling for demographic factors, a statistically significant relationship between carsharing and alternative vehicle ownership was found.

Disaster and Emergency Management 2

Contributed Session

Chair: Paul Cronin, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, paul.cronin@utexas.edu

1 - Locating Mobile Telecommunications Infrastructure in Extreme Events

Nannan Chen, Industrial and Systems Engineering - Texas A&M University, 3131 TAMU, College Station, TX, 77840, United States of America, nnchen@tamu.edu, Justin Yates

This research develops an integer formulation for locating mobile telecommunications equipment in the context of regional hurricane evacuation to temporarily alleviate cellular system stress. Agent-based simulation modeling is used to investigate the effectiveness of telecommunications equipment location given the inherent diversity and uncertainty of individual decision-making during evacuation.

2 - Managing Inventory under Catastrophe Risk

Bahar Biller, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, billerb@andrew.cmu.edu, Elliot Wolf, Enver Yucesan

We study the problem of managing inventory when the facilities storing inventory have exposure to catastrophic events such as fires, tornados, floods, and earthquakes. We develop a graphical model to capture not only the individual catastrophe risk at a single location but also the spatial dependencies among events across locations. Combining our catastrophe risk model with simulation optimization, we identify how to optimally manage inventory while hedging against catastrophe risk.

3 - Optimal Procurement Policies for Goods from Genuine and Potentially Counterfeit Sources

Laura Wagner, Zaragoza Logistics Center, C/ Bari 55, Edificio N-yade 5, Zaragoza, 50197, Spain, laurawa@mit.edu, Mahmut Parlar, Mustafa Cagri Gürbüz

Dispensers frequently faced with shortages of medicines from their main source. These periods are exploited by some distributors to breach supply chains and push counterfeits, forcing dispensers to implement measures to mitigate social/financial costs. We study dispenser's replenishment policies under various detection methods and determine the optimal strategy to safeguard against spurious drugs, and quantify the optimal procurement decisions in a dual-supplier and multi-period setting.

4 - A Decision-Theoretic Model for Hurricane Inventory Planning
Paul Cronin, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78712, United States of America, paul.cronin@utexas.edu, Douglas Morrice, John Butler, Fehmi Tanrisever

As a hurricane nears the coast, consumers stock up. Inventory allocation is challenging for retailers in the region. We use an econometric model to estimate demand using actual purchase data and NOAA data from 2003-2008. A stochastic inventory model is used to investigate the optimal timing and level of inventory allocation. We develop insights into the relationships among holding costs, shortage costs, initial inventory, and the value of a two-stage allocation policy.

Transportation, Freight

Contributed Session

Chair: Kamal Lamsal, Emporia State University, S243, PBB, Emporia, KS, 52246, United States of America, kamal-lamsal@uiowa.edu

1 - Sugarcane Harvest Logistics in US
Kamal Lamsal, Emporia State University, S243, PBB, Emporia, KS, 52246, United States of America, kamal-lamsal@uiowa.edu, Barrett Thomas, Philip Jones

Louisiana sugarcane farms start harvesting early in the morning and deliver most of the cane to the mill within a few hours. The mill requires a steady supply, so current practice creates a mismatch between cane supply and demand, resulting in longer turn-around times for trucks at the mill which increases the number of trucks needed to haul the cane. We present a field logistics model that spreads arrivals at the mill to match cane supply and demand, thereby reducing turn-around time and cost.

2 - Strategies for Recovery from Railroad Disruptions
Manish Verma, Associate Professor, McMaster University, 1280 Main Street W, Hamilton, ON, L8S 4M4, Canada, mverma@mcmaster.ca, Elkafi Hassini, Nader Azad

Railroads can be disrupted due to accidents, work stoppages or natural disasters. In such events shipments may be delayed or damaged. In this presentation we propose a model for timely and efficient recovery from such disruptions in order to maintain high customer service levels.

3 - Transportation Options and Indexes
Ronald Lembke, Associate Professor, University of Nevada, MGRS / 0028, Reno, NV, 89503, United States of America, ronlembke@unr.edu, Dale Rogers

Transportation options provide the buyer the right, but not the obligation, to buy or sell transportation capacity at a future date. These options can provide shippers, carriers and logistics companies a significant opportunity to reduce risks and increase capacity flexibility. This paper summarizes some of these benefits, describes a number of issues to be resolved before trading transportation options can become a reality, and presents possible resolutions for these issues.

4 - Impact of Tollway Polices on Truck Route Selection for Shipping Containers of Specific Commodities
Mazen Hussein, Assistant Professor, University of Wisconsin Platteville, 1 University Plaza, Platteville, WI, 53818, United States of America, husseinm@uwplatt.edu

The cost model for shipping commodities by truck developed by Hussein M. (2010) is extended to consider the impact of tollway polices on truck route selection for shipping containers of specific commodity groups near a container terminal. A path-finding model is built for this purpose. The values of time were used to mimic the truck's choices to ship containers of different commodities between container terminal and different facilities.

5 - Exploring Shipper-Carrier Dynamics in a Truckload Environment
Alex Scott, PhD Student, Penn State University, 463 A Business Building, State College, PA, 16802, United States of America, alexscott@psu.edu, Chris Parker, Chris Craighead

Shippers share a common pool of for-hire truckload transportation providers. Short-term imbalances in supply and demand conditions can cause significant volatility in service levels and the cost of moving freight. When carriers reject tendered freight, shippers engage the spot market. The literature has acknowledged that not much is known about freight rejection and spot market prices. In this study, we explore shipper-carrier dynamics using a transactional data set from a large US shipper.

Supply Chain, Shipping and Transportation

Contributed Session

Chair: Yann Bouchery, Ecole de Management de Normandie, 30, Rue de Richelieu, Le Havre, 76087, France, y.bouchery@tue.nl

1 - Raw Material Transportation System in Iron-steel Industry with Data-driven Consideration
Defeng Sun, PhD Candidate, The Logistics Institute, Northeastern University, NO. 3-11, Wenhua Road, Heping District, Shenyang, 110819, China, cdfsun@gmail.com, Lixin Tang

We considered the transportation system of multiple raw materials in iron-steel industry with a central warehouse and multiple production plants. The demand of each plant is uncertain and hard to predict, so we apply a data-driven approach to minimize the associated transportation and inventory costs.

2 - Modeling the Impact of Social Media on Collaborative Freight Transport
Michael Bartolacci, Pennsylvania State Univesity, Berks, Reading, PA, 19610, United States of America, mbartolacc@aol.com, Yasanur Kayikci

Collaborative transport is an ever-growing area of logistics and supply chain management. We investigate how to model the use of social media and utilize it in optimizing collaborative freight transport.

3 - Model and Analysis of Products Damage in Supply Chain Network
Samir Alsobhi, PhD Student, Wichita State University, 11328 E. Pine Meadow Ct., Wichita, KS, 67206, United States of America, saalsobhi@wichita.edu, Abdulaziz Almaktoom, Krishna Krishnan, Deepak Gupta

Supply chain complexity and uncertainty of transportations hazards and packaging quality increases product damages during shipping. Appropriate packaging quality and transportation method will help to reduce damage cost. A mathematical model has been developed and programed in MATLAB to find the best routes and packaging to minimize the cost of damages in transit. Case studies have been developed and implemented to illustrate and validate developed model.

4 - Cargo Driven Container Logistics for Fresh Products in the Netherlands
Yann Bouchery, Ecole de Management de Normandie, 30, Rue de Richelieu, Le Havre, 76087, France, y.bouchery@tue.nl, Jan C. Fransoo

To improve the competitiveness of hinterland supply chains, the traditional focus on containers has to be complemented by a focus on the cargo inside the containers. When taking this cargo driven perspective, new supply chain solutions such as cross-docking may be developed. This paper aims at identifying the key logistics factors affecting the location of a cross-docking facility by taking the example of the import of fresh products in the Netherlands.

5 - Determining Road Toll Charges: A Reference Model
Mario Dobrovnik, Research Associate, Vienna University of Economics and Business, Welthandelsplatz 1, Vienna, 1020, Austria, mario.dobrovnik@wu.ac.at, Sebastian Kummer

Numerous European countries have introduced road tolls as a means of traffic guidance and control. These policy decisions have significantly affected entire economic regions as well as individual companies along the supply chain. For transport companies, passing the additionally incurred cost to the (final) customer as reasonably as possible therefore is of utmost importance. We propose a reference model that allows for determining the additional toll costs for individual shipments.

New Concepts to Minimize Delay in Terminal Area Operations

Sponsor: Aviation Applications

Sponsored Session

Chair: Heng Chen, Isenberg School of Management, University of Massachusetts, Amherst, MA, 01003, United States of America, heng@som.umass.edu

1 - Distance vs. Time Based Metering in Optimized Profile Descent Operations

Heng Chen, Isenberg School of Management, University of Massachusetts, Amherst, MA, 01003, United States of America, heng@som.umass.edu, Senay Solak

One of the NextGen operational concepts is the introduction of time-based metering, which is typically viewed as being more efficient. In this paper, we explore the optimal sequencing and spacing policies under the context of Optimized Profile Descent. Potential fuel and environmental savings are provided. A comparison between time-based metering method and distance-based metering is presented.

2 - The Departure Regulator

John-Paul Clarke, Associate Professor, Georgia Institute of Technology, 270 Ferst Drive, Atlanta, GA, 30332, United States of America, johnpaul@gatech.edu

Seventy percent of US airline passengers use at least one of the 35 OEP airports that serve major metropolitan areas, and 23 of these OEP airports have at least one pair of closely spaced parallel runways. The capacity of CSPRs and thus airport delay are strong functions of weather, therefore there is a great need for concepts and technologies that increase capacity in bad weather. To this end, we present a new concept of operations that increases the bad-weather capacity of CSPRs by up to 34%.

3 - Data-driven Approaches for Robust Airline Resource Allocation under Uncertainty

Lavanya Marla, University of Illinois, Urbana, IL, United States of America, lavanyam@illinois.edu, Vikrant Vaze, Garrick Li

We address the issue of pro-actively building robust airline networks that are less vulnerable to uncertainty. We demonstrate the necessity of data-driven models in the context of aviation and present new data-driven approaches that (i)are faithful to implicit information in the underlying data, and (ii)are less fragile to disruption. We conclude with results from a real-world case study.

4 - Managing Demand Uncertainty through En Route Speed Control

James Jones, University of Maryland, College Park, MD, 20742, United States of America, jonesjc1@umd.edu, David Lovell, Michael Ball

We present an approach for transferring terminal delay to the en route phase of flight. We propose two integer programming models designed to assign delays to flights in advance of the terminal. The first model attempts to assign controlled times of arrival to flights by reducing airborne queuing delay while the second reduces the probability of scheduling conflicts. Each model effectively transfers delay en route and yields significant fuel savings benefits on a per flight basis.

1 - Optimal Responses to Stockouts: Lateral Transshipment versus Emergency Order Policies

Yi Liao, Southwestern University of Finance and Economics, 555 Liutai Ave, Chengdu, China, yiliao@swufe.edu.cn, Xinxin Hu, Wenjing Shen

When a stockout takes place, retailers often apply one of two strategies to resolve the issue ñ placing an emergency order or arranging a lateral transshipment. Choosing the optimal response to a stockout is complicated by customers' spontaneous reactions. In this study, under a single-period setting with two retail stores, we investigate the optimal inventory decisions under each strategy, and conduct a comparison between lateral transshipment and emergency order options.

2 - Optimal Decisions in Production-inventory System with Demand and Production Disruptions

Haiyan Wang, Southeast University, School of Economics and Management, Nanjing, China, hywang@seu.edu.cn, Xiaolin Xu

The paper discusses the optimal production-inventory decisions in a production-inventory system for products which have the characteristic of perishable items with demand and production disruptions. In order to lower the cost, we address these issues and propose optimal production run time, replenishment time and order quantity for manufacturer.

3 - Component Procurement Strategies in Decentralized Assembly Systems under Supply Uncertainty

Wenting Pan, Assistant Professor, Saint Mary's College of California, 380 Moraga Road, Moraga, CA, 94597, United States of America, wp3@stmarys-ca.edu, Rick So

We analyze the interactions among the assembler and two component suppliers in their procurement decisions under a vendor-managed inventory contract. We assume that one of the component suppliers suffers from the random yield. We first analyze the special case under deterministic demand, and then extend our analysis to the general case under stochastic demand. We derive the optimal component prices offered by the assembler and the equilibrium production quantities of the component suppliers.

4 - The Effect of Manufacturer-to-Consumer Rebates in Competition Environment

Pengyu Chen, PhD Student, Huazhong University of Science & Technology, School of Management, 1037 Luoyu Road, Wuhan, China, andychen@hust.edu.cn, He Xu, Shilu Tong

Previous research shows that M-to-C rebates help to manage strategic inventory in a serial supply chain. This paper extends this research by examining how competition from upstream firms or downstream firms may influence this effect of rebates. Our results show that this effect always exists under the downstream competition but may disappear if the upstream competition is intensive. We also observe that the intensity of competition has a negative externality towards the usage of rebates.

Chair: Baozhuang Niu, Assistant Professor, Sun Yat-sen University, Lingnan College, No. 135, Xingangxi Road, Guangzhou, China, niubzh@mail.sysu.edu.cn

1 - Personalized Price Optimization through Controlled Price Experimentation

Yan Zhao, Graduate Student, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, zhaoyanmit@gmail.com, Xiao Fang, David Simchi-Levi

We consider the situation where customers can be randomly assigned to different groups and correspondingly offered different prices for a particular product. Customers' purchasing decisions, together with their characteristics, are observed. Our objective is to choose the revenue-maximizing price for each point in the space of customer characteristics.

2 - When and How to Rely on the Free-ride of Word of Mouth for a New Product Introduction

Vahideh Abedi, Assistant Professor, California State University Fullerton, Information Systems & Decision Sciences, 800 N State College Blvd, Fullerton, CA, 92834, United States of America, vabedi@fullerton.edu, Oded Berman, Dmitry Krass

The success of introduction of a new product or service significantly depends on the firm's marketing strategies and the word of mouth spread about the product between customers. The firm can partly rely on customer word of mouth to reduce its marketing expenditures, but such a strategy might fail if not properly encouraged by the firm's marketing strategies. Using the Bass model for sales of a new product, we provide insights on how and when the firm can earn a free ride from word of mouth.

3 - Manufacturer Warranties for Durable Goods and Channel Structure

Zeynep Kirkizoglu, MAN Truck and Bus Turkey, Esenboga Havalimani Yolu 22.km, Akyurt, Ankara, 06750, Turkey, zeynep.kirkizoglu@man.eu, Ozgen Karaer

Durable goods manufacturers usually provide sales and aftersales services through retailers. Especially aftersales revenues are essential for retailers that provide both the repair services for the manufacturer during the warranty period and all other repair and maintenance services demanded by the customer. In this study, we look into how the warranty period affects aftersales revenues, and the decisions made by the manufacturer and the retailer accordingly.

4 - Quality Yield Risk and Optimal Sourcing in a Co-opetitive Supply Chain

Baozhuang Niu, Assistant Professor, Sun Yat-sen University, Lingnan College, No. 135, Xingangxi Road, Guangzhou, China, niubzh@mail.sysu.edu.cn, Jiawei Li

Consider a co-opetitive supply chain comprising an OEM and a competitive supplier who provides qualified components, but also competes with the OEM in the downstream market. OEM may shift orders to a non-competitive supplier whose products have quality yield risk. We analyze the value of dual-sourcing for the OEM and the competitive supplier's optimal response.

Sponsored Session

Chair: Kwang-Jae Kim, Professor, Postech, Eng. Bldg. 4-316, 77 Cheongam-ro, Nam-gu, Pohang, Korea, Republic of, kjk@postech.ac.kr

1 - Analysis of Vehicle Operational Data for Driving Safety Enhancement

Min-Jun Kim, PhD Candidate, Postech, Eng Bldg. 4-316, 77 Cheongam-ro, Nam-gu, Pohang, Korea, Republic of, minjun@postech.ac.kr, Kwang-Jae Kim, Ki-Hun Kim, Chang-Ho Lee

The Korean government developed a system to collect the operational data of commercial vehicles. This talk presents an analysis of the operational data collected in conjunction with traffic accident data. The goal of the analysis is to gain insights for the development of new service concepts for driving safety enhancement. The relationship between the driving patterns and accident history of drivers is identified and utilized in developing service concepts supporting driving safety enhancement.

2 - Service Process Design for Hypertension Patient Management Services

Ryeok-Hwan Kwon, PhD Candidate, Postech, Engineering Building #4-316, Pohang, 790-784, Korea, Republic of, klh1706@postech.ac.kr, Ki-Hun Kim, Kwang-Jae Kim, Sung-Hong Kang, Yea-Eun Kim

The National Health Insurance Service of Korea has collected health service data of nearly all the citizens since 2001. This research aims to develop a new service model for hypertension patient management using a sample of the data set. This talk focuses on the process of designing and evaluating the service production and delivery processes reflecting the characteristics of target customers. The processes for a service supporting blood pressure self-control will be presented as an example.

3 - Development of Healthcare Service Concepts using National Health Insurance Service Database in Korea

Ki-Hun Kim, PhD Candidate, Postech, Eng Bldg. 4-316, 77 Cheongam-ro, Nam-gu, Pohang, Korea, Republic of, ksw12312@postech.ac.kr, Chi-Hyuck Jun, Chie-Hyeon Lim, Sung-Hong Kang, Kwang-Jae Kim

In Korea, the National Health Insurance Service (NHIS) has collected insurance and medical record data of nearly all the citizens since 2001. We developed eight new healthcare service concepts which utilize the NHIS database. In this talk, we present how the new service concepts were developed. We also discuss some challenges of developing healthcare service concepts.

Chair: Augustine Osagiede, Professor, University of Benin, Ugbowo-Lagos Road, Benin City, Nigeria, augustine.osagiede@uniben.edu

1 - How Can Wholesale Price Contract Coordinate Supply Chain

Chongqi Wu, Associate Professor of Management, Cal State East Bay, 25800 Carlos Bee Blvd, Hayward, CA, 94542, United States of America, chongqi.wu@csueastbay.edu

Based on classic Hotelling model, I demonstrate that wholesale price contract and its derivative, two-part tariff contract, can coordinate a simple two-echelon supply chain, either with or without asymmetric information. Under some realistic conditions, not only is supply chain coordinated, both supply chain members make positive profits.

2 - The Transient Per Capita Income Shares in Continuous-time From a Tax-subsidy Perspective

Augustine Osagiede, Professor, University of Benin, Ugbowo-Lagos Road, Benin City, Nigeria, augustine.osagiede@uniben.edu, Virtue Ekhosuehi

We consider a scenario where individuals in an economy are classified according to their income. We determine the transient per capita income shares. The idea of entropy is employed as a theoretical underpinning to attain even per capita income shares. We provide a guide on subsidy selection from several alternatives.

3 - Rent Contracts Between Co-Stores

Lama Moussawi-Haidar, Assistant Professor, American University of Beirut, PO Box 11-0236 Riad El Solh, Beirut, 1107-2020, Lebanon, lm34@aub.edu.lb, Nagihan Comez Dolgan

High rental rates and space scarcity are pushing retailers to cooperate. One way of cooperating is co-location, where a retailer rents out some of his available floor space to another retailer. Using the double moral hazard theory, we show that a percentage revnue sharing contract results in the second-best optimal solution for the landlord. We analyze the properties of optimal contract, by assuming a Cobb-Douglas sales functions and exponential disutility functions of efforts.

4 - Impact of Upstream Strategic Alliance on Downstream Horizontal Competition

Jooyol Maeng, Assistant Professor, Pacific Lutheran University, 12180 Park Ave. S., Tacoma, WA, 98023, United States of America, maengjy@plu.edu

This paper examines a competition between two retailers sharing one upstream supplier. Dynamics between downstream firms is investigated when one of them has a strategic alliance with the supplier.

1 - Innovation Diffusion in Citation Network

Chuanzhen Wu, Xiamen University, China, Boston University, Boston, MA, wuchzhen@126.com, Di Xu

This paper tries to use some open dataset to find the network structure and statistics of citation network. Characteristics for innovation diffusion process will be discovered and discussed.

2 - The Geography of Imitation: Global Innovation Ecosystems and the Risk of Being Infringed

J. Nils Foege, Research Associate, RWTH Aachen University, Kackertstrasse 7, Aachen, 52072, Germany, foege@time.rwth-aachen.de, Torsten-Oliver Salge, Erk Peter Piening

Firms are increasingly embedded in global innovation ecosystems, which enhance the potential for both valuable knowledge inflows and unintended knowledge leakage. Our analyses of 612 German manufacturing firms reveal the risk of collaboration-induced infringement of technical inventions to be greatest for those firms with a wide set of geographically distant innovation partners and a strong innovation track record increasing their perceived attractiveness as an imitation target.

3 - Startup Accelerators: The Role of Networks and Prior Experience

Jorge Mejia, PhD Candidate, University of Maryland, 421 A St NE #4, Washington, DC, 20002, United States of America, jmejia@rhsmith.umd.edu, Anand Gopal

There are approximately 2,000 startup accelerators worldwide. These programs provide entrepreneurs with mentorship, networking, and often capital to launch their business. Despite their importance in the current startup ecosystem, accelerators remain understudied in the management literature. Using team-level data from the full cohort of a major global accelerator, our study aims to understand the role of network ties and prior experience in the success of startups in these programs.

4 - Brazilian Laws of Industrial Property and Innovation: Analysis of Impact in Patent Applications

Suzana Russo, Dr, Federal University of Sergipe - UFS, Rua Josué de C. Cunha, Aracaju, SE, 49035490, Brazil, suzana.ufs@hotmail.com, Adonis Reis, Edilson Pires, Rafaela Silva, Ikaro Barreto, Stephane Fabris

This paper analyzes the behavior of the number of patent applications made in Brazil to identify the impacts, after the change in the Industrial Property Law. The analysis was performed globally, by residents and non-residents. Linear regression models were used. Data were analyzed seeking also compare and evaluate these indicators, so one can achieve a positive response or not for these law alterations, in order to support decision makers.

Sponsored Session

Chair: Karthik Natarajan, Carlson School of Management, 321 19th Ave South, Minneapolis, MN, 55454, United States of America, knataraj@umn.edu

1 - Models for Allocation and Inventory Management of Specialized Nutritious Foods

Melih Celik, Georgia Institute of Technology, 765 Ferst Dr. NW, Atlanta, GA, United States of America, melihcelik@gatech.edu, Ozlem Ergun, Pinar Keskinocak, Dima Nazzal

Specialized nutritious foods (SNF) are blended foods that contain a broad set of macro- and micro-nutrients to treat or prevent malnutrition. In this study, we consider the allocation of SNF from a central warehouse to distribution locations through (i) hubs that act as crossdocks, or (ii) district warehouses that hold stocks. Our models and solution approaches analyze the effects of network structure, uncertainty of demand, perishability, and equity considerations on the allocation structure.

2 - Quantifying the Impact of Decentralization through Robust Optimization

Luke Muggy, PhD Candidate, Kansas State University, Industrial and Manufacturing Systems Eng, 2037 Durland Hall, Manhattan, KS, 66502, United States of America, lmuggy@k-state.edu, Jessica Heier Stamm

Humanitarian operations are often characterized by decentralized decision making, in contrast to centrally coordinated actions. This research quantifies the impact of decentralized facility location decisions on beneficiary treatment access using a dynamic, robust facility location model as a centralized benchmark. The method is illustrated using data from the response to the 2010 Haiti cholera epidemic.

3 - Modeling for the Equitable and Effective Food Distribution under Uncertainty

Irem Sengul, North Carolina State University, 400 Daniels Hall College of Engineering, Raleigh, NC, United States of America, isengul@ncsu.edu, Julie Ivy, Reha Uzsoy

Our objective is to identify equitable and effective food distribution policies under conditions of uncertainty in partnership with a local food bank that provides food assistance to people at risk of hunger in 34 counties. The primary source of uncertainty is the county capacity that limits total food distribution due to equity requirements. We develop robust optimization and stochastic programming models for optimal food distribution under stochastic capacity constraints.

4 - Delivering Health Care to underserved and Impoverished Communities

Kingshuk Sinha, Professor, Mosaic Company Professor of Corporate Responsibility, Carlson School of Management, University of Minnesota, Minneapolis, MN, United States of America, ksinha@umn.edu, Emily Kohnke

We report the development of a framework to inform the delivery of socially responsible health care innovations in underserved and impoverished communities. The framework was developed through the application of grounded theory and empirical research methods. The setting for the study is an underserved and impoverished community in China.

1 - Logistical Impact of Stadium Locations for the Qatar 2022 FIFA World Cup

Agha Iqbal Ali, Professor, Department Isenberg School of Management, 121 Presidents Dr., University of Massachusetts, Amherst, MA, 01003, United States of America, aiali@isenberg.umass.edu, Ahmed Ghoniem, Mohammed Al-Salem

The number of venues for the twenty FIFA World Cups since 1930 has ranged from 3 to 20 and the number of participating teams has grown from 13 to 32. Due to the compactness of Qatar, the logistical impacts of different numbers and locations of venues can be significant for the Qatar 2022 FIFA World Cup. These impacts are studied in a scenario analysis using mathematical programming.

2 - Olympic Team Selection Optimization: The Dutch Speed Skaters Case

Gerard Sierksma, Professor, University of Groningen, PO Box 800, Groningen, 9747AE, Netherlands, g.sierksma@rug.nl

The Dutch speed skaters won 23 of the 36 medals during the Olympic Games. The success was preceded by a novel selection system. The IOC prescribes a maximum of 20 skaters so that choices between 500 and 5000m specialist needed to be made. We have applied an ILP-model with medal winning probabilities. We explain how this model was used for the final selection and elaborate on Gould's hypothesis: the differences between performances of top athletes become smaller and smaller over the years.

3 - Scheduling Games in Indian Premier League (IPL)

Amit Verma, Assistant Professor of Logistics, Delta State University, 120, Gibson Gunn Building, Cleveland, MS, United States of America, averma@deltastate.edu, Kamal Lamsal

Scheduling games in the IPL is a challenge. The global nature of the audience means that not all live broadcasts of games air during optimal viewing hours. TV viewership of a match is contingent on the presence of famous foreign players. These players drive the viewership in their respective countries of origin. The local timing of the live broadcast also impacts the viewership. We present a scheduling model that maximizes global TV viewership considering the constraints and discuss the results.

4 - Pathologies of Ranking: An Improvement to the Sensitivity of the Markov Method

Baback Vaziri, Purdue University, 315 N. Grant St., West Lafayette, IN, 47906, United States of America, bvaziri@purdue.edu, Tom Morin, Yuehwern Yih, PhD

The Markov method is a ranking method that uses Markov chains to rank items based on a collection of votes that represent pairwise comparisons between the alternatives. Its application spans from ranking webpages (PageRank) to sports teams. However, the Markov method has been shown to be sensitive to small perturbations, which can result in poor rankings. This study will propose a modified voting algorithm that will reduce the effect of unexpected results, and produce a more robust ranking.

5 - Stochastic Frontier Analysis Model of Players Performance Comparison for the NBA Teams

Wei Xiong, PhD Student, University of Cincinnati, 880 Rue de La Paix, Cincinnati, OH, 45220, United States of America, xiongwi@mail.uc.edu, Yi Tan

Instead of generally comparing all players in a league, we act ourselve as a manager of a NBA team, and then compare targeting players via stochastic frontier analysis model with only considering of the game strategy of our team". We create a mutual platform which connect all targeting players, and exclude the effect from each targeting player's original team. The goal of this project is to avoid the over-estimation and bias via players' performance comparison procedure for each team in NBA.

1 - An Empirical Analysis of Smartphone Diffusions by Mobile Platform

Daegon Cho, Assistant Professor, Pohang University of Science and Technology, 77 Cheongam-Ro, Nam-Gu, Pohang, 790-784, Korea, Republic of, dgcho@postech.ac.kr

This study examines the cross-country diffusion of the iPhone and the Android. A Bass diffusion model is applied, and we use a data set of aggregated smartphone sales from 15 countries between 2008 and 2013. Our result suggests that there would be a higher innovation effect for both platforms in developed countries than in developing countries. Our finding also suggests that the Android's diffusion negatively affects the iPhone's, but the iPhone's diffusion positively affects the Android's.

2 - A New Weighting Method of Measuring Corporate Social Performance (CSP)

Yoonsun Jeong, Masters Student, Korea University Business School, Anam-Dong, Seongbuk-Gu, Seoul, Korea, Republic of, yoonsun@korea.ac.kr, Shijin Yoo

The relationship between CSP and corporate financial performance(CFP) has been studied to find inconsistent results. This paper examines the possibility that the various ways of weighting CSP sub-dimensions can in fact determine the outcome of such results. A partial least squares model is proposed as a new way of weighting CSP sub-dimensions. In an empirical analysis using a database collected in Korea, the proposed PLS-weighted CSP only finds a significant relationship with CFP.

3 - An Empirical Analysis of Price Endings with Questionnaire data

YoshiyukiI Okuse, Professor, Senshu University, 2-1-1, Higashimita, Tama-ku, Kawasaki, Kanagawa, 2148580, Japan, okuse@isc.senshu-u.ac.jp

In the research area of pricing strategy, a lot of researches on price endings have been developed to date. This research attempted to specify the effect of price endings with data for Price Sensitivity Measurement (PSM). PSM is one of the most popular price research methods to understand consumers' acceptable price range. A questionnaire survey of Japanese people was conducted to collect PSM data. A total of 206 samples were collected for each of 9 product categories.

Health Care Process 2

Contributed Session

Chair: Fan Tseng, Professor of Management Science, University of Alabama in Huntsville, AL, 301 Sparkman Dr., College of Business, Huntsville, Al, 35899, United States of America, tsengf@uah.edu

1 - Can Hospitals Streamline Patient Flow Through Identifying Sources of Variation? A Case Study

Nasim Arbabzadeh, Rutgers, The State University of New Jersey, 96 Frelinghuysen Road, Piscataway, NJ, 08854-8018, United States of America, nasim.rutgers@gmail.com, Kian Seyed, Mohsen Jafari

Each hospital inpatient is classified into one of around 500 Diagnosis-Related Groups, and the hospital is paid a fixed amount irrespective of what it charges for. Therefore, it is logical to expect that by reducing the within DRG discrepancies, hospitals can cut cost and improve patient safety. This paper demonstrates the applicability of classical process control tools and data mining methods for variation reduction using a real case of a chest pain inpatient process in a New Jersey hospital.

2 - Balancing Outcomes of Care: Examining the Contribution of Nurse Staffing to Patient Outcomes

Fan Tseng, Professor of Management Science, University of Alabama in Huntsville, 301 Sparkman Dr., College of Business, Huntsville, AL, 35899, United States of America, tsengf@uah.edu, Karen Frith, Faye Anderson, Eric Fong

In this study, We investigate the relationship between nursing care resources and performance as indicated by multiple outcomes at the nursing unit level by applying the Data Envelopment Analysis technique to sample data collected from multiple hospitals. We also use multivariate statistical techniques to identify critical factors that determine the efficiency of a nursing unit.

3 - The Impact of Discharge Policies on the Efficiency of a Pediatric Ward

Robert Saltzman, Professor, San Francisco State University, College of Business, 1600 Holloway Ave., San Francisco, CA, 94132, United States of America, saltzman@sfsu.edu, Theresa Roeder, Judith Lambton

Hospital patients are often moved from one bed to another for both medical and non-medical reasons. In a highly-utilized in-patient pediatric ward that we have studied, bed and nursing resources are stressed not only by frequent movement of patients but also by the ward's patient discharge policy. We present a discrete-event simulation model for examining how patient movement and the ward's efficiency may be improved by a better discharge policy.

Risk Assessment in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Sanjay Mehrotra, Professor, Northwestern University, 2145 Sheridan Rd, Industrial Engineering and Mgmt. Sciences, Evanston, IL, 60208, United States of America, mehrotra@northwestern.edu

1 - Lifetime Risk Assessment in the Presence of Incomplete Data

Brittany Bogle, PhD Candidate, Northwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60201, BrittanyBogle2015@u.northwestern.edu

We assess lifetime risk of a binary outcome in a longitudinal cohort study. In a this type of dataset, variables are measured during each exam; however, participants miss exams, some data is missing, and not all variables are collected over all exams. We use a competing Kaplan-Meier approach to compute lifetime risk. Complete-case analysis results are presented as well as a comparison of imputation methods, using the Framingham Heart Study with an outcome variable of sudden cardiac death.

2 - A DOE Approach to Validation Sampling for Logistic Regression with Error-Prone Medical Records

Liwen Ouyang, Graduate Student, Northwestern University, 2145 Sheridan Rd, C217, Evanston, IL, 60208, United States of America, LiwenOuyang2011@u.northwestern.edu, Daniel Apley, Sanjay Mehrotra

Disease risk factors are often identified via logistic regression on medical record databases. However, high error rates in the recorded response (ICD-9 codes) will render the model unreliable unless a sample of cases are validated by manual chart review and incorporated into the modeling. In contrast to the random validation sampling used in existing approaches, we propose a new paradigm using DOE principles to judiciously select which cases to validate for maximum information content.

3 - Bayesian Component Selection in Multi-response Hierarchical Structured Additive Models

Kai Yang, Professor, Wayne State University, 4815 Fourth Street, Detroit, MI, 48201, United States of America, Saeede Ajorlou, Kai Yang

We develop a multivariate version of hierarchical structured additive regression (STAR) models involving a set of patient factors and also higher level effects to capture heterogeneity between patients within the same medical home team and facility. We propose a Bayesian component selection that allows inclusion or exclusion single effects as well as grouped coefficients representing particular model terms. A case study of from VA patient centered medical home data is presented.

Sponsored Session

Chair: Shan Liu, Assistant Professor, Industrial and Systems Engineering, University of Washington, UW Box 352650, Seattle, WA, 98195-2650, United States of America, liushan@uw.edu

1 - Bayesian Learning for Optimal Dosing in Adaptive Clinical Trials

Jakob Kotas, University of Washington, Applied Mathematics, Seattle, WA, United States of America, jkotas@uw.edu, Archis Ghate

We investigate the problem of finding optimal dosing policies in adaptive clinical trials while learning dose response parameters for a cohort of patients. We first study the clairvoyant case where we establish monotonicity of optimal doses in patient disease states. We then propose approximate dynamic programming methods to solve the full-scale optimal learning problem. Results will be illustrated through exponential and Michaelis-Menten dose response functions.

2 - Network Optimization of Functional Connectivity MRI to Detect Cognitive Decline

Daehan Won, PhD Sstudent, University of Washington, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98105, United States of America, wondae@uw.edu, W. Art Chaovalitwongse, Thomas J. Grabowski, Sherry Wills, Onur Seref, Paul Borghesani

We develop a sensitive non-invasive test to detect abnormal cognitive decline via fMRI. Default mode networks (DMN) have been identified to be sensitive to marker of abnormality. Since there is no exact physical information of the DMN, we suggest the k-cardinality tree (KCT) as a topological biomarker of functional connectivity network. In this study, we develop the IP model to find a KCT and conduct experiments to analysis our findings and provide the outcome from a population based comparison.

3 - Patient Transitions across Health Care Services: A Framework for Accountable Care Organizations

Zelda Zabinsky, Professor, University of Washington, Industrial & Systems Engineering, Box 352650, Seattle, WA, 98195-2650, United States of America, zelda@u.washington.edu, Joseph Heim, Paul Fishman

Managing care transitions is a critical aspect for successful implementation of Accountable Care Organizations (ACOs). We present a Markov model for how patients transition between and among providers and health care settings, using data from Group Health Cooperative with over 600,000 individuals enrolled. Our model allows us to explore different patterns of health service use and patient transitions in order to and assess the impact of alternative modes of care in particular medicine.

4 - Approximate Dynamic Programming for Advanced Scheduling with Cancellations and Overbooking

Mahshid Salemi Parizi, University of Washington, Industrial and Systems Engineering, Seattle, WA, United States of America, msalemip@uw.edu, Archis Ghate

Advanced scheduling arises in many applications including healthcare. The goal is to schedule randomly arriving jobs into future slots within a booking horizon. In practice, planners usually employ overbooking to mitigate adverse effects of cancellations. We present an MDP formulation of this problem and propose approximate dynamic programming methods for its solution. We compare the performance of these methods with simple heuristic scheduling policies.

Supply Chain Management XI

Contributed Session

Chair: Ramakrishna Govindu, Instructor, University of South Florida, 8350 N Tamiami Trail, SMC-C263, Sarasota, FL, 34243, United States of America, rgovindu@usf.edu

1 - Minimizing Penalties in Supply Chain Scheduling Involving Multiple Customers

Ramakrishna Govindu, Instructor, University of South Florida, 8350 N Tamiami Trail, SMC-C263, Sarasota, FL, 34243, United States of America, rgovindu@usf.edu, Anurag Agarwal

We propose models, heuristics and results for a supply chain scheduling problem involving multiple customers operating in a just-in-time environment. The objective is to minimize penalties for late deliveries. The proposed heuristics involve splitting deliveries and lots to achieve its objectives.

2 - Pricing and Coordination Analysis of A Dual Channel Supply Chain in the Case of Free Riding

Shuzhen Sun, Oklahoma State University, 502 Engineering North, Oklahoma State University, Stillwater, OK, 74075, United States of America, shuzhen.sun@okstate.edu, Tieming Liu

We develop a Hotelling model to study a supply chain with one manufacture and two retail channels, where the manufacture-owned online channel free-rides the brick-and-mortar retailer's sales effort. To coordinate it, we examine two pricing scenarios: endogenous prices and exogenous prices. A new contract with selective rebate and revenue sharing under the price match policy is designed to coordinate the supply chain and realize the arbitrarily split of the system profit in the two scenarios.

3 - The Supply Chain Management of Fresh Produce with Price Fluctuation

Xiangyu Hou, Department of Industrial Engineering, Tsinghua University, Haidian District, Beijing, Beijing, China, houxy0727@gmail.com, Dacheng Liu

We study the supply chain of fresh produce in China, which is operated by many small self-employed vendors. For a typical supply chain, three echelons are included, i.e., supplier, wholesaler and retailer. The price at the wholesale market is fluctuant due to uncertainties such as weather. Such reasons make the supply chain cooperation almost impossible in China. We try to model this supply chain and propose a plan for the cooperation on the chain.

4 - Measurement and Optimization of Responsiveness in Supply Chain Networks

Sin-Hoon Hum, National University of Singapore, NUS Business School, 15 Kent Ridge Drive, Singapore, Singapore, bizhumsh@nus.edu.sg, Yun Zhou, Mahmut Parlar

We consider multi-stage supply chains of serial or network structure which are either exogenous or endogenous, and define supply chain responsiveness as the probability of fulfilling customer orders within a promised lead-time. We optimize the responsiveness of the supply chain by maximizing the probability that the order will be fulfilled within the promised lead-time subject to a budget constraint. With endogenous chains, we study the problem in the context of queuing effects.

5 - Strategic Debt and Supply Chain Games

Qiaohai Hu, City University of Hong Kong, AC-1, Room 7605, Dept. of Management Science, Kowloon, China, joice.hu@gmail.com, Ping Su

We examine the interaction of debt financing and supply chain competition. Two retailers use strategic debt to influence their product market competition. We find that both retailers will adopt strategic debt in equilibrium, producing more, but both worse off than if they were purely equity-financed. Their supplier(s), however, are better off. More interestingly, when the retailers have a common supplier and only one retailer use strategic debt, the leveraged one gains the first-move advantage

Uncertainties in Radiation Therapy

Sponsor: Health Applications

Sponsored Session

Chair: Omid Nohadani, Associate Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, nohadani@northwestern.edu

Co-Chair: Arkajyoti Roy, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, arkajyoti.roy@northwestern.edu

1 - A Column Generation and Routing Approach to 4p Vmat Radiation Therapy Treatment Planning

Troy Long, University of Michigan, Ann Arbor, MI, troylong@umich.edu, Thomas Bortfeld, David Papp, Edwin Romeijn, Jan Unkelbach, David Craft

Volumetric Modulated Arc Therapy (VMAT) is rapidly emerging as a method for delivering radiation therapy treatments to cancer patients that is of comparable quality to IMRT but much more efficient. Since VMAT only uses coplanar beam arcs, the next step is to consider non-coplanar arcs in the 4p space around the patient as well. We propose a constructive approach that employs both column generation and routing heuristics.

2 - Incorporating Liver Functionality Information in Radiation Therapy Treatment Planning

Victor Wu, PhD Student, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, vwwu@umich.edu, Mary Feng, Edwin Romeijn, Martha Matuszak, Marina Epelman

Goals of radiotherapy include (i) eradicating tumor cells and (ii) sparing critical structures to ultimately preserve functionality. Liver perfusion (blood flow) maps show that functionality is non-homogenous, implying the dose distribution's spatial features matter. We propose an optimization model that explicitly incorporates functionality information from perfusion maps to redistribute dose from well-perfused areas without sacrificing tumor coverage. We validate our model with patient cases.

3 - Optimal Learning in Adaptive Biologically Conformal Radiotherapy
Fatemeh Saberian, University of Washington, Industrial & Systems Engineering, Box 352650, Seattle, WA, 98105, United States of America, negar.saberian@gmail.com, Archis Ghate, Minsun Kim

We present a Bayesian framework for learning radiobiological parameters for dynamically adapting treatment plans based on information acquired from functional images over the treatment course. We model this as a high-dimensional stochastic control problem and discuss approximation algorithm rooted in convex programming. Computational results on head-and-neck test cases will be discussed.

4 - Robust Dynamic Multi-Objective IMRT
Arkajyoti Roy, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, arkajyoti.roy@northwestern.edu, Omid Nohadani

Traditionally, competing objectives in radiation therapy are addressed using ad hoc weights to achieve desired dose distributions. Resulting plans are delivered repeatedly over several weeks. However, spatiotemporal anatomical changes often diminish the quality of such plans. We present a novel approach that exploits anatomical variations, improves plan quality, and is robust to model uncertainties.

Computational Network Flows and Routing

Sponsor: Computing Society

Sponsored Session

Chair: Matthew Saltzman, Associate Professor, Clemson University, Dept. of Mathematical Sciences, Martin Hall, Box 340975, Clemson, SC, 29634-0975, United States of America, mjs@clemson.edu

1 - Capacitated Flow-path Inequalities
Birce Tezel, University of California, Berkeley, Sutardja Dai Hall (CITRIS), Room # 450/63, Berkeley, CA, 94720-1764, United States of America, btezel@berkeley.edu, Simge Kucukyavuz, Alper Atamturk

We derive strong inequalities for capacitated fixed-charge network flow problems based on path-set relaxations. These inequalities are based on exact characterizations of submodular value functions for fixed-charge flow on simple paths and they generalize the well-known flow cover inequalities.

2 - Generalized Interval-flow Networks: Models, Applications, and Solution Methods
Angelika Leskovskaya, Southern Methodist University, PO Box 750123, Dallas, TX, 75275, United States of America, aleskovs@mail.smu.edu, Richard Barr

Generalized interval-flow networks are a new extension of the classic generalized network formulation that adds a conditional lower bound constraint on the arcs. Practical applications of this modeling technique are presented along with efficient solution methods that exploit the underlying network structure.

3 - Vehicle Scheduling with Time Windows and Business-driven Priorities
Barin Nag, Towson University, Towson, MD, United States of America, bnag@towson.edu, Natalie Scala

Customer priorities and preferences from business needs and strategies may exist in an applied routing problem. This research includes these factors by using the Analytic Hierarchy Process to map factors to consistent values, forming inputs to various algorithms developed to satisfy business strategies. Algorithmic results are compared using various metrics.

4 - Integer Programming Models for the Backhaul Vehicle Routing Problem
Yuanyuan Dong, PhD Student, Southern Methodist University, 3145 Dyer Street, Suite 337, Dallas, TX, 75205, United States of America, ydong@mail.smu.edu, Eli Olinick, Andrew Yu

We present a MIP for the backhaul vehicle routing problem whereby profit is maximized by accepting unscheduled deliveries during the time-limited backhaul trip to the vehicle's starting location. The MIP is inspired by a novel formulation of multicommodity flow that significantly reduces the size of the constraint matrix compared to a model based on the classical approach. We show that our model is a stronger formulation and present computational results using the two approaches.

Strategy/Strategic Planning II

Contributed Session

Chair: Pooya Tabesh, Instructional Assistant, University of Houston, Department of Management, Bauer College of Business, Houston, TX, 77204, United States of America, ptabesh@uh.edu

1 - The Impact of Slack Resources on Exploration and Exploitation: An Upper Echelons Perspective
Pooya Tabesh, Instructional Assistant, University of Houston, Department of Management, Bauer College of Business, Houston, TX, 77204, United States of America, ptabesh@uh.edu, Dusya Vera

Slack is a pool of excess resources that can be critical for organizational success, but cumulative research on the slack-performance link has resulted in mixed findings. We untangle the effect of slack by differentiating between the impact of absorbed slack and unabsorbed slack and investigating their effects on exploratory and exploitative activities in organizations. Furthermore, we highlight the critical role of CEO tenure, functional track, and education level in slack resource deployment.

2 - Barbarians at the Gate: How Firm Competition Affects Intraorganizational Conflict
Bryan Hong, Assistant Professor, Ivey Business School, 1255 Western Road, London, ON, N6B 3R7, Canada, bhong@ivey.ca

Although intraorganizational conflict contributes to the economic rents extracted from a firm's resources and capabilities, little is known about how firm competition influences the degree of conflict within firms. In this study, I estimate the effect of foreign competition on the likelihood and prevalence of conflicts using a novel dataset of representative establishments in the Canadian economy. The results show that competition leads to a lower likelihood of strikes and fewer grievances.

3 - Healthcare Supply Chain: A Comparative Study of Practices in Emerging Economies
Mario Ferrer-Vasquez, Assistant professor of Operations Management, College of Business Alfaisal University Riyadh, KSA, P.O. Box 50927, Takhasusi Road, Riyadh, P.O. 50927, Saudi Arabia, mferrer@alfaisal.edu, Daniel Romero, Alvaro Sierra, Julio-Mario Daza-Escorcia

This paper is motivated by the significant economic importance of the healthcare industry in emerging economies, which needs to be modeled, understood and managed.The research involves conceptualizing the key healthcare supply chain coordination factors. We propose and test a model, that is founded constructs such as access, affordability, and awareness and their impact on supply chain operatives performance of two emerging economies.

4 - Applying Strategic Decision Analysis (Game Theory) to Project Dispute Resolution
James Lee, Staff Economist, Shell Exploration & Production, Woodcreek Center, Suite 7520, 200 North Dairy Ashford, Houston, TX, 77079, United States of America, James.Lee@Shell.com

An integrated business team added significant amount of value through acquiring working interests from partners by creating a win-win outcome with minimal cost. The decision analyst provided material advice during negotiation and dispute resolution. Strategic Decision Analysis (SDA) was applied and dynamic deal spaces of key players were quantified. This paper is to illustrate how to replicate this success and to apply SDA broadly, by using this actual project as case study.

Behavioral Operations 3

Contributed Session

Chair: Matthew Walsman, Cornell University, 455 Statler Hall, Ithaca, NY, 14853, United States of America, mcw237@cornell.edu

1 - Allocating Service Capacity through a Multi-Item Second Price Auction: A Lab Experiment
Matthew Walsman, Cornell University, 455 Statler Hall, Ithaca, NY, 14853, United States of America, mcw237@cornell.edu, Chris Anderson, Scott Sampson

We investigate a service capacity problem where human subjects often attempt to "game the system" (i.e. course registration). By adapting auction and matching theory from economics, we developed an allocation system designed to discover true preferences and reduce gaming. We then test this system through a behavioral experiment.

2 - Epistemic Demand Uncertainty and Inventory Control: The Ambiguity Effect and Performance

Siqi Ma, University of Arkansas, Sam M. Walton College of Business, Business Building 475, Fayetteville, AR, 72701, United States of America, siqima@uark.edu, John Aloysius

Demand uncertainty due to incomplete information from the environment creates challenges for inventory control. Prior literature has mostly studied risky inventory decisions, but we experimentally study the behavior of replenishment managers in the face of ambiguity. We find evidence for the ambiguity effect on both decision behavior and task performance.

3 - The Role of Diasporas in the Facility Location Decision

Peruvemba S. Ravi, Associate Professor, School of Business & Economics, Wilfred Laurier University, 75 University Ave, West Waterloo, ON, N2T1H9, Canada, pravi@wlu.ca, Peruvemba S. Jaya

It is often assumed that facility location decisions are based on an evaluation of the quantifiable costs and benefits associated with candidate locations. However, intangible factors such as the preferences and biases of the decision-maker may play a significant role. The fact that several decision-makers in multinational companies are members of diasporic communities may have a significant impact on the facility location decision.

■ WE46

Hilton- Lombard

Mixed Integer Programming

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Mahdi Doostmohammadi, Research Associate, University of Strathclyde, 40 George Street, Glasgow, G1 1QE, United Kingdom, mahdi.doostmohammadi@strath.ac.uk

1 - Approximation Algorithms for the Incremental Knapsack Problem via Disjunctive Programming

Chun Ye, PhD Candidate, Columbia University, 500 West 120th Street, IEOR Department Rm 315, New York, NY, 10027, United States of America, cy2214@columbia.edu, Daniel Bienstock, Jay Sethuraman

We consider an incremental version of the knapsack problem (IK), where we wish to find an optimal packing of items in a knapsack whose capacity grows weakly as a function of time. We will first show that the problem is strongly NP-hard. We will then discuss a constant factor approximation algorithm for IK, under mild restrictions on the growth rate of the knapsack capacity, and a PTAS for IK when the time horizon T is a constant. Both of our algorithms uses ideas from disjunctive programming.

2 - Multiperiod Optimization for Fleet Defense: Centralized and Distributed Approaches

Nikita Korolko, PhD Candidate, Massacusetts Institute of Technology, 77 Massachusetts Avenue, E40-149 Operations Research Center, Cambridge, MA, 02139, United States of America, korolko@mit.edu, Dimitris Bertsimas, Patrick Jaillet

We prove that the highly nonlinear discrete fleet defense problem can be solved online with MIP callback techniques. A new extended MIP formulation is also introduced for multiperiod scenario when the fleet has to plan the defense for several consecutive attacks. Finally, we develop a cooperation protocol for the decentralized setting in which captains of the assets have to make local decisions based on their own objectives and some limited communication with other ships.

3 - Valid Inequalities for Two-Period Relaxations of Big Bucket Lot-Sizing Problems

Mahdi Doostmohammadi, Research Associate, University of Strathclyde, 40 George Street, Glasgow, G1 1QE, United Kingdom, mahdi.doostmohammadi@strath.ac.uk, Kerem Akartunali

Although many researchers have studied big bucket lot-sizing problems, they are still difficult to solve to optimality. In previous research different relaxations such as single-item and single-period have been investigated. In this study, we present two-period relaxations, and then we study the polyhedral structure of such a mixed integer set. We derive several families of valid inequalities, investigate facet-defining conditions, and present preliminary computational results.

4 - Three-partition Inequalities for Fixed-charge Network Flows

Andres Gomez, University of California at Berkeley, 2020 Delaware St. Apt. 3, Berkeley, CA, 94709, United States of America, a.gomez@berkeley.edu, Alper Atamturk, Simge Kucukyavuz

We define new valid inequalities for the capacitated fixed-charge network flow problem by exploiting the internal structure of the subgraphs defining the cuts. In particular, the new inequalities are based on three-partitioning of the nodes.

Theory and Applications of Robust Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Phebe Vayanos, MIT Sloan School of Management, 50 Memorial Dr., Cambridge, MA 02142, United States of America, pvayanos@mit.edu

1 - Two-Stage Robust Integer Programming

Wolfram Wiesemann, Imperial College London, SW7 2AZ, London, United Kingdom, ww@imperial.ac.uk, Grani Hanasusanto, Daniel Kuhn

In this talk, we approximate two-stage robust optimisation problems with integer recourse by their corresponding K-adaptability problems, in which the decision maker pre-commits to K second-stage policies here-and-now and implements the best of these policies once the uncertain parameters are observed. We study the approximation quality and the computational complexity of the K-adaptability problem, and we propose two MILP reformulations that can be solved with off-the-shelf software.

2 - Robust Inventory Routing

Joel Tay, MIT Operations Research Center, 77 Massachusetts Avenue, Building E40-149, Cambridge, MA, 02139, United States of America, joeltay@mit.edu, Dimitris Bertsimas, Swati Gupta

We consider the finite horizon inventory routing problem with uncertain demand. Current techniques that solve an exact formulation of this problem with stochastic demand do not scale to large problems. We propose an efficient and scalable algorithm via robust and adaptive optimization, and present very promising computational results.

3 - Optimal Crowdsourcing via all Pay Auctions – A Robust Optimization Approach

Chaithanya Bandi, Kellogg School of Management, Northwestern University, Evanston, IL, United States of America c-bandi@kellogg.northwestern.edu, Rajarshi Ghosh

In this talk, we present and analyze a model in which users select among, and subsequently compete in, a collection of contests offering various rewards. The objective is to capture the essential features of a crowdsourcing system, an environment in which diverse tasks are presented to a large community. We answer this question in the setting of incomplete information via All pay auctions and robust optimization.

4 - Data-driven Approaches for Adaptive Optimization

Vishal Gupta, Assistant Professor, USC Marshall School of Business, Data Sciences and Operations, Bridge Hall, 401, Los Angeles, CA, 90089-0809, United States of America, vishal.gupta@aya.yale.edu, Dimitris Bertsimas

Inspired by machine learning algorithms, we propose data-driven constructions of uncertainty sets and policies for adaptive optimization. Both our sets and policies are theoretically tractable and enjoy probabilistic performance guarantees. We illustrate the methods through a case-study of the unit commitment problem using real data from ISO. Overall, both our sets and policies successfully exploit structure in the data, yielding higher quality solutions than non-data-driven robust approaches.

Resource Allocation

Contributed Session

Chair: Ju Myung Song, Rutgers Business School, PhD Program, 1 Washington Park, Room 430C, Newark, NJ, 07102, United States of America, jumyung.song@rutgers.edu

1 - Designing Allocation Mechanism for Scarce Capacity: Reserve and Trade

Ju Myung Song, Rutgers Business School, PhD Program, 1 Washington Park, Room 430C, Newark, NJ, 07102, United States of America, jumyung.song@rutgers.edu, Chan Choi, Yao Zhao

Turn-and-earn depends on only sales history and ignores market signals. Proportional, a well-known allocation rule, can include forecast and other private information, but it may inflate order. For unknown demand, we modified the proportional rule by a general two-stage mechanism using reservation fee and trade. We found the conditions under which this mechanism design works and mitigate inflation of retailers.

2 - Staffing under Uncertainty: The Case of Fast-food Industry
Raha Akhavan Tabatab, Los Andes University,
Cra 1 Este # 19A-40, Apartment 2625, Bogota, 76155, Colombia,
r.akhavan@uniandes.edu.co, Diego Javier Rodriguez,
Carlos Felipe Ruiz, Andrés L. Medaglia, Leonardo Lozano

Fast-food managers often face the problem of allocating human resources (cashiers, chefs or dispatchers), to meet a service level target at the minimum cost. Since in most cases, the demand is uncertain and highly volatile, determining the right number of staff to satisfy a predetermined service level can be a challenging task. We apply optimization techniques and queueing theory to find a near-optimal staffing policy that minimizes the costs subject to meeting a service level.

3 - Project Scheduling Methods: A Synthesis
Osman Oguz, Associate Professor, Bilkent University, 06800
Ankara Turkey, osoguz@gmail.com

Traditionally, there are three basic models of scheduling projects: i-Critical Path Method (CPM) and Project Evaluation and Review Technique (PERT) PERT. ii-Time-cost trade off analysis using linear programming. iii-Integer programming models to allocate scarce resources to activities. The new approach proposed in this study consists of a new deterministic combined model that provides a single solution in one shot

4 - Analysis of Congestion Pricing Model to Handle Day of Operations" Airport Capacity Reduction
Abdul Qadar Kara, Asst. Professor, King Fahd University of Petroleum and Minerals, KFUPM Box 1819, Dhahran, 31261, Saudi Arabia, aqkara@kfupm.edu.sa

In my earlier work, a model was built on basic econometric principle of congestion pricing embedded within an optimization model. The model provided a mechanism to manage airport runway capacity reduction. The current work reports further analysis of the model and its response against the effect of airline's disagreement on assigned runway slots.

Statistical Analysis of Network Structures

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Xin Chen, Assistant Professor, Southern Illinois University, PO Box 1805, Edwardsville, IL, United States of America, xchen@siue.edu

1 - Complex Network Modeling using MLE and EM
Xin Chen, Assistant Professor, Southern Illinois University, PO Box 1805, Edwardsville, IL, United States of America, xchen@siue.edu

Structure of a complex network provides important information about its performance and may be used to predict changes in network performance. Four degree distributions, including the power law, Weibull, Poisson, and negative binomial, are applied to model three complex networks, the Krebs, HIV, and Power Grid networks. To improve accuracy of network modeling, the MLE method and EM algorithm are used to estimate parameters of the four degree distributions.

2 - Optimal Development of Wind Farm under Uncertainty
Qing Li, PhD, Rutgers University, 96 Frelinghuysen Road,
CoRE Building, Room 201, Piscataway, NJ, 08854,
United States of America, ql78@rutgers.edu, Honggang Wang

Renewable resources, e.g. wind and solar, provide clean and zero-carbon emission energy. In this work, we propose stochastic models for optimal development of wind farm. Specifically, we aim to explore the number and placement of turbines considering wind uncertainty and dynamic interactions in the field. Computational models are demonstrated with wind/farm data for wind farms in the central US. Discrete field modeling and optimization methods of wind farm development will be discussed as well.

3 - Sustainable Wind Energy Distribution Network Based on Failure Prediction and Collaboration Protocols
Xin Chen, Department of Industrial and Enterprise Systems Engineering, University of Illinois at Urbana-Champaign, 216C Transportation Building, 104 S. Mathews, Urbana, IL, 61801,
United States of America, xinchen@illnois.edu, Shimon Nof,
Hoo Sang Ko, Ehsan Jahanpour

Wind energy has gained more attention as a green alternative. Uncertainties in power generation, however, limit its penetration into power grids. This study applies pattern recognition for improved output estimation by failure prediction. Also presented is a collaboration platform to support demand-and-capacity sharing and best matching protocols that facilitates collaboration to create sustainable networks. A simulation study of two communities is illustrated to show the impact of the platform.

1 - Optimizing Employee Compensation Plans: A Restless Bandit Approach
Munish Goyal, IBM Research, MEBP, Bangalore, India,
mungoyal@in.ibm.com, Alankar Jain, Parijat Dube

Rewarding and Retaining productive employees is one of the most important functions of HR organizations. In this work we derive a productivity maximizing compensation investment strategy in a restless bandit framework. Specifically, given the attrition risk scores and the productivity levels of employees, we derive an index heuristic that determines a subset of employees and their respective compensation investment amounts while maximizing a long run expected return on investment.

2 - Application of the Discrete Moment Problem in Option Valuations
Mariya Naumova, Rutgers University, 100 Rockafeller Rd,
Piscataway, NJ, 08854, United States of America,
mnaumova@rci.rutgers.edu

We present a brief survey of some of the basic results related to the discrete moment problems (DMP) and a new numerical integration method, based on DMP that can be used for univariate piecewise higher order convex functions. We present novel applications of the DMP to valuations of financial instruments.

3 - Complexity and Approximation Algorithms in Elastic Optical Networks
Sahar Talebi, NCSU, 2113-A Gorman St, Raleigh, NC, 27606,
United States of America, stalebi@ncsu.edu, George Rouskas

The routing and spectrum assignment (RSA) problem has emerged as the key design and control problem in elastic optical networks. We show that the RSA and its simpler version, i.e. the spectrum assignment (SA) problem, in mesh networks transforms to the multiprocessor scheduling problem. This new perspective helps us to investigate the complexity of the RSA/SA problem under different scenarios. We also develop new constant-ratio approximation algorithms for the SA problem.

Game Theory 3

Contributed Session

Chair: Mikhail Sher, PhD Candidate, Decision Sciences Department, Drexel University, 3141 Chestnut St, Philadelphia, PA, 19104, United States of America, MikhailSher@gmail.com

1 - Price and Quality Competition with Quality Positions
Shogo Kurokawa, Keio University, 3-14-1, Hiyoshi Kouhoku-ku,
Yokohama City, Japan, scarletcurio@gmail.com,
Nobuo Matsubayashi

We investigate price and quality decisions under duopoly in the presence of firms' quality positions given as the quality levels of their existing core products. Based on a standard model of vertical differentiation, we incorporate a repositioning cost"which is in proportion to the quality differences between their core and new products. With varying quality levels of the core products, we analyze the impact of this cost on the equilibrium outcomes.

2 - Extensive-Form Game Abstraction with Bounds
Tuomas Sandholm, Carnegie Mellon University,
5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America,
sandholm@cs.cmu.edu, Christian Kroer

Abstraction has emerged as the key to solving large extensive-form games of incomplete information. We develop the first analysis framework that can be used to give bounds on solution quality for extensive-form game abstraction. While it can be used for lossy abstraction, it is also powerful for lossless abstraction. Prior abstraction algorithms typically operate level by level in the game tree; we prove hardness results and an impossibility for that family. Experiments are presented.

3 - Stochastic Duopoly Market Share Competition with Asymmetric Exercising Delay

KiHyung Kim, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, kihyung.kim.1@purdue.edu, Abhijit Deshmukh

Option exercise games have become a popular approach for academic researchers and industry practitioners to deal with competition under stochastic environments. We investigated the mixed strategy closed loop equilibrium of R&D and patent protected technology competition in a stochastic duopoly market governed by a continuous time stochastic process. The main difference between the two players within the model is assumed to be the length of delay of the exercise decision.

4 - Supply Chain Coordination with Quantity Discount for Seasonal Demand

Mikhail Sher, PhD Candidate, Decision Sciences Department, Drexel University, 3141 Chestnut St, Philadelphia, PA, 19104, United States of America, MikhailSher@gmail.com, Seung-Lae Kim

In this paper,we develop a supply chain coordination mechanism in a system with a dominant manufacturer that delivers seasonal products to a group of buyers. A twice-stage ordering and production system is introduced in which the first order is placed at some time prior to the selling season and a second order is placed closer to the selling period. This twice-stage model allows the buyer to collect additional seasonal demand information resulting in savings for both manufacturer and the buyers.

Optimization, Other

Contributed Session

Chair: Mahendra Prasad Biswal, Professor, Indian Institute of Technology, Kharagpur, Department of Mathematics, IIT Kharagpur, Kharagpur, WB, 721302, India, mpbiswal@maths.iitkgp.ernet.in

1 - A MIP Formulation for the Capacitated Stochastic Lot Sizing Problem with Service-level Constraints

Huseyin Tunc, Hacettepe University, Institute of Population Studies, Sihhiye, Ankara, Turkey, huseyin.tunc@hacettepe.edu.tr, Onur A. Kilic, S. Armagan Tarim

We study the capacitated stochastic lot-sizing problem with service level constraints under static uncertainty strategy and propose a mixed integer programming formulation thereof. We modify an earlier formulation of static-dynamic uncertainty strategy developed for the uncapacitated stochastic lot-sizing problem. We conduct an extensive numerical study and show that the formulation can optimally solve large problem instances in reasonable computation time.

2 - Application of the Penalty Function Method to Generalized Convex Programs

Chandal Nahak, Associate Professor, IIT Kharagpur, Department of Mathematics, Kharagpur, 721302, India

We use the Penalty Function Method to study duality in generalized convex (invex) pro- gramming. In particular, we will obtain a new derivation under which the generalized convex (invex) programs do not have duality gaps.

Risk Analysis

Contributed Session

Chair: Jonathan Crook, Professor, University of Edinburgh, 29 Buccleuch Place, Edinburgh, United Kingdom, j.crook@ed.ac.uk

1 - Competitive Analysis with Risk Considerations

Jian Yang, Associate Professor, Rutgers University, Dept. of MSIS, Newark, NJ, 07102, United States of America, jyang@business.rutgers.edu

We explore games in which players are with risk considerations. Particular attention will be paid to the coherent risk measure. We address existence and various other issues.

2 - Intensity Modelling with Macroeconomic Effects and Simulated Transitions

Jonathan Crook, Professor, University of Edinburgh, 29 Buccleuch Place, Edinburgh, United Kingdom, j.crook@ed.ac.uk, Mindy Leow

We estimate intensity models to predict probabilities of delinquency and default for individual credit card accounts over duration. We find different trends for different groups of accounts, and over time. Random distributions based on properties of observed transition rates are generated and compared against predicted probabilities to get predicted transitions for each account over time. From the results of this simulation, we calculate distributions for the transitions and losses.

3 - Resource Allocation to Reduce Active Shooter Risk

Robert Brigantic, Operations Research Scientist, Pacific Northwest National Laboratory, 902 Battelle Blvd, Richland, WA, 99352, United States of America, robert.brigantic@pnnl.gov

An active shooter is defined by the U.S. Department of Homeland Security as "an individual actively engaged in killing or attempting to kill people in a confined and populated area." We present a methodology to quantify risk from an active shooter in a large scale venue (e.g., transportation system) and a means to reduce the risk from an active shooter via the efficient allocation of constrained security resources.

4 - Variance Reduction Techniques for Estimation of Distortion Risk Measures

Lihua Sun, Tongji University, School of Economics and Management, Tongji Univ. 1239 Siping Road, Shanghai, China, sunlihua@tongji.edu.cn

Distortion risk measures has traditionally been used in insurance for premium setting and had been extended to various places such as calculating risk capitals of banks and insurers. In this paper, we propose several variance reduction methods to improve the accuracy in estimation of distortion risk measures via Monte Carlo simulation. We then prove the efficiency of our method theoretically and numerically.

5 - Analytics-based Method to Support Telecommunication Software Testing Design

Adi Fledel Alon, Senior Data Scientist, Amdocs, Ganey Shefa, Raanana, Israel, adifl@amdocs.com, Gilli Shama, Sagar Surana

Software testing plays an important role in any software development project and the price of fixing a defect increases as the lifecycle of the software progresses. Testing under all combinations of inputs and prerequisites is not feasible, even with a simple product. Here, we present a big data analytics approach for planning of software testing in the Telecommunications industry. We developed a new risk based methodology and tool for efficient and effective test plan design.

Tractable Models and Algorithms for Optimization in Engineering

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Cristobal Guzman, Georgia Tech, 755 Ferst Drive NW, Atlanta, GA, United States of America, cguzman@gatech.edu

1 - Additive Consistency of Risk Measures and Its Application to Risk-averse Routing in Networks

Alfredo Torrico, Georgia Tech, 755 Ferst Drive, NW, Atlanta,GA, United States of America, atp.13jvl@gmail.com, Roberto Cominetti

This paper investigates the use of risk measures and theories of choice for modeling risk-averse route choice with random travel times. We interpret the postulates of these theories, and we identify additive consistency as a plausible condition that allows to reduce risk-averse routing to a standard shortest path problem. Within the classical theories of choice under risk, we show that the only preferences that satisfy this consistency property are the ones induced by the entropic risk measures.

2 - The Little Grothendieck Problem – Generalization and Applications to Orthogonal Procrustes

Christopher Kennedy, christopher.garrett.kennedy@gmail.com

The little Grothendieck problem from combinatorial optimization consists of optimizing a quadratic objective function over binary variables. We first discuss an approximation algorithm for this problem and then consider the natural extension from binary variables to the general Orthogonal and Unitary groups. Our proposed algorithm - Orthogonal Cut - uses techniques in semi-definite programming to achieve a constant approximation ratio for the generalized Grothendieck problem. We will mention applications of this generalized algorithm to the Orthogonal Procrustes problem, global registration over Euclidean transforms, and others.

3 - Minimizing an Indefinite Quadratic Function Subject to a Single Indefinite Quadratic Constraint

Maziar Salahi, Associate Professor, University of Guilan, Namjoo Street, Rasht, Iran, salahim@guilan.ac.ir, Saeed Fallahi, Tamas Terlaky

In this paper we consider the problem of minimizing an indefinite quadratic function subject to a single indefinite quadratic constraint. We show that it can be solved by solving a linearly constrained convex univariate minimization problem. Our preliminary numerical experiments on several randomly generated test problems show that the new approach is much faster in finding the global optimal solution than the semidefinite relaxation approach especially on large scale problems.

Customer Performance ñ Models and Applications

Sponsor: Applied Probability Society

Sponsored Session

Chair: Ananth Krishnamurthy, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, ananth@engr.wisc.edu

1 - Employing the EDD Rule in MTO Production Systems with External Due Dates

Miray Oner-Kozen, Technische Universitat München, Arcisstr. 21, Munich, 80333, Germany, miray.koezen@tum.de, Stefan Minner

We model a single machine MTO production system as a discrete time M/M/1/K queuing system. The due date of an order is random. We perform an exact analysis for evaluating the effect of the earliest due date first rule (EDD) on the system performance and compare the results to the first-in-first-out (FIFO) rule as a benchmark. Our numerical results show that, although the EDD rule seems intuitive to improve the customer related performance, its effect is dependent on the performance criteria.

2 - Self-Interested Routing with Path-Flexible Agents

Andrew Frazelle, Duke University, Durham, NC, 27708, United States of America, andrew.frazelle@duke.edu, Yehua Wei, Alessandro Arlotto

We introduce a queueing network with self-interested, route-flexible agents who seek to minimize their individual wait times. Agents have no preference over the route they take through the network apart from the impact of the route on their total wait time. We model the system as an extensive-form game and derive subgame perfect Nash equilibria under several slightly different assumptions. Motivations/applications include amusement parks, grocery stores, and shopping malls (e.g. Black Friday).

3 - Estimating the Likelihood the Democrats will Retain Control of the Senate in the 2014 Midterms

James Cochran, University of Alabama, Culverhouse College of Commerce and Bus, 347 Alston Hall, Tuscaloosa, AL, 35487, United States of America, jcochran@cba.ua.edu

Control of the Senate is critical to both parties, but is of particular important to the party that does not hold the Presidency; this allows the party to wield greater power during confirmation proceedings and coordinate legislation with the House so as to force compromise from the White House. We apply a randomization test to the FiveThirtyEight forecasted probability a Democrat will win each contested seat in 2014 to estimate the likelihood the Democrats will retain control of the Senate.

Bayesian Approach

Contributed Session

Chair: Hiba Baroud, University of Oklahoma, 202 West Boyd St, Room 124, Norman, OK, 73019, United States of America, hbaroud@ou.edu

1 - An Proposal of How to Improve Conjoint Measurement Model using Hierarchical Bayesian Method

Sakamaki Yoshikazu, Miyagi University, 1, Gakuen,Taiwa-Cho,Kurokawa-Gun, Miyagi, Japan, megacity@f3.dion.ne.jp

Recent years, hierarchical Bayesian statistics that estimates model parameters by assuming prior distribution for each parameter gets high attention. In this study, we apply hierarchical Bayesian method to traditional conjoint measurement and show our proposal can improve fitness degree and forecasting power.

2 - A Dynamic Sampling Framework for Medical Overpayments

Rasim Musal, Assistant Professor of QM, Texas State University, 601 University Dr. McCoy 404F, Austin, TX, 78746, United States of America, mmusal@gmail.com, Tahir Ekin

Sampling methods take front stage in estimating loss due to over-payments to providers participating in Medicare/Medicaid programs. We propose a dynamic sampling framework for medical assessment that can capture the skewed nature and multi-modality of medical claims data. Our framework considers two decision indices that are based on estimated over-payment values and entropy based expected information gain. The model considers over-payments as a mixture of fixed number of populations.

3 - A Bayesian Dynamic Probit Approach to Predict Bidders' Behavior in Secondary Market Auctions

Babak Zafari, The George Washington University School of Business, 2201 G Street NW, Funger Hall, Suite 415, Washington, DC, 20052, United States of America, zafari@gwu.edu

The experience of the bidders in the market and the available information in auctions can shape bidders' bidding behavior. In this study, we use the Bayesian data augmentation algorithm for dynamic probit models in an attempt to predict whether a bidder will be the first bidder in an upcoming auction. While we're mainly focusing on the predictive modeling aspect of this problem, we're also observing the underlying dynamics and change of behavior of the bidders over the time (learning).

4 - Bayesian Modeling of Global Supply Chains Risk Analysis

Hiba Baroud, University of Oklahoma, 202 West Boyd St, Room 124, Norman, OK, 73019, United States of America, hbaroud@ou.edu, Kash Barker, Royce Francis

Companies often operate facilities or have suppliers in countries prone to natural hazards, extreme weather, or political turmoil. While such business strategies offer low operating costs, they might be introducing risks leading to high impact disruptions in global supply chains. Bayesian kernel methods are used here to assess the probability of a supply chain disruption given information on past disruptions and the company's risk management strategies.

The Impact of Heterogeneity in Reliability Prediction and Maintenance Planning

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Yisha Xiang, Assistant Professor, Sun Yat-sen University, 135 W. Xingang Rd., Guangzhou, 57025, China, xiangysh@mail.sysu.edu.cn

1 - Condition-Based Maintenance using the Inverse Gaussian Degradation Model

Nan Chen, Assistant Professor, National University of Singapore, 1 Engineering Drive 2, Singapore, Singapore, isecn@nus.edu.sg

Condition-based maintenance (CBM) has been proven effective in reducing unexpected failures with minimum operational costs. This study considers an optimal CBM policy with optimal inspection interval when the degradation conforms to an inverse Gaussian process with random effects. The random effects parameter is used to account for heterogeneities among a product population. We prove that the monotone control limit policy is optimal. We also provide numerical studies to validate our results.

2 - An Opportunistic Maintenance Model for Multi-component Systems under Mixed Policies

Qiushi Zhu, PhD Candidate, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, Q.Zhu@tue.nl, Hao Peng, Geert-Jan Van Houtum

We propose an opportunistic maintenance model for multi-component systems. Different components may follow different maintenance policies (i.e., age-based, corrective, and condition-based maintenance). The coordination of the maintenance actions is crucial since there is a high fixed setup cost for maintenance visits. To solve real-world problems, we propose a heuristic algorithm to optimize the opportunistic maintenance policy and verify its accuracy by comparing it with simulated results.

3 - Optimization of Manufacturer's Warranty Period in Consideration of After-sales Service Contract

Jin Qin, University of Science and Technology of China, 96 Jinzhai Rd, Hefei, China, qjin@ustc.edu.cn

Retailers, like bestbuy and buy.com, are zealously promoting after-sales warranty service contract to gain more profit from customers. Manufacturer needs to rethink its warranty policy considering customer heterogeneity and competition from the retailers. What is the optimal warranty period under this new situation?

4 - Approximating Weibull Renewal via Regression and Sinc Function
Tongdan Jin, Associate Professor, Texas State University, 601 University Drive, San Marcos, TX, 78666, United States of America, tj17@txstate.edu, Jose Espiritu, Fei Sun, Heidi Taboada

Weibull distribution is perhaps the most popular model for lifetime analysis, yet the closed-form solution to Weilbull renewal equation is not tractable. We propose a hybrid method to approximate the Weibull renewal equation. The method is built upon partial numerical computation together with a sinc function. We compare our model with the actual renewal data, and the result shows that the approximation model is quite satisfactory for a wide range of shape parameter between 1 and 10.

1 - Development of Modeling and Control Strategies for Approximated Gaussian Process
Shisheng Cui, The Pennsylvania State University, 355 Leonhard Building, University Park, PA, 16802, United States of America, suc256@psu.edu, Chia-Jung Chang

The Gaussian Processes Model has been widely used as priors of functions with good performance. However, specifying the large number of parameters correctly affects efficiency in computation and feasibility of implementing control strategies. We propose a linear model to approximate GP, which expands the GP model by basis functions. Several examples and simulation studies are presented to demonstrate the advantages of the method. A control strategy is provided with the proposed linear model.

2 - A Spatial Calibration Model for Nanotube Film Quality Prediction
Xin Wang, Tsinghua University, Zijing Apt 14, Room 406A, Tsinghua Univ, Haidian District, Beijing, 100084, China, xinwang09@mails.tsinghua.edu.cn, Su Wu, Kaibo Wang, Xinwei Deng

The anisotropy of CNTs film, which is a spatially distributed quality index, is hard to be measured in practice. As anisotropy is correlated with height and height can be measured much easier, we here propose a spatial model for predicting anisotropy using height. A hierarchical model is built to characterize the relationship between the spatial input and output; the proposed model is verified using both numerical simulations and a real data set.

Sustainable Infrastructure Management and Decision-Making: Construction, Energy and Transportation Industries

Sponsor: Simulation

Sponsored Session

Chair: Hakob Avetisyan, Assistant Professor, California State University Fullerton, Department of Civil and Env. Engineering, 800 N. State College Blvd, Fullerton, CA, 92834, United States of America, havetisyan@fullerton.edu

1 - When Combining Sustainable Design with Sustainable Construction
Uksun Kim, Chair and Associate Professor, California State University - Fullerton, 800 N. State College Blvd., Fullerton, CA, 92834, United States of America, ukim@fullerton.edu, Hakob Avetisyan

This research will incorporate sustainable design with sustainable construction. The outcome of this research directly affects the construction. The selection of construction equipment and methods for construction are highly dependent on the design outcomes. A modeling framework will be developed to analyze its consequence on equipment. As a case study a real life infrastructure project will be considered. Several scenarios will be compared to assess the overall sustainability practice.

2 - State Recognition of Construction Equipment for Emission Simulation Modeling and Control
Reza Akhavian, University of Central Florida, 4000 Central Florida Blvd, Orlando, FL, 32816, United States of America, reza@knights.ucf.edu, Amir Behzadan

Extensive use of energy-intensive equipment in construction and infrastructure industries results in a high level of greenhouse gas emission. In particular, different working states of construction machinery such as idling modes (e.g. different rpm levels) and busy modes (e.g. different activities) produce different levels of emission. In this research, a data-driven simulation modeling approach using mobile sensor nodes for equipment state recognition and emission modeling is investigated.

3 - Integrating Qualitative and Quantitative Assessment Outcomes for Sustaining Long Term Projects
Deepak Sharma, Visiting Assistant Professor, University of Baltimore, 1420 N Charles Street, Business Center BC475, Baltimore, MD, 21201, United States of America, dsharma@ubalt.edu

Procurement decisions of long term infrastructure projects are based on the "value" expected from a candidate project. The value is determined by analyzing a project quantitatively and qualitatively and then integrating the outcomes. Review shows that the procurement guidelines have remained silent about the integration. This work introduces Data Envelopment Analysis (DEA) as a tool that can be used to integrate the assessment outcomes for better decision making.

1 - A Stochastic Multi-criteria Decision Model for Sustainable Biomass Crop Selection
Halil Cobuloglu, PhD Candidate, Wichita State University, 1845 Fairmount St, Wichita, KS, United States of America, halil.cobuloglu@gmail.com, Esra Buyuktahtakin

Biomass crop type selection is a multi-criteria decision-making (MCDM) problem since it has various environmental and economic impacts. In this paper, we determine criteria for decision makers (farmers) to select the most sustainable biomass crop type. We build up the Stochastic AHP evaluation model and criteria with respect to economic, environmental, and social aspects based on the literature. As an illustration of the model, we rank biomass crop type alternatives in Kansas.

2 - Integrated Sustainable Bioenergy Pathways: An Agent Based Modeling Approach
Liu Su, Iowa State University, 301 S. 4th Street, #13, Oakridge Apartment, Ames, IA, 50010, United States of America, suliu@iastate.edu, Lizhi Wang, Guiping Hu

We study the interactions between different interdependent market players in a bio-energy supply, which consists of land owners, biofuel producers, biopower producers, biofuel market, food market, biopower marker, and policy makers. We integrate the agent based modeling approach with actual agricultural data to analyze and predict potential interactions between different marker players under various policy scenarios.

3 - Metaheuristics applied to Biorefinery Supply Chain Problems
Krystel Castillo, Assistant Professor, The University of Texas at San Antonio, One UTSA Circle, San Antonio, TX, 78249, United States of America, krystel.castillo@utsa.edu

Metaheuristics are strategies for solving complex and large-scale optimization problems which provide a near-optimal or practically useful solution. The aim of this talk is to present a survey of metaheuristics and the available literature regarding the application of metaheuristics in the bioenergy supply chain field as well as the uniqueness and challenges of the mathematical problems applied to bioenergy.

4 - Green Building Decision-Making using Sequential Design and Optimization

John Dickson, University of Texas at Arlington, IMSE Dept, Arlington, TX, 76019, United States of America, john.dickson@mavs.uta.edu, Victoria Chen, Jay Rosenberger, Anthony Robinson

A decision making model is developed for green buildings to select a set of building options that will improve the building performance. A sequential design of experiments approach is used to select the design points to perform the simulation. A metamodel is created using treed regression which is then optimized using a mixed integer linear programming model. A single story residential building based in California is used as a case study

1 - DYI Forecasting: Judgment, Models and Judgmental Model Selection

Konstantinos Nikolopoulos, Bangor Business School, Bangor University, College Road, Bangor, LL57 2DG, United Kingdom, k.nikolopoulos@bangor.ac.uk, Nikolaos Kourentzes, Fotios Petropoulos

In this paper we explore how judgment can be used to improve statistical model selection for forecasting. We investigate the performance of various judgmental model selection methodologies against the benchmark statistical one, based on information criteria. We evaluate the performance of experts in terms of selecting the best model and forecasting performance, identifying major improvements. We examine how to extend statistical model selection to incorporate additional insights from experts.

2 - Determining an Optimal Hierarchical Forecasting Model Based on the Characteristics of the Data Set

Zlatana Nenova, University of Pittsburgh, 241 Mervis Hall, Pittsburgh, PA, United States of America, zdn3@pitt.edu, Jerrold May

High-dimensional pyramidal databases are common in the supply chains of large manufacturing companies. Such organizations often forecast shipments and consumption patterns at different hierarchical levels. Determining the most appropriate forecast aggregation approach is often a very computationally intensive task. Using a large food-processing firm data, we built a model that requires only correlation metrics and produces an accurate prediction of the optimal forecasting approach.

3 - How Change of the Relative Importance of Product Attribute to Consumers can Influence Sales Forecast

Semco Jahanbin, Doctoral Researcher, University of Bath, Flat 8, Royston house, 5 Duke Street, Bath, BA24AH, United Kingdom, s.jahanbin@bath.ac.uk, Sheik Meeran, Joao Quariguasi Frota Net, Paul Goodwin

Customer preferences are not stable, especially where a consumer needs to make a complex or unfamiliar decision. In this research, the instability of consumer preferences for different attributes for a purposive sample of electronics products will be examined and compared from different angles with the aim of finding its influence on choice based conjoint analysis as a new product sales forecasting method.

Chair: Masood Parvania, Postdoctoral Scholar, University of California, Davis, One Shields Avenue, Davis, CA, 95616, United States of America, mparvania@ucdavis.edu

1 - Multiscale Analysis of Wind Power Ramping Events

Masood Parvania, Postdoctoral Scholar, University of California, Davis, One Shields Avenue, Davis, CA, 95616, United States of America, mparvania@ucdavis.edu, Anna Scaglione

The stochastic nature of wind speed makes the output power of wind plants highly variable in various time scales. Advanced knowledge about the time, magnitude, speed and frequency of large wind power variations, also called wind power ramping events, is of great importance for secure and economic operation of power systems. In this presentation, we will present our efforts for multiscale analysis of stochastic wind power generation and the associated ramping events.

2 - The Impact of Supply Chain Resilience on the Business Case for Smart Meter Installation

Behzad Samii, Vlerick Business School, Ave. du Boulevard 21, Brussels, Belgium, behzad.samii@vlerick.com, Hakan Umit, Kris Meyers

To produce realistic cost benefit assessments for the rollout of electricity smart meters, financial and operational decision-makers can collaborate using the framework of operational excellence and supply chain resilience. Strategies of product standardization, installation cost unification, onsite uncertainty reduction, and binding investments deferral not only reduce electricity supply chain vulnerabilities but also provide considerable cost reduction and resource optimization.

3 - Influence of Pricing Policies on Industrial Competition among Different Energy Technologies

Zhaomiao Guo, University of California, Davis, One Shield Ave., Davis, CA, United States of America, zmguo@ucdavis.edu, Yueyue Fan

Most U.S. electricity markets impose some pricing regulations, e.g. price cap, to mitigate market power abuse, which makes frequently-assumed smooth demand function unrealistic. In general, pricing policies directly affect companies' revenue. Moreover, in imperfect competition, they might also affect companies strategic behaviors. In this paper, we investigate how pricing policies might influence industrial competition among renewable and conventional energy technologies.

4 - Effects of Human Health Externalities on Generation Expansion Plans

Mark Rodgers, PhD Candidate, Rutgers University, 96 Frelinghuysen Road, Piscataway, NJ, 08854, United States of America, mdrodgers07@gmail.com, David Coit, Frank Felder

Generation expansion planning problems are least-cost, optimization problems, and the resulting expansion plans include fossil fuels, which satisfy the load on the system, but produce emissions that are health hazards. These health hazards as negative externalities realized by consumers. In this research, mixed-integer, multi-period optimization problems are solved to find the optimal expansion plan in order to minimize total system-wide costs, including human health externalities.

5 - Maximizing Wind Power Capture Considering Wind Turbine Dynamics

Fran Li, Associate Professor, University of Tennessee, 1520 Middle Drive, MHK 523, Knoxville, TN, 37996, United States of America, fli6@utk.edu, Can Huang

This paper aims to achieve a balance between maximization of power output and minimization of the drive train torsional torque fluctuation for a wind energy conversion system (WECS). A realistic model of a box uncertain set is applied to consider spatial and temporal distribution of wind speed forecast error. Then, the box uncertainties are combined with a proposed Intelligent Maximum Power Point Tracking method to a WECS robust optimization problem solved by semi-definite programming (SDP).

Targeted Demand Side Management: Uncovering Energy Usage Decisions from Data

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Adrian Albert, Senior Scientist, C3 Energy, 1300 Seaport Blvd, Redwood City, CA, 94062, United States of America, adrian.albert@c3energy.com

1 - Detecting Thermal and Occupancy-related Energy Use from Smart Meter Data: An Experimental Validation

Adrian Albert, Senior Scientist, C3 Energy, 1300 Seaport Blvd, Redwood City, CA, 94062, United States of America, adrian.albert@c3energy.com, Ram Rajagopal

We present an experimental evaluation of a methodology that decomposes single-point source smart meter data into thermal, baseload, and occupant-driven components by viewing consumption as a sequence of user decisions of what level of each of these components to consume. We show that, given just hourly consumption time series data, the model is able to accurately detect significant levels of HVAC, as well as usage induced by occupant activity.

2 - Negative Dividends: Internality Losses can Outweigh Externality Gains

Anshuman Sahoo, PhD Candidate, Stanford University, 473 Via Ortega, Stanford, CA, 94305, United States of America, asahoo@stanford.edu, Nik Sawe

The Energy Star label could increase or decrease a consumer's focus on the energy consumption of alternatives. We ask if individuals of different types respond to the label in systematically different ways and, if so, what these differences imply about its value to consumers. Results from a stated choice experiment suggest an affirmative answer to the first question. Moreover, heterogeneity in responses implies that losses from larger internalities outweigh gains from lower externalities.

3 - Do Wind Power Producers have Market Power and Exercise It?

Yang Yu, PhD Candidate, Stanford University, 139 Running Farm Ln Apt 104, Stanford, CA, 94305, United States of America, yangyu1@stanford.edu

In this paper, we developed a theoretical framework to measure the ability and willingness of wind power producers in manipulating the market price. Through a case study of the ERCOT control area, we demonstrate these producers do posses market power even at relatively low penetrations.

4 - Scalable Algorithms for Control and Assessment of Electric Vehicle Charging Services

Jing Ma, PhD Candidate, Stanford University, Management Science and Engineering Dept, Stanford University, Stanford, CA, 94305, United States of America, jingma@stanford.edu, Ram Rajagopal, Erica Plambeck

We consider electric vehicle (EV) charging models for different scenarios. Our optimal charging rules are characterized by explicit equilibrium equations and are efficiently computable. The framework of our analysis gives rise to the scalable algorithms for control of large-scale EV charging systems and services. Simulation results involving real-life EV data (taking into account both energy and emission cost) are discussed.

Parc- Mission II

Power System Resilient Design and Optimization

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Seyedamirabbas Mousavian, Assistant Professor, Clarkson University, School of Business, Potsdam, NY, 13699, United States of America, amir@auburn.edu

1 - Optimal Resilient Distribution Grid Design

Russell Bent, Los Alamos National Laboratory, PO Box 1663, MS C933, Los Alamos, NM, 87545, United States of America, rbent@lanl.gov, Scott Backhaus

Natural disasters such as earthquakes, hurricanes, and other extreme weather pose serious risks to modern critical infrastructure such as electrical distribution grids. Here, we present optimization methods for designing and upgrading these grids with smart devices to better withstand and recover from these threats, i.e. so that the post-event damaged grid meets a minimum standard of service (98% of the critical demand is met and 50% of all other load is served).

2 - Software System for Large-Scale Decentralized Unit Commitment

Mitch Costley, PhD Candidate, Advanced Computational Electricity Systems (ACES) Laboratory, Georgia Institute of Technology, Atlanta, GA, United States of America, mitch.costley@gatech.edu, Mohammad Javad Feizollahi, Sungkap Yeo

In this work, we describe the implementation of a novel decentralized algorithm for solving power system unit commitment problems. The algorithm itself, based on ADMM, is described, and its performance is evaluated in a computing cluster. Test systems include various configurations of openly available 3,000-bus power systems and a utility system model of over 12,000 buses. The software architecture using both Open MPI and the CPLEX C++ API is discussed along with dynamic job migration features.

3 - Resilient Distribution System by Microgrids Formation After Disastrous Events

Chen Chen, Argonne National Laboratory, 9700 S. Cass Avenue, Bldg. 221, Argonne, IL, 60439, United States of America, morningchen@anl.gov, Jianhui Wang, Feng Qiu

We propose a novel distribution system operational approach that will build on recent industry trends and form multiple microgrids from the distribution network in real-time operations, to restore the loads of customers from power outage. Specifically, an integer linear program is formulated for the self-adequacy microgrids formation problem. A distributed multi-agent coordination scheme is designed via local communications for the global information discovery as inputs of the optimization.

4 - Investment Decisions on Optimal Resilient Allocation of Phasor Measurement Units

Seyedamirabbas Mousavian, Assistant Professor, Clarkson University, School of Business, Clarkson University, Potsdam, NY, 13699, United States of America, amir@auburn.edu, Jianhui Wang, Jorge Valenzuela

Reliability of the electrical power systems necessitates full observability of the power grid. PMUs collect synchronized phasors of voltages and currents in real time and are utilized for full observability of the power systems. Due to considerable cost of installing PMUs, it is not possible to install PMUs at all buses. We study the effect of transmission switching and single contingencies on the optimal placement of PMUs and propose an ILP model to find the optimal two-phase PMU allocation.

■ WE75

Parc- Mission III

Simulation III

Contributed Session

Chair: Amine Kamali, The University of Oklahoma, 202 W. Boyd St., Room 436, Norman, OK, 73019, United States of America, amine@ou.edu

1 - Simulation Optimization of Production and Maintenance Policies for Manufacturers with Deterioration

Héctor Rivera-Gómez, Researcher, Autonomous University of Hidalgo, Pachuca-Tulancingo Road, km. 4.5, Pachuca, Hg, 42184, Mexico, hriver06@hotmail.com, José Ramön Corona-Armenta, Ali Gharbi, Eva Selene Hernández-Gress, Jaime Garnica-Gonzalez

We investigate the simultaneous production and maintenance planning for an unreliable manufacturing system subject to deterioration, whose effect is observed mainly on the rate of defectives. Overhaul activities can be conducted to counter the effect of deterioration. A stochastic dynamic programming model is proposed, where we approximate the related control parameters, through a simulation optimization approach. Sensitivity analyses are conducted to show the usefulness of the policy obtained.

2 - Reducing Water Discharges Exceedances a Wastewater T reatment Plant

Jean Carlos Rivera, Universidad del Turabo, P.O. Box 3030, Gurabo, PR, 00778-3030, Puerto Rico, jrivera735@email.suagm.edu, Wesley Marrero, Marie Velazquez, Martha A. Centeno

We present the modeling of a water treatment plant that serves four industrial plants. Water discharges are regulated by the Puerto Rico Aqueduct & Sewer Authority, which has established a maximum of 130,000 GPD. The plant has had 90 exceedances from 08/2013 to 04/2014, representing $505,814 in penalties. Solutions include reusing and manage stored water to balance discharge flow. Using a simulation model, we determine a configuration for the tank pump set points that reduces the exceedances.

3 - Design and Analysis of Agent Based Simulation for Cellular Transport System

Elif Karakaya, TU Dortmund, Leonhard-Euler-Str. 5, Dortmund, 44227, Germany, elif.krky@gmail.com, Tobias Hegmanns, Axel Kuhn

Recent developments in the field of intralogistics have led to fully automated warehouses in order to obtain high throughput volume and improve the accuracy.However, intralogistics systems are not flexible enough due to bulk conveyor systems, huge sorters with installation cost.In accordance with this purpose,Cellular Transport System (CTS) has been developed as an alternative intralogistics system by Fraunhofer Institute (IML).This study examines CTS as a whole by using Agent-Based Simulation.

4 - Natural Gas Trading: A Simulation Optimization Approach

Amine Kamali, The University of Oklahoma, 202 W. Boyd St., Room 436, Norman, OK, 73019, United States of America, amine@ou.edu, Hank Grant

This research focuses on developing a simulation optimization framework that models the price impact of high-frequency trading on the natural gas market. The objective is to maximize the expected profit subject to multiple constraints over a limited time horizon. Different scenarios are simulated and the data collected are compared to historical data. In this setting, high-frequency trading can disturb temporarily or permanently natural gas market equilibrium price.

Parc- Embarcadero

Practicum and Internship Experiences at Analytics Programs

Sponsor: The Practice Track

Sponsored Session

Chair: Jeff Hamrick, Associate Professor of Finance and Analytics, University of San Francisco, 2130 Fulton Street, San Francisco, CA, 94117, United States of America, jhamrick@usfca.edu

1 - LSU Master of Science in Analytics Practicum

James Van Scotter, Associate Professor of ISDS, Louisiana State University, 2215 Business Education Complex, Baton Rouge, LA, 70803, United States of America, jvanscot@lsu.edu, Joni Shreve, Saumitra Sharma

Team-based projects are at the core of LSU's M.S.in Analytics program. These projects are intended to produce tangible value for sponsors and help students learn important lessons about the practice of analytics that can't be taught in a classroom. Key lessons include: critical thinking, understanding business models, choosing appropriate analytical approaches, project management, team work, maintaining relationships with company sponsors, and communicating results to executives.

2 - Overview of the USFCA MS in Analytics Practicums

Matthew Dixon, Assistant Professor of Analytics, University of San Francisco, 2130 Fulton Street, San Francisco, CA, 94117, United States of America, mfdixon@usfca.edu

This talk describes the USFCA MS in Analytics Practicum - a 9 month industry collaborative course designed for students to solve data mining intensive analytics problems posed by participating companies. We describe the process by which student teams use state-of-the-art technical skills to provide research insights across a range of business functions. Example projects shall be used to illustrate the value of the Practicum through advancing a company's analytics capabilities.

3 - An Exploratory Study of the Development of Analytics Capabilities within Organizations

Matthew Liberatore, Director, Center for Business Analytics, Villanova University, 800 E. Lancaster Avenue, Villanova, PA, 19085, United States of America, matthew.liberatore@villanova.edu, Bruce Pollack-Johnson, Suzanne Clain

Little is known about the characteristics of firms that decide to invest in analytics. Do the factors that influence IT investment intensity also relate to investing in analytics? The purpose of this research is to determine what factors influence a firm's decision to invest in analytics. This study draws on data obtained from firms that participated in a series of intensive workshops held by IBM over 2009 - 2011.

4 - University of Tennessee Business Analytics Capstone Experience

Melissa Bowers, Beaman Professor of Business, University of Tennessee at Knoxville, 255 Stokely Management Center, Knoxville, TN, 37996, United States of America, mrbowers@utk.edu

The University of Tennessee, Knoxville offers a Master's Degree in Business Analytics. The academic program is three semesters in length. In the third semester of the program, each student enrolls in a three-hour "Business Analytics Experience" capstone class in which student teams work on a real world problem with a business partner in real time. The administrative and pedagogical structures of the capstone experience will be outlined.

5 - The Practicum Experience at NC State's Institute for Advanced Analytics

Christopher West, Practicum Manager, North Carolina State University, 920 Main Campus Drive, Suite 530, Raleigh, NC, 27606, United States of America, cjwest4@ncsu.edu

Our practicum learning experience involves 5 person student teams conducting real-world analytics projects for sponsors, understanding the business problem, then cleaning and analyzing the data. Projects span 7 months and culminate with a report and presentation to the sponsor. Teams perform their work under confidentiality agreement. Results are the sole property of the sponsor. There is no sponsorship fee. Past projects span every industry segment and include the world's best known brands.

■ WE77

Parc- Market Street

Joint Session Analytics/HAS: Strategic Payment and Pricing Healthcare Analytics

Sponsor: Analytics & Healthcare Applications

Sponsored Session

Chair: Thomas Roh, Mayo Clinic, 200 1st St. SW, Rochester, MN, 55905, United States of America, roh.thomas@mayo.edu

1 - Healthcare Asset Replacement Problem under Technological Change and Deterioration

Emmanuel des-Bordes, Graduate Research Assistant, Wichita State University, 1845 Fairmount Street, Wichita, KS, 67260, United States of America, exdes-bordes@wichita.edu, Esra Buyuktahtakin

This paper presents a discrete optimization model for keeping or replacing a group of aging assets that operate in parallel under a limited budget. Numerical results and sensitivity analyses are presented to illustrate the optimal replacement strategies for Magnetic Resonance Imaging (MRI) and Extremity-MRI machines (eMRI).

2 - Identifying Episodes-of-Care Trough Data Mining

Seyed Emami, RIT, 716 Merchants Road, Rochester, NY, United States of America, sme3279@rit.edu

We designed a clustering based methodology to identify episodes-of-care for medical conditions in order to assess the implementation of bundled payment reimbursement system. Our methodology automatically determines the set of services that constitute an episode-of-care for discrete group of diagnoses and patient cohorts.

3 - Fair Division of Shared Savings for Value-Based Purchasing Payment Model

Brendan Bettinger, Northeastern University, 360 Huntington Ave, Boston, MA, 02115, United States of America, b.bettinger@neu.edu, James Benneyan

The goal of this research is to design a new payment model between a nonprofit care delivery organization and skilled nursing facilities to reward a better standard of care at lower cost. Mechanism design is applied to define and calibrate financial incentives so the expected division of savings satisfies both parties.

■ WE78

Parc- Mason

Decision Support Systems 3

Contributed Session

Chair: Thomas Edmunds, Associate Program Leader - Energy Systems Analysis, Lawrence Livermore National Laboratory, 7000 East Av. L-175, Livermore, CA, 94550, United States of America, edmunds2@llnl.gov

1 - Stochastic Optimization of Renewable Generators

Thomas Edmunds, Associate Program Leader - Energy Systems Analysis, Lawrence Livermore National Laboratory, 7000 East Av. L-175, Livermore, CA, 94550, United States of America, edmunds2@llnl.gov

Wind and solar renewable generators increase the variability and uncertainty in power grid operations. Demand response, where consumers choose to reduce or increase energy usage in response to grid states, and energy storage can be used to mitigate uncertainty and variability. We describe coupled stochastic weather, renewable generator, and production simulation models that can assess the value that demand response and storage can provide.

2 - Tips and Tricks to Write Scalable Models using Cplex Optimization Studio

Arnaud Schulz, Software Architect, IBM, 1681 Route Des Dolines, Les Taissounieres HB2, Valbonne, 06560, France, arnaud.schulz@fr.ibm.com

A good optimization model has to execute fast, but also it has to be scalable to adapt to changes in data and/or constraints. In this software tutorial, we will give you tips and tricks to write such models using the OPL Language.

3 - Evaluation Model for Signal Coverage of Satellite Communication, Navigation and Positioning System

Maria José Pinto Lamosa, Dra., IEAv/CTA, Trevo Cel Av. José A. A. do Amarante, 1, São José dos Campos, Brazil, maju@ieav.cta.br, Monica Maria De Marchi, Diogo Maciel Almeida, Osvaldo Catsumi Imamura

Embedded spatial sensor coverage evaluation takes into account spatial and temporal parameters. Decision making process often requires data associated to the monitored targets and their features. To provide satellite attitude and sensor positioning optimized control, the model takes sensor and target characteristics for coverage planning and performance analysis, matching the sensor capacity with the target in the observed scenario. Sensor technical characteristics and limitations are simulated.

4 - Detecting Knowledge Transitions between Science and Technology for Forecasting Growing Fields

Hajime Sasaki, The University of Tokyo, #307 Build. Engineering 3, 7-3-1, Hongo, Bunkyo-ku, Tokyo, To, 1138656, Japan, sasaki@pp.u-tokyo.ac.jp, Yuya Kajikawa, Ichiro Sakata

The purpose of this research is to suggest a methodology for identifying promising fields by grasping dynamic transition between science and technology. We extracted 50,913 academic papers and 63,972 patent gazettes with solar cell" as search queries. We applied Newman clustering to these citation networks for identifying fields and tracked time-series of Cosine similarity within the clusters thorough the time window. Then we grasped a forerunner of transition between science and technologies.

Model and Model Validation in Disaster Management

Sponsor: Decision Analysis

Sponsored Session

Chair: Jing Zhang, University at Buffalo,SUNY, 2 Bristol Ct, Apt B, Buffalo, NY, 14228, United States of America, jzhang42@buffalo.edu

1 - Measuring a Community's Resilience to Disasters

Julia Phillips, 9700 S. Cass Avenue, Argonne, IL, United States of America, Argonne National Laboratory, phillipsj@anl.gov

Community resilience is often viewed as a combination of societal, organizational and infrastructure resilience. Holistically capturing this symbiotic relationship is challenging. Community resilience studies have traditionally required large amounts of data and significant time to complete. We present a decision analytic approach to capturing components of community resilience and discuss a potential framework to provide the holistic view necessary for disaster management and recovery efforts

2 - Risk Tolerance Model Validation Before and After Significant Disasters

Darlene Alexander-Houle, UoP/HP, 14207 Torrey Vista Dr, Houston, TX, 77014, United States of America, dalexhoule@att.net, Gary Houle

The RiskPACK model measures individuals' risk tolerance in decision making. A change in risk tolerance after weather and financial disasters validate the model using the FRB's SCF data for the USA over a 21-year period. Results propose characteristics of risk takers and avoiders, controlling for age and education.

3 - Defensive Resource Allocations of Assembly Occupancies System in a Sequential Defender-attacker Game

Shuying Li, Tsinghua University, Institute of Public Safety Research, 1018 Liuqing Building, Beijing, 100084, China, lishuying_susie@qq.com, Shifei Shen, Jun Zhuang

Optimal defensive resource allocation was studied facing with intentional attacks using game theory and risk analysis methods. This research considers a series of assembly occupancies, such as large railway stations, as the system targets (classified into two categories). The consequences of attack are calculated, based on the optimal resource allocations for both attackers and defenders studied in an n-period game. We illustrated the model using the 2014 Kunming terrorist attack case study.

4 - Modeling Ballistic Missile Defense Deterrence

Jonathan Trexel, Program Manager, SAIC, 7416 Grand Oaks Drive, Lincoln, NE, 68516, United States of America, trexelj@saic.com

This presentation explores the role of Japan's ballistic missile defense (BMD) program and its deterrent effect upon North Korean behavior during general deterrence conditions. A mixed-methods approach is employed. Empirical quantitative data included tabulated monthly cooperative-conflictual behavioral interaction between Japan and North Korea. A strategic profile developed from deterrence theory provided essential qualitative background to compliment the quantitative analysis.

5 - Optimal Allocation of Defensive Resources for Counter-Terrorism: Modeling and Validation

Jing Zhang, University at Buffalo,SUNY, 2 Bristol Ct, Apt B, Buffalo, NY, 14228, United States of America, jzhang42@buffalo.edu, Jun Zhuang

In this research, we study the optimal defensive resource allocation by proposing a novel class of multi-period and multi-target attacker-defender games where the attackers may have multiple attacking options. We provide both analytical results and algorithm to solve this game, as well as numerical illustration and model validation using real data. This research provides some new insights to homeland security resource allocation.

Parc- Divisadero

Predictive Models in Data Mining

Sponsor: Data Mining

Sponsored Session

Chair: Onur Seref, Assistant Professor, Virginia Tech, Pamplin 1007, Blacksburg, VA, 24061, United States of America, seref@vt.edu

1 - Relaxed Support Vector Machine Extensions

Talayeh Razzaghi, Postdoctoral Research Fellow, School of Computing, Clemson University, Clemson, SC, 29634, United States of America, trazzag@clemson.edu, Onur Seref, Petros Xanthopoulos

Relaxing the constraints of support vector classifiers has been found to work well for classification problems in the presence of outliers. Here we present the extension of this concept for applications beyond supervised learning and compare against traditionally popular algorithmic schemes.

2 - Inferring Correlated Consumer Valuations for Data-Driven Bundle Pricing

Ben Letham, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, United States of America, bletham@mit.edu, Anshul Sheopuri, Wei Sun

Optimal bundle pricing requires learning the joint distribution of consumer valuations for the items in the bundle, that is, how much they are willing to pay for each item. We suppose that a retailer has sales transaction data, and the corresponding consumer valuations are latent variables. We develop a statistically consistent and computationally tractable inference procedure for fitting a copula model of correlated valuations, using only sales transaction data for the individual items.

3 - A Latent State Hazard Model

Ramin Moghaddass, MIT Sloan School of Management, Cambrdige, MA, United States of America, raminm@mit.edu, Cynthia Rudin

We present a new statistical model for reliability analysis that is able to distinguish the latent internal vulnerability state of the equipment from the vulnerability caused by temporary external sources. If we can isolate the underlying latent state, we will better understand the effects of external sources, leading to more robust decision making. Our hazard model has been effective both in simulations and on a wind farm study based on SCADA data from 28 turbines in Italy.

4 - The L1-Norm Best-Fit Line Problem

Paul Brooks, VCU, PO Box 843083, Richmond, VA United States of America, jpbrooks@vcu.edu, Jose Dula

The L1-norm best-fit line problem has applications in facility location and robust principal component analysis. In this talk we present properties of the L1-norm best-fit line that suggest an efficient heuristic.

Parc- Haight

System Analysis

Contributed Session

Chair: Ali Shafaat, Purdue University, 3386 Peppermil Dr., Apt 2A, West Lafayette, IN, 47906, United States of America, ashafaat@purdue.edu

1 - A Photo Elicitation of Systemic Perception

James Corner, University of Waikato, 12 Bronte, Cambridge, 3432, New Zealand, jcorner@waikato.ac.nz, Raimo Hamalainen, Rachel Jones

Systems perception is important as a necessary ingredient for acting with systems intelligence. However, research shows that the average person is unable to articulate their understanding of systems and apply systems thinking formally. This study attempts to expand our understanding of how people perceive the systems around them. A photo elicitation methodology, coupled with thematic analysis, shows how the use of photos can significantly improve one's understanding of the complexity of systems.

2 - A System Dynamics Model for Estimating the Energy Imbalance Among US Children

Saeideh Fallah-Fini, Assistant Professor, California State and Polytechnic University, Pomona, 3801 W. Temple Ave, Pomona, CA, 91768, United States of America, sfallahfini@csupomona.edu, Hazhir Rahmandad, Regina Bures, Terry Huang

This paper uses systems dynamics to present a population-level model that quantifies the energy imbalance gap responsible for the obesity epidemic among U.S. children (across different gender/ethnicity/age subpopulations) during the past decades. Our model creates a platform to better understand obesity intervention targets in different segments of children.

3 - Measuring Complexity in Mechanical Systems

Ali Shafaat, Purdue University, 3386 Peppermill Dr., Apt 2A, West Lafayette, IN, 47906, United States of America, ashafaat@purdue.edu

In engineered systems, complexity of human-human and human-mechanical system interactions absorbed the main attention. This paper tries to fill the gap by using a forward approach with clear terminology. This research would take a simple reactive mechanical system and make it gradually more complex. Each step increases the system adaptivity by getting farther from reactivity. It makes the measurement, comparison, and judgment of the system complexity more precise.

4 - Implementations of Remote Sensing and Traceability Technologies

Chun-Hung Cheng, Associate Professor, The Chinese University of Hong Kong, Dept of Syst. Engg. & Engg. Mgmt., Shatin, NT, Hong Kong - PRC, chcheng@se.cuhk.edu.hk, Dorbin Tobun Ng, Ziye Zhou

In this project, we will talk about implementations of remote sensing and traceability technologies in an airmail center and a museum. Remote traceability technology is used to track air mail bags more efficiently and remote sensing technology is designed for real-time monitoring the environment of the museum. The implementation challenges in these facilities are discussed. Initial experiences in using these systems are shared. Other applications of the technologies are also explored.

5 - Linking Requirements Change to Project Performance

Sherrica Holloman, Aerospace Corporation, 2100 Crystal Drive, Arlington, VA, 22315, United States of America, ssn@gwu.edu

Requirements is often implied or cited as critical to overall project performance; however, little empirical data outside of interview or survey data exists to support the notion. This gap in literature can be addressed by analyzing requirements change over the life-cycle of select NASA projects. It is expected that measurements of requirements change is an early indicator of project performance.

Data Mining 5

Contributed Session

Chair: Fakhrosadat Mohammadi, PhD Student in Library and Information Sciences, Chamran Univeristy, Motahayeri Street, Sohrevardi Shomali, Tehran, Iran, fmohamadi1@gmail.com

1 - Functional Hazard Analysis of Call Center Data

Gen Li, UNC-CH, 100 Rock Haven Road E207, Carrboro, NC, 27510, United States of America, ligen@live.unc.edu, Jianhua Huang, Haipeng Shen

We build a novel two-dimensional hazard model to study customer patience and offered waiting time across different time of a day of a call center. The smooth hazard surface is estimated by maximizing a regularized likelihood function. The optimization problem is efficiently addressed by an alternating direction method of multipliers (ADMM) algorithm. We apply the method to US bank call center data. The proposed method reveals interesting patterns of calls being abandoned or answered.

2 - The Ten Killer Data Mining Errors:

Sam Koslowsky, VP Modeling Solutions, Harte Hanks, 1271 Ave. of the Americas, 43rd Floor, New York, NY, 10020, United States of America, sam.koslowsky@hartehanks.com

Most errors that occur in a data mining exercise are ones that can easily be avoided. Indeed, contrary to what many analysts may believe, these issues are non-technical in nature. From using biased samples to employing inappropriate predictors,these errors can easily be avoided. And they come from all three phases of a project-data preparation,algorithm development,and model deployment.I show some actual mini case studies, and provide some quick rules that will aid in avoiding these problems.

3 - Learning Product Knowledge from Online Reviews

Feng Mai, PhD Student, University of Cincinnati, Carl H. Lindner Hall, 2925 Campus Green Drive, Cincinnati, OH, 45221, United States of America, maifg@mail.uc.edu, Xin Wang, Roger Chiang

We investigate how consumer generated product reviews can facilitate product designing and brand positioning. We propose and evaluate a new framework for learning from unstructured online reviews to conduct market structure analysis.

4 - using Data Mining Techniques for Reaching to Competitive Edge, Evaluating Customer Loyalty

Fakhrosadat Mohammadi, PhD Student in Library and Information Sciences, Chamran Univeristy, Motahayeri Street, Sohrevardi Shomali, Tehran, Iran, fmohamadi1@gmail.com, Farideh Osareh, Behzad Sanayei

Customer loyalty have critical role in reaching to competitive edge in market. We evaluate it using data mining techniques by focusing on the numbers like lifetime customer value. Mining these data can help us improve acquisition costs and also identify why customers bail. The combination of tacit may come in handy because of the data will tell us where they are falling off.

5 - A New MIP Model for Clustering Binary Networks

Harun Pirim, KFUPM, Dhahran, Saudi Arabia, harunpirim@gmail.com

Integer programming models for clustering have applications in market segmentation, facility location problems. Models are important for guiding clustering algorithms that are capable of handling high dimensional data. Here, a new mixed integer programming model for clustering relational networks is presented. Relational networks are mainly used in social sciences and bioinformatics. The model is applied on several social networks.

Zhou, Zhi MD72, TC73
Zhou, Zhili SB47, WB49
Zhou, Zhouyang SA24, SD24
Zhou, Ziye WE82
Zhu, Bo SA06
Zhu, Cheng MA39
Zhu, Feida SC37
Zhu, Helin MD53, TB05
Zhu, Jianmin SA72
Zhu, Jing WC07
Zhu, Joe SA15
Zhu, Kaijie WD04, WE08
Zhu, Kevin TB03, WB44, WC05
Zhu, Leon MD19, TA04
Zhu, Li MB66
Zhu, Michael Yu MA66
Zhu, Qiushi WE66
Zhu, Shanjiang SD22
Zhu, Tao MD55
Zhu, Wanshan TB60, WA11
Zhu, Xinyuan TA37
Zhu, Yu Jiao WC14
Zhu, Yunxia SB30
Zhuang, Jun TA82, WA79, WB79, WE79
Zhuo, Xiaohui TD51
Zhuo, Yueran SA40, TD36
Zhupanska, Olesya WD48
Zijm, Henk TD60
Zinchenko, Yuriy MC52
Zipkin, Paul WA59
Zitezwitz, Eric SB20
Ziya, Serhan SB77, MA10
Zobel, Christopher MB34
Zolfagharinia, Hossein MA23
Zollo, Maurizio MA38, WD44
Zorc, Sasa WC79
Zou, Bo MB28, TD27
Zou, Han SD23
Zou, Jikai MC74
Zou, Na TA66
Zoumpoulis, Spyros MD17
Zu, Ling WA13
Zubizarreta, Jose MA09, MB39
Zuidwijk, Rob TD26, WB23
Zuluaga, Luis TC50, TD53, WB48
Zverovich, Victor SC56, MC46
Zvilichovsky, David SD33
Zwart, Bert MA65, MC65, TC60, TD18, WB64, WB65

Session Index

Sunday, 8:00am- 9:30am

SA01 Analysis in Support of National Security
SA02 Harvesting Big Data for Technology Intelligence
SA03 Entrepreneurship and Innovation
SA04 Managing Systems with Random Yields
SA05 Empirical Studies of Service Operations
SA06 Stochastic Modeling In Healthcare Operations
SA07 Using Complementarity Modeling for Planning and Policy Analysis of Electricity & Energy Markets
SA08 2014 INFORMS Prize Winner: Mayo Clinic
SA09 Empirical Healthcare Operations
SA10 Consumer Behavior and Revenue Management
SA11 Information and Incentives in Supply Chains
SA12 Sustainability and Supply Chains
SA15 Two-stage and Fuzzy DEA Topics
SA16 Risk Management in Supply Chains
SA17 Consumer Behavior in Services
SA18 Choice Models in Revenue Management and Pricing I
SA19 New Frontiers in Pricing and Revenue Management
SA21 Design of Transportation and Supply Chain Networks
SA22 Real-Time Information in Transportation
SA23 Less-than-Truckload Optimization Problems
SA24 Advances in Traffic Flow Theory
SA26 Location Analysis
SA27 Railway Application Section Student Paper Award
SA28 Data Mining in Aviation
SA29 JFIG Paper Competition I
SA30 Project Scheduling: Stochastic And Game Theoretic Aspects
SA31 Modeling Co-creative Systems
SA32 Stochastic Models in Service Science
SA33 Microfoundations of Innovation in Supplier Driven and Crowd Driven Contexts
SA34 Homeland Security Applications I
SA35 Challenges of Post-Disaster Humanitarian Logistics
SA36 Panel Discussion: Teach Sports Analytics
SA37 Analyzing Social Networks and Social Media I
SA38 Capacity Management in Operating Rooms and Clinics
SA39 Patient Monitoring at Hospital and at Home
SA40 Medical Decision Making and Public Policy
SA41 Transplantation and Organ Allocation
SA42 Dynamic Scheduling
SA43 Joint Session ICS/OPT: Global Optimization and Mixed-Integer Nonlinear Programming
SA44 Digital Channels and User Behavior
SA45 Remembrances of Susan Hong Xu
SA46 Remembrances of Manfred Wilhelm Padberg
SA47 Topics in Stochastic Optimization
SA48 Applications of Distance Geometry: Nanostructures, Astrometry, and Big Data
SA49 Network Optimization and Applications
SA50 Optimization in Graphs and Digraphs
SA51 Large-Scale Nonlinear Optimization Algorithms
SA52 Applications of Conic Optimization
SA53 Optimal Control in Finance
SA54 Quantitative Methods in Finance
SA55 Sigmoidal and Geometric Programming: From Aircraft Design, to Virus Propagation, to Political Elections
SA56 Software Demonstrations
SA64 Stationarity in Many-server Queues
SA65 Control of Queues
SA66 Joint Session QSR/ENRE: Statistical Modeling and Analysis in Renewable Power Systems
SA67 Nonlinear Dynamics and Chaos (Tutorials and Research)
SA68 Nanomanufacturing and Nanoinformatics
SA69 Decision Analysis for Energy Systems
SA70 Copper Mining Applications
SA71 Auctions and Trading Agents
SA72 Energy Management Analytics in the Demand Side
SA73 Real Options in the Energy Sector
SA74 Market Issues for Hydro-Dominated Electricity Systems
SA75 Simulation Optimization and Ranking and Selection
SA76 Planning and S&OP Processes
SA77 Analytics Applications on Decision Making
SA78 Stochastic Analytics Models and Methods
SA79 The Next 50 Years of Decision Analysis
SA80 Military Applications of Decision Analysis
SA81 Networks and Information
SA82 Robust Multiobjective Optimization
SA83 Doing Good with Good OR - Student Paper Competition

Sunday, 11:00am - 12:30pm

SB01 DIME/PMESII I
SB02 Strategies for Developing Inventions and Profiting from Them
SB03 Business Model Innovation: Operations and Information Management Perspectives
SB04 Topics in Operations with Marketing Incentives
SB05 Retail Operations
SB06 Behavioral Research in Information Sharing
SB07 Critical Infrastructure
SB09 Incentive and Contracting in Healthcare Networks
SB10 Product Assortment: Theoretical and Experimental Developments
SB11 Operations Economics
SB12 Sustainable and Socially Responsible Supply Chains
SB16 Operational Issues in Agriculture
SB17 Strategic Behavior in Service Systems
SB18 Choice Models in Revenue Management and Pricing II
SB19 Topics in Pricing and Revenue Optimization
SB20 Empirical Market Design
SB21 Routing Problems with Time Windows Constraints
SB22 Logistics Planning under Disruptions
SB23 Urban Logistics
SB24 Mitigating Network Disruptions and Special Events
SB25 Transportation Network Assignment and Optimization
SB26 Location Models
SB27 RAS Problem Solving Competition
SB28 Modeling Airline Coordination and Competition for Improving National Airspace System Performance
SB29 JFIG Paper Competition II
SB30 Planning and Scheduling Issues in Service and Manufacturing Systems
SB31 Online Reviews of Services: An Examination of Their Content, Structure and Impact
SB32 Service Science in the Emerging Markets
SB33 Technology Adoption and Innovation Management as a Search Process
SB34 Optimization and Modeling For Election Systems
SB35 Routing for Public Needs
SB36 Decomposition Techniques for Network Design
SB37 Analyzing Social Networks and Social Media II
SB38 Data-Driven Research in Healthcare
SB39 Decision-Making for Population Health Outcome Interventions
SB40 Appointment Scheduling
SB41 Healthcare Modeling for Efficient Policy Decisions
SB42 Stochastic Models on Medical Decision Making
SB43 Joint Session ICS/OPT: Global Optimization and Mixed-Integer Nonlinear Programming II
SB44 Digital and Social Media
SB45 Behavioral Modeling in Business
SB46 MINLP
SB47 Stochastic Optimization in Networks
SB48 Stochastic Programming - A Mix of Recent Results
SB49 Risk-averse Optimization in Networks
SB50 Network Design, Dynamics and Optimization

SB51 Optimization in Dynamics and Control
SB52 First-Order Methods for Huge-Scale Optimization
SB53 Systemic Risk
SB54 Financial Engineering & Risk Management
SB55 Integer Nonlinear Programming and Applications - I
SB56 Software Demonstrations
SB64 Applications of Approximate Queueing Analysis
SB65 Systemic Financial Risk
SB66 QSR Student Introductions and Interactions
SB67 Condition Monitoring and Degradation Modeling
SB68 Reliability Evaluation and Maintenance Optimization
SB69 Design and Optimization of Sustainable Supply Chains
SB70 Open Pit Mining and Logistics
SB71 Auctions and Markets for Information
SB72 Demand Response in Electricity Markets
SB73 New Paradigms in Transmission Expansion Planning
SB74 Mitigating Uncertainty in Power System Operations through Market Design and Computational Methods
SB75 Simulation Modeling for Anaysis
SB76 Cloud Infrastructure Planning and Optimization
SB77 Stochastic Models in Health Care
SB78 Nicholson Student Paper Prize I
SB79 Decision Analysis and Behavioral Research
SB80 Decision Analysis in Integrated Care (Healthcare and Social care)
SB81 The Role of Information in Dynamic Games
SB82 Choice Behavior in MCDM
SB83 Doing Good with Good OR - Student Paper Competition

Sunday, 1:30pm - 3:00pm

SC01 MAS Tutorial Session. A Quick Peek at Predictive Analytics
SC02 Organizational Issues in Technology Management
SC03 Business Model Innovation in Cleantech Markets
SC04 Strategic Decision Making in Manufacturing & Service Operations
SC05 Innovation in the Supply Chain
SC06 Topics in Sustainable Operations
SC07 From Data to Assessments and Decisions: Epi-Spline Technology
SC09 The Impact of Workload and System Factors on Patient Outcomes
SC10 Supply Risk Management/Inventory Control
SC11 Competition and Coordination in Supply Chains
SC12 Sustainable Operations Management with Public Interest
SC15 Computational Issues and the Relationships Between Related Models
SC16 Operations and Finance Interface
SC17 Retail Operations
SC18 Choice Models in Revenue Management and Pricing III
SC19 Topics in Revenue and Capacity Management
SC20 Matching and Market Design
SC21 Traffic Flow Modeling and Management
SC22 Optimization and Disaster Management
SC23 Rich Vehicle Routing Problems I
SC24 Traffic and Emissions Modeling
SC25 Flexible Transit and Ride-Share Systems
SC26 Location Optimization I
SC27 Roundtable Discussion on Bridging Data and Decisions I
SC28 Advanced Analytics: Applications to Solve Aviation System Level Problems
SC29 "Just the Facts" Papers in Strategy
SC30 Scheduling in Maritime Logistics
SC31 Delivering Services Over the Digital Media
SC32 Accelerate Service Innovations with Data Mining and Machine Learning
SC33 Managing the Innovation Process for New Product Development
SC34 Humanitarian Logistics and Development
SC35 Public Health I
SC36 Telecommunications Best Paper Award
SC37 Methods and Models for Large Social Networks
SC38 Systems Engineering and Public Health
SC39 Medical Decision Making
SC40 Scheduling Problems in Healthcare
SC41 Medical Decision Making: Research by Bonder Scholars
SC42 Network Epidemics: Theory Advancements and Applications
SC43 Software and Tools for Large-Scale Optimization
SC44 Service Operations and Information Systems
SC45 Service Operations Management
SC46 Joint Session OPT/ENRE: Mixed-integer Robust Optimization Models and Applications in Electric Power Systems
SC47 Computational Stochastic Dynamic Optimization
SC48 Stochastic Integer Programming
SC49 Connectivity and Cluster Detection in Networks
SC50 Network Analysis
SC51 Methods in Nonlinear Optimization
SC52 Optimization, Variational Inequality Problems, and Games: Uncertainty, Imperfect Information, and Distributed Computation
SC53 Data Driven Computational Finance
SC54 Financial Risks
SC55 Global Optimization: Algorithms and Applications
SC56 Software Demonstrations
SC64 Data-driven Decisions in Healthcare
SC65 Case Competitions I
SC66 Data Fusion in Manufacturing and Biomedical Systems
SC67 System Informatics and Control: Learning from Complex Data
SC68 Simulation Optimization and Sequential Sampling Rules
SC69 Land Use, Conservation and Sustainability
SC70 Topics in Underground Mine Planning
SC71 Incentive Auctions
SC72 Energy Storage for Grid Integration of Renewable Energy
SC73 Policy Analysis and Planning in Energy Sector
SC74 Strategic and Complementarity Models in Energy Markets
SC75 Efficient Learning in Stochastic Optimization
SC76 Community Service OR: Learn By Doing
SC77 Joint Session Analytics/HAS: Topics of Healthcare Analytics I
SC78 Panel Discussion: Promoting INFORMS International Activities
SC79 Joint Session DAS/SPPSN: Societal Applications of Decision Analysis
SC80 Ensembles and Big Data
SC81 The Role of Information in Dynamic Games
SC82 Business Location Analysis with MCDM
SC83 INFORMS Data Mining Best Student Paper Award

Sunday, 4:30pm - 6:00pm

SD01 Mathematical Modeling and Operations Research in Military Decision Making I
SD02 Entrepreneurial Innovation Process (Discussant Session)
SD03 Innovating in the Mobile World using Analytics
SD04 Empirical Research in Operations Management
SD05 Supplier Responsibility Management
SD06 Strategic Supply Risk Management
SD07 Global Healthcare Operations
SD09 Tackling Readmissions: From Policy to Practice
SD10 Crowdsourcing
SD11 Joint Session M&SOM Supply Chain/BOM: Pricing from the Practitioner's Perspective
SD12 Sustainability Impacts of Operational Choices in Energy Generation and Storage
SD15 Stochastic Alternatives: SFA and StoNED
SD16 Information, Risk Management, and Production Strategies
SD17 Customer Behavior and Call Center Management
SD18 Choice Models in Revenue Management and Pricing IV
SD19 Integrating Pricing and Supply Chain Planning
SD20 Matching Markets
SD21 Transportation and Routing under Uncertainty I
SD22 Preparing for and Responding to Disaster with Tools of OR
SD23 Rich Vehicle Routing Problems II

SD24 Modeling of Emerging Sensor Technologies
SD25 Advances in Routing and Scheduling Problems
SD26 Location Optimization II
SD27 Roundtable Discussion on Bridging Data and Decisions II
SD28 AAS Dissertation Prize Finalists
SD29 New Directions in Understanding Buyer-Supplier Relations
SD30 Supply Chain and Scheduling
SD31 Theory Development, Measurement and Testing in Service Science
SD32 Data Science in Online Retailing
SD33 Incentives and Organizational Issues In New Product Development
SD34 Humanitarian Operations Management Applications
SD35 Decisions in a Nonprofit Supply Chain I
SD36 Wireless Mobility Modeling
SD37 Social Intelligence: Learning, Aggregation and Applications
SD38 Healthcare Analytics
SD39 Joint Session HAS/Analytics/CPMS: Practicing OR/OM in Healthcare Providers - A Panel
SD40 Public Health Applications
SD41 Decision Modeling for Disease Prevention Considering Imperfect Screening
SD42 Healthcare Operations
SD43 Sparse Optimization: Theory and Applications
SD44 Social Media and Virtual Worlds
SD45 INFORMS BOM Best Working Paper Award Finalist Presentations
SD46 New Developments on MINLP and MIQCP
SD47 Computations and Applications of Stochastic/Robust Optimization
SD48 Applications of Stochastic Programming
SD49 Optimal Allocation of Scarce Infrastructure Capacity: Lessons from Different Network Industries
SD50 Network Design with Hubs I
SD51 Recent Advances in Numerical Aspects for Nonlinear Programming
SD52 Advances in Binary Quadratic Programming
SD53 Robust and Data-Driven Portfolio Optimization
SD54 Financial Services Section Student Paper Competition
SD55 Meta-control Techniques for Non-convex Optimization
SD56 Software Demonstrations
SD64 Scaling Limits of Stochastic Networks
SD65 Case Competitions II
SD66 Recent Advances in Experimental Designs
SD67 Data Mining in Medical Decision Making and Bioinformatics Applications
SD68 Interfaces Between Simulation and Optimization
SD69 Sustainable and Responsible Supply Chain Management
SD70 Analytics in the Petrochemical/Petroleum Industry
SD71 Panel Discussion: Government Auctions of Spectrum Licenses
SD72 KINFORMS
SD73 ENRE Awards Session
SD74 Analytics Case Studies
SD75 Simulation Methods for Risk Analysis and Finance
SD76 Innovations in Supply-Chain Operations
SD77 Joint Session Analytics/CPMS: Panel Discussion: Making the Connection Between Analytics and OR
SD78 Predictive Analytics Models and Methods
SD79 Applications of Decision Analysis
SD80 Real Option Applications
SD81 Optimization and Modeling in Radiation Therapy Treatment Planning
SD82 Bilevel Optimization: Algorithms and Applications
SD83 Machine Learning, Data Mining, and Statistics I

Monday, 8:30am -9:30am

MA01 Advances in Military Healthcare Operations Research
MA02 Growth Oriented Innovation in Entrepreneurial and Ecosystem Settings
MA03 Social Networks, Personal Information, and Open Innovation
MA04 Empirical Research in Operations / Supply Chain
MA05 Supply Chain Operations
MA06 Information in Supply-Chains
MA07 From OR to OM: Observations on the Emergence of a Discipline
MA08 Applications of Little's Law
MA09 Healthcare Operations
MA10 Stochastic Models for Service Operations
MA11 Pricing and Contracts in Supply Chains
MA12 Pricing and Regulation Issues in Sustainable Operations
MA14 Air Traffic Control: Safe and Sound?
MA15 Applications in Electricity Networks and Natural Disasters
MA16 Operations and Finance
MA17 Empirical Research in Service Operations
MA18 Choice Models in Revenue Management and Pricing V
MA19 Operations and Marketing Interface
MA20 Pricing & Revenue Management Convergence
MA21 Transportation and Routing under Uncertainty II
MA22 Post-Disaster Relief and Response
MA23 Uncertainty in Transportation Models I
MA24 Active Traffic Control Strategies for Real-Time Management
MA25 Infrastructure Investment and Management
MA26 Urban Operations Research
MA27 Railroad OR Models
MA28 Airline Network Planning and Schedule Development
MA29 Joint Session Wagner/CPMS: Daniel H. Wagner Prize for Excellence in Operations Research Practice
MA30 Stochastic Scheduling and Supply Chains
MA31 Service Operations and Marketing Inter-Related Issues
MA32 Frontiers in Service Science
MA33 Incentives for Innovation/Innovative Projects
MA34 Modeling the Education System
MA35 Public Health II
MA36 Network Design
MA37 Predictive Analytics for Social Media
MA38 Exploring Strategies for Innovation and Learning
MA39 Hospital-based Challenges
MA40 Monitoring and Prevention of Hospital Acquired Infections
MA41 Online Decision Making in Healthcare
MA43 Computational Optimization
MA44 Information Systems and the Digital Society
MA45 Behavioral Research on Inventory and Pricing
MA46 Convexification Techniques in MIP & MINLP
MA47 Stochastic/Robust Optimization in Energy Systems
MA48 Decomposition Algorithms for Stochastic (Integer) Programs
MA49 Network Analysis Methods and Applications
MA50 Network Design with Hubs II
MA51 Optimization of Energy Systems
MA52 Stochastic Methods and Machine Learning in Optimization
MA53 Portfolio Planning
MA54 Stochastic Control and Optimal Stopping in Finance
MA55 Expediting Global Optimization Algorithms via Special Mathematical Structure
MA56 Software Demonstrations
MA64 Matching in Markets
MA65 Diffusion Models for Queues
MA66 QSR Best Student Paper Competition
MA67 Reliability Analysis and Fault Management for Complex Engineering Systems
MA68 Recent Advances in Simulation-Based Optimization
MA69 Applications of OR in Bioenergy
MA70 Natural Hazard Management
MA70 Natural Hazard Management
MA71 Auctions for Procurement
MA72 Study of Reliability and Security in Power Systems
MA73 Investment in Renewables & CCS Technology and

Cost of Renewables
MA74 Design and Control of Energy Systems
MA75 Simulation and Optimization I
MA76 Predictive Analytics for Structured and Unstructured Data
MA77 Joint Session Analytics/CPMS: Predictive Analytics Applicatons
MA78 JIPE and IJOR Special Session on Analytics
MA79 Panel Discussion: Early DA Applications – What Would We Do Differently Today? A Panel of Early DA Pioneers will Review The Classic Applications and Share what they Would do Differently Today
MA80 Evaluating Forecasts
MA81 Data Analytics & Optimization with its Applications
MA82 Multi-Criteria Analysis for Supply Chain and Logistics
MA83 Statistical Approaches for Medical Engineering

Monday, 11:00am - 12:30pm

MB01 Analytics for New Efficiencies: Quality and Lifecycle Management in the DoD
MB02 Best Dissertation Award Finalists - Technology, Innovation Management and Entrepreneurship Section
MB03 Economics of Information
MB04 Information, Incentives and Behavioral Decision Making in Operations Management
MB05 Empirical Research and Quality Risk
MB06 Contract Design in Various Operations
MB07 Clearing the Jungle of Stochastic Optimization
MB08 Celebrating the Contributions of George Dantzig: Applications and Software
MB09 Empirical Studies on Hospital Operations
MB10 Learning in Queues
MB11 Empirical Research in Supply Chain Management
MB12 Environmental Sustainability in Service Operations
MB14 Airport/Airline Operations Management
MB15 Efficiency Analysis Applications
MB16 Managing Financial Flows in Supply Chain
MB17 Queuing Models for Service Management
MB18 RM & Pricing Topics
MB19 Demand Response Pricing in Data Centers and Grids
MB20 Pierskalla Award
MB21 Novel Techniques for Vehicle Routing
MB22 Disaster Planning
MB23 Uncertainty in Transportation Models II
MB24 Advances in Network Modeling
MB25 New Methods for Leveraging Open Data in Public Transit Analysis and Modeling
MB26 Location Modeling & Applications
MB27 Railway Analytics
MB28 Air Cargo and Aviation Operational Performance
MB29 Joint Session Wagner/CPMS: Daniel H. Wagner Prize for Excellence in Operations Research Practice
MB30 Scheduling in Practice
MB31 Stochastic Methods in Cloud Computing Services
MB32 Service Science Best Paper Award
MB33 New Research Topics on Innovation
MB34 Joint Session SPPSN/MIF: Disaster Relief and Humanitarian Logistics
MB35 Decisions in a Nonprofit Supply Chain II
MB36 Reliable Sensor Cover and Network Design
MB37 Joint Session AI/QSR: Multidisciplinary Information Fusion for System Informatics
MB38 Cognition and Positioning
MB39 Joint Session HAS/Analytics: Learning from Healthcare Data
MB40 Payment Innovations in Health Care
MB41 Patient-Centric Healthcare and Personalized Medicine
MB42 Using OR to Model Healthcare Policy
MB43 Quadratic Assignment Problems and Applications
MB44 Digital Content Distribution and Management
MB45 Inspections and Improvement Initiatives in Supply Chains
MB46 Advances in Discrete Optimization
MB47 Computational Methods for Stochastic Optimization and Variational Problems
MB48 Multistage Stochastic Optimization and Applications in Healthcare
MB49 Interdiction Models in Complex Networks
MB50 Network Design in the Automotive Industry
MB51 Optimization for Large-scale Data Analysis and Optimization
MB52 Recent Progresses on Solving Markov Decision Processes
MB53 Mathematical and Statistical Analysis of High Frequency Tradings
MB54 Some Recent Topics in Financial Engineering
MB55 Optimization for Dimension Reduction
MB56 Software Demonstrations
MB64 Applied Probability for Smart Cities
MB65 Fluid and Diffusion Approximations of Stochastic Systems
MB66 Simulation and Computer Experiments
MB67 Industrial Data Analytics
MB68 Simulation Methodology Applications
MB69 Models for Electric Vehicle Charging Infrastructure Network
MB70 Using Optimization for Wildfire Preparation and Mitigation
MB71 Procurement and Auction Markets
MB72 Assorted Topics in Distributed Energy Generation
MB73 Uncertainty in Climate Policy Modeling
MB74 Existing Challenges in Non-convex Electricity Markets
MB75 Simulation and Optimization II
MB76 Making Operations Research Deliver
MB77 Joint Session Analytics/CPMS: The Whys Hows and Whats of Analytics Certification
MB78 Big Data Industry Applications
MB79 Decision Analysis in Organizations
MB80 Value of Information Analysis: Theory and Applications
MB81 Joint Session Data/AI/HAS: Big Data Analytics and Smart Health I
MB82 Multiple Criteria Decision Making Applications
MB83 Optimization Models in Data Mining

Monday, 12:30pm - 2:30pm

Interactive Session

Monday, 1:30pm - 3:00pm

MC01 Sensors and Weapons
MC02 Rx for Patent Fatigue in Innovation Research: New Data, New Causal Methods, and New Results
MC03 Data-Driven Analysis in eBusiness
MC04 New Topics in Supply Chain Network and Design
MC05 MSOM Student Paper Competition Finalists
MC06 Operations and Marketing Interface
MC07 Cloud Computing for Optimization
MC08 George Dantzig?s Continuing Impact on Advances in Optimization
MC09 Appointment Scheduling Models
MC10 New Advancements in Classic Inventory Problems
MC11 Incentives for Socially-beneficial Goods
MC12 Green Business Models and Strategies
MC14 Best Practices in Reviewing Papers
MC15 Banking and Manufacturing Applications
MC16 Mitigating Supply Risk
MC17 Pricing and Strategic Behavior in Queueing Systems
MC18 Practice-driven Revenue Management I
MC19 New Applications in Pricing and Revenue Management
MC20 Joint Session Analytics/CPMS: Business Analytics in Higher Education Industry
MC21 Freight Fleets Logistics and Management
MC22 Application of Machine Learning in Transportation
MC23 Multimodal Transportation
MC24 Network Science and Transportation
MC25 Recent Advances in Day to Day Traffic Assignment

MC26 New Directions in Location Research
MC27 Models for Fleet Management and Scheduling
MC28 Airline Operations
MC29 Joint Session Wagner/CPMS: Daniel H. Wagner Prize for Excellence in Operations Research Practice
MC30 Uncertainty and Cooperation
MC31 Service Queues
MC32 Service Science Best Paper Award
MC33 Managing Uncertainty in Innovation
MC34 Humanitarian Logistics
MC35 Socially Responsible Operations
MC36 Network Traffic Modeling
MC37 DM2: Data Mining in Decision Making with Theory & Applications
MC38 Scheduling Staff and Space in Healthcare
MC39 Innovations in Healthcare Delivery Systems
MC40 Methodologies for Health Policy Making
MC42 Healthcare Operations and Scheduling
MC43 Decision Diagrams in Optimization I
MC44 Multi-Channel Advertising
MC45 Field Experiments
MC46 Advances in MIP Modeling Systems
MC47 Stochastic Optimization for Natural Resources
MC48 Network and Graphs 1
MC49 Networks Robustness and Vulnerability Analysis
MC50 Service Parts Networks and Inventory Optimization
MC51 Recent Advances in First Order Methods
MC52 Recent Advances in Linear Programming and Complementarity Problems
MC53 Optimization and Financial Engineering
MC54 Default and Systemic Risk
MC55 MINLP Methodology and Applications
MC56 Software Demonstrations
MC64 POMDPs and Applications
MC65 Stochastic Systems
MC66 Joint Session QSR/DM: Panel Discussion: Funding Opportunities
MC67 IIE Transactions Session
MC68 Recent Trends in Composing Heterogeneous Simulation Models
MC69 Carbon Footprint and the Management of Supply Chains
MC70 Incorporating Ecological Concerns into Harvest Scheduling
MC71 Analysis of Matching Markets
MC72 Optimization and Analysis of Smart Grids with Renewable Energy and Storage
MC73 Investment in Electricity Markets
MC74 Stochastic and Robust Optimization in Electric Power Systems Operations and Planning
MC75 Operations Research to Inform Health Policies
MC76 The Data Lifecycle - Selected Case Studies
MC77 Joint Session Analytics/HAS: Predictive and Prescriptive Analytics for Reducing Health Risks
MC78 Dynamic Decision Making
MC79 50th Anniversary Update from Some Ramsey Award Winners
MC80 Price, Ambiguity and Value of Information
MC81 Joint Session Data/AI/HAS: Big Data Analytics and Smart Health II
MC82 Tutorial: Exact Methods for Multi-Objective Combinatorial Optimization
MC83 Big Data Analytics for Various Applications

Monday, 4:30pm - 6:00pm

MD01 Analytics for Surviving Austerity: Doing More with Less
MD02 TIMES Distinguished Speaker - Haim Mendelson
MD03 Experimental Economics in E-Commerce
MD04 Social Operations Management
MD05 MSOM Student Paper Competition Finalists
MD06 Nonprofit Operations
MD07 Simulation Based Education in Supply Chain and Project Management
MD09 Big Data Optimization for Data Mining and Statistical Analysis
MD10 Disruptive Technologies and Business Models
MD11 Managing Relationships in Supply Chains
MD12 Empirical Operations Management and Sustainability
MD14 External Letters of Recommendation for Tenure: Hear from Those Who Write and Read Them
MD15 Applications of DEA
MD16 New Models in Revenue Management and Pricing
MD17 Innovation in Services and Retail
MD18 Practice-driven Revenue Management II
MD19 Product Quality, Information, Social Learning, and Pricing
MD20 Transportation Analytics
MD21 Electrical Vehicles Routing
MD22 Energy Logistics and Supply Chains
MD23 Same-Day Delivery and Routing
MD24 Parking and Network Modeling Innovations
MD25 Transportation Network Design and Pricing
MD26 Reliable Facility Location Models
MD27 Railway Operations Modeling and Analysis
MD28 Aviation Applications Section: Keynote Presentation
MD29 The George B. Dantzig Disseration Award
MD30 Contemporary Scheduling
MD31 Digital Services in the Sharing Economy
MD32 Workforce Planning I
MD33 Organizing for Successful Product Development
MD34 Community-Based Operations Research
MD35 Operations Research in Public Policy Analysis
MD36 Topics In Telecommunications
MD37 Supply Chain Optimization and Analytics
MD38 OR Techniques to Improve Patient Scheduling
MD39 Operations Analysis for Health Care
MD40 Bundled Payments and Payment Systems
MD41 Stochastic Models in Healthcare Delivery
MD42 Health Care Supply Chain, Competition, and Risks Management
MD43 Decision Diagrams in Optimization II
MD44 Information, Information Accuracy and Information Policy in E-commerce Applications
MD45 Opportunities in Behavioral Operations: Different Perspectives
MD46 Cutting Plane and Formulation Techniques for Mixed Integer Programming
MD47 Joint Session Optim/ MIF: Developments in Stochastic Integer Programming Methods
MD48 Network and Graphs 2
MD49 Supply Chain Network Competition: Advances in Models
MD50 Optimization, Network 1
MD51 First-order Methods for Large-scale Convex Optimization
MD52 Algorithms for Optimization and Learning
MD53 Portfolio Optimization and Solution Methods
MD54 Joint Session FSS/OPT: Optimal Portfolio Management and Execution
MD55 Optimization Modeling and Methodologies in Big Data
MD56 Software Demonstrations
MD64 Markov Lecture
MD65 Modeling & Simulation in Healthcare Service Delivery
MD66 Applied Probability and Bayesian Models for Industrial Statistics
MD67 Statistical Approaches to Personalized Healthcare I
MD68 Recent Advances in Simulation Metamodeling Techniques
MD69 Joint Session ENRE/DAS: Expert Judgment and Learning Curves in Energy & Environment
MD70 Supply Chain Management in the Forest Sector
MD71 Dynamic Matching Markets
MD72 Energy I
MD73 Energy/Climate Modeling
MD74 Stochastic Control and Optimization of Power Systems with Renewables
MD75 Joint Session MIF/HAS: Healthcare Analytics
MD76 O.R. Approaches to Plan and Build Data Networks
MD77 Joint Session Analytics/CPMS: 2014 Innovative Applications in Analytics
MD78 Decision Analysis 1
MD79 Decision Analysis Society Awards

MD80 Panel Discussion: Meet the Editors ? Service Science Track
MD81 Joint Session Data/Computing: Statistical Learning in Stochastic Optimization
MD82 Preferences and Multiple Objectives
MD83 Machine Learning, Data Mining, and Statistics II

Tuesday, 8:00am - 9:30am

TA01 Mission Planning I
TA02 Outsourcing, Offshoring, and the Changing Nature of Organizational Boundaries and Architectures
TA03 Social Media and Business Marketing
TA04 Operations Management and Marketing
TA05 Bayesian Estimation and Optimization
TA06 Operational Issues in Trade-in Programs
TA07 Service Science: Toward Systematic Service System Innovation
TA08 Optimization and Modeling for Individual Decision-Making
TA09 Novel Techniques in Integer Programming
TA10 Dynamic Optimization with Uncertain Demand
TA11 Topics in Supply Chain Management
TA12 Doctoral Work in Sustainable Operations Management
TA14 Panel Discussion on Journal Publication Tips
TA15 DEA Methodology
TA16 Dynamic Mechanism Design in Revenue Management
TA17 Behavioral Perspectives
TA18 Revenue Management in Retail and Service I
TA19 Dynamic Learning and Pricing
TA20 Facility Logistics I
TA21 Innovative Solutions for Congestion Mitigation I
TA22 Selective and Time Dependent Routing Problems
TA23 Network Design and Repositioning for Bike-sharing Systems
TA24 Emerging Vehicle and Sensor Technologies
TA25 Public Transportation
TA26 Facility Location
TA27 Demand-Responsive Rail Service Design
TA28 Air Transport Data Analysis for Safe and Efficient Operations
TA29 Project Management 1
TA30 Vacation and Online Scheduling
TA31 Analytics in Cloud
TA32 Team Performance
TA33 Product Design and Manufacturing
TA35 Risk Analysis Models for Critical Infrastructure and Service Systems
TA36 Telecommunications Network Flows and Design
TA37 Public-Private Partnership and Performance Based Logistics Contract Design
TA38 Health Care Modeling Optimization I
TA39 Optimization in Radiation Therapy and Epidemic Control
TA40 Healthcare Delivery Optimization
TA41 Workload, Quality, and Staffing
TA42 Inventory Management in Healthcare
TA43 Issues Related to Large-scale Data Mining
TA44 Energy Information Systems
TA45 Behavior in Supply Chains and Procurement
TA46 Non-traditional Topics in Integer Programming
TA47 Robust and Prior-free Optimization - Theory and Applications
TA48 Network and Graphs 3
TA49 Network Interdiction Applications
TA50 Optimization, Network 2
TA51 Network Flow & Nonlinear Optimization
TA52 Conic Optimization
TA53 Operations - Finance Interface
TA54 Stochastic Modeling in Financial Engineering
TA55 Improved Methods for Solving Special Classes of MINLP
TA56 Software Demonstrations
TA57 Assessment Techniques
TA58 Production and Scheduling 1
TA59 Joint Session JFIG/ENRE: Optimization Methods for Invasive Species Control
TA60 INFORMS Undergraduate Operations Research Prize
TA61 MAS Tutorial Session. Management Innovation to Transform The Department of Defense Logistics Enterprise: An Update
TA64 Optimal Policies - Supply Chain Applications
TA65 Stochastic Analysis in Games
TA66 Smart Monitoring of Complex Systems
TA67 Statistical Approaches to Personalized Healthcare II
TA68 Data Analytics in Simulation
TA69 Biofuel Supply Chain and Market
TA70 Analytics in the Petrochemical and Petroleum Industries
TA71 Bidding and Behavior in Procurement Markets
TA72 Energy II
TA73 Optimization for Critical Infrastructure Resilience
TA74 Renewable Energy Integration and Trading in Electricity Markets
TA75 Simulation and Optimization III
TA76 Succeeding with Revenue Management
TA77 Joint Session Analytics/HAS: Topics of Healthcare Analytics II
TA78 The Past, Present and Future of Teaching Decision Analysis
TA79 Medical Applications in Decision Analysis
TA80 Real Options in Business Strategy
TA81 Joint Session Data/AI/HAS: Big Data Analytics and Smart Health III
TA82 Behavioral Issues in Adversarial Preference Modeling
TA83 Quality and Statistical Decision Making in Health Care Applications

Tuesday, 11:00am - 12:30pm

TB01 Mission Planning II
TB02 Business Ecosystem, Networks and Innovation
TB03 IS Research with Policy Implications
TB04 Empirical Supply Chain Studies
TB05 Dynamic Learning and Decision Making
TB06 Practice-Based Research in Humanitarian Operations Management
TB07 Cloud Computing
TB08 Joint Session Social Media/MAS: Social Media in Disaster Response
TB09 Crowdsourcing and the Cloud
TB10 Economics of Operations Management
TB11 Procurement
TB12 Regulation Issues in Sustainable Operations
TB14 Panel Discussion: Philosophy of Hiring and Advising Graduate Students
TB15 Data Envelopment Analysis 1
TB16 Revenue Management and Pricing of Multiple Products and Assortments
TB17 Contact Centers
TB18 Revenue Management in Retail
TB19 Choice and Pricing Models in Revenue Management
TB20 Facility Logistics II
TB21 Innovative Solutions for Congestion Mitigation II
TB22 Designing, Modeling and Managing Disrupted Transportation Networks
TB23 Inventory Routing Models
TB24 ITS Best Presentation Award Session
TB25 Public Transportation - Railroad
TB26 Facility Planning and Design
TB27 Rail System Performance
TB28 Airline Choice-based Pricing and Revenue Management
TB29 Project Management 2
TB30 Supply Chain Scheduling and Optimization
TB31 Overcoming Business Impact Uncertainty
TB32 Workforce Planning II
TB33 Operations/Finance Interface 1
TB34 Models for Emergency Medical Services
TB35 Joint Session SPPSN/Minority Issues: Panel Discussion–Publishing Community and Humanitarian Operations Research in High-Impact Journals
TB36 Optimization Techniques for Reliable Operation of

Mobile Communication Systems
TB37 Data Mining and Machine Learning
TB38 Health Care Modeling Optimization II
TB39 Managing Capacity and Demand in Healthcare Services
TB40 Stochastic Modeling in Healthcare Delivery
TB41 OR/MS in Healthcare Quality and Patient Safety
TB42 Joint Session HAS/QSR/Analytics: Advanced Predictive Analytics for Health and Wellness Assurance
TB43 Data Analysis
TB44 Economics of Information Systems
TB45 Modeling Human Behavior in OM
TB46 Recent Advances in Conic Integer Programming
TB47 Risk-Averse Dynamic Optimization
TB48 Optimization, Combinatorial 1
TB49 Social and Economic Network Models
TB50 Optimization Methodologies 1
TB51 Data-driven Methods for Decision Making
TB52 Linear Programs and Generalizations
TB53 Economics/ Finance
TB54 Tutorials in Financial Services
TB55 Euclidean Distance Geometry Problems
TB56 Software Demonstrations
TB57 Flipped Classrooms
TB58 Production and Scheduling 2
TB59 Panel Discussion: Academic Leadership
TB60 Inventory Management I
TB61 DIME/PMESII 2
TB64 Scheduling of Queues
TB65 Academic Job Search Panel
TB66 Technometrics Invited Session: Novel Statistical Methods with Interesting Applications
TB67 Complex Process Modeling and Monitoring
TB68 Learning in Optimization and the Exploration/Exploitation Tradeoff
TB69 Socially-Responsible Operations Management
TB70 Natural Resources
TB71 Auctions and Mechanism Design
TB72 Energy - Optimization
TB73 Multilevel Optimization Problems in Energy I
TB74 Accounting for Risk in Investments in Electric Power Systems
TB75 Stochastic Processes
TB76 Joint Session CPMS/Analytics: Panel Discussion: What is Industry Looking for in Analytics Hires?
TB77 Applications and Spreadsheets
TB78 Spatial Analysis for Multicriteria Decisions
TB79 Organizational Challenges in Decision Making
TB80 Behavioral Decision Theory
TB81 Analytics for Network and Text Data
TB82 Advances in Multiobjective Programming
TB83 Image and Functional Data Analysis: Methods and Applications

Tuesday, 12:30pm - 2:30pm

Interactive Session

Tuesday, 1:30pm - 3:00pm

TC01 Mission Planning III
TC02 Technology, Innovation Management and Entrepreneurship Section Best Paper Winner Presentation
TC03 The Social Crowd: New Research in Social Media and Crowdsourcing
TC04 Energy Markets and Demand Management
TC05 Retail Operations
TC06 Managing Supply Chain Disruptions
TC07 Identification, Assessment and Correction of Ill-Conditioning and Numerical Instability in Linear and Integer Programs
TC08 Joint Session Social Media/MAS: Diplomacy, Sentiment, & Social Network Analysis Using Social Media
TC09 Cognitive Decision Support Tool for Policy Makers
TC10 Information and Competition in Supply Chains and Service Systems
TC11 Supply Chain Risk Management
TC12 Sustainability Issues in Supply Chain Management
TC14 Joint Session JFIG/ENRE: Models and Analysis of Invasion Processes
TC15 Data Envelopment Analysis 2
TC16 Omni-channel Retail Analytics
TC17 Dynamic Pricing in Service Systems
TC18 Managing Customer Behavior in Service and Retail Systems
TC19 Contemporary Topics in Revenue Management
TC20 Facility Logistics III
TC21 TSL Prize Winners
TC22 Coordinating Decentralized Transportation Systems
TC23 Network Design Models and Methods
TC24 Professional Development Workshop
TC25 Transportation Planning I
TC26 Transportation, Maritime I
TC27 Advanced Analytics Tools for Smart Railroad Terminal Operations
TC28 Emerging Issues in Airport-Airline Gate Management and Operations
TC29 Project Management 3
TC30 Models and Algorithms for Sequencing and Scheduling in Applied Transportation Problems
TC31 Staffing and Resource Allocation in Public and Private Service Systems
TC32 Service Science - Telemarketing and Call Centers
TC33 Operations/Finance Interface 2
TC34 Transportation and Security under Uncertainty
TC35 Models for Health Care Delivery
TC36 Information Systems 1
TC37 Intelligent Heuristics and Systems
TC38 Health Care Modeling Optimization - Planning and Optimization
TC39 Hospital Capacity and Resource Management
TC40 Healthcare Operations Research
TC41 Health Care, Strategy, and Policy 1
TC42 Joint Session HAS/Analytics: Analytics for Chronic Care Decision-Making
TC43 Computational Optimization and Applications
TC44 Online Social Networks and Content Generation
TC45 Behavioral Aspects in Forecasting and Inventory decisions
TC46 MIP Theory and Multi-level Applications
TC47 Stochastic/Robust Optimization Application in Energy Systems
TC48 Optimization, Combinatorial 2
TC49 Network Optimization and Routing Problems
TC50 Optimization Methodologies 2
TC51 Optimization Society Prizes
TC52 Optimization, Convex
TC53 Finance, Portfolio Analysis 1
TC54 Quantitative Financial Risk Management
TC55 Stochastic MINLP With Endogenous Uncertainty
TC56 Software Demonstrations
TC57 Curriculum Development
TC58 Production and Scheduling 3
TC59 Special Session: Best of Women in OR/MS
TC60 Inventory Management II
TC61 Military Applications Research at RAND
TC64 Market Microstructure and High Frequency Asymptotics
TC65 Industry Job Search Panel
TC66 Panel Discussion on "Publishing in Quality and Reliability: The Editor's Perspective
TC67 Application of Game-Theoretical Methods in Supply Chain
TC68 New Directions in Applied Probability
TC69 Joint Session ENRE/JFIG: Analysis of Biomass/Biofuel Production: Economic and Environmental Impacts
TC70 Sustainability I
TC71 Pricing and Computation in Package Auctions
TC72 Energy III
TC73 Storage and Demand Side Resources in Power Systems

TC74 Stochastic Programming in Energy
TC75 Reliability I
TC76 Practical & Tactical Pricing Decision Support Approaches
TC77 Joint Session Analytics/HAS: Clinical Analytics
TC78 Decision Analysis 4
TC79 Joint Session DAS/SPPSN: Decision Analysis in Policy Applications
TC80 Recent Advances in Utility Theory
TC81 Social Media and Network Analysis in Data Mining
TC82 MCDM & Service Science: Theory and Applications
TC83 Optimization Models and Algorithms for Data Mining with Uncertainties

Tuesday, 4:30pm - 6:00pm

TD01 Search Theory
TD02 Technology Entrepreneurship in China
TD03 Economics of Online Services
TD04 Pharmaceutical and Healthcare Supply Chains
TD05 Retail Operations
TD06 Disruption Risk Management
TD07 INFORMS Analytics Maturity Model
TD10 Supply Chain Design
TD11 MSOM Fellows Session
TD12 Emerging Issues in Sustainable Operations
TD14 Joint Session WORMS/JFIG/MIF: Speed Networking
TD15 Revenue/Yield Management I
TD16 New Applications of Pricing and Revenue Management
TD17 Empirical Studies in Healthcare Operations Management
TD18 Customer Choices, Upgrades and Prices
TD19 Pricing and New Product Development in Supply Chains
TD20 Facility Logistics IV
TD21 Innovative Solutions for Congestion Mitigation III
TD22 Emergency Response Capability Modeling
TD23 Joint Inventory and Location Models
TD24 Optimal Sensor Locations in Traffic Networks
TD25 Transportation Planning II
TD26 Transportation, Maritime II
TD27 Optimization for Rail Planning
TD28 Control of Airport Operations for Congestion Mitigation
TD29 Operations Management/Manufacturing
TD30 Operations Management/Marketing Interface I
TD31 Retail Service Operations
TD32 Service Science II
TD33 Health Care Modeling Optimization III
TD34 Transport Risk Management
TD35 Joint Session DAS/SPPSN: Decision Analysis Insights for Homeland Security
TD36 Information Systems 2
TD37 Big Data 1
TD38 Health Care Modeling Optimization IV
TD39 Kidney Exchange Models
TD40 Dynamic Programming in Health Care
TD41 Health Care, Strategy and Policy 2
TD42 Joint Session HAS/Analytics: Big Data Analytics in Healthcare
TD43 Data-driven Service Systems
TD44 Social Media Consumer Analytics
TD45 Quality and Inventory Issues in Behavioral Operations
TD46 Dynamic Combinatorial Optimization under Uncertainty
TD47 Information, Networks and Big Data
TD48 Optimization, Robust 1
TD49 Combinatorial Optimization and Social Network Analysis
TD50 Optimization, Robust 1
TD51 Data Mining in Medical and Engineering Domain
TD52 Optimization, Constraint Programming
TD53 Finance, Portfolio Analysis 2
TD54 Optimal Stopping with Applications to Finance and Economics
TD55 Integer Nonlinear Programming and Applications - 2
TD56 Software Demonstrations
TD57 Panel Discussion: Publishing in INFORMS Transactions on Education
TD58 Scheduling I
TD59 Panel Discussion with Department Chairs: How to Recruit, Retain, and Support Women and Minority Students
TD60 Inventory Management III
TD61 Joint Session MAS/DAS: Military Decision Analysis Applications
TD62 Social Media Sentiment
TD63 Behavioral OR and Applications of Cognitive Analytics
TD64 Rare Events, Sensitivity, and Exact Simulation
TD65 Stochastic Control Applications
TD66 Data Fusion for Prognostics
TD67 Data Driven Scientific Discovery
TD68 Emerging Topics in Simulation Analysis & Optimization
TD69 Carbon-Considerate Operations Management
TD71 The Economics of Auction Markets
TD72 Energy IV
TD73 Energy Planning and Uncertainty
TD74 Stochastic Programming for Planning Electricity Supply
TD75 Reliability II
TD76 Revenue Management Applications for non-Travel Industries
TD77 Joint Session Analytics/SPPNS: Analytics in Government
TD78 Decision Analysis 5
TD79 Forecasts and Judgments
TD80 Graphical Models in Decision Analysis
TD81 Time Series Data Mining
TD82 Building MCDM Models: Practical and Methodological Issues
TD83 Advances in Business Data Analytics

Wednesday, 8:00am - 9:30am

WA01 Mathematical Modeling and Operations Research in Military Decision Making II
WA02 Knowledge, Learning and Intellectual Capital (KLIC)
WA03 The Economic and Social Impacts of Mobile Apps
WA04 Entrepreneurial/Innovative Operations Management
WA05 Supply Chain Management
WA06 Data-Driven Methods in Inventory Management
WA07 Supply Chain Management I
WA08 Military Application 1
WA09 Applications of Cognitive Analytics
WA10 Operations/Sustainability 1
WA11 Supply Chain, Risk Management I
WA12 Sustainable Operations in Electric Vehicle and Electricity Generation Systems
WA13 Education 1
WA15 Revenue/Yield Management II
WA16 Returns Management at the Operations-Marketing Interface
WA17 Managing Queues in Service Systems
WA18 Data-driven Revenue Management Studies
WA19 Innovative Applications in Pricing and Revenue Management
WA20 Analytics for the Tactical Edge: Better Business through Operations Research in the DoD
WA21 Maritime Logistics and Operation
WA22 Business and the Bottom of the Pyramid
WA23 Sustainable Logistics: Models and Applications
WA24 Challenges in Dynamic Ride-sharing
WA25 Transportation Planning III
WA26 Vehicle Routing I
WA27 Logistics 1
WA28 Airline Crew Management
WA29 Manufacturing 1
WA30 Operations Management/Marketing Interface II
WA31 Matching-Based Service Allocation Models
WA32 Operations/Service 1
WA33 Health Care Modeling Optimization IV
WA34 Homeland Security and Energy Policy
WA35 Healthcare and Humanitarian Logistics
WA36 Information Systems 3
WA37 Big Data 2
WA38 Health Care Modeling Optimization VI

WA39 Inverse Optimization in Healthcare
WA40 HSEA -I- Undergraduate Projects in Healthcare Engineering
WA41 Health Care, Public Health
WA42 System Dynamics in Health I
WA43 Applications and Computation
WA44 Strategic Value of IT/IS
WA45 Behavior, Queueing, and Processing Times
WA46 Games and Optimization Over Networks
WA47 Computational Challenges for Sequential Stochastic Optimization
WA48 Optimization, Robust 2
WA49 Routing Problems
WA50 Optimization, Integer 1
WA51 Operations/Quality Management
WA52 Optimization, Heuristic
WA53 Finance, Financial Engineering 1
WA54 Behavioral Portfolio Selection and Asset Pricing
WA55 Industrial Applications of MINLP
WA56 Software Demonstrations
WA57 Teaching Sustainability
WA58 Scheduling II
WA59 Inventory Management V
WA60 Inventory Management IV
WA61 Organization Theory 1
WA62 Applied Probability 1
WA63 Dynamic Programming/ Control 1
WA64 Flexibility, Inventory and Resource Pooling
WA65 Learning in Stochastic Systems
WA66 Journal of Quality Technology Invited Session
WA67 Gaussian Process and Spatial Data Analysis (I)
WA68 Recent Advances in Stochastic Simulation
WA69 OR for the Developing World
WA70 Economics
WA71 Ad Auctions
WA72 Energy V
WA73 Models and Algorithms for Renewable Energy Integration
WA74 Advanced Algorithms for Power System Operations
WA75 Reliability III
WA77 Exposing Students to Practice with a Case Competition
WA78 Decision Analysis 6
WA79 Joint Session DAS/MAS: Game Theory, Decision Analysis, and Homeland Security, Part I
WA80 How Sound Decision-making Can be Taught and Measured
WA81 Data Analytics for Manufacturing System Design
WA82 Multicriteria Decision Making 1
WA83 Data Mining 1

Wednesday, 11:00am - 12:30pm

WB01 New Voices in Military Operations Research
WB02 Modularity in the Context of Service Management
WB03 Social Media and Business Analytics
WB04 Operations Management and Marketing Interface
WB05 Economics in Operations
WB06 Urban Spatial Issues
WB07 Supply Chain Management III
WB08 Text Analytics Applications in Social Media
WB09 Meta-Algorithms - Algorithms that Improve other Algorithms
WB10 Operations/Sustainability 2
WB11 Supply Chain, Risk Management II
WB12 Incentive Issues in Sustainable Operations
WB13 Education 2
WB14 Supply Chain, Practice, Empirics
WB15 Revenue/Yield Management III
WB16 Behavorial Bias and Revenue Management
WB17 Reducing and Accommodating Customer Variability in Services
WB18 Joint Session RM/TSL: Pricing Applications in Logistics: Inventory Control, Distribution, and Transportation
WB19 Revenue Optimization under Uncertainty in Healthcare
WB20 Analysis
WB21 Maritime Transportation
WB22 Identity and Change in Organization Science
WB23 Container Supply Chain Coordination
WB24 Transportation, Intelligent Systems I
WB25 Transportation Planning IV
WB26 Vehicle Routing II
WB27 Logistics 2
WB28 Breaking the Silos in Airline Crew Scheduling
WB29 Manufacturing 2
WB31 Applying Computational Creativity in Service Industries
WB32 Operations/Service 2
WB33 New Product Development 1
WB34 Preposition and Distribution Decisions in Humanitarian Operations
WB35 Next Generation Decision Support for the Next Pandemic
WB36 Information Systems 4
WB37 Big Data 3
WB38 Health Care Modeling Optimization VII
WB39 HSEA -II-Spotlight on HSEA Student Research
WB40 Inverse Planning for Cancer Treatment
WB41 Supply Chain Management II
WB42 System Dynamics in Health II
WB43 Computational Integer Optimization
WB44 The Interface Between Information Systems and Operations Management
WB45 From Deadline to Reciprocity: Assorted Topics in Behavioral Operations
WB46 Advances in Mixed-integer Programming Theory
WB47 Monte Carlo Simulation-Based Methods for Stochastic Programming
WB48 Optimization, Robust 3
WB49 Network Optimization and its Applications
WB50 Optimization, Integer 2
WB51 Optimization, Nonlinear 1
WB52 Optimization, Large Scale 1
WB53 Finance, Financial Engineering 2
WB54 Control Methods in Finance
WB55 Algorithmic and Computational Aspects of Mixed-Integer Nonlinear Optimization
WB56 Software Demonstrations
WB57 Technology in the Classroom
WB58 Scheduling III
WB59 Group Decisions and Negotiation
WB60 Inventory Management VI
WB61 Organization Theory 2
WB62 Applied Probability 2
WB63 Dynamic Programming/ Control 2
WB64 Methods for Staffing Nonstationary Queueing Systems
WB65 Large-scale Stochastic Systems and Resource Allocation
WB66 Predictive Modeling and Control for Additive Manufacturing
WB67 Data Fusion in Manufacturing Systems
WB68 Initialization Bias and Related Problems
WB69 Decision Making for Holistic Sustainability Assessment
WB70 Economics (Game Theory)
WB71 Auctions/ Mechanism Design 1
WB72 Data Analytics for Healthcare Applications
WB73 Multilevel Optimization Problems in Energy II
WB74 Robust and Stochastic Modeling in Power System Operations and Planning
WB75 Queuing Models
WB76 Analytics in Bioinformatics and Healthcare
WB77 Joint Session Analytics/SpORts: Baseball Analytics
WB78 Analytic Hierachy Process
WB79 Joint Session DAS/MAS: Game Theory, Decision Analysis, and Homeland Security, Part II
WB80 Infrastructure Modeling for Improved Decision Making
WB81 Analytics and Energy
WB82 Multicriteria Decision Making 2
WB83 Data Mining

Wednesday, 12:45pm - 2:15pm

WC02 Risk, Incentives and Cooperation in Technology Management
WC03 Economics of Information Systems
WC04 Service Operations Design and Management
WC05 Collaboration and Information in Supply Chains
WC06 Service Business Models
WC07 Supply Chain Management V
WC08 Models of Human Dynamics in Social Data
WC09 E-Business/ Commerce 1
WC10 Supply Chain/Green I
WC11 Supply Chain, Risk Management III
WC12 Supply Chain Optimization I
WC14 Supply Chain/Decision Analysis
WC15 Semiconductor Industry
WC16 Empirical Studies in Revenue Management and Pricing
WC17 Design and Control of Service Systems
WC18 Big Data Analytics and Predictive Modeling in Revenue Management
WC19 Retail Operations
WC20 Homeland Security Applications II
WC21 Maintenance Problems in Transportation and Routing
WC22 Organizational Behavior and Ethics
WC23 Topics in Freight Transport and Logistics
WC24 Transportation, Intelligent Systems II
WC25 Transportation, Operations I
WC26 Vehicle Routing III
WC27 Logistics 3
WC28 Measuring and Managing Delay through Trajectory Analysis
WC29 Manufacturing 3
WC30 Operations Management/Marketing Interface III
WC31 Incorporated Models in Business Processes Optimization
WC32 Supply Chain, Game Theory & Combinatorial Auctions
WC33 New Product Development 2
WC34 Performance Measurement 1
WC35 Fire and Emergency Medical Services
WC36 Humanitarian Operations in a Response Supply Chain
WC39 Operations Research Methods for Cancer Care
WC40 New Models of Health Care Delivery: Reengineering for Efficient
WC41 Supply Chain Management IV
WC42 HSEA - III - Undergraduate Student Research Presentation
WC43 Constraint Programming
WC44 IT in Healthcare and Education
WC45 Behavioral Operations 1
WC46 Advances in Theory and Computation of Integer Programming
WC47 Stochastic Optimization in a Data-Driven Context
WC48 Optimization, Stochastic 1
WC49 3Rs of Networks: Restoration
WC50 Optimization, Integer 3
WC51 Game Theory 1
WC52 Optimization, Linear Programming 1
WC53 Finance
WC54 Financial Regulation and Risk Management
WC55 Global Optimization in Graphs/Networks
WC57 Academic Projects and Cases Using Real-world Data and Scenarios to Prepare Students for the Workforce
WC58 Scheduling IV
WC59 Operations Management
WC60 Inventory Management VII
WC61 Military Application 2
WC62 Homeland Security
WC63 Decision Analysis 3
WC64 Probability Theory and Combinatorial Optimization
WC65 Optimal Control in Queueing Networks
WC66 Sensor-based System Informatics and Control
WC67 Data Fusion for Process Monitoring and Diagnosis
WC68 Simulation Applications of Supply Chain and Reverse Logistics
WC69 Expert Elicitation, Climate, and Energy Technologies
WC70 Economics- Policy
WC71 Auctions/ Mechanism Design 2
WC72 Energy VI
WC73 Optimization for Distributed Power Systems
WC74 Modelings in Electricity Markets for Policy Insights
WC75 Simulation I
WC76 Multi-Channel Attribution Modeling
WC77 Theory and Applications of Analytics and Big Data
WC78 Decision Support Systems 1
WC79 OR Models in Decision Analysis
WC80 Joint Session DAS/ENRE: Energy Infrastructure: Decisions and Models
WC82 Data Mining 6
WC83 Data Mining 3

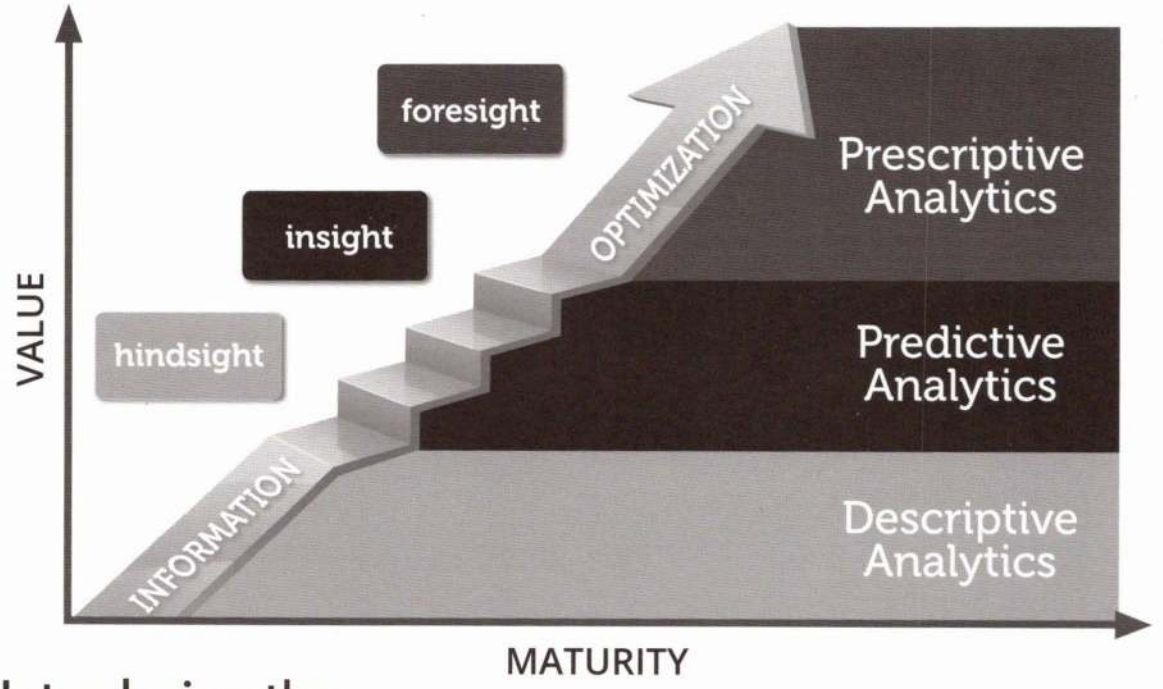
Wednesday, 2:45pm - 4:15pm

WD01 MAS Tutorial Session. The State of Operations Research in the US Military: A 75th Anniversary Perspective
WD02 Product Development and Process Development in Pharmaceutical Industry
WD03 Electronic Markets and Mechanisms
WD04 Topics in Supply Chain Management
WD05 Multichannel Retailing
WD06 Humanitarian-Driven Inventory Management: Pre-positioning and Responses
WD07 Supply Chain Management VII
WD08 Supply Chain Management VIII
WD09 E-Business/ Commerce 2
WD10 Supply Chain/Green II
WD11 Supply Chain, Managing Disruptions I
WD12 Supply Chain Optimization II
WD14 Retail Management I
WD15 Procurement and Purchasing Management 1
WD16 Joint Session RMP/BOM: New Results on Strategic Consumer Behavior in RM
WD17 Customer Differentiation in Services
WD18 New Topics in RM: Demand Learning
WD19 Revenue Optimization in Retail and Services II
WD21 Supply Chain and Transportation
WD22 Historical and Microfoundations of Strategy
WC22 Organizational Behavior and Ethics
WD23 Traffic Management I
WD24 Disaster and Emergency Management 1
WD25 Transportation, Managing Disruptions I
WD26 Vehicle Routing IV
WD27 Aviation
WD28 Data Mining and Optimization for Air Traffic Operations
WD29 Operations Management/others
WD30 Operations Management/Marketing Interface IV
WD31 Innovation and Quality in Service Delivery
WD32 Supply Chain/Competition
WD33 Research and Development
WD34 Performance Measurement 2
WD35 Dynamic and Stochastic Models in Emergency Response and Preparedness
WD36 Sports & Entertainment I
WD37 Marketing 1
WD38 Health Care, Process 1
WD39 Optimization in Radiation Therapy
WD40 Center for Systems Engineering in Health
WD41 Supply Chain Management VI
WD42 HSEA -IV- Undergraduate Projects in Healthcare Engineering
WD43 Network Flow Optimization
WD44 Strategy/Strategic Planning I
WD45 Behavioral Operations 2
WD46 Complexity and Algorithmic Aspects in Linear and Nonlinear Optimization
WD47 Topics in Stochastic Programming
WD48 Optimization, Stochastic 2
WD49 Network Analytics
WD50 Optimization, Integer 4

WD51 Game Theory 2
WD52 Optimization, Linear Programming 2 Integer 4
WD53 Finance Theory and Empirics
WD54 Modeling and Computations in Financial Engineering
WD55 Chance, Inference and Robustness
WD58 Scheduling V
WD63 Decision Analysis 2
WD64 Algorithms on Graphs and Trees
WD65 Performance Evaluation and Optimal Policies
WD66 Decision Analysis Approaches and Predictive Modeling to Managing Uncertainty in Manufacturing and Service Systems Design & Operations
WD67 Gaussian Process and Spatial Data Analysis (II)
WD68 Agent-Based Computational Models of Economic and Financial Processes
WD69 Pollution Regulation and Abatement
WD70 Forecasting 1
WD72 Energy VII
WD73 Integrating High Resolution Spatial Data and Optimization Models for Energy Production/distribution Analysis
WD74 Modern Optimization Techniques for Fundamental Computation Problems in Power Systems
WD75 Simulation II
WD76 New Analytics Frontiers in Retail
WD77 Analytics at its BEST
WD78 Decision Support Systems 2
WD79 Project Analytics
WD80 Behavioral Decision Making
WD81 Data Mining in Renewable Energy
WD82 Data Mining 7
WD83 Data Mining 4

Wednesday, 4:30pm-6:00pm

WE02 Technology Management
WE04 Remanufacturing
WE05 Supply Chain/Closed Loop I
WE06 Supply Chain/Closed Loop II
WE07 Supply Chain Managemen IX
WE08 Supply Chain Management X
WE09 E-Business/ Commerce 3
WE11 Supply Chain, Managing Disruptions II
WE12 Supply Chain Optimization III
WE14 Retail Management II
WE15 Design Engineering
WE17 Supply Chain, Design and Services
WE18 Optimal Pricing in E-commerce
WE19 Sales Optimization Management System – A Combined Optimization and Statistical Approach to Proactively Managing Enterprise Sales Resource Requirements and Sales Forecasting & Funnel Management
WE21 Sustainable Transportation/Logistics System Design
WE23 Traffic Management II
WE24 Disaster and Emergency Management 2
WE25 Transportation, Freight
WE26 Supply Chain, Shipping and Transportation
WE28 New Concepts to Minimize Delay in Terminal Area Operations
WE29 Operations Management/inventory
WE30 Operations Management/Marketing Interface V
WE31 Data Analytics-based Service Concept Development
WE32 Operations/Economics Interface
WE33 Innovation/Entrepreneurship
WE35 Managing Supply Chains in the Public and Non-profit Sector
WE36 Sports & Entertainment II
WE37 Marketing 2
WE38 Health Care Process 2
WE39 Risk Assessment in Healthcare
WE40 Optimization Models in Healthcare Applications
WE41 Supply Chain Management IX
WE42 Uncertainties in Radiation Therapy
WE43 Computational Network Flows and Routing
WE44 Strategy/Strategic Planning II
WE45 Behavioral Operations 3
WE46 Mixed Integer Programming
WE47 Theory and Applications of Robust Optimization
WE48 Resource Allocation
WE49 Statistical Analysis of Network Structures
WE50 Optimization, Application
WE51 Game Theory 3
WE52 Optimization, Other
WE54 Risk Analysis
WE55 Tractable Models and Algorithms for Optimization in Engineering
WE64 Customer Performance – Models and Applications
WE65 Bayesian Approach
WE66 The Impact of Heterogeneity in Reliability Prediction and Maintenance Planning
WE67 Gaussian Process and Spatial Data Analysis (III)
WE68 Sustainable Infrastructure Management and Decision-Making: Construction, Energy and Transportation Industries
WE69 Optimization Approaches for Designing a Green Energy System
WE70 Forecasting 2
WE72 Energy VIII
WE73 Targeted Demand Side Management: Uncovering Energy Usage Decisions from Data
WE74 Power System Resilient Design and Optimization
WE75 Simulation III
WE76 Practicum and Internship Experiences at Analytics Programs
WE77 Joint Session Analytics/HAS: Strategic Payment and Pricing Healthcare Analytics
WE78 Decision Support Systems 3
WE79 Model and Model Validation in Disaster Management
WE81 Predictive Models in Data Mining
WE82 System Analysis
WE83 Data Mining 5



Introducing the

INFORMS ANALYTICS MATURITY MODEL®

OFFICIAL LAUNCH AT 2014 INFORMS ANNUAL MEETING

Attend the workshop with Norman Reitter, Aaron Burciaga, Barry List
TD07: Tuesday Nov 11, 4:30 - 6:00pm
Hilton, Continental 4, BR Level

https://analyticsmaturity.informs.org

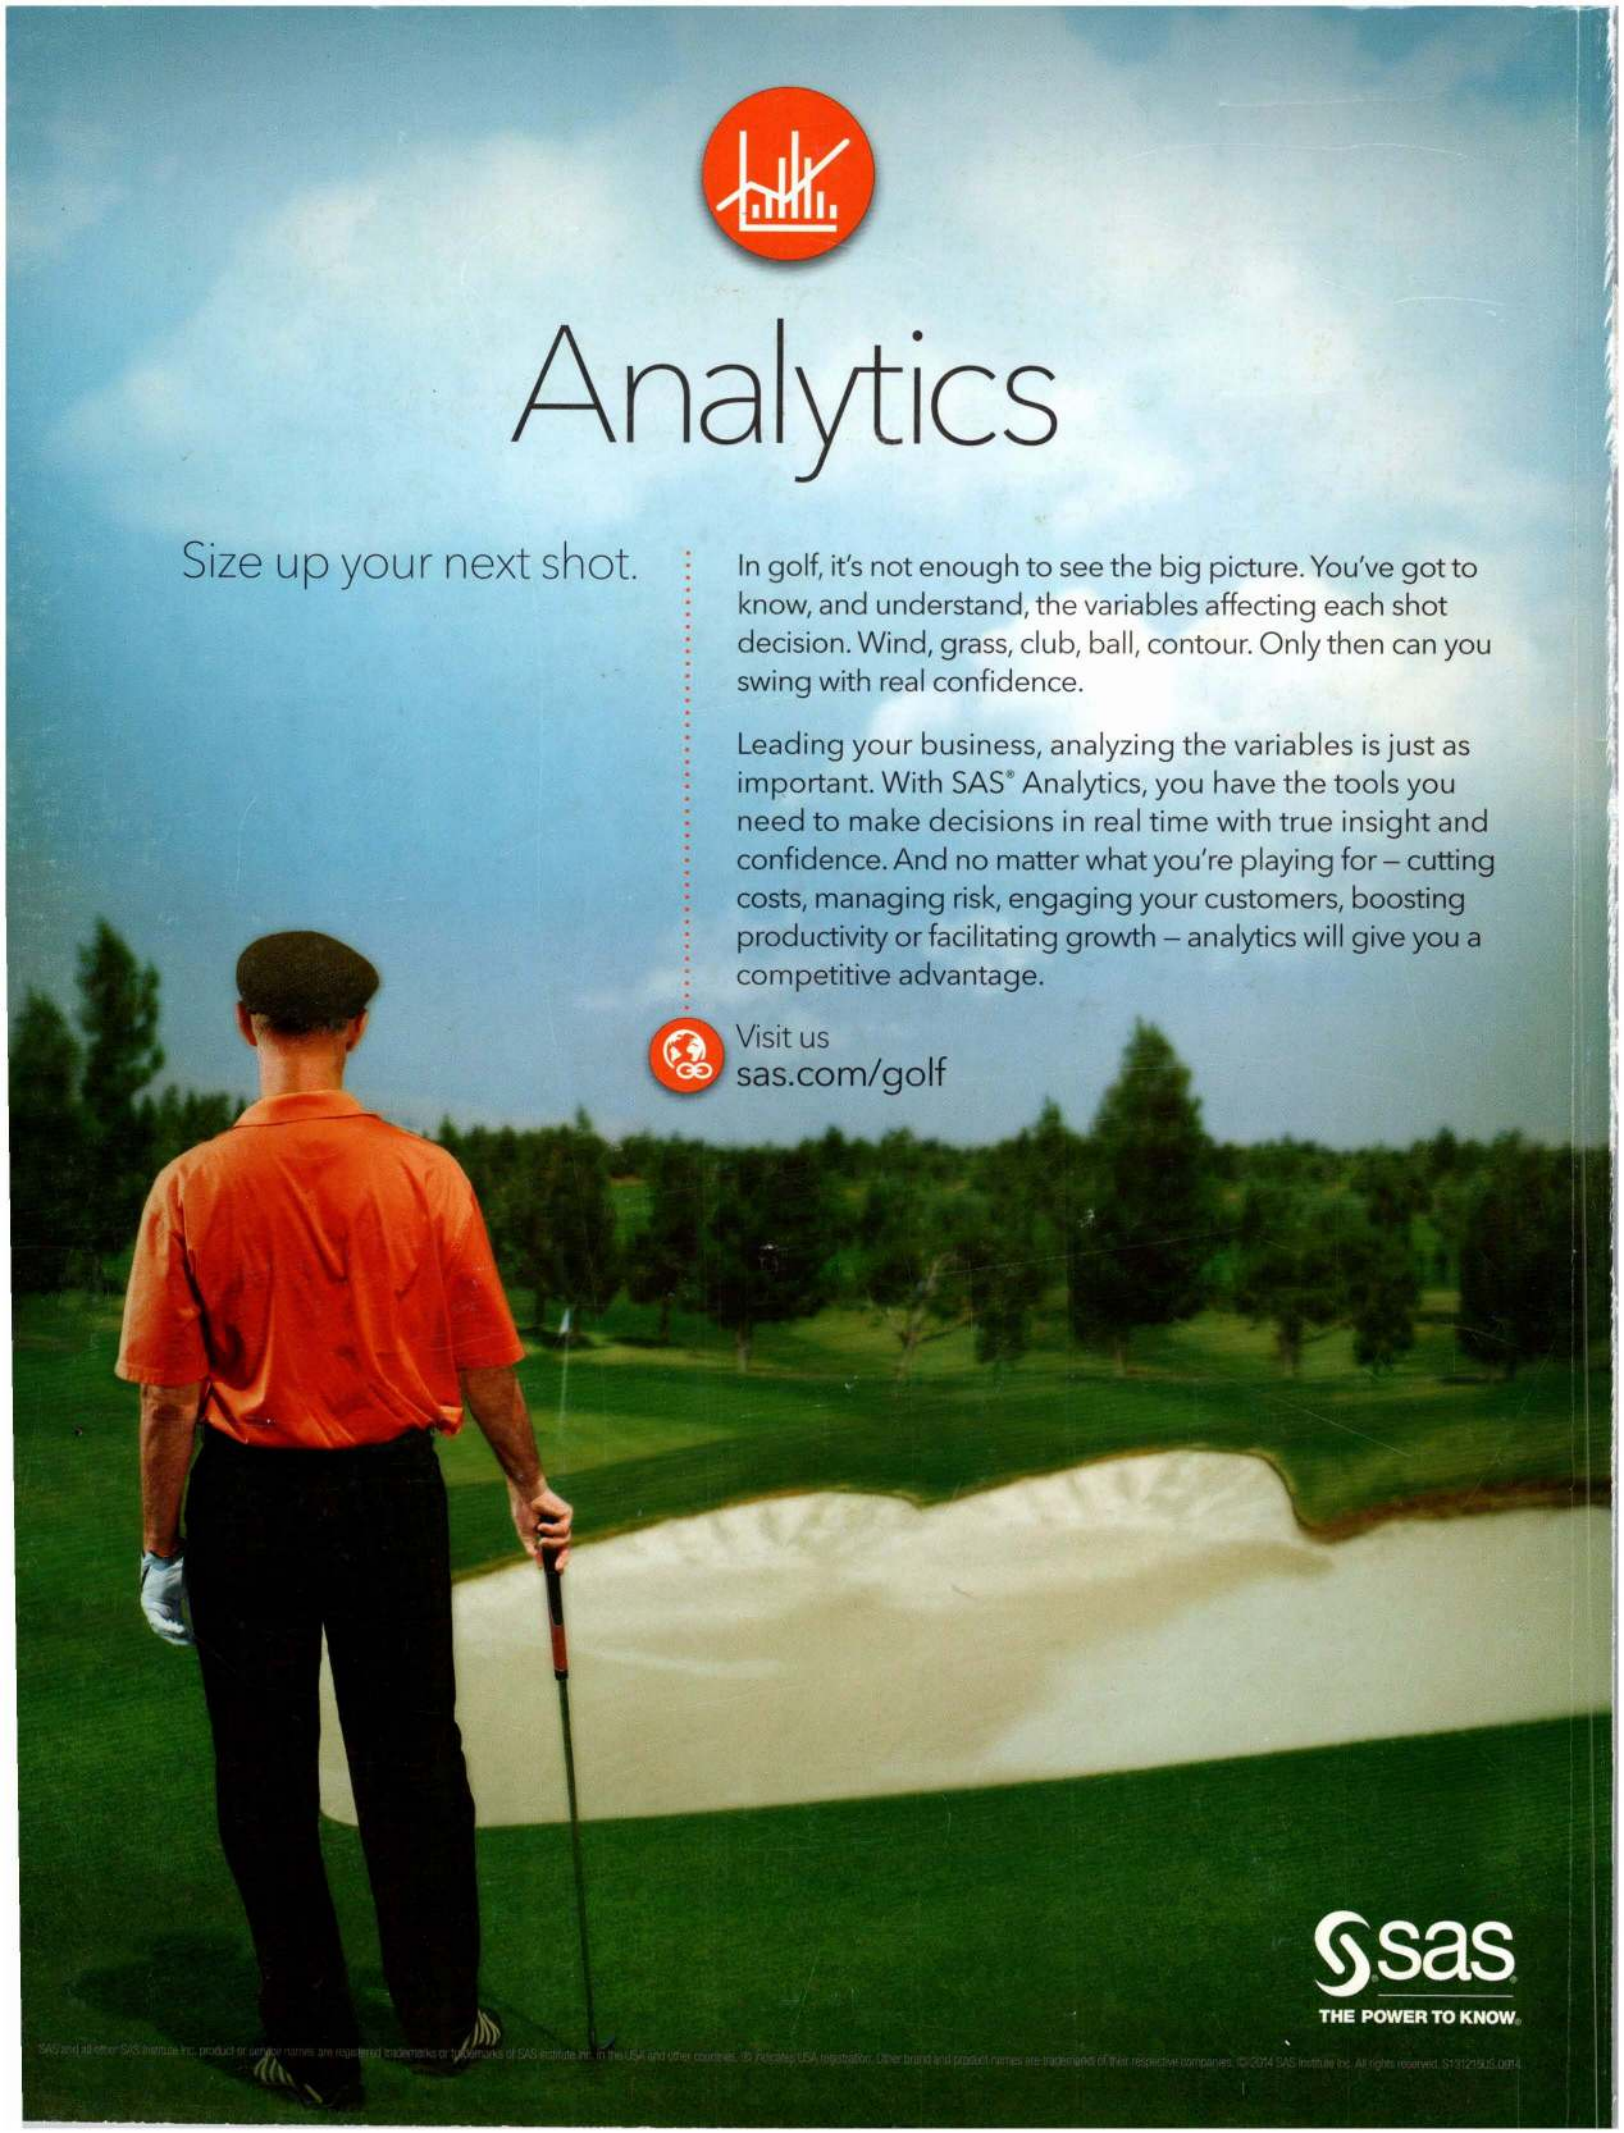
- Assess the way your organization uses analytics
- Create an improvement plan
- Track your progress
- Tap the resources of the leading professional association for advanced analytics professionals
- Extra safeguards to protect your data

THE INFORMS DIFFERENCE

- Reputable
- International Leader
- Free Access to INFORMS Analytics Maturity Model
- Resilient Model That Grows to Meet Your Needs

Begin using the official version of the INFORMS Analytics Maturity Model.
Just go to **https://analyticsmaturity.informs.org**. Start today!

For additional information, email informs@informs.org or call 433-757-3500, ext. 560



Analytics
Size up your next shot.
In golf, it's not enough to see the big picture. You've got to know, and understand, the variables affecting each shot decision. Wind, grass, club, ball, contour. Only then can you swing with real confidence.
Leading your business, analyzing the variables is just as important. With SAS® Analytics, you have the tools you need to make decisions in real time with true insight and confidence. And no matter what you're playing for – cutting costs, managing risk, engaging your customers, boosting productivity or facilitating growth – analytics will give you a competitive advantage.
