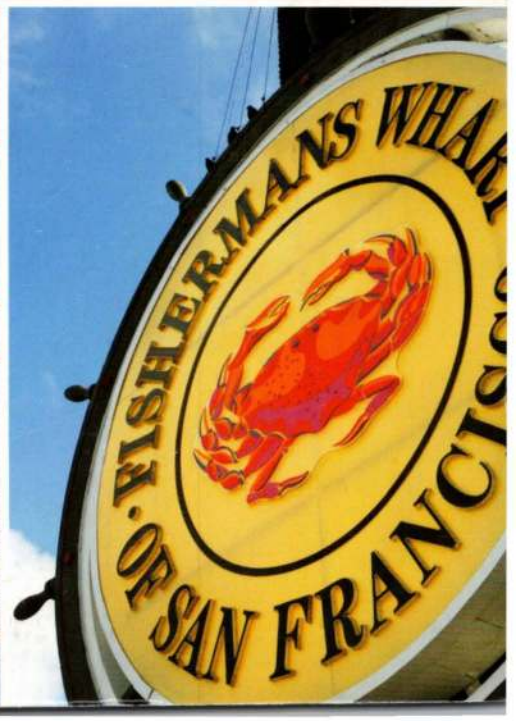
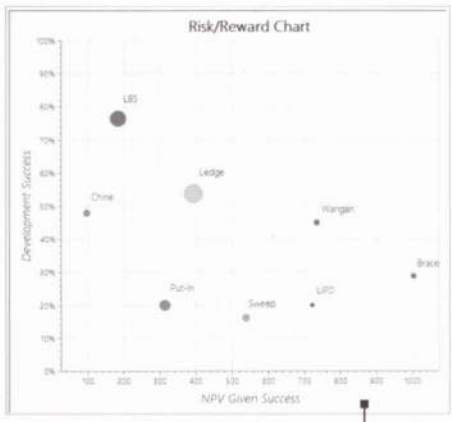
BRIDGING DATA AND DECISIONS

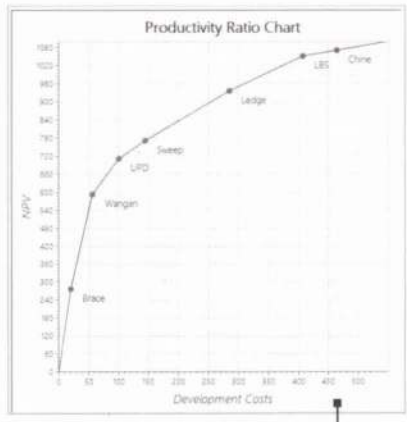
meetings.informs.org/sanfrancisco2014



DPL 8 PORTFOLIO

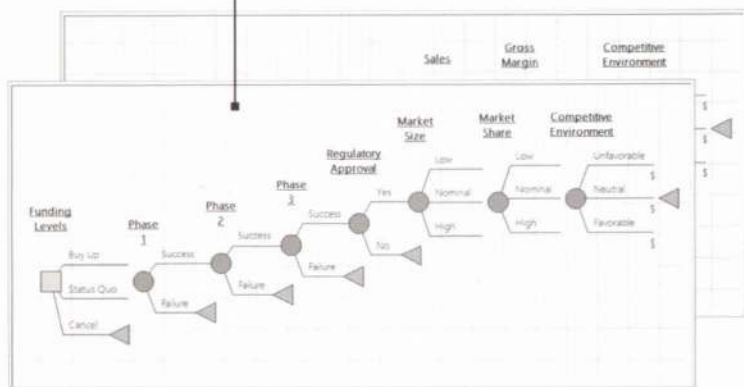
The turnkey decision analytic portfolio prioritization system



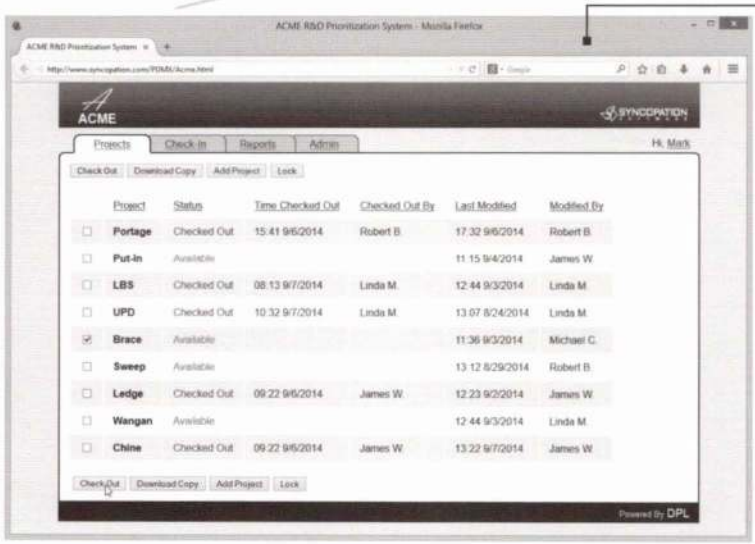


- VISUALIZE PORTFOLIO BALANCE
- RANK PROJECTS BASED ON CAPITAL EFFICIENCY
- COMPLETE SUITE OF OUTPUTS TO OPTIMIZE YOUR PORTFOLIO:
  - *PROJECT VALUE RANGE
  - *RISK PROFILES
  - *TIME SERIES PERCENTILES
  - *EXPECTED/POTENTIAL VALUE
  - *USER DEFINED CHARTS AND DATA REPORTING

- STANDARDIZED TEMPLATE MODELS WITH FLEXIBLE INPUTS
- UNLIMITED CUSTOMIZATION FOR CRITICAL PROJECTS
- RIGOROUS ANALYTICS BASED ON A CLASS-LEADING DECISION ANALYSIS TOOL



Visit us in Booth 36 to learn more



- FAMILIAR EXCEL DATA ENTRY AND VALUATION ENVIRONMENT
- TRANSPARENT, EASILY MAINTAINABLE EXCEL TEMPLATES
- CENTRALIZED DATA STORAGE (REPOSITORIES)
- VERSION TRACKING AND CONTROL
- MULTI-USER WITH ACCESS CONTROLS
- BROWSER/INTRANET ACCESS

Dear INFORMS Friends and Colleagues,

Welcome to the 2014 INFORMS Annual Meeting in San Francisco, the City by the Bay. The conference theme, "Bridging Data and Decisions," reflects the broad scope of what will be covered, from data analytics to new optimization and analysis methodologies to models and practical applications pertinent to numerous industries.
An unusually distinguished group of keynote and plenary speakers headlines the program:

- Nobel Laureate Alvin Roth, the Craig and Susan McCaw Professor of Economics at Stanford and the Gund Professor of Economics and Business at Harvard will give the opening address on "Market Design and the Economist as Engineer."
- Richard Cottle, Professor Emeritus of Management Science and Engineering at Stanford University, will offer a biographical perspective on George Dantzig to celebrate the 100th birthday of the father of linear programming.
- Omego Rho Lecturer Jonathan Caulkins, the H. Guyford Stever Professor of Operations Research and Public Policy at Carnegie Mellon University, will discuss "Operations Research in Service of Drug & Addictions Policy."
- IFORS Distinguished Lecturer Lyn Thomas, Professor of Management Science at Southampton Management School (UK) will offer lessons for OR modeling from the recent global financial crisis.
- Dimitris Bertsimas, Boeing Global Leaders for Manufacturing Professor of Operations Reseach and Statistics at MIT will give the Philip McCord Morse Lecture: "Statistics and Machine Learning via a Modern Optimization Lens."
- Anthony Levandowski, Product Lead for the Google Driverless Car Project, will share his experiences in developing and driving Google's self-driving car.
- Martin Haugh, Garud Iyengar, Kay Giesecke and Dimitris Bertsimas will provide perspectives on their experiences with Massive Online Open Courses (MOOCs) at Columbia University, Stanford and MIT.
- Mark Rothleder, Vice President for Market Quality and Renewable Integration at the Caliornia Independent System Operator, will discuss how optimization is used in managing the electricity grid.

Winners of the Franz Edelman, UPS George D. Smith and Daniel H. Wagner Prizes will also give presentations.

Please take advantage of the many opportunities to network – and eat – at the conference, including the Welcome Reception on Sunday evening and the General Reception on Tuesday evening.

I am grateful to the INFORMS Meetings Committee for their support, and for the dedication and effort of the INFORMS meetings staff, without whom this meeting would not have been possible. I also thank the "Local" organizing committee, including Phil Kaminsky, Shmuel Oren, Alexandra Newman, Janny Leung, Hyun-Soo Ahn, Damien Beil, Rachel Chen, Ana Muriel, Hari Balasubramanian, Theresa Roeder, Julia Miyaoka, Alper Atamturk, Max Shen, Vijay Mehrotra, Warren Lieberman, Thomas Olavson and Steven Nahmias, for their hard work.

We appreciate the generous support of our major sponsors: IBM, the Seth Bonder Foundation, FICO, AIMMS, Chevron, Caterpillar, City University of Hong Kong and the University of California at Berkeley.

Thank you for your participation. We hope you enjoy the conference, as well as the sights, sounds and flavors of San Francisco.

Candace Arai Yano

BADGES REQUIRED FOR TECHNICAL SESSIONS

INFORMS Annual Meeting 2014 badges must be worn to all sessions and events. Badges will be checked at the entrance to technical session areas, as well as the Exhibit Hall. Attendees without badges will be directed to the INFORMS registration desk to register and pick up their badges. *All attendees, including speakers and session chairs, must register and pay the registration fee.* Lost badges can be replaced at the registration desk for a fee of $5.00.

Awards Ceremony open to all, doors close at 8:45pm.

ESPECIALLY FOR STUDENTS

Coffee with a Member

This wonderful program connects INFORMS students with some of INFORMS most enthusiastic members for 15-minute impromptu meetings and some sage INFORMS advice. We know the Annual Meeting can be a bit overwhelming and are hoping these casual meetings will make students more comfortable, knowledgeable, and enthusiastic about both the meeting and INFORMS. Student attendees were offered the opportunity to sign up before the meeting on a first-come, first-served basis (it is not possible to sign up onsite in San Francisco). We will follow up after the meeting with a short survey to the students and members who participated to help us improve the program for future meetings.

BECOME A CERTIFED ANALYTICS PROFESSIONAL
DON'T BE LEFT BEHIND.

www.informs.org/Build-Your-Career/Analytics-Certification

BENEFITS OF CERTIFICATION

- Advances your career potential by setting you apart from the competition
- Drives personal satisfaction of accomplishing a key career milestone
- Helps improve your overall job performance by stressing continuing professional development
- Recognizes that you have invested in your analytics career by pursuing this rigorous credential
- Boosts your salary potential by being viewed as experienced analytics professional
- Shows competence in the principles and practices of analytics

APPLICATIONS

- Prepare to apply by reviewing Candidate Handbook & Study Guide Draft
- Arrange now to secure academic transcript and confirmation of "soft skills" to send to INFORMS

COMPUTER-BASED TESTING

It is now more convenient than ever to schedule your CAP exam in more than 700 Kryterion test centers in more than 100+ countries. To find the location closest to you, check this site: www.kryterionline.com/host_locations/

QUESTIONS? certification@mail.informs.org

DOMAINS OF ANALYTICS PRACTICE

Domain	Description	Weight*
I	Business Problem (Question) Framing	15%
II	Analytics Problem Framing	17%
III	Data	22%
IV	Methodology (Approach) Selection	15%
V	Model Building	16%
VI	Deployment	9%
VII	Life Cycle Management	6%
	*Percentage of questions in exam	100%

SEARCHING?
HIRING?

INFORMS CAREER CENTER is the place to be.

The INFORMS Career Center offers employers expanded opportunities to connect to qualified O.R. and analytics professionals. INFORMS Career Center now offers a complete line of services to be used alone or in conjunction with the Job Fair at the 2014 Annual Meeting. Both give applicants and employers a convenient venue to connect. The Career Center is free to INFORMS member applicants.

- Hundreds of analytics jobs
- Preferred jobs
- Featured jobs
- Job alerts
- Anonymous career profiles
- Powerful searching capabilities
- Detailed career resources

Business, Receptions and Networking... All Welcome!

SPEAKER GUIDELINES

Audio/Visual Equipment

All session rooms will be equipped with a computer projector, but please note that you must provide your own laptop or pre-arrange to share with others in your session. Please follow these guidelines to ensure a successful presentation:

- Bring your laptop to your session. We recommend that you pre-arrange with other speakers in your session to ensure that at least one of you brings a laptop from which you can project your talks.
- Bring a power adapter with you. We recommend that you do not attempt to run your presentation off the laptop battery.
- If your laptop is not compatible with AC power, please bring an electrical adapter so that you can connect to U.S. electricity.
- If your laptop is an Apple product, you will need the appropriate adapter for the external video output.
- Arrive at your session at least 15 minutes before it begins. All presenters in a session should set up and test the connection to the projector before the session begins.
- We encourage speakers to put their presentations on a USB flash drive as a backup.

Presentation Guidelines

The room and location of your session are listed in the Technical Sessions section and in the Master Track Schedule. Please be on time for your session and check in with the session chair. Presentations should be limited to key issues with a brief summary. Time your presentation to fit within your designated time span and leave an opportunity for questions and audience participation. INFORMS does not produce proceedings with complete papers. To obtain complete copies of any papers abstracted in the program, please contact the authors directly at the address supplied with each abstract.

For Questions about the Program: Program Information Desk

If you have general questions about the meeting and/or questions about your own presentation, stop by the Program Information Desk located in the Hilton near INFORMS Registration (in Yosemite B-C). We ask Session Chairs to notify the Information Desk about any changes or cancellations; these changes will be posted outside the meeting rooms.

For Assistance during Your Session: Session Monitor Desks

Session Monitor Desks are located in several areas in both hotels (see maps on the Quick Reference guide for specific locations). If you have a problem in your session room related to AV needs or any other requests, go to the Session Monitor Desk in the area to ask for assistance.

Courtesy to Fellow Speakers

Attendees are asked to be respectful of their colleagues by turning off cell phones and mobile devices before the presentations begin. In addition, please note that use of cameras and all recording devices is prohibited during sessions unless you have received prior permission from the speaker.

SESSION CHAIR GUIDELINES

The role of the Chair is to coordinate the smooth running of the session. The Chair:

- Begins and ends the session on time. Each session lasts 90 minutes, with the time per presentation determined by the number of papers in the session. Equal time should be given to each paper.
- Introduces each presentation (just the title of the paper and the name of the presenting author).
- Ensures that presentations are made in the order shown in the program. This allows for "session jumping." If a speaker cancels or does not attend, the original time schedule should be adhered to rather than sliding every talk forward.
- Completes the session attendance forms (forms will be in the room).
- Reminds the audience to (a) turn off all mobile devices and (b) that photography is not allowed without the prior permission of the speaker.

THANK YOU

GAMS

Exhibits, Internet, Email

Name badges must be worn for admittance to the Exhibit Hall, located in the Hilton, Grand Ballroom, during the following hours:

Sunday, Nov. 9	12:00pm-5:00pm
	7:30pm-9:00pm
	Welcome Reception
Monday, Nov. 10	9:00am-5:00pm
Tuesday, Nov. 11	9:00am-5:00pm
Wednesday, Nov. 12	9:00am-3:00pm

Free wireless Internet and an email center are located at the back of the hall. There are a limited number of computers available in the email center if you do not have your own computer.

REGISTRATION

Badges Required for Technical Sessions

INFORMS Annual Meeting 2014 badges must be worn to all sessions and events. Badges will be checked at the entrance to technical session areas, as well as the Exhibit Hall. Attendees without badges will be directed to the INFORMS registration desk to register and pick up their badges. All attendees, including speakers and session chairs, must register and pay the registration fee **Lost badges can be replaced at the registration desk for a fee of $5.**

Registration Fee

Your registration fee includes admittance to the complete technical program, the Exhibit Hall, Email Center and most special programs. The following social/food events are also included: Sunday evening Welcome Reception and Awards Ceremony, Tuesday evening General Reception, and all morning and afternoon coffee breaks. No other meals are included.

OTHER SERVICES

Business Center

The business center in the Hilton is located near the hotel registration desk.

Luggage Check

A luggage check area will be located near the INFORMS Registration Desk later on Tuesday and on Wednesday.

Guest Registration

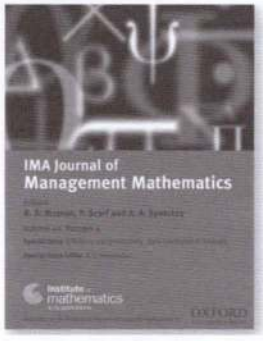
If your guest would like to accompany you to the major social events, you can purchase a guest registration ($75) that covers admission to the Sunday Welcome Reception, Sunday Awards Ceremony and Tuesday General Reception. Guests are not eligible to attend the technical sessions. You can register your guest at the INFORMS Registration Desk.

San Francisco Visitor Information

Assistance is available with tourist information and directions at the Hilton and Parc 55 concierge desks.

EXCELLENCE IN EVIDENCE

IMA JOURNAL OF MANAGEMENT MATHEMATICS
Edited by Rogemar S Mamon, Philip Scarf and Aris A Syntetos



The mission of the *IMA Journal of Management Mathematics* is to publish original, high quality mathematical research that will have a significant impact on the theory and practice of business, finance, management, and policy making.

INFORMS members get 30% off 2014 subscriptions

Visit www.imaman.oxfordjournals.org to:
- Browse table of contents and abstracts

OXFORD UNIVERSITY PRESS

These events are located in the Hilton.

SATURDAY, NOVEMBER 8

INFORMS Membership Meeting & Reception
5:00pm-6:00pm
Imperial A, BR Level
The INFORMS Board of Directors encourages all members to bring their ideas, opinions and suggestions to this annual meeting. Current business and future directions for INFORMS are on the agenda. Wine and cheese will be served.

SUNDAY, NOVEMBER 9

New Member Welcome Breakfast
By Invitation Only
7:00am-8:00am
Imperial A, BR Level
New INFORMS members received an invitation for this welcome breakfast and a reminder is included in their registration packets. The session will feature a presentation on member benefits, a brief orientation for navigating the meeting, and a chance to relax and connect with colleagues. Representatives from INFORMS communities will facilitate networking tables where you can meet other members who share your professional interests.

Junior Faculty Interest Group Luncheon
12:30pm-1:30pm
Imperial A, BR Level
A limited number of tickets may be available on-site. Go to the INFORMS registration desk for information on availability. No tickets will be sold at the door.
The winners of the 2014 JFIG Paper Competition will be presented with awards. All junior faculty are invited to participate. This event gives junior faculty in engineering and business schools the opportunity to discuss career development and exchange ideas.

Sponsored by Georgia Southern University, Texas A&M University, University of Arkansas, Dept. of Industrial Engineering, Wichita State University, University at Buffalo-Industrial and Systems Engineering.

INFORMS Online & Social Networking Reception
6:30pm-7:30pm
Golden Gate 5, Lobby
What's your social networking strategy for yourself or for INFORMS? We invite all contributors to IOL (the INFORMS website) and INFORMS social networking sites to come and meet face to face. Join us for refreshments and drinks - we are your INFORMS Online community!

Minority Issues Forum Reception
8:00pm-9:00pm
Golden Gate 3, Lobby
Come meet old friends and make new ones while talking about minority issues and other intellectual issues and opportunities. Posters submitted to the Minority Issues Forum Poster Competition will be on display during the reception.

Sponsored by Cornell University, North Carolina A&T State University (NCAT), North Carolina State University-Industrial and Systems Engineering, Texas A&M University-Industrial and Systems Engineering, and Clemson University-Dept. of Industrial Engineering.

MONDAY, NOVEMBER 10

COIN-OR Members & Users Meeting - Bag Lunch
12:30pm-1:30pm
Continental 1, BR Level
Anyone interested in open-source software tools, open standards, and data and model repositories for any aspect of operations research is encouraged to attend this Computational Infrastructure for OR (COIN-OR) meeting. Please bring your own lunch and ideas. For more information, visit www.coin-or.org.

SPPSN Lunch
12:30pm-1:30pm
Imperial A, BR Level
A limited number of tickets may be available on-site. Go to the INFORMS registration desk for information on availability. No tickets will be sold at the door.

This lunch and business meeting is open to members of the INFORMS Section on Public Programs, Service and Needs and also those who are interested in joining the section.

Sponsored by George Washington University, Dept. of Engineering Management and Systems Engineering and University of Michigan, Dept. of Industrial and Operations Engineering.

INFORMS Fellows Lunch & Awards Ceremony
By Invitation Only
12:45pm-2:30pm
Plaza A, Lobby
This luncheon honors INFORMS Fellows, examples of outstanding lifetime achievement in operations research and the management sciences. These individuals have demonstrated exceptional accomplishments and made significant contributions to the advancement of OR/MS over a period of time. Their service to the profession and to INFORMS has culminated in election to the INFORMS Fellow Award.

Class of 2014 Newly-Elected INFORMS Fellows:

Michel L. Balinski	Steve Nahmias
Jonathan Eckstein	Robert Phillips
Terry P. Harrison, CAP	Nikolaos Sahinidis
Robert R. Inman	Tuomas Sandholm
Radhika Kulkarni	J. George Shanthikumar
Russell P. Labe Jr., CAP	Candace A. Yano

Student Awards Ceremony & Student Reception
Awards Ceremony: 7:30pm-8:00pm
Reception: 8:00pm-9:30pm
Plaza A & B, Lobby
All students registered for the meeting are invited to attend the Student Awards Ceremony. The Chapters/Fora Committee will present the winners of the Student Chapter Annual Awards and the Judith Liebman Awards. Join us to recognize the great contributions of our most dynamic student volunteers. Plan to stay for the Student Reception, which immediately follows the ceremony.

The reception that follows the Student Awards Ceremony is open to all students – join us for an evening of food and drink, fun and networking. Come relax after a busy day of sessions and mingle with fellow students from universities around the world.

THANK YOU

The Seth Bonder Foundation

TUESDAY, NOVEMBER 11

Women in OR/MS Forum Luncheon
12:30pm-1:30pm
Plaza A, Lobby
A limited number of tickets may be available on-site. Go to the INFORMS registration desk for information on availability. No tickets will be sold at the door.
All those interested in issues related to women professionals in OR/MS are invited to join us.

Sponsored by Arizona State University; Harvey Mudd College; Northwestern University; SAS; SIMUL8 Corporation; The Ohio State University; University of Massachusetts, Isenberg School of Business; University of Alabama; University of Arizona; University of California-Irvine; University of Florida; University of Michigan; University of Southern California; University of Tennessee; and University of Texas at Austin.

MOBILE APP

INFORMS is pleased to offer a free mobile app for smart phones and tablet users. Use the app to access conference information on the go, including the schedule of talks, maps showing meeting locations, exhibit details and much more. As this is a native app, you do not need an internet data connection to use it during the conference.

When you enter the meeting program in the app, you can either browse through the parallel sessions and special events or search for a specific speaker or keywords. As you locate the events, sessions and presentations you are interested in, click on the star button which bookmarks it into the My List itinerary. Use My List for a quick reference tool.

- **Android Devices** - to download, go to the Google Play Store and search for INFORMS Mobile.
- **Apple Devices** - to download on either iPhone or iPad, go to the App Store and search for INFORMS Mobile.

Please Provide Your Input

We encourage you to complete the survey on the information screen of the main menu. The conference committee greatly appreciates your feedback on individual sessions and on the meeting overall.

Mobile App Information Desk

Visit the booth located next to INFORMS Registration in the Hilton, Yosemite, BR Level. We're happy to help you make the most of your INFORMS Mobile App experience!

Join the Twitter Conversation

Add the hashtag #informs2014 to your tweets to associate them with the meeting. Tweets with #informs2014 will be displayed in the Attendee Twitter Feed on the homepage, along with official conference tweets that will alert you to late breaking information. If you haven't become a Twitter-ite but would like an introduction, stop by the INFORMS booths for a quick lesson.

Facebook

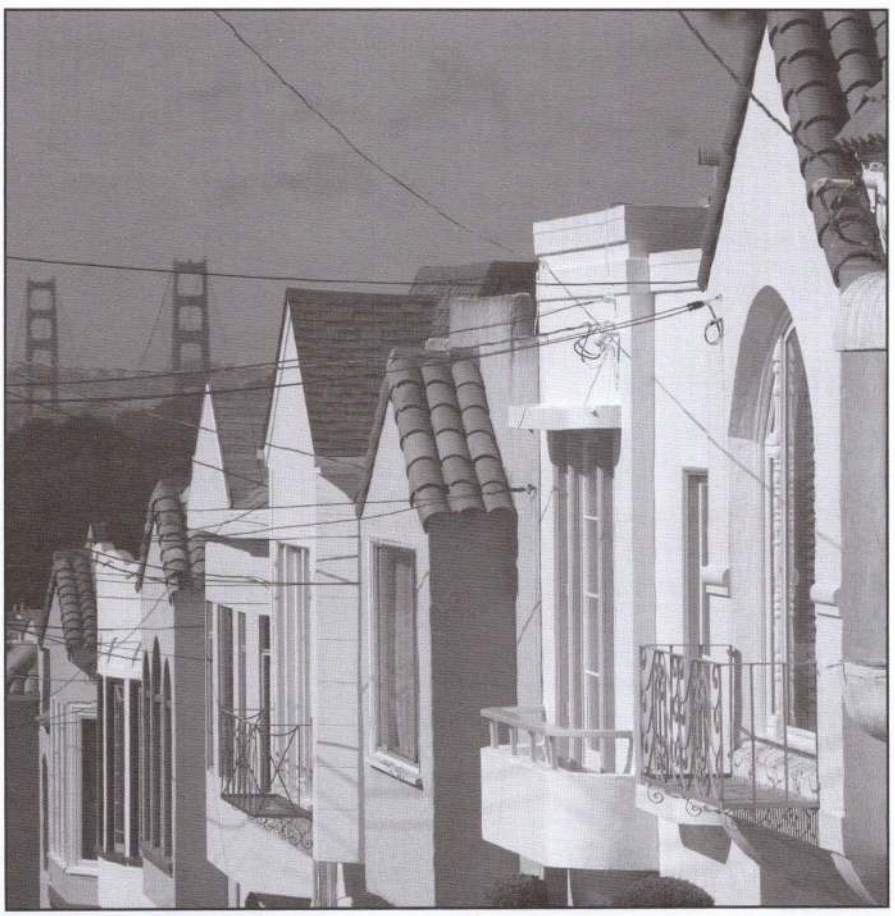
RSVP for the Annual Meeting and see which of your colleagues are attending. Go to our Facebook page and click through events to the INFORMS Annual Meeting page.

LinkedIn

Connect with other attendees on the Annual Meeting LinkedIn Group to discuss key topics. Go to the Annual Meeting website homepage to find a link leading to the Annual Meeting LinkedIn group.

Pinterest

Visit our Pinterest Annual Meeting Board to view a collection of fun things to do and see while visiting San Francisco. http://www.pinterest.com/informs/2014-informs-annual-meeting/.



YOUR BADGE IS YOUR TICKET

Wear your badge for admission to these events; your meeting registration fee includes these special receptions. If your guest would like to accompany you, a guest registration must be purchased (guests will receive a special badge). The $75 guest fee includes the Sunday Welcome Reception, Sunday Awards Ceremony and the Tuesday General Reception.

SUNDAY

WELCOME RECEPTION & EXHIBITS

7:30pm-9:00pm
Hilton - Grand Ballroom

INFORMS and the San Francisco Organizing Committee welcome you to the 2014 Annual Meeting with an evening of fellowship and fun. The Welcome Reception is the perfect venue to meet with colleagues and visit the exhibits. Light snacks will be served. Soft drinks are complimentary, with a cash bar for other beverages.

INFORMS AWARDS CEREMONY & DESSERT RECEPTION

8:30pm-9:45pm (Doors close at 8:45pm)
Hilton - Imperial Ballroom

The INFORMS Board of Directors invites you to honor and celebrate the achievements of our colleagues at the annual Awards Ceremony. You can attend the Welcome Reception first and then proceed to the Imperial Ballroom for the Awards Ceremony. Following the ceremony, you'll have an opportunity to congratulate the awardees at a special dessert reception.

These prestigious awards will be presented during the ceremony:

Saul Gass Expository Writing Award
Stephen Boyd, Stanford University

INFORMS President's Award
To be announced at the Awards Ceremony.

INFORMS Prize for the Teaching of ORMS Practice
Jason Merrick, Virginia Commonwealth University

George E. Kimball Medal
Terry P. Harrison, CAP, Pennsylvania State University

John von Neumann Theory Prize
To be announced at the Awards Ceremony.

INFORMS Impact Prize
Brenda Dietrich, IBM
JP Fasano, IBM
Lou Hafer, Simon Fraser University
John Forrest, IBM
Brady Hunsaker, Google
Laszlo Ladanyi, IBM
Robin Lougee, IBM
Ted Ralphs, Lehigh University
Matthew Saltzman, Clemson University

Bonder Scholarship for Applied Operations Research in Health Services
Jónas Oddur Jónasson, London Business School

Bonder Scholarship for Applied Operations Research in Military Applications
Jason Southerland, George Mason University

Four student awards will also be announced during the ceremony: the George E. Nicholson Student Paper Competition, the George B. Dantzig Dissertation Prize, the Doing Good with Good O.R. Student Competition and the Undergraduate Operations Research Prize.

THANK YOU

CATERPILLAR®

TUESDAY

GENERAL RECEPTION

7:30pm-10:00pm
Hilton, Continental & Golden Gate Rooms

San Francisco is just as famous for its cuisine as it is for its cable cars and the Golden Gate Bridge. Join us as we serve up an eclectic menu showcasing the delectable fare the Bay area has to offer. This year's general reception will also feature a jazz band for entertainment, so dust off those dancing shoes! There will be a variety of food stations, along with complimentary soft drinks and a cash bar. This reception provides the perfect atmosphere for fellowship and networking, while also having a bit of fun after a long day of sessions.

THANK YOU

Whether you work in industry, consulting or government – doing descriptive, predictive or prescriptive analytics/O.R. work, you'll find the best applications resources at the INFORMS Annual Meeting.

PLENARY AND KEYNOTE PRESENTATIONS

Operating the Grid
Mark Rothleder, Vice President, Market Quality and Renewable Integration, California Independent System Operator Corporation
Monday, 3:10pm-4:00pm; Hilton, Continental 5

IFORS Distinguished Lecture:
Credit Where Credit is Due: Lessons for O.R. Modelling from the Global Financial Crisis
Lyn Thomas, Professor of Management Science, University of Southampton
Tuesday, 3:10pm-4:00pm; Hilton, Continental 5

The Google Driverless Car
Anthony Levandowski, Project Leader, Google
Tuesday, 3:10pm-4:00pm; Hilton, Continental 6

AWARD WINNERS

Reprise of the 2014 Edelman Award-Winning Presentation
U.S. Centers for Disease Control and Prevention, with Kid Risk, Inc. - Polio Eradicators Use Integrated Analytical Models to Make Better Decisions
Sponsored by CPMS, The Practice Section of INFORMS
Monday, 10:00am-10:50am; Hilton, Continental 6

2014 INFORMS Prize Winner
Mayo Clinic - Sustained Excellence in Clinical Care, Research and Education Through Effective Integration of Advanced Analytics and O.R.
Amy Donahoe-Anshus, Mayo Clinic
Sunday, 8:00am-9:30am; Hilton, Continental 5, BR Level (MA08)

Innovative Applications in Analytics Award 2014 Winner Reprise
UNICEF Uganda, US Fund for UNICEF, and IBM Research - A SMS Text Classification System for UNICEF Uganda
Rick Lawrence, Manager, Machine Learning
IBM Research
Monday, 4:30pm-6:00pm; Parc, Market Street, Level 3 (MD77)
Sponsored by the Analytics Section of INFORMS and CPMS, The Practice Section of INFORMS

2014 Daniel H. Wagner Prize Competition
Sponsored by CPMS, The Practice Section of INFORMS
The Daniel H. Wagner Prize is awarded for a paper and presentation that describe a real-world, successful application of operations research or advanced analytics. Competitors for the 2014 prize include Intel, Sabre Holdings, Ford and Procter and Gamble.

Competition
Monday, Track 29 (MA, MB, MC); Hilton, Union Square 9, Level 4

Award Presentation & Winner's Reprise
Wednesday Keynote, 10:00am-10:50am; Hilton, Continental 5

ANALYTICS & PRACTICE TRACKS

These tracks showcase O.R. and analytics in practice at a wide range of companies and organizations. The presentations span the entire length of the meeting and include these topics and more.

Analytics in Government & Defense
Applications in Decision Making
Big Data Industry Applications
Cloud Analytics
Data Lifecycle
Data Networks
Healthcare Analytics
Predictive Analytics Models
Revenue Management
Supply Chain Operations
Transportation Analytics

Track 76, Parc-Mission, Level 4; Track 77, Parc-Market St., Level 3; Track 78, Parc-Mason, Level 3.

MORE ANALYTICS & PRACTICE SESSIONS

Software Demonstrations
Sunday-Wednesday
See pages 20-21 for details and room locations.
These sessions feature applications you can use at work or in research. Learn about new product releases, case studies and software presented by leading vendors and solution providers.

Tutorials
Sunday-Wednesday
See page 27 for details.
These 90-minute sessions offer an in-depth look at current methodologies. Topics include modeling choice, risk-averse optimization, simulation optimization, organ transplant operations, portfolio optimization and more.

NETWORKING

INFORMS Analytics Section Business Meeting & Reception
Monday, 6:15pm-7:15pm; Parc, Cyrin Magnin 3, Level 4
The Analytics Section invites all attendees to participate in the business meeting and reception. Enjoy light refreshments and listen to the officers discuss recent accomplishments of the section. Help chart the course for the future of the section.

CPMS Isolated Practitioner Workshop & Reception
Monday, 6:15pm-7:15pm; Parc, Balboa, Level 4
CPMS, The Practice Section of INFORMS, sponsors this workshop on topics of interest to isolated practitioners, the "Lone Rangers" of OR/MS. All are welcome to participate. Wine and cheese will be served.

Certified Analytics Professional Reception
Tuesday, 6:15pm-7:15pm; Hilton, Franciscan C, BR Level
Members of the INFORMS Certification Task Force will make a short presentation and answer questions related to the program.

SUNDAY

OMEGA RHO Distinguished Lecture
3:10pm-4:00pm
Hilton, Continental 5-6

Operations Research in Service of Drug & Addictions Policy: Lessons from and for the Discipline of Operations Research
Jonathan P. Caulkins, H. Guyford Stever Professorship of Operations Research and Public Policy, Carnegie Mellon University

I am an OR missionary. I have carried our tools and perspectives into the fields of drug policy and addiction. When traveling far afield, one often encounters opportunities to do good by applying what seem to be quite basic precepts back home, and one returns with a deeper understanding of one's own culture and its strengths and weaknesses. That has certainly been true of my professional tour. I will share success stories – instances in which by virtue of being the only person thinking about an issue from the perspective of a math modeler, I was able to make fundamental contributions by doing analyses that anyone with training in OR would view as quite elementary. I will also try to share some insights into our disciplinary culture. Drug policy, like most policy domains, is inherently interdisciplinary. So I work with scholars from many disciplines. That experience has given me an appreciation of different disciplines' strengths and limitations when grappling with messy unstructured problems. I firmly believe that diversity is essential to good decision making, including disciplinary diversity. But I am also interested in which disciplines' graduates are leaders, not just members, of the teams that shape high-level and strategic decision making. I will close with some thoughts about how we might increase our discipline's "market share" within those leadership roles.

Jonathan P. Caulkins has been on the Heinz School faculty since 1990, with leaves of absence to be co-director of RAND's Drug Policy Research Center in Santa Monica, to found RAND's Pittsburgh Office, and to teach at Carnegie Mellon's campus in Doha, Qatar. At the Heinz School he was director of the Masters of Science in Public Policy and Management (MSPPM) program and served as interim Associate Dean for Faculty. Caulkins serves or has served on the editorial board of *Management Science, Operations Research, Mathematical and Computer Modelling*, the *Journal of Drug Issues, Socio-Economic Planning Sciences*, and *I/S: A Journal of Law and Policy for the Information Society*, and has refereed for over 85 different journals.

OMEGA RHO

OMEGA RHO, the official Honor Society of INFORMS, was founded in 1976 to recognize superior scholarship and encourage leadership in operations research, management science, and related disciplines. The society has 40 active collegiate chapters, more than 5,000 student and faculty members and is a member of the Association of College Honor Societies. In addition to sponsoring OMEGA RHO Distinguished Lectures at INFORMS Annual and International meetings, OMEGA RHO provides financial support to the annual INFORMS Colloquium. Honorary Membership in OMEGA RHO is bestowed upon individuals who provide leadership and extraordinary support for the encouragement of operations research and management science through their professional activities. Prior to delivering the OMEGA RHO Distinguished Lecture, Jonathan P. Caulkins will be inducted as an Honorary Member of OMEGA RHO.

MONDAY

KEYNOTE

Honoring George B. Dantzig at 100: Remembering the Dantzig Century
Richard Cottle
Professor Emeritus, Dept. of Management Science and Engineering, Stanford University

George Bernard Dantzig was born on November 8, 1914, one hundred years and two days before the delivery of this talk and the cluster of two sessions in his honor. The sessions are intended to highlight the continuing impact of several areas to which he contributed during his remarkably productive lifetime. This talk will complement these sessions and recount some of the biographical side of this great figure to whom we owe so much.

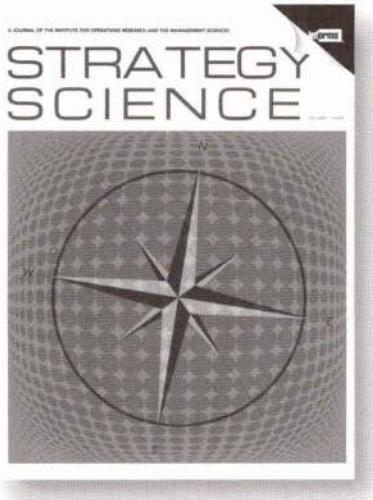
STRATEGY SCIENCE

Daniel A. Levinthal,
Wharton School of the University of Pennsylvania, Editor-in-Chief



Frequency: 4 issues/year
ISSN: 2333-2050 (print)
eISSN: 2333-2077 (online)
First Year Published: 2015

INFORMS is pleased to announce the introduction of our 14th journal, *Strategy Science*. The first issue is scheduled to be published in 2015.

Strategy Science is a quarterly journal that seeks to publish outstanding research directed to the challenges of strategic management in both business and nonbusiness organizations. This agenda encompasses a broad range of topics including relatively macro-level concerns of industry dynamics and the institutional context in which organizations operate to more organizational-level focused work, such as processes of organizational change, and important work that links the organization to its external context, such as questions of firm boundaries and strategic positioning.

The journal is eclectic with respect to methodologies, including field-based work, large-sample empirical work, and computational and analytic models. *Strategy Science* is open to a wide variety of underlying disciplinary approaches including economics, operations research, political science, psychology, and sociology.

U.S. Centers for Disease Control and Prevention with Kid Risk Inc. - Polio Eradicators Use Integrated Analytical Models to Make Better Decisions
Kid Risk, Inc.: Kimberly Thompson, Radboud J. Duintjer Tebbens
U.S. Centers for Disease Control and Prevention: Stephen L. Cochi, Mark A. Pallansch, Steven G. F. Wassilak

The U.S. Centers for Disease Control and Prevention, one of four spearheading partners of the Global Polio Eradication Initiative (GPEI) initiated a collaboration with Kid Risk, Inc. to develop and apply integrated analytical models to answer high-stakes policy questions related to managing the risks of polioviruses with consideration of human health and economic outcomes. Over the last decade, the collaboration innovatively combined numerous operations research and management science tools, including simulation, decision and risk analysis, system dynamics, and optimization to help policy makers understand and quantify the implications of their choices. These integrated modeling efforts helped motivate faster responses to polio outbreaks, leading to a global resolution and significantly reduced response time and outbreak sizes. Insights from the models also underpinned a global resolution to coordinate global cessation of the use of one of the two vaccines after wild poliovirus eradication (i.e., allowing continued use of the other vaccine as desired). Finally, the model results made the economic case for a continued commitment to polio eradication by quantifying the value of prevention and showing the health and economic outcomes associated with the alternatives. The work helped to raise the billions of dollars needed to support the completion of polio eradication that will prevent devastating cases of polio and enable realization of an estimated $40 to $50 billion in net benefits by the countries coved by the GPEI, while protecting the significantly larger net benefits enjoyed by the countries that stopped wild poliovirus transmission without support of the GPEI.

Panel on MOOCs: Just a Fad or Here to Stay?
Moderator: Martin Haugh, Co-Director of the Center for Financial Engineering (CFE), Department of IE & OR, Columbia University

Panelists: Dimitris Bertsimas, Professor of Operations Research and Statistics, Massachusetts Institute of Technology
Kay Giesecke, Associate Professor of Management Science & Engineering, Stanford University
Garud Iyengar, Professor of Industrial Engineering & Operations Research, Columbia University
Soulaymane Kachani, Professor of Industrial Engineering & Operations Research, Columbia University

Massive open online courses or MOOCs have been the subject of considerable recent media attention, with some claiming they will revolutionize education and others claiming they are over-hyped and just a passing fad. Perhaps a middle ground is more appropriate? In this panel discussion we will hear the views of academics in the OR/MS community who have been involved in the delivery and/or teaching of MOOCs within their respective universities. In addition to sharing their experiences, they will attempt to answer questions on the future development of MOOCs as well as their impact on education and the lives and careers of people in the OR community. A question and answer session will be held at the end of the discussion.

Operating the Grid
Mark Rothleder, Vice President
Market Quality and Renewable Integration
California Independent System Operator Corporation

The ISO manages the flow of electricity across the high-voltage, long-distance power lines that make up 80 percent of California's and a small part of Nevada's power grid. The nonprofit public benefit corporation safeguards the economy and well-being of 30 million customers by "keeping the lights" on 24/7. The ISO facilitates a $10 billion electrical wholesale market. To efficiently and effectively manage the ISO wholesale market, the ISO utilizes sophisticated optimization techniques to: simultaneously balance supply and demand, allocate transmission, commit generating resources and procure operating reserves. These optimization routines produce a reliable dispatch plan and locational marginal prices used for settlement every day for the next operating days 24 hours. Routines also execute in real-time every five minutes for next two hour dispatch horizon. As California fulfills important environmental polices related renewable resources and the reduction of greenhouse gas emissions from the electric energy sector, the ISO leverages its optimization routines to help successfully achieve policy objectives. Starting in the fall of 2014, the ISO's energy imbalance market optimization routine is being offered to improve regional coordination, and provide economic benefits to interested neighboring balancing areas.

Mark Rothleder is Vice President, Market Quality and Renewable Integration at the California Independent System Operator Corporation and is leading the ISO's renewable integration work. He has held several critical positions at the ISO after joining the grid operator as one of its first employees in 1997. In spring 2009, he led a multifunctional team in designing and implementing market rules and software modifications related to the ISO's Market Redesign and Technology Upgrade (MRTU). Rothleder holds a B.S. degree in Electrical Engineering from the California State University, Sacramento. He has taken post-graduate coursework in Power System Engineering from Santa Clara University and earned an M.S. in Information Systems from the University of Phoenix.

THE FRANZ EDELMAN AWARD

The Franz Edelman Award for Achievement in Operations Research and the Management Sciences calls out, recognizes and rewards outstanding, high-impact applications of OR/MS. Each year, six finalists compete in the "Super Bowl" of O.R. in practice. The 2014 finalists include Alliance for Paired Donation, The Energy Authority, Grady Health System, NBN Company and Twitter. In this keynote, the first-place U.S. Centers for Disease Control and Prevention team with Kid Risk, Inc. will reprise their winning presentation.

UPS GEORGE D. SMITH PRIZE

The UPS George D. Smith Prize recognizes an academic department or program for effective and innovative preparation of students to be good practitioners of O.R., management science or analytics. The UPS George D. Smith Prize is created in the spirit of strengthening ties between industry and the schools of higher education that graduate young practitioners of operations research. INFORMS, with the help of CPMS, awards the prize annually to an academic department or program for effective and innovative preparation of students to be good practitioners of operations research, management science or analytics. The UPS George D. Smith Prize is named in honor of the late UPS Chief Executive Officer who was a champion of operations researchers at a leading Fortune 500 corporation. UPS has generously underwritten the award in his memory.

Massachusetts Institute of Technology
Georgia Perakis, William F. Pounds Professor
Donald Rosenfield, LGO Program Director, 1988-2014

The MIT Leaders for Global Operations (LGO), partnership among global operations companies and MIT, trains students for careers in operations and manufacturing. The two-year dual-degree program includes a six-month research internship, on-site labs and in-depth partner company visits as well as on-campus coursework and results in an MBA or MS from the MIT Sloan School of Management and an MS from one of seven MIT engineering programs. During the internship, students work on an operations problem at one of 23 LGO partner companies and write a master's thesis based on their research and solutions. Courses in operations research and analytics are central to the LGO curriculum, which is based on the belief that deep knowledge of these fields is essential to achieving the best results for industry. MIT faculty members at the forefront of operations research and engineering practice serve as LGO teachers and thesis advisors.

10:00-10:50am
Hilton, Continental 5

Statistics and Machine Learning via a Modern Optimization Lens
Dimitris Bertsimas, Professor of Operations Research and Statistics, Massachusetts Institute of Technology

Key problems of classification and regression in statistics and machine learning can naturally be formulated as mixed integer optimization (MIO) models. While continuous optimization approaches has had a significant impact in statistics, discrete optimization has played a very limited role, primarily based on the belief formed in the 1970s and 1980s that MIO models are computationally intractable and not practically relevant. While such beliefs were accurate then, in the last twenty-five years (1990-2014), algorithmic advances in integer optimization combined with hardware improvements have resulted in an astonishing 200 billion factor speedup in solving MIO problems. We develop discrete extensions of modern first order continuous optimization methods to find high quality feasible solutions that we use as warm starts to a MIO solver that finds provably optimal solutions. We report results for the classical best subset selection problem in linear regression currently solved by LASSO heuristically, least quantile regression, factor analysis and optimal CART. In all cases we demonstrate that the solutions found by modern optimization methods outperform the classical approaches in developing more interpretable models and providing stronger predictive power. This body of work collectively suggests that the belief widely held in statistics and machine learning that MIO is not practically relevant for statistics applications needs to be revisited.

Dimitris Bertsimas is the Boeing Leaders for Global Operations Professor and the Co-Director of the Operations Research Center at the Massachusetts Institute of Technology. His research interests include analytics and their applications, especially in a variety of industries with particular emphasis in healthcare. He has co-authored more than 150 scientific papers and has co-authored three graduate level textbooks. He is a member of the National Academy of Engineering, has received several research awards including the Farkas prize (2008), the Erlang prize (1996), the SIAM prize in optimization (1996), the Bodossaki prize (1998) and the Presidential Young Investigator award (1991-1996).

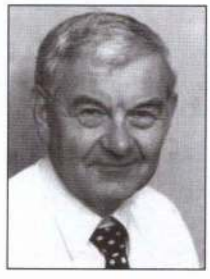
Credit Where Credit is Due: Lessons for O.R. Modelling from the Global Financial Crisis
Lyn Thomas, Professor of Management Science, University of Southampton

Credit scoring, the operations research and statistical models used to assess the default risk in consumer lending, has proved essential to the growth in consumer credit experienced in the last fifty years. It has also seen the development of methodologies and ways of model assessment that have proved fundamental in data mining applications from prison parole to intensive care treatment. It is also an early example of the use of "quite big data." Initially credit scoring was used to ensure consistent and optimal accept/reject decisions when new customers requested loans. The approach was extended to assess the default risk of existing customers; to assess whether customers would pay off their loan early or move to other lenders; and to risk-based pricing. The advent in 2006 and 2013 of the Basel II and Basel III banking regulations meant scoring models became essential in setting the capital requirements of banks and this has introduced new areas of research. Yet credit scoring together with the models used by rating agencies to assess the default risk of portfolios of consumer loans are highlighted in the debate on the causes of the subprime mortgage crash and the subsequent global financial crisis. Identifying the performance of these models during this period leads to a number of lessons which are relevant to Operations Research modelling in many areas. These include whether models should be publically available and the need to recognize when the objectives of the model are no longer in line with those of the real problem.



Lyn Thomas has been Professor of Management Science at the University of Southampton since 2000. He was Professor of Management Science at the University of Edinburgh from 1985-2000. He served as President of the Operational Research Society (1994-1995). Thomas is a fellow of the Royal Society of Edinburgh 1992, member of the EPSRC College (since 1995), and previously a member of the EPSRC Mathematics Committee and Chairman of the Operational Research Panel. He was a member of DSAC Operations Analysis Board (2001-2012).

The Google Driverless Car

Anthony Levandowski, Project Leader, Google

The Google Self-Driving Car is a project by Google that involves developing technology for autonomous cars. The software powering Google's cars is called Google Chauffeur. Lettering on the side of each car identifies it as a "self-driving car." The talk will describe the status of the project and highlight the underlying technology and recent accomplishments.

Anthony Levandowski is a tech lead for Google's self-driving car project, where he oversees laser development and legislative efforts. He joined Google in 2007 to launch Street View, a technology featured in Google Maps and Google Earth, which provides panoramic views from positions all over the world. After building Street View, He spearheaded the effort to mine Street View imagery and create the road network database that powers Google Maps, enabling for the first time free turn-by-turn navigation on all mobile phones. As a graduate student at the University of California, Berkeley, Levandowski led the team that created the world's first autonomous motorcycle, Ghostrider, which competed in a 2005 contest sponsored by the military's DARPA.

KEYNOTE

2014 Daniel H. Wagner Prize Winner Announcement and Reprise

10:00am-10:50am
Hilton, Continental 5

Daniel H. Wagner earned his PhD in mathematics from Brown University in 1951. He began his career in the US Navy's Operations Evaluation Group (OEG) at the Pentagon, where he worked on operations research for naval warfare. In 1963, he created the firm of Daniel H. Wagner Associates, Inc., which is still in existence today. During his years as president and principal owner of Wagner Associates, Dan brought many high-quality mathematicians into the operations research community. This led to significant advances in the firm's fields of endeavor and delivery of significant applications to the Navy, Coast Guard, and other clients; many of these applications are still in service today. After retirement from his eponymous company, Dan Wagner continued his commitment to the field of operations research, serving in various teaching and research positions with the US Naval Postgraduate School and the US Naval Academy. He was an active member of ORSA, and then INFORMS, for more than 40 years.

DANIEL H. WAGNER PRIZE

The Daniel H. Wagner Prize is awarded for a paper and presentation that describe a real-world, successful application of operations research or advanced analytics. The prize criteria emphasize innovative, elegant mathematical modeling and clear exposition.

INFORMS MEETINGS

2015

April 12-14
INFORMS Conference on Business Analytics & Operations Research
Hyatt Huntington Beach
Huntington Beach, California
Chair: Manoj Chari, SAS
http://meetings.informs.org/analytics2015

June 14-17
CORS/INFORMS International Conference
Le Centre Sheraton Hotel
Montreal, QC, Canada
Chair: Louis-Martin Rousseau, CIRRELT, École Polytechnique de Montréal
http://meetings.informs.org/montreal2015

July 29-31
INFORMS Healthcare Conference
Omni Nashville
Nashville, Tennessee
Chair: Eric Johnson & Bob Dittus, Vanderbilt University

November 1-4
INFORMS Annual Meeting 2015 Philadelphia
Pennsylvania Convention Center & Marriott Philadelphia Downtown
Chair: Tamas Terlaky, Lehigh University

INFORMS COMMUNITIES

2014

December 7-10
Winter Simulation Conference
Westin Savannah Harbor Golf Resort & Spa
Savannah, Georgia
Chair: Stephen J. Buckley, IBM Research
http://wintersim.org/2014

2015

January 11-13
INFORMS Computing Society Conference
Omni Richmond
Richmond, Virginia
Chair: J. Paul Brooks, CAP
Virginia Commonwealth University
https://sites.google.com/site/2015icsconference

February 5-8
Organization Science Winter Conference
Canyons Resort
Park City, Utah
Chairs: Sarah Kaplan & Dan Levinthal
http://pubsonline.informs.org/page/orsc/winter-conference

June 17-20
INFORMS Marketing Science Conference
Baltimore Marriott Waterfront Hotel
Baltimore, Maryland
Chair: Dipankar Chakravarti
Dipankar.chakravarti@jhu.edu

July 5-8
19th Applied Probability Conference
Istanbul, Turkey

July 12-17
22nd International Symposium on Mathematical Programming (ISMP)
Wyndham Grand Pittsburgh Downtown
Pittsburgh, Pennsylvania
Chair: Francois Margot
http://www.ismp2015.org

TUTORIALS IN OPERATIONS RESEARCH

All attendees receive free online access to the *INFORMS 2014 TutORials in Operations Research: Bridging Data and Decisions* series volume concurrently with the meeting. 2014 INFORMS Annual Meeting attendees will have ONLINE access to the 2014 TutORials on November 1, 2014 (Members on January 1, 2015). Go to INFORMS PubsOnLine (pubsonline.informs.org) to access your content and view previous year's volumes. You will need your INFORMS customer account or your username and password found on your conference registration receipt; you can also request LOGIN information when you go to the TutORials PubsOnLine site. You can order the 2014 book or previous volumes through the TutORials website: http://pubsonline.informs.org/series/educ. For more information, visit the INFORMS booths #51-53 in the exhibit hall.

All tutorials are located in the Hilton, Continental 4, BR level.

SUNDAY

■ SA07
8:00am-9:30am
Using Complementarity Modeling for Planning and Policy Analysis of Electricity & Energy Markets
Ben Hobbs, Johns Hopkins University; Antonio J. Conejo, Ohio State University; J. David Fuller, University of Waterloo; Steven A. Gabriel, University of Maryland; Carlos Ruiz, Universidad Carlos III de Madrid

■ SB07
11:00am-12:30pm
Assessing and Improving Operational Resilience of Critical Infrastructures and Other Systems
Dave Alderson, Gerald Brown & Matt Carlyle
Naval Postgraduate School

■ SC07
1:30pm-3:00pm
From Data to Assessments and Decisions: Epi-Spline Technology
Johannes Royset, Naval Postgraduate School

■ SD07
4:30pm-6:00pm
Research in Public Health for Efficient, Effective, and Equitable Outcomes
Pinar Keskinocak, Turgay Ayer & Julie Swann
Georgia Institute of Technology

MONDAY

■ MA07
8:00am-9:30am
From OR to OM: Observations on the Emergence of a Discipline
John Buzacott, York University

■ MB07
11:00am-12:30pm
Clearing the Jungle of Stochastic Optimization
Warren Powell, Princeton University

■ MC07
1:30pm-3:00pm
Cloud Computing for Optimization
Jeff Linderoth, University of Wisconsin-Madison

■ MD07
3:00pm-4:30pm
Simulation-Based Education in Supply Chain and Project Management
Yale T. Herer, Avraham Shtub & Avinoam Tzimerman
Technion-Israel Institute of Technology

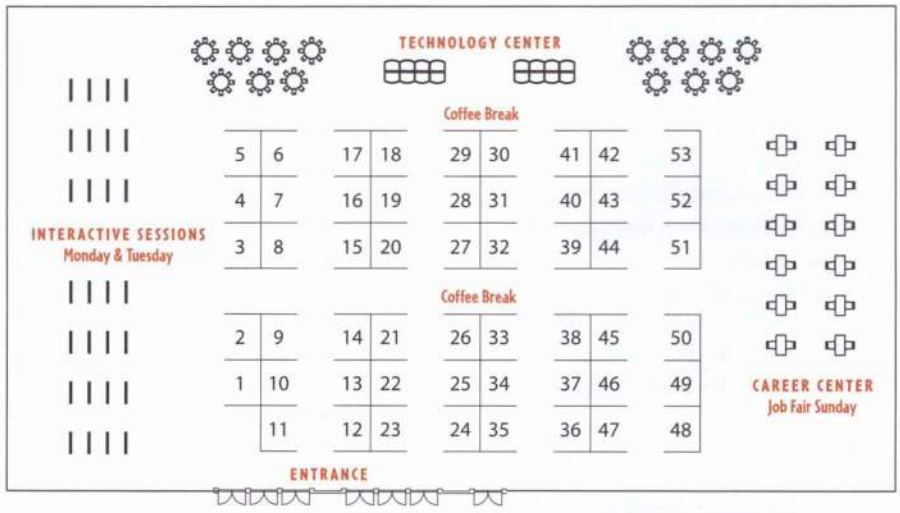
TUESDAY

■ TA07
8:00am-09:30am
Service Science: Toward Systematic Service System Innovation
Paul Maglio, University of California, Merced

■ TB07
11:00am-12:30pm
Cloud Computing and Decision Analytics
Stefan Voss & Leonard Heilig, University of Hamburg

■ TC07
1:30pm-3:00pm
Identification, Assessment and Correction of Ill-Conditioning and Numerical Instability in Linear and Integer Programs
Ed Klotz, IBM

EXHIBIT HALL - HILTON GRAND BALLROOM A-B



TECHNOLOGY CENTER

Free Wi-Fi

Free wireless Internet and a technology center are located in the Hilton, Grand Ballroom. There are a limited number of computers available in the Technology Center if you do not have your own computer. Name badges must be worn for admittance. The Technology Center will be open during the following hours:

Sunday, Nov. 9	12:00pm-5:00pm
Monday, Nov. 10	7:00am-5:00pm
Tuesday, Nov. 11	7:00am-5:00pm
Wednesday, Nov. 12	7:00am-3:00pm

THANK YOU

INFORMS CAREER CENTER

INFORMS Career Center (ICC) is the largest source of operations research and analytics jobs and resumes. It's where job seekers go to land the right job in academia or industry and where employers post their jobs and search our resume database for qualified candidates.

Job Fair

Sunday, 12:00pm-5:00pm
Hilton - Grand Ballroom
The Job Fair provides an opportunity for job seekers to meet participating employers in an informal atmosphere and to discuss employment opportunities within those organizations. Employers meet and collect resumes from many job seekers in a short period of time early in the meeting, giving them the chance to set up interviews during the meeting.

ICC On-Site Interviews

Monday-Tuesday, 9:00am-5:00pm
Wednesday, 9:00am-3:00pm
Hilton - Grand Ballroom
This service provides employers and applicants with a convenient venue for on-site interviews to explore opportunities in academia, industry and government. In addition, the job placement service offers:

- Online access to job listings and applicant files,
- Expanded information about jobs and applicants,
- Weekly updates of the database,
- Improved database search capabilities,
- Online data entry for applicants and employers,
- Extended availability of the database. http://career-center.informs.org

Panel Discussions

Select panels will lead informal discussions about the industry and academic interview processes.

The Academic Job Search
Monday, 11:00am-12:30pm (TB65)
Parc 55 - Cyril Magnin 2, Level 4

The Industry Job Search
Monday, 1:30pm-3:00pm (TC65)
Parc 55 - Cyril Magnin 2, Level 4
Interactive Sessions

INTERACTIVE SESSIONS

Interactive Sessions

Monday & Tuesday, 12:30pm-2:30pm
Hilton - Grand Ballroom
Interactive Session Chairs: Hari Balasubramanian & Ana Muriel, University of Massachusetts Amherst

Researchers, practitioners and students share their O.R. and analytics projects in these special sessions presented as poster displays, laptop demonstrations and other creative formats.

Abstracts and authors for posters are listed in the chronological program, under the day and time for each Interactive Session.
Monday, pages 185-190
Tuesday, pages 296-301

Interactive Competition

INFORMS places special emphasis on high-quality poster presentations. All interactive session presenters were invited to submit their posters to the competition. In Round 1 of the process, submitters sent a PDF of their finished poster to the judging panel for review. The judges have evaluated these submissions and selected a group of semifinalists. The judging panel is made up of distinguished ORMS professionals, both academics and practitioners, many of whom are INFORMS leaders.

Monday Judges	*Tuesday Judges*
Dolores Romero-Morales	Bjorn Berg
Erin Baker	Diana Negoescou
Yao Zhao	Anahita Khojandi
Jennifer Ryan	Jun Zhuang
Nick Petruzzi	Tahir Ekin
Ana Muriel	Jay Simon

In Round 2, the judging panel will review the semifinalist presentations during the Interactive Sessions in San Francisco. In Round 3, also held during the Interactive Sessions, the judges will name the 1st, 2nd and 3rd place winners. Three winners will be identified and awarded each day. Recognition includes a plaque, an award check, and announcements on the INFORMS website and in newsletters.

Exhibits Open

Sunday, Nov. 9	12:00pm-5:00pm
	7:30pm-9:00pm
	(Welcome Reception)
Monday, Nov. 10	9:00am-5:00pm
Tuesday, Nov. 11	9:00am-5:00pm
Wednesday, Nov. 12	9:00am-3:00pm

AIMMS® **#27**
www.aimms.com
AIMMS is an innovative technology company with offices in The Netherlands, Seattle, Singapore, and Shanghai. For 25 years, our award-winning optimization platform has helped Fortune 1000 companies create high business impact by informing better decision making for complex strategic, tactical and operational problems. AIMMS quickly and effectively delivers custom solutions that will impact every level of your organization and help you gain a competitive edge.

American Optimal Decisions **#13**
www.aorda.com/aod/psg.action
American Optimal Decisions provides consulting services and software solutions in advanced statistics, optimization and risk management. The main software product is Portfolio Safeguard (PSG), an advanced nonlinear mixed-integer optimization package. Use simple codes for sophisticated optimization problems, calling non-linear functions without additional programming. Function groups: linear, nonlinear, utilities, cardinality, average, VaR, CVaR, and more. AOD provides consulting in various engineering areas involving statistics and optimization.

AMPL Optimization, Inc. **#15**
www.ampl.com
AMPL Optimization develops, distributes and supports the AMPL modeling language, a powerful and natural tool for developing and deploying the complex optimization models that arise in diverse business applications. AMPL is notable for its convenient support of extended problem formulations and advanced algorithmic alternatives. It features an integrated scripting language for automating analyses and building iterative optimization schemes; links for reading and writing spreadsheet and database files; and application programming interfaces for use with popular programming languages. AMPL works with over 30 powerful optimization engines including well-known large-scale solvers such as CPLEX, CONOPT, Gurobi, KNITRO, MINOS, SNOPT and Xpress.

AnyLogic North America, LLC **#14**
www.anylogic.com
AnyLogic simulation and modeling software is an essential productivity and decision making tool for your company's various needs. AnyLogic is the only simulation tool that supports all the most common simulation methodologies in place today: system dynamics, process-centric (aka discrete event), and agent-based modeling. The unique flexibility of the modeling language enables the user to capture the complexity and heterogeneity of business, economic and social systems to any desired level of detail. Join GE, PwC, Intel, IBM, Cardinal Health and other industry leaders who are using AnyLogic to leverage the power of dynamic simulation throughout their entire business lifecycle.

Artelys **#22**
www.artelys.com
Artelys is an optimization and analytics company dedicated to providing decision-making solutions through technology, operations research and statistics. Artelys develops, distributes and supports a comprehensive portfolio of efficient and robust tools: Artelys Kalis, hybrid constraint programming and mixed-integer programming solver; FICO Xpress Optimization suite; KNITRO, nonlinear programming solver with extended features; and AMPL. Relying on these optimization tools, the state-of-the-art development and deployment platform Crystal, and a high level of expertise in quantitative methods, Artelys has been successful in delivering 100+ efficient solutions to the most complex business problems.

Cambridge University Press **#26**
www.cambridge.org/us/academic
Cambridge's publishing in books and journals combines state-of-the-art content with the highest standards of scholarship, writing and production. Visit our stand to browse new titles, available at a 20% discount, and to pick up sample issues of our journals. Visit our website to see everything we do: www.cambridge.org/us/academic.

COIN-OR **#31**
www.coin-or.org
The Computational Infrastructure for Operations Research publishes high quality, free, open source tools for O.R. professionals and students, suitable for commercial, educational and personal use. COIN-OR is the place to go when you need a "white box" for algorithm research and development. COIN-OR is a strategic partner of the INFORMS Computing Society.

Cogentus LLC **#47**
www.cogentus.co.uk
Smart Decisions is unique software taking a full lifecycle view for solving a problem. It provides a robust, transparent "Record of Decision" and includes tools for problem definition, ideas generation (including Triz), MCDA and measures of effectiveness. We offer full training on the software and methodology plus consultancy to support Clients on technically complex and challenging problems particularly those with multiple stakeholder viewpoints with a high degree of uncertainty.

Decision Sciences Journal **#46**
www.decisionsciencesjournal.org
The exhibit will feature the *Decision Sciences Journal*, the flagship publication of the Decision Sciences Institute, an interdisciplinary business research association dedicated to the quantitative analysis of managerial decision making. The journal is featuring a new section on Analytics and another new section on Methodological Best Practices. We wish to acquaint the INFORMS membership with this as well as other publication opportunities in this premier business research journal.

Dynamic Ideas **#42**
www.dynamic-ideas.com
Dynamic Ideas is a publisher of scientific books that have quality and originality in the areas of Operations Research and Applied Mathematics. The key objective of our titles is to "educate the next generation." Many of our books are currently being used as the main textbook in academic courses in some of the finest universities and research institutions in the world.

Elsevier **#30**
www.elsevier.com
Elsevier is a leading publisher of ORMS journals, including the *European Journal of Operational Research, Computers & Operations Research, Omega* and the *Journal of Operations Management.* Come to our booth to find out about our journals, how to publish open access including new OA journal *Operations Research Perspectives* and how to enrich your journal article with exciting innovations such as graphical abstracts, video and AudioSlides.

FICO #1-2
www.fico.com/Xpress
FICO is a leading analytics software company, helping businesses around the world make better decisions that drive higher levels of growth, profitability and customer satisfaction. FICO's optimization tools, which include FICO® Xpress Optimization Suite, provide high-performance solvers, flexible modeling and application development tools. FICO's optimization capabilities are now available on the FICO® Analytic Cloud and the FICO® Decision Management Platform, an easy, cost-effective way to evaluate, customize, deploy and scale state-of-the-art analytics and decision management solutions. Learn more at www.fico.com/Xpress. FICO: Make every decision count™.

Forio #32
www.forio.com
Forio Epicenter lets you quickly build analytics applications such as forecasting tools or statistical analyses, as well as educational simulations or even games. Let your audience explore for themselves. Epicenter allows them to benefit from your analyses, even without a background in data analytics or modeling. If you need assistance building your analytics application, Forio can help you develop and deliver online forecasting tools, predictive analytics and training simulations. With our highly skilled staff of web and mobile interface developers, data visualization experts, user interface designers, modelers and QA testers, we can get your application running quickly.

Frontline Systems, Inc. #11
www.solver.com
See Analytic Solver Platform, the surprisingly easy, surprisingly powerful integrated analytics software from Excel Solver developer Frontline Systems, the company that has "democratized analytics" for hundreds of thousands of users. Learn how quickly you can "come up to speed" and create data mining and forecasting models, simulation and risk analysis models, and conventional and stochastic optimization models, for fastest time to business value–in Microsoft Excel or a Web browser, or in your favorite programming language. See how you can use our analytics engines to deliver results in your consulting practice, or your company's own Web-based or desktop applications.

GameLab Ltd. #34
www.gamelab.cl
We are a technological company that produces digital games for courses at universities, primary MBAs. Our games seek to motivate students and to create a dynamic environment, converting the class into an unforgettable experience... by playing!

GAMS Development Corp. #9
www.gams.com
The General Algebraic Modeling System (GAMS) is a high-level modeling system for mathematical programming and optimization. It consists of a language compiler and a stable of integrated high-performance solvers. GAMS is tailored for complex, large-scale modeling applications, and allows you to build large maintainable models that can be adapted quickly to new situations. Come to our booth to learn more about our new GAMS distribution or ask for an evaluation license. You can also visit our technology workshop or software demo.

Gurobi Optimization #20
www.gurobi.com
Gurobi Optimization provides high performance LP, QP, QCP, and MIP solvers using the most advanced implementations of the latest algorithms. We offer best-in-class performance, support a broad range of interfaces and modeling languages, and offer flexible licensing together with transparent, no surprises, pricing, all backed by outstanding, easy to reach support.

IBM #43-44
www.ibm.com/optimize
IBM CPLEX® has helped more organizations drive performance improvements from optimization than any other company, including 4x as many Edelman Award finalists. Practitioners can rely on CPLEX for prescriptive analytics to deliver bottom-line impact, leveraging big data and analytic insights to support decision making at the speed of business. Visit booths 43-44 to learn how Decision Optimization with CPLEX helps businesses make better decisions, faster.

IEOM Society #39
www.iieom.org
The IEOM Society is designed to encourage critical thinking in the field of Industrial Engineering (IE) and Operations Management (OM); provide means to communicate and network among people enthused with similar interests through yearly conferences, seminars and workshops across the globe; and illustrative research publications to disseminate the earned knowledge and experience. The IEOM Society and IEOM 2015 Conference will be promoted. The IEOM 2015 Conference is sponsored by INFORMS.

Imagine That, Inc. #24
www.extendsim.com
Simulation is a key technology to understanding business processes and identifying opportunities for improvement. ExtendSim helps guide decision making by simulating processes and determining the best system configuration. ExtendSim features a customizable graphical modeling logic where relationships between modeling components are visible. Its flexibility provides the ability to create and couple hierarchical subsystems, design interactive user interfaces, and freedom to rapidly explore design options. ExtendSim's robust data storage and manipulation tools put you in control of model information, facilitating organization of complex data.

INFORMS #51-53
www.informs.org
Visit INFORMS booth/bookstore to meet and speak with INFORMS staff about our products and services. Learn more about INFORMS journals and magazines, member benefits and services, CAP certification, continuing education, communities, upcoming meetings, networking opportunities (INFORMS Connect), and our new journal *Strategy Science*. INFORMS staff is available to assist you with purchasing products, or renewing memberships and will have the latest information about INFORMS newest member benefits. We look forward to seeing you!

INFORMS Analytics Maturity Model Official Launch #38
https://analyticsmaturity.informs.org/
INFORMS, your trusted professional association, now brings you a new, thorough way to reassess the way that your organization uses analytics and plan even better ways to improve. Visit with INFORMS staff and the development team from Accenture, FICO, ORTEC, Spinnaker and CANA Advisors. Try out the new maturity model. Bring your questions and share your expert recommendations. But first visit https://analytics maturity.informs.org/.

LINDO Systems, Inc. #23
www.lindo.com
LINDO Systems offers three products hooked to industrial strength solvers for linear, integer, stochastic, NLP and global solvers. See the latest solver enhancements including exploitation of multicore hardware. LINGO includes a powerful modeling language and convenient data options to make building models faster and easier. What'sBest! allows you to build large optimization models in Excel. Models are easy to build and understand for anyone comfortable within Excel. LINDO API allows you to plug the power of the LINDO solvers right into customized applications that you have written. Stop by the booth for a free trial CD with full capacity versions.

MathWorks #17
www.mathworks.com
MATLAB is a platform for analysis, visualization, simulation, and optimization. You can access and analyze real-world data and develop customized algorithms that help make better decisions. Join us to see what's new and how MATLAB can help you explore data, develop algorithms, and integrate programs into enterprise applications.

Maximal Software, Inc. #29
www.maximalsoftware.com
Maximal Software is a leading provider of software for developing and formulating models in the field of optimization.. Organizations need to make intelligent decisions to obtain optimal use of their available resources, such as manpower, equipment, raw materials and capital. The discipline of optimization is used to assist organizations with solving their complex business problems in areas such as manufacturing, operations planning, distribution and transportation, supply-chain, finance, and defense related industries. Maximal is the developer of the MPL Modeling System and the OptiMax Component Library, and has many years of practical experience providing innovative solutions to our customers.

MOSEK ApS #18
www.mosek.com
MOSEK ApS provides optimization software that helps our clients to make better decisions. Our customer base consists of financial institutions and companies, and engineering and software vendors, among others. MOSEK ApS was established in 1997 by Erling D. Andersen and Knud D. Andersen. It specializes in creating advanced software for solution of mathematical optimization problems. In particular, the company focuses on solution of large-scale linear, quadratic and conic optimization problems.

North Carolina State University #4
http://engineeringonline.ncsu.edu
The College of Engineering offers 21 master degree programs and 13 PhD programs on campus through a variety of rich learning and work experiences on campus. Professional engineers and computer scientists can participate in the college's Engineering Online program and take classes for professional development or towards the completion of one of the 15 online master degree programs available for distance students. For more information visit these websites: www.engr.ncsu.edu and http://EngineeringOnline.ncsu.edu.

North Carolina State University #5
http://www.ise.ncsu.edu/
The Edward P. Fitts Department of Industrial and Systems Engineering at North Carolina State University is among the top ranked programs in the country. The department features educational and research programs in optimization, stochastic processes, simulation, systems analysis and analytics, quality and reliability, logistics, and health systems. We offer Masters and Doctoral degrees in industrial engineering as well as a Master of Supply Chain Engineering and Management joint with the Poole College of Management.

now publishers #19
www.nowpublishers.com
now publishers publishes high quality reference, research and review journals in business and technology. Our marquee product, *Foundations and Trends® (Fnt)* is already acclaimed as a "go to" resource for graduate students scoping out a topic and for senior researchers looking for a high-level introduction to a new area.

Palgrave Macmillan #33
www.palgrave.com
Palgrave Macmillan is a global academic publisher for scholarship, research and professional learning. We publish monographs, journals, reference works and professional titles, online and in print. With a focus on humanities and social sciences, Palgrave Macmillan offers authors and readers the very best in academic content whilst also supporting the community with innovative new formats and tools.

Palisade Corporation #12
www.palisade.com
Palisade Corporation is the maker of the market leading risk and decision analysis software @RISK and the DecisionTools® Suite. Virtually all Palisade software adds in to Microsoft Excel, ensuring flexibility, ease-of-use, and broad appeal across a wide range of industry sectors. Free trial downloads at www.palisade.com.

ProbabilityManagement.org #45
http://probabilitymanagement.org
Nonprofit ProbabilityManagement.org promotes standards for communicating uncertainties through arrays of big data known as SIPs (Stochastic Information Packets). SIPs are: •Actionable-may be used directly in Excel to perform thousands of Monte Carlo trials before your finger leaves the key using only the Data Table command. •Additive-may be aggregated across platforms across the enterprise. •Auditable-are represented as unambiguous data with provenance. Packages such as Crystal Ball, @Risk, Risk Solver, MATLAB, R and SAS may be leveraged through shared stochastic libraries using the open SIPmath™ standard. Visit SIPmath.org for videos and Excel demo models.

Provalis Research #37
www.provalisresearch.com
Provalis Research is a leading developer of text analytics software with ground-breaking qualitative and quantitative analysis programs, such as QDA Miner, an innovative mixed-methods qualitative data analysis software; WordStat, a powerful add-on module for computer assisted content analysis and text mining; and Simstat, an easy yet powerful statistical software. One of the most distinctive features of these tools is their interoperability, allowing researchers to integrate numerical and textual data into a single project file and to seamlessly move back and forth between quantitative and qualitative data analysis, as well as to easily explore relationships between numerical and textual data.

Responsive Learning Technologies #41
www.responsive.net
Excite and engage your operations and supply chain management students with our award-winning, competitive web-based games. Ensure student readiness for MBA programs with our online assessors and tutorials in math, statistics, finance, economics, accounting and spreadsheets.

SAS #48
www.sas.com
Successful organizations today rely on the coordinated use of a diverse array of analytic methods. That's why SAS provides an array of integrated analytic capabilities, including data integration, statistics, data and text mining, econometrics and forecasting, and operations research (optimization, simulation, and scheduling). SAS helps organizations around the world build models, populate them with relevant data and analytic insights, communicate recommended decisions effectively, and surface these capabilities within accessible, business-oriented interfaces. Visit us to see how SAS can help you make better use of your data, more fully understand past and present conditions, anticipate the future, and make better decisions.

SAS Global Academic Program #49
www.sas.com/academic
SAS is the leader in business intelligence and analytical software and services. The SAS® Global Academic Program works with professors, students and researchers to support industry partnerships with academia; deliver technology and resources for teaching and learning; and educate students about business intelligence, analytics and data mining for business advantage. Learn more: www.sas.com/academic. Since 1976, SAS has given educators The Power to Know®.

SAS Institute Inc., JMP Division **#50**
www.jmp.com
JMP® is the SAS® software that links robust statistics with interactive graphics, in memory and on the desktop. JMP is also an analytic hub, integrating with SAS, R, Excel and MATLAB, to provide a point and click user interface.

Springer **#6-7**
www.springer.com
Looking to publish your research? Discover Springer's print and electronic publication services, including open access! Get high-quality review, maximum readership and rapid distribution. Visit our booth or springer.com/authors. You can also browse key titles in your field and buy eBooks at discount prices. With Springer you are in good company.

Statistics.com **#25**
www.statistcs.com
Statistics.com, the leading provider of online education in statistics, offers 110+ courses in introductory and advanced analytics and statistics, certificate programs too. Students from around the world study with renowned authorities via private discussion boards on flexible schedules. Teaching assistants provide individual feedback on practical exercises.

Syncopation Software, Inc. **#36**
www.syncopationsoftware.com
Syncopation Software is a leading provider of business analytic tools for decision analysis, risk analysis, Monte Carlo simulation, and real option valuation. The latest release of Syncopation's flagship product, DPL 8, includes an easy access ribbon interface, an all-new Excel-side interface, completely re-worked, presentation-ready graphics, and more. We offer a flavor of DPL for every decision professional: from quick and simple risk and decision analysis within your spreadsheet to building a definitive, extensible risk and decision support solution. And Syncopation is always there for you; our customers praise our flexible, responsive support and variety of efficient training courses.

Taylor & Francis Group LLC-CRC Press **#3**
www.crcpress.com
CRC Press/Taylor & Francis is a premier books and journals publisher. Stop by our booth to browse our books to pick up a journal sample copy, or to meet with our editor if you are interested in developing a new book project.

Texas A&M University, MS Analytics **#35**
http://analytics.stat.tamu.edu
The Department of Statistics in partnership with Mays Business School at Texas A&M University offers a MS in Analytics degree which will prepare working managers and professionals to make better informed decisions more quickly to optimize business performance and identify new business opportunities. Courses will be taught at Houston City Centre and via live video around North America in the evenings, offering a convenient two year, part-time program for working professionals. Open to individuals with strong quantitative skills, for example bachelor's degree holders in the sciences, mathematics, business and engineering fields. Accepting pre-questionnaires now for our next fall cohort.

University of Southern California **#16**
Viterbi School of Engineering
http://viterbi.usc.edu/gapp
The USC Viterbi School of Engineering offers 40+ graduate programs entirely online via DEN@Viterbi, our online delivery system. In 2014, DEN@Viterbi was ranked a top online graduate engineering program by *U.S. News & World Report*, including the #1 Online Graduate Computer Information Technology (Computer Science) Program. Our unique blended model allows for online and on campus students to fully engage and interact in the same graduate classes - with no residency requirement. DEN@Viterbi program areas include: Computer Science, Cyber Security, Engineering Management, Financial Engineering, and Systems Architecting and Engineering.

Wiley **#8**
www.wiley.com
Wiley is the leading society publisher. We publish on behalf of more societies and membership associations than anybody else, and offer libraries and individuals 1250 online journals, thousands of books and e-books, reviews, reference works, databases, and more. For more information, visit www.wiley.com, or our online resource: onlinelibrary.wiley.com.

Ziena Optimization LLC **#21**
www.ziena.com
Ziena was founded in 2001 by world-renowned scientists to provide robust software tools and responsive, professional technical support for difficult nonlinear optimization problems. Many Fortune 100 customers and hundreds of sites worldwide rely on Ziena's KNITRO solver to deliver optimization excellence in various financial, energy, communications, science and engineering applications. Stop by the Ziena booth to see how KNITRO can be used to address your nonlinear optimization needs.

All demos take place in the Hilton, Green Room, GB Level.

Continuing Education

INFORMS continuing education program is designed for today's analytics professionals. Four intensive hands-on courses provide you with real take-away value. You will leave the course with the skills, tools and methods that you can implement immediately in your work.

Essential Practice Skills for Analytics Professionals

Learn how to integrate and apply your analytical skills to real-world problem solving for businesses and other organizations. This course provides approaches that you can apply immediately to a wide variety of settings, whether within your own organization or for an external client.

Introduction to Monte Carlo and Discrete-Event Simulation

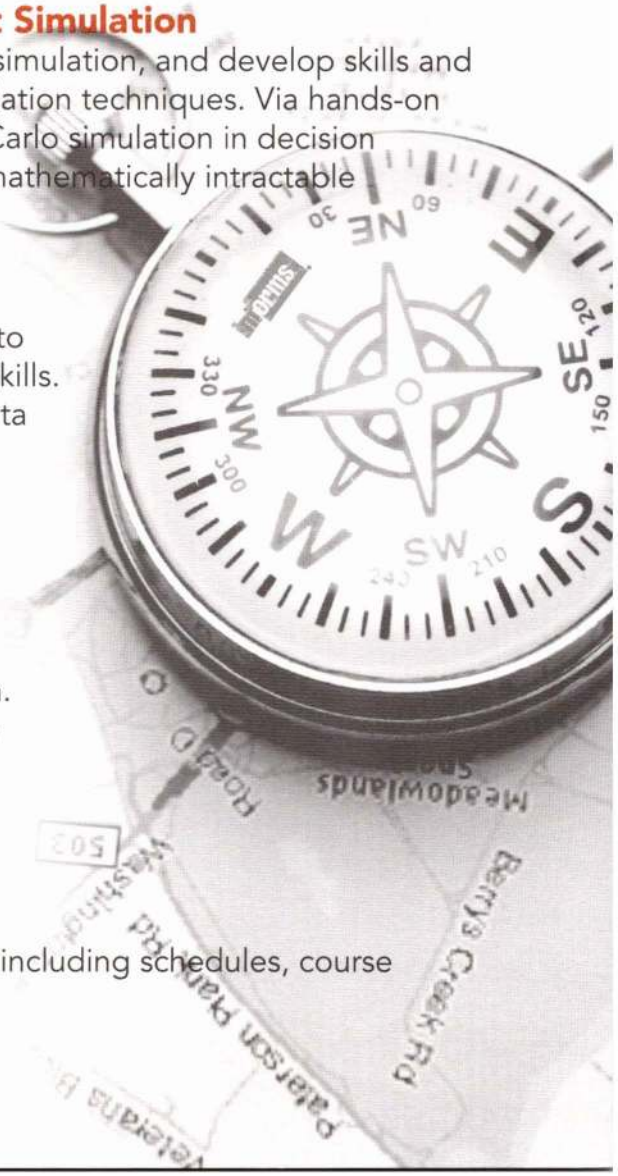
Learn to identify real-world problem types appropriate for simulation, and develop skills and intuition for applying Monte Carlo and discrete-event simulation techniques. Via hands-on interactive sessions, you will investigate the use of Monte Carlo simulation in decision making, and the use of discrete-event simulation to solve mathematically intractable problems in stochastic modeling.

Foundations of Modern Predictive Analytics

Learn data mining techniques and tools that will allow you to make the link between business needs and your technical skills. This course gives you hands-on practice in handling real data types, real business problems and practical methods for delivering business-useful results.

Data Exploration & Visualization

Hands-on training that focuses on the critical steps in the process of analyzing data: accessing and extracting data, cleaning and preparing data, exploring and visualizing data. This course uses several of the most popular software tools intensively, and provides an overview of the range of available software options.



Visit our website for more information about these courses including schedules, course outlines, instructors, and to REGISTER.

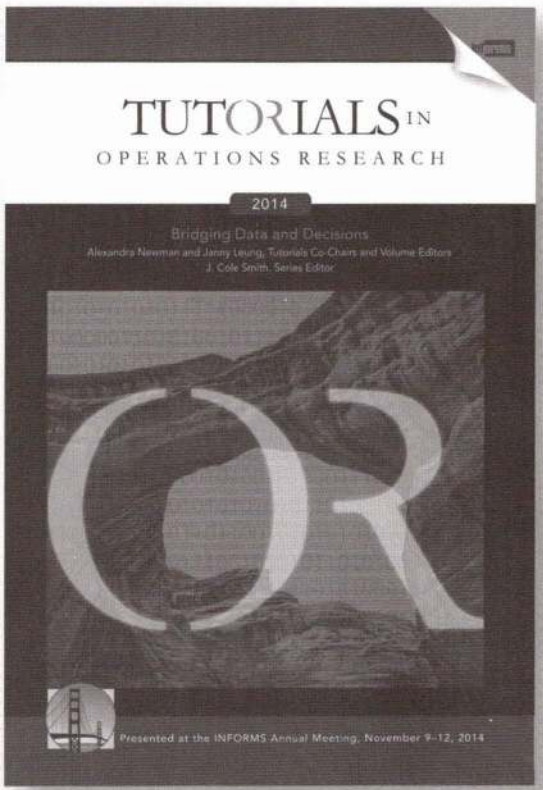
ADVANCE ACCESS!
2014 TutORials are now available ONLINE for all INFORMS Annual Meeting attendees!

TUTORIALS IN OPERATIONS RESEARCH

Bridging Data and Decisions
Alexandra Newman and Janny Leung, volume editors
J. Cole Smith, series editor



INFORMS 2014 edition of the *TutORials in Operations Research* series will be available online to all 2014 INFORMS Annual Meeting registrants on November 1, 2014 as part of their meeting registration. All INFORMS 2015 members will be able to access all the 2014*TutORials* content in its entirety starting January 1, 2015.

The *TutORials in Operations Research* series is published annually by INFORMS as an introduction to emerging and classical subfields of operations research and management science. The series provides in-depth instruction on significant operations research specialties and practices. Use the searchable content for classrooms, boardrooms, and personal use on your desktop.

The nine chapters in this year's volume discuss research in stochastic optimization, cloud computing, system-wide critical infrastructure analysis, data analysis and correction, numerical instability in linear and integer programs, healthcare operations, and service systems. This collection also focuses on decision-making as a system of data analysis, optimization theory, computing technology, and policy.

SPECIAL OFFER:
Visit the INFORMS booth to purchase the 2014 book for only $30! Post-Conference Price $45.

Order the 2005-2014 *TutORials in Operations Research* Books & CDs

How to Navigate the Technical Sessions

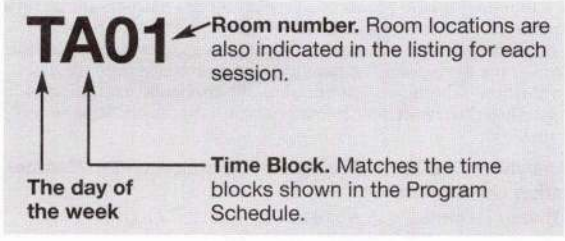
There are four primary resources to help you understand and navigate the Technical Sessions:

- This Technical Session listing, which provides the most detailed information. The listing is presented chronologically by day/time, showing each session and the papers/abstracts/authors within each session.
- The Author and Session indices provide cross-reference assistance (pages 501-542).

Quickest Way to Find Your Own Session

Use the Author Index (page 501) — the session code for your presentation will be shown along with the room location. You can also refer to the full session listing for the room location of your session.

The Session Codes



Time Blocks

Sunday - Tuesday

A — 8:00am - 9:30am
B — 11:00am - 12:30pm
C — 1:30pm - 3:00pm
D — 4:30pm - 6:00pm

Wednesday

A — 8:00am - 9:30am
B — 11:00am - 12:30pm
C — 12:45pm - 2:15pm
D — 2:45pm - 4:15pm
E — 4:30pm - 6:00pm

Room Locations /Tracks

All tracks and technical sessions will be held in the Hilton Hotel and Parc 55. Room numbers are shown on the Track Schedule and in the technical session listing.

Sunday, 8:00am - 9:30am

■ SA01

Hilton- Golden Gate 6

Analysis in Support of National Security

Sponsor: Military Applications Society
Sponsored Session

Chair: Richard Deckro, Professor of Operations Research, Air Force Institute of Technology, AFIT/ENS;Bldg 641, 2950 Hobson Way, Wright-Patterson AFB, OH, 45433, United States of America, richard.deckro@afit.edu

1 - A Markov Decision Process Model for the Optimal Dispatch of Military Medical Evacuation Assets
Matthew Robbins, Assistant Professor, Air Force Institute of Technology, 2950 Hobson Way, WPAFB, OH, 45433, United States of America, matthew.robbins@afit.edu, Sean Keneally, Brian Lunday

We develop a Markov decision process model to examine optimal military medical evacuation dispatch policies in a combat environment, considering complicating aspects to include the priority level of each casualty, multiple-casualty events, threat conditions at service locations, and the option for armed helicopter escort. We present the results of applying a relative-value iteration dynamic programming algorithm to instances representative of medical support to ground operations in Afghanistan.

2 - Reducing Cognitive Load on the UAS Controller
Jasmine Morgan, DSE/USMA, Bldg 752, 4th Floor, West Point, NY, 10996, United States of America, Jnikole08@yahoo.com, Michael J. Kwinn, Jr.

This is a final senior year capstone project for four US Military Academy Cadets. They were asked by the Product Manager for Unmanned Aerial Systems (PM-UAS, Army) to develop ideas to reduce the cognitive load on the currently required two operators for small UASs by redesigning the controller station. The team went a bit further by looking at a leap in technology from what the system currently employed.

3 - Utilizing Wargaming in Unrestricted Warfare: Benefits and Limits
David Smalenberger, Air Force Institute of Technology, Department of Operations Research, AFIT/ENS; Bldg 641, 2950 Hobson Way, Wright-Patterson AFB, OH, 45433, United States of America, David.Smalenberger@afit.edu, Richard Deckro

Wargaming (WG) enables doctrine and weapon systems evaluation in variable and replicable environments. This provides early warning detection of fallacies and capability limitations with scientific rigor. Capabilities testing through WG is therefore limited to interpolation of the current state. Unrestricted warfare (UW) provides a rebalancing of asymmetric advantages enjoyed by technologically advanced forces. This presentation discusses UW and the use of WG in the UW environment.

Hilton- Golden Gate 7

Harvesting Big Data for Technology Intelligence

Sponsor: Technology, Innovation Management and Entrepreneurship
Sponsored Session

Chair: Tugrul Daim, Associate Professor, Portland State University, Eng'g and Tech Mgmt Dept, Portland, United States of America, tugrul@etm.pdx.edu

1 - Trigger-based Location-Based Services: A Viral Geo-fencing Approach to Direct Digital Marketing
Robert Harmon, Professor of Marketing & Service Innovation, Portland State University, School of Business, P.O. Box 751, Portland, OR, 97207, United States of America, harmonr@pdx.edu, Robert Brown

The viral growth behavior of social media-based interactions has raised the potential for harnessing these epidemic-like communication dynamics as a digital marketing approach in the context of trigger-based geo-fencing LBS strategies. Recent developments in the integration of social networking dynamics, big data analytics, text mining, semantics, dynamic behavioral profiling, and real-time trigger-based geo-sensing capabilities are enabling the next generation of high performance LBS.

2 - Action Research of Bibliometrics in Public R&D Programs – Lessons Learned

Yuya Kajikawa, Tokyo Institute of Technology, 3-3-6 Shibaura, Minato-ku,, Tokyo, Japan, kajikawa@mot.titech.ac.jp

Science of science policy is becoming a new field of research. Decision making based on scientifically analyzed evidence is crucial and there are much rooms for bibliometrics analyzing papers and patents to contribute in policy making process of public R&D programs. In this contribution, results of action research utilizing bibliometrics for planning and management of public R&D projects are presented and lessons learned there are discussed.

3 - Technology Mining for Lighting Technologies

Nazrul Islam, School of Management and Business, Aberystwyth University, Rheidol Building, Aberystwyth, UK, mni@aber.ac.uk, Kevin van Blommestein, Tugrul Daim

An Energy Efficiency Technology Roadmap was develop to provide a direction for future R&D investments. This paper provides an analysis of a part of this roadmap with objective of identifying the right experts for providing input for the roadmap development. The research integrates the use of bibliometrics, patent analysis and social network analysis.

4 - Innovation Measurement Framework to Determine Innovativeness of a Company: Case of Semiconductor I

Kenny Phan, Assistant Professor, Portland State University, 1900 SW 4th Ave LL 50-02, ETM Dept - Portland State Univ, Portland, OR, 97201, United States of America, kenny4660@gmail.com, Dundar Kocaoglu

Innovation is one of the most important sources of competitive advantage. Because of its importance,companies need to manage it.This paper develops a framework to determine the innovativeness of a company in semiconductor industry by using output indicators. A hierarchical decision model (HDM) was constructed for the framework. The top three sub-factors are revenue from new products, market share of new products, and products that are new to the world.

■ SA03

Hilton- Golden Gate 7

Entrepreneurship and Innovation

Cluster: Business Model Innovation

Invited Session

Chair: Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, serguei.netessine@insead.edu

1 - Inclusive Innovation: Broader Market Coverage for Innovative Products with Deliberate Supply Chain

Oleksiy Mnyshenko, University of California - San Diego, 9500 Gilman Drive, La Jolla, United States of America, omnyshenko@ucsd.edu, Vish Krishnan, Hyoduk Shin

How can we achieve broader market coverage for innovative products, i.e., inclusive innovation? Grounded in industrial practice, we show that deliberately choosing the contract leader and the investor in a multi-tiered supply chain can have a significant impact on market coverage. We discuss leadership handovers along the product life cycle.

2 - Optimal Time Allocation for Process Improvement and Growth for Entrepreneurs

Steve Yoo, UCL Department of Management Science and Innovation, Gower St, London, onesun.yoo@ucl.ac.uk, Charles Corbett, Guillaume Roels

Entrepreneurs are often reported to pay too little attention to process improvement before growing their business. In this paper, we characterize a dynamic model of time allocation for process improvement in small growth-oriented entrepreneurial firms. We find that entrepreneurs should first engage themselves in process improvement activities, which would save them future time, and then on revenue enhancement activities, which would make them earn future money, before harvesting profit.

3 - Business Model Innovation

Christophe Pennetier, Student, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, Christophe.Pennetier@insead.edu, Serguei Netessine, Karan Girotra

Using a novel dataset that combines information form 3 different sources (VentureSource, CrunchBase, AngelList), we study the success of start-ups through the lean start-up angle: how should entrepreneurs implement and use the key drivers of business model innovation that will mitigate the uncertainty risks putting any new venture at stake?

4 - The Role of Uncertainty and Bounded Rationality in Selecting Scientific Research Projects

Karim Lakhani, Harvard Business School, k@hbs.edu, Kevin Boudreau, Eva Guinan, Chris Riedl

We theorize & test how uncertainty surrounding innovative research projects shapes evaluations. We predict how uncertainty affects evaluations using data from a grant proposal process at a medical school with randomized assignment of evaluators and proposals. We find evaluators who judge proposals closer to their own specialized knowledge to give systematically more negative scores & highly novel research proposals to receive more critical evaluations.

Hilton- Continental 1

Managing Systems with Random Yields

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Saurabh Bansal, The Pennsylvania State University, Business Building, University Park, United States of America, sub32@psu.edu

1 - Optimal Policies for a Utility under the Renewable Portfolio Standard

Sha Liao, Ph.D. Candidate, University of British Columbia, 202-8640 Shaughnessy St, vancouver, Canada, sha.liao@sauder.ubc.ca, Tim Huh, Mahesh Nagarajan

A utility needs to supply a percentage of its energy from renewable resources, and will demonstrate its compliance by holding Renewable Energy Certificates (RECs). We formulate a single utility's problem as a dynamic stochastic program, and study its choice between renewable and regular energy, as well as its trading policy in the REC market. Explicit formulas are derived for the optimal purchasing quantities under different scenarios, along with monotonicity analysis.

2 - Sustainable Product Line Design under Co-production Technology

Yen-Ting Lin, Assistant Professor, University of San Diego, San Diego, 92110, United States of America, linyt@sandiego.edu, Haoying Sun, Shouqiang Wang

We consider a monopolist who produces a product using a scarce material such as wood. The quality of material varies by nature. The monopolist considers introducing only one product or multiple products using co-production technology. We examine how the monopolist's optimal product line design depends on consumers' valuation on resource sustainability. We also study the impact of consumers' sustainability awareness on material consumption and quantity of waste generated.

3 - Wine Analytics: Fine Wine Pricing and Selection under Weather and Market Uncertainty

Mert Hakan Hekimoglu, Syracuse University, 721 University Avenue, Syracuse, NY, United States of America, mhekimog@syr.edu, Burak Kazaz, Scott Webster

We investigate a distributor's portfolio selection problem of fine wine futures and bottles. Using Liv-ex.com data, we first empirically show how the evolution of futures prices for young wines can be predicted by changes in weather and market conditions. We then examine the distributor's investment decisions in futures, bottles, and cash position analytically using a Value-at-Risk measure.

4 - Sequential Capacity Management and Random Yield

Mahesh Nagarajan, Associate Professor and Division Chair, University of British Columbia, Henry Angus 478,, Sauder School of Business,2053 Main Mall, vancouver, BC, Canada, mahesh.nagarajan@sauder.ubc.ca, Saurabh Bansal

We discuss the problem of determining the optimal capacity allocation and lot sizes for two sequential production runs, where each production run is subject to random yield. We first provide an analytical solution to the problem and then discuss its structural properties. We use this to construct heuristics with a provable worst case performance that can be used in these setting effectively.

Empirical Studies of Service Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Robert Batt, Asst. Professor, UW-Madison, 975 University Ave., Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu

1 - Retail in High Definition: using Video Analytics in Salesforce Management

Marcelo Olivares, Assoc. Professor, Columbia University, Broadway 3027, New York, United States of America, molivares@columbia.edu

In some product categories, assisting customer can be an important factor to generate a sale (for example, in apparel and electronics). Our research develops an empirical approach to estimate the impact of assisting customers on sales, combining sales transaction with video analytics tracking customer shopping paths in stores. These empirical results are used to support decisions related to store staffing and personnel training.

2 - The Persistence of Customer Misalignment: Evidence from a Retail Bank Acquisition

Ryan Buell, Assistant Professor, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States of America, rbuell@hbs.edu, Dennis Campbell

In the event a firm acquires a customer whose needs and preferences are misaligned with the operating system, will the customer's preferences conform over time? Will the customer defect? Or, will the misalignment persist? To answer this question, we leverage a natural experiment created when one nationwide retail bank acquired another. Our results highlight the persistence of incompatible customers and their downward effect on operating performance.

3 - Third Party Ownership and the Adoption of Solar Energy Systems in the U.S. Residential Market

Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, United States of America, jguajardo@haas.berkeley.edu, Ernesto Guerra

We analyze the role of business models in the adoption of solar PV systems in the U.S. residential market. We formulate an empirical model to characterize the drivers and effects of Third Party Ownership in the adoption of solar systems, in the context of government incentives and supply-side determinants.

4 - Who's Next?: An Empirical Study of Doctor-patient Selection in an Emergency Department

Robert Batt, Asst. Professor, UW-Madison, 975 University Ave., Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu

We study an emergency department where physicians have the freedom to choose which patients to take on as their own and which to ignore. We empirically examine the operational and behavioral factors that influence these decisions. We also examine the impact of the patient selection decisions on patient flow.

Stochastic Modeling In Healthcare Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Masha Shunko, Purdue University, 403 W. State Street, West Lafayette, IN, 47906, United States of America, mshunko@purdue.edu

1 - Critical Care in Hospitals: When to Introduce a Step Down Unit?

Mor Armony, New York University, marmony@stern.nyu.edu, Carri Chan, Bo Zhu

Step Down Units (SDUs) provide an intermediate level of care between the Intensive Case Units (ICUs) and the general medical wards. There is an ongoing debate in the medical community as to whether and how SDUs should be used. An SDU alleviates ICU congestion by providing a safe environment for post-ICU patients, but it also takes capacity away from the ICU. We find that under some circumstances the optimal size of the SDU is zero, while in other cases, having a sizable SDU may be beneficial.

2 - Pareto Improving Policies in EMS Flow Control

Masha Shunko, Purdue University, 403 W. State Street, West Lafayette, IN, 47906, United States of America, mshunko@purdue.edu, Hung Do

In decentralized queueing systems, a performance improving coordination policy is sustainable only if it benefits all service agents. Using Emergency Medical Setting as motivation, we find classes of coordination policies for ambulance traffic that improve performance of the system according to multiple objectives and guarantee that all agents are better off.

3 - Pareto Improving Flow Control Policies for Multi-Server Emergency Departments - New Perspectives

Hung Do, University of Vermont, Burlington, Burlington, United States of America, hdo@bsad.uvm.edu, Masha Shunko

Using Emergency Medical Services setting as motivation, we design and analyze flow control policies for service systems with N multiple-server queues. We focus on policies that improve performance of the system and that are also beneficial to all involved entities. We propose a new perspective on performance measures, conduct analysis and reveal managerial insights that help design such Pareto improving policies in practice.

4 - Human Resource Collaboration: An Empirical Study of Capacity Loss

Lu Wang, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, l-wang@kellogg.northwestern.edu, Jan Van Mieghem, Itai Gurvich

Collaboration and resource sharing in processing networks may introduce a capacity loss due to synchronization. To investigate this phenomenon, we conduct a model-based empirical study of collaboration and synchronization in a large hospital. In the presence of individual and collaborative tasks, doctors must decide which to process next. Combining a queueing network model and the hospital data, we study the impact of doctors' prioritization rules on the capacity loss induced by synchronization.

Hilton- Continental 4

Using Complementarity Modeling for Planning and Policy Analysis of Electricity & Energy Markets

Cluster: Tutorials

Invited Session

Chair: Ben Hobbs, Professor, Johns Hopkins University, 3400 N Charles St, Baltimore, MD, 21218, United States of America, bhobbs@jhu.edu

1 - using Complementarity Modeling for Planning and Policy Analysis of Electricity & Energy Markets

Ben Hobbs, Professor, Johns Hopkins University, 3400 N Charles ST, Baltimore, MD, 21218, United States of America, bhobbs@jhu.edu, Antonio J. Conejo, Steven A. Gabriel, Carlos Ruiz, J. David Fuller

Complementarity models can represent the simultaneous optimization problems of one or several interacting decision makers, and have become a powerful tool for formulating and solving bottom-up energy market models. An overview is provided of complementarity-based formulations (including MPECs and EPECs), followed by illustrative electricity market applications, including oligopolistic generation markets, transmission infrastructure planning, and environmental policy.

Empirical Healthcare Operations

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Diwas KC, Emory University, 1300 Clifton Road, Atlanta, GA, 30322, United States of America, diwas.kc@emory.edu

1 - A Text Mining Analysis of Patient Portals

Hessam Bavafa, Assissant Professor, Wisconsin School of Business, 975 University Ave, Madison, WI, 53706, United States of America, bavafa@wharton.upenn.edu, Christian Terwiesch

We study the micro-structure of electronic communication between patients and providers through patient portals. We examine detailed information about the patients, providers, and communication details, e.g., message timing and text, to establish a better understanding of their role in primary care.

2 - Priority and Predictability

*Jillian Berry Jaeker, Harvard Business School, Morgan Hall, Soldiers Field, Boston, MA, 02163, United States of America, jjaeker@hbs.edu

We explore how patient admission characteristics moderate the effects of high workload and demand, specifically, probability for admission for scheduled vs. emergent incoming patients. We find that while scheduled surgical patients, who are less emergent, are more likely to be postponed as the occupancy nears the hospital maximum, but are also more likely to cause the early discharge of currently convalescing patients as occupancy increases.

3 - Pacing Work under Goals and Deadlines: Econometric Analysis of an Outpatient Department

Sarang Deo, Assistant Professor, Indian School of Business, Hyderabad, 500032, India, sarang_deo@isb.edu, Aditya Jain, Pradeep Pendem

We draw upon psychology literature to build hypotheses regarding the impact of progress toward goals and deadlines on work pace and empirically test them in a high volume, tertiary care OPD. We find that teams regulate their effort in response to the discrepancy between intermediate subgoals and their performance toward them. Moreover, teams speed up closer to the deadline. Finally, teams are less likely to regulate their effort in response to a discrepancy closer to the deadline.

4 - Testing Patient Patience: Role of Time to Appointment on Patient Flow

Diwas KC, Emory University, 1300 Clifton Road, Atlanta, GA, 30322, United States of America, diwas.kc@emory.edu

Using data from over 900 providers, we examine the extent to which time to appointment impacts patient flow and overall clinic throughput.

■ SA10

Hilton- Continental 7

Consumer Behavior and Revenue Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Gustavo Vulcano, New York University, 44 West Fourth St, Suite 8-76, New York, NY, 10012, United States of America, gvulcano@stern.nyu.edu

1 - Inventory Management with Buy-Online-Pickup-in-Store

Fei Gao, The Wharton School, University of Pennsylvania, Philadelphia, United States of America, feigao@wharton.upenn.edu, Xuanming Su

Many retailers offer customers the option to buy online and pickup in store. We study the impact of this new initiative on inventory management in both online and offline channels. We identify situations when this initiative may hurt profits and offer recommendations to retailers.

2 - Loss Aversion and Reference Dependence: Evidence from Performing Arts Industry

Senthil Veeraraghavan, senthilv@wharton.upenn.edu, Necati Tereyagoglu

We hypothesize that not only the past price but also the observed sales for a seating area determines the utility of a customer from buying a ticket for a show in this industry. We test the reference effects for both prices and sales using customer level transaction data from an organization, and show that customer decisions are driven by the position of the seating alternatives relative to price and sales expectations. Finally, we find that the revenue effects of referencing are significant.

3 - Operating a Group-buy Mechanism in the Presence of Strategic Consumers

Gustavo Vulcano, New York University, 44 West Fourth St, Suite 8-76, New York, NY, 10012, United States of America, gvulcano@stern.nyu.edu, Navaporn Surasvadi, Chris Tang

We consider a group-buy mechanism under which a retailer offers multiple units at both a regular price and a lower price that will be activated when a pre-specified number of reservations has been made. Forward-looking consumers arrive over time, and if both prices are still offered, they must decide which one to pay. We analyze the subgame among consumers, and through an extensive numerical study, we show the convenience of this mechanism.

4 - Quantity Competition in the Presence of Strategic Consumers

Yuri Levin, Queen's School of Business, 143 Union Str., Kingston, Canada, ylevin@business.queensu.ca, Mikhail Nediak, Andrei Bazhanov

Retailers choose initial inventories of undifferentiated limited-lifetime product offered to strategic consumers. A manufacturer sets full price, while market clearing determines discount price. A complete characterization of symmetric pure-strategy rational expectations equilibria yields: increasing strategic behavior can benefit retailers and hurt consumers; increasing competition may harm local economy; and strategic behavior may protect against sales at salvage value.

Hilton- Continental 8

Information and Incentives in Supply Chains

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Fuqiang Zhang, Washington University, Olin Business School, St. Louis, United States of America, fzhang22@wustl.edu

1 - Public Forecast Information Sharing in a Market with Competing Supply Chains

Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Noam Shamir

Studying the motivation to publicly announce forecast information, we show that by making forecast information publicly available to both his manufacturer and the competitor, a retailer is able to credibly share his forecast information - an outcome that cannot be achieved by exchanging information within the supply chain.

2 - Offshoring Versus Reshoring: Supply Flexibility, Market Proximity, and Operational Levers

Bin Hu, Assistant Professor, University of North Carolina, Chapel Hill, NC, 27519, United States of America, bin_hu@kenan-flagler.unc.edu, Li Chen

The existing offshoring literature mostly focuses on cost advantages and market proximity. We instead note that a reshoring manufacturer may lose some supply flexibility that it once enjoyed when offshoring, and show that even without any cost differences, supply flexibility and market proximity can influence the manufacturer's preference between offshoring and reshoring. We further discuss operational levers that can tilt the preference either way.

3 - An Optimal Procurement Mechanism with Post-Bid Cost-Reduction

Patrick Nestor, University of Michigan, 1205 Beal Avenue, Room 2778, Ann Arbor, MI, 48105, United States of America, psnestor@umich.edu, Damian Beil, Izak Duenyas

We consider a procurement auction setting where the buyer may, after seeing the suppliers' price bids, exert effort to identify cost reduction opportunities with one or more suppliers, before selecting the contract winner. The buyer seeks to minimize her total procurement costs, namely the contract payment plus the cost of investigation effort. Using optimal mechanism analysis, we derive the optimal auction and cost investigation policy.

4 - Forecast Accuracy, Risk Aversion, and Information Sharing in Supply Chain

Fuqiang Zhang, Washington University, Olin Business School, St. Louis, United States of America, fzhang22@wustl.edu, Yifan Xu, Baojun Jiang, Lin Tian

In many distribution channels, the manufacturer may possess superior demand-forecast information than the downstream retailer. This paper studies the impacts of the manufacturer's accuracy and the retailer's risk aversion on information sharing between the channel members.

■ SA12

Hilton- Continental 9

Sustainability and Supply Chains

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Robert Swinney, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27516, United States of America, robert.swinney@duke.edu

1 - Impact of Electricity Pricing Policy on Renewable Energy Investments and Carbon Emissions

Safak Yucel, PhD Student, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, safak.yucel@duke.edu, Gurhan Kok, Kevin Shang

We investigate the impact of electricity pricing policies on renewable energy investments and carbon emissions from the perspectives of different investors. We show that the time-invariant (flat) pricing policy usually promotes renewable energy investments and reduces carbon emissions. Moreover, our results indicate that the pricing policy that leads to higher investments may not reduce carbon emissions.

2 - Inducing Environmental Disclosures: A Dynamic Mechanism Design Approach

Shouqiang Wang, Assistant Professor, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634, United States of America, shouqiw@clemson.edu, Peng Sun, Francis de Vericourt

When regulating a revenue-maximizing firm who is subject to a privately observable stochastic environmental hazard, compliance benefits (e.g., subsidy) and inspection are two commonly used instruments to induce voluntary disclosure. We examine the regulator's problem of designing an efficient dynamic regulation policy using these two instruments. The optimal policy, featured by a cyclical structure, depends critically on the precision of the inspection technology.

3 - Managing Social Responsibility in Multi-tier Supply Chains

Lu Huang, PhD Student, Fuqua School of Business, Duke University, 700 Bolinwood drive, Chapel Hill, NC, 27514, United States of America, lu.huang2@duke.edu, Robert Swinney, Jing-Sheng Song

We consider a multi-tier supply chain in which a Tier 2 supplier potentially violates social and environmental standards, resulting in both capacity and demand loss for a downstream (Tier 0) firm. We analyze the efficacy of both direct (Tier 0 to Tier 2) and indirect (Tier 0 to Tier 1 to Tier 2) mechanisms to improve responsibility of the Tier 2 supplier, and determine under what conditions the downstream firm should delegate responsibility management to intermediate suppliers.

4 - The Effect of Sourcing Policies on a Supplier's Sustainable Practices

Deishin Lee, Boston College, Carroll School of Management, Chestnut Hill, United States of America, deishin.lee@bc.edu, Vishal Agrawal

We investigate the sourcing decisions of firms who want to source sustainably-produced parts, e.g., organic ingredients, in order to offer sustainable products. We examine how the firm's sourcing policy and competition can influence an upstream supplier's decision to convert to a new sustainable processing standard.

■ SA15

Hilton- Exec. Boardroom

Two-stage and Fuzzy DEA Topics

Cluster: Data Envelopment Analysis

Invited Session

Chair: Wade Cook, Wade D. Cook Schulich School of Business, York University, Toronto, Ontario M3J 1P3, Canada, wcook@schulich.yorku.ca

1 - A Framework for a Sustainable Sourcing: A Flexible Cross Efficiency Evaluation in Fuzzy DEA

Pegah Khoshnevis, Master Student, Université Catholique de Louvain, 34 Voie du Roman Pays, L1.03.01, Louvain-la-Neuve, 1348, Belgium, pegah.hajimirza@Student.uclouvain.be, Per Agrell, Constantin Blome, Adel Hatami-Marbini

Nowadays, customer attitudes focus on sustainability of the products/services regarding environmental, social and economic aspects. In this study, we propose a product-based framework for sustainable supplier sourcing in SCM, which considers sustainability, operational and organizational criteria in terms of the outsourced product. We develop a flexible cross efficiency evaluation DEA for effectively discriminating suppliers along with using fuzzy sets to tackle the vagueness information.

2 - A Fully Fuzzified Two-stage DEA

Adel Hatami-Marbini, Université Catholique de Louvain, 34 Voie du Roman Pays, L1.03.01, Louvain-la-Neuve, 1348, Belgium, adel.hatamimarbini@uclouvain.be, Joshua Ignatius, Ali Ebrahimnejad

There is a growing literature in DEA where researchers are opening the black box to evaluate the efficiency performance of internal processes. Within this context, we study a relational two-stage DEA model where there is imprecision in the representation of the input and output data. The imprecision is captured using fuzzy sets and the models are evaluated with this representation. Insights are provided and future research directions are outlined.

3 - Two-Stage DEA: When Intermediate Measures Can Act as Outputs from the Second Stage

Wade Cook, wcook@schulich.yorku.ca, Sonia Aviles-Sacoto, Raha Imanirad, Joe Zhu

This paper investigates efficiency measurement in a two-stage data envelopment analysis (DEA) setting. While in the conventional closed serial system, the only role played by the outputs from stage 1 is to behave as inputs to stage 2, the current paper examines a variation of that system where the set of final outputs is comprised not only of those that result from stage 2, but can include, in addition, certain outputs from the previous (first) stage.

4 - Two-Stage Financial Risk Tolerance Assessment using Data Envelopment Analysis

Joseph Paradi, Professor Emeritus, University of Toronto, 200 College Street, Toronto, On, M5S3E5, Canada, paradi@mie.utoronto.ca, Angela Kingyens

In Canada Securities Acts in each Province include the "Know Your Client" rule. This requires FSIs to consider an investor's personal and financial status and comfort level for risk before recommending investments. They use questionnaires to create a risk profile so an appropriate investment portfolio can be recommended. The exact value of these risk profiles is unknown since questionnaires vary widely. This work introduces DEA to this process with significant improvements to any existing model.

Hilton- Franciscan A

Risk Management in Supply Chains

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Xuan Zhao, Associate Professor, Wilfrid Laurier University, 75 University Ave. W., Waterloo, Canada, xzhao@wlu.ca

1 - The Value of Audit in Managing Supplier's Process Improvement

Mohammad Nikoofal, PhD Student, McGill University, 1001 Sherbrooke Street West, Bronfman Building, Montreal, QC, H3A 1G5, Canada, mohammad.nikoofal@mail.mcgill.ca, Mehmet Gumus

Besides the benefits of outsourcing, firms are concerned about the lack of information regarding their suppliers. Moreover, suppliers may take certain actions that affect their supply risks without informing their buyers. We study the effectiveness of incentive- and audit-based contracts in dealing with such suppliers.

2 - Strategic Risk Management in Spot Market for Supply Chains under Competition

Xuan Zhao, Associate Professor, Wilfrid Laurier University, 75 University Ave. W., Waterloo, Canada, xzhao@wlu.ca, Wei Xing, Shanshan Ma

This paper studies two risk management strategies related to spot market to mitigate firms' exposure to demand uncertainty, namely, operational hedging and financial hedging. We consider a supplier sells an intermediate good to two manufacturers, who use it to produce a final product and compete with each other in the final product market with uncertain demand.

3 - Price-matching Guarantees in Dual Channels

Arcan Nalca, arcan.nalca@business.queensu.ca

Price-matching guarantees (PMGs) are policies by which firms promise to match any lower price offered by the competition. The impact of PMGs between a retailer and a supplier is disregarded in the literature since previous studies concentrate PMGs between competing retailers. We address this gap by shedding light on the following research question: Why and when, i.e., under which market and industry conditions, does the retailer and/or the supplier offer PMG in a dual channel?

4 - Retailing in the Presence of Valuation Uncertainty and a Peer-to-Peer Marketplace

Benny Mantin, Assistant Professor, University of Waterloo, 200 University Ave. W., Waterloo, Canada, bmantin@uwaterloo.ca, Stanko Dimitrov, Lifei Jiang

Consumers oftentimes face uncertainty regarding their valuation for the goods they seek to purchase. A peer-to-peer marketplace can potentially mitigate the valuation uncertainty faced by consumers by allowing them to resell unwanted goods and at the same time it introduces competition to the retailer. We derive the equilibrium outcomes and characterize the conditions under which a marketplace can be bene?cial (or detrimental) to the retailer, the consumers, and the overall welfare.

■ SA17

Hilton- Franciscan B

Consumer Behavior in Services

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Pnina Feldman, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, feldman@haas.berkeley.edu

1 - Lifting the Veil: How Cost Transparency Increases Purchase Intentions

Bhavya Mohan, Doctoral Candidate, Harvard Business School, 27 HBS Mail Center, 500 Soldiers Field Road, Boston, MA, 02163, United States of America, bmohan@hbs.edu, Leslie John, Ryan Buell

Firms typically do not reveal details of their cost structures to their consumers. However, a handful of online retailers are experimenting with cost transparency on their retail websites, by revealing the costs incurred during the production of a good. In a field experiment and series of lab studies, we examine when and how a firm's decision to disclose its costs influences a consumer's willingness to purchase.

2 - Inventory Announcements with Strategic Customers: A Structural Estimation Approach

Kate Ashley, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, kate_ashley@haas.berkeley.edu, Jun Li, Pnina Feldman

Does inventory announcement affect the timing of consumer purchases? Using data from the airline industry, we estimate a structural model that accounts for the impact of a firm's inventory announcement policy on customer purchase decisions. We analyze the extent to which customers treat messages from the firm as cheap talk or as credible information, and characterize the market conditions under which various types of announcement policies are preferred by the firm.

3 - Managing Customer Expectations and Priorities with Delay Announcements

Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Qiuping Yu, Achal Bassamboo

We study in a service environment, how to manage customers' expectations and to prioritize customers appropriately to maximize the firm's profits. Specifically, we focus on a setting where the firm uses only delay announcements and study the opportunities and limitations of this mechanism. We are particularly interested in when and how the customers can be influenced by delay announcements.

4 - Blind Queues: The Impact of Consumer Beliefs on Revenues and Congestion

Shiliang Cui, Georgetown University, McDOnough School of Business, Washingrton, DC, 20057, United States of America, shiliang.cui@georgetown.edu, Senthil Veeraraghavan

In many service settings, customers have to join the queue without being fully aware of the parameters of the service provider. We analyze a firm serving customers making decisions under arbitrary beliefs about the service parameters, and show while revealing the service information to customers improves revenues under certain customer beliefs, it may however destroy consumer welfare or social welfare.

■ SA18

Hilton- Franciscan C

Choice Models in Revenue Management and Pricing I

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: William Cooper, Professor, University of Minnesota, Industrial and Systems Engineering, Minneapolis, MN, 55455, United States of America, billcoop@umn.edu

1 - Assortment Optimization under Consider-then-choose Models

Ali Aouad, PhD Candidate, MIT, 99 1/2 Myrtle St Apt 2, Boston, MA, 02114, United States of America, aaouad@mit.edu, Retsef Levi, Vivek Farias

One classical approach to modeling choice in marketing explains that customers faced with a purchasing decision follow a two stage, consider-then-choose behavior. This work attempts to operationalize several models commonly used in marketing with assortment decisions. We investigate the combinatorial structure of the assortment optimization problem resulting from the incorporation of specific behavioral heuristics and devise exact polynomial time algorithms for such underlying choice structures.

2 - Near Optimal Algorithms for Constrained Assortment Optimization

Vineet Goyal, 304 S.W. Mudd Building, Columbia University, New York, NY, 10027, United Statesvg2277@columbia.edu, Antoine Desir

We consider the capacitated assortment optimization problem where each product has a given weight and there is a capacity constraint on the assortment. We present a fully polynomial time approximation scheme (FPTAS) for the capacitated assortment problem for a large family of choice models including the MNL model, Nested logit model, and the mixture of constant number of MNL models. We also show that the capacitated assortment optimization is NP-hard even for the special case of MNL model.

3 - Assortment Optimization under the d-Level Nested Logit Model

Paat Rusmevichientong, Associate Professor, University of Southern California, Marshall School of Business, Los Angeles, CA, United States of America, rusmevic@marshall.usc.edu, Huseyin Topaloglu, Guang Li

We provide a new formulation of the d-level nested logit model using a tree of depth d. We establish structural properties and develop an efficient algorithm for computing the optimal assortment. For a d-level nested logit model with n products, the running time of the algorithm is O(d n log n).

4 - Pricing for a Multinomial Logit Model with Network Effects

William Cooper, Professor, University of Minnesota, Industrial and Systems Engineering, Minneapolis, MN, 55455, United States of America, billcoop@umn.edu, Zizhuo Wang, Chenhao Du

We consider an extension of a classical MNL assortment pricing problem to network goods. For such network goods, the overall purchase quantities are not an explicit function of the prices. Rather, the quantities arise as an equilibrium outcome characterized by the consistency of the purchase quantities with the MNL choice probabilities. We describe the solution of the assortment pricing problem and discuss insights from the model.

New Frontiers in Pricing and Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Robert Phillips, Columbia University, rp2051@columbia.edu

1 - Pay-per-unit vs. Subscription Pricing for Experiential Products under Competition

Varun Gupta, University of Texas at Dallas, Campbell road, Richardson, United States of America, varun.gupta@utdallas.edu, Ozalp Ozer, Alp Muharremoglu

In a market where distributors compete to sell experiential products (e.g.; movies and music), should they use pay-per-unit pricing or use subscription pricing? We study market dynamics when a content provider is selling to two distributors which are using different pricing modalities and characterize conditions where both can co-exist profitably, where only one can make money and where price wars would be expected. We also investigate the role of the contractual powers of the players.

2 - "Big-Data" Revenue Management
Robert Phillips, Columbia University, rp2051@columbia.edu

In the spirit of Rudin and Vahn's "Big Data Newsvendor" (2013), we present a machine-learning approach to the single-resource revenue management problem that can accommodate a large number of features relative to the number of resource. The approach is non-parametric and can easily be made adaptive. We illustrate the effectiveness of the approach through numerical examples.

3 - The Effectiveness of Field Price Discretion: Empirical Evidence from Auto Lending
A. Serdar Simsek, Instructor/Researcher, Cornell ORIE, 282 Rhodes Hall, Ithaca, NY, United States of America, as2899@cornell.edu, Garrett van Ryzin, Robert Phillips

How much (if any) pricing discretion headquarters should grant local salespeople is a topic of debate. We used a unique data set from an auto lender and estimated the local sales force adjusted prices in a way that improved profits by 11%. A counterfactual analysis shows that using a centralized pricing optimization system could improve profits even further, up to 20% over current profits. Hence, centralized pricing –if appropriately optimized– can be more effective than field price discretion.

4 - Estimating Willingness-to-Pay in a Negotiated Selling Environment
Neil Biehn, Vice President, PROS Solutions, 3100 Main Street, ,Suite 900, Houston, TX, 77002, United States of America, nbiehn@pros.com

In this talk, we'll explore the definition of Willingness-to-Pay (WTP) and what the literature has to say about estimating it. Recent tests and interviews with customers and sales people reveal that many B2B companies are purposefully under-pricing. Alternate approaches to estimating WTP are examined with a new WTP model presented along with numerical examples.

Co-Chair: Yasin Ceran, Santa Clara University, 500 El Camino Real, Santa Clara CA, United States of America, yceran@scu.edu

1- Customer Churn Prediction in a Noncontractual Setting
Yasin Ceran, Santa Clara University, 500 El Camino Real, Santa Clara CA, United States of America, yceran@scu.edu, Debora Donato, Xiaojing Dong, Oytun Eskiyenturk

Under a noncontractual setting,customers conduct business with the firm as they wish and they donot need to declare when they become inactive.It is therefore challenging for the firm to reduce customer churn rate.In this study, we obtained a unique dataset from a social media website.Using a stochastic process model based on the Pareto/NBD framework, we developed a methodology that allows us to predict the churn probability, and identify efficient activities to prevent the customer from leaving.

2 - The Influence of Direct and Indirect Experience on Somatosensory Technology Adoption
Pei-Lee Teh,Senior Lecturer, Monash University, Jalan Lagoon Selatan, Bandar Sunway, Selangor 46150, Malaysia, teh.pei.lee@monash.edu, Pervaiz K. Ahmed, Emily Yim Lee Au, Soon-Nyean Cheong, Ravindra S. Goonetilleke, Wen-Jiun Yap

This study investigates the influence of direct and indirect experience on somatosensory technology adoption in two research settings (video demonstration versus product trial). Our findings provide an important implication for somatosensory technology marketers that product trial (direct experience) engenders more reliable inferences than does exposure to video demonstration (indirect experience).

3 - The Impact of IT on the Production Structure
Fengmei Gong, University of Calgary, MGIS Area, Haskayne School of Business, Calgary AB T2N 1N4, Canada, fgong@ucalgary.ca, Byungwan Koh, Barrie Nault

Information sharing and coordination as captured by supply chain members' IT investment has made product design and production methods possible that are not possible without information sharing. Consequently, industries are able to develop supply chains with different industries than they did before, and this can possibly change the production structure of the economy. We examine whether IT is responsible for the change in the production structure.

Design of Transportation and Supply Chain Networks

Sponsor: Transportation Science & Logistics
Sponsored Session

Chair: Weijun Xie, Georgia Institute of Technology, Atlanta, GA, United States of America, xieweijun06@gmail.com

1 - Capacitated Relay Network Design with Generalized Imbalance Constraints
Halit Uster, Southern Methodist University, Lyle School of Eng., Dallas, TX, 75275, United States of America, uster@smu.edu, Panitan Kewcharoenwong

We introduce a relay network design problem under link capacity and flow imbalance considerations with applications in Less-than-Truckload (LTL) and and Truckload (TL) transportation. We present an efficient Lagrangean Decomposition algorithm for model solution and computational results to illustrate the performance of the approach and the impact of using relay networks in freight transportation.

2 - Freight Transportation Network Design in Urban Areas
Mehmet Pancaroglu, Research Assistant, Middle East Technical University, ODT Universiteler Mahallesi, Dumlupinar Bulvari No:1, Ankara, 06800, Turkey, mpancar@metu.edu.tr, Sinan Gürel, Haldun Süral

In this study, we investigate urban freight transportation under the perspective of City Logistics. From a strategic point of view, we aim to design low-cost and efficient urban freight transportation network. We try to decide on the number and location of distribution centers, fleet size and routes to make last mile delivery.

3 - Truck Line Network Optimization Based on Big Data Analytics
Hongbo Li, Manager, IBM Research - China, Diamond Building, ZGC Software Park #19,, Beijing, 100193, China, hboli@cn.ibm.com, Xin Shi, Hongwei Ding, Shuang Ren

Nationwide truck line network is the key infrastructure to supply high-level logistics service for large-scale 3PL company. It's very challenge to make a tradeoff between timeliness and cost for the transportation network designer. We present an improved method to optimize truck line network. Wherein, we integrate huge historical demand orders, waybills data, truck line information, transit ports data and so on to mine the frequent load patterns and find out the optimal transportation network.

4 - Optimal Spatial Layout of Transshipment Facilities on An Infinite Homogeneous Plane
Weijun Xie, Georgia Institute of Technology, Atlanta, GA, United States of America, xieweijun06@gmail.com, Yanfeng Ouyang

This paper studies optimal spatial layout of transshipment facilities and their corresponding service regions on an infinite homogeneous Euclidean plane that minimizes the total cost for facility set-up, outbound delivery and inbound replenishment transportation. This paper provides a tight bound for the Gersho's conjecture (1979) with the inbound transportation cost, which can be archived by elongated cyclic hexagons. Numerical study further verifies the analytical findings.

Real-Time Information in Transportation

Sponsor: Transportation Science & Logistics
Sponsored Session

Chair: Dong Yoon Song, Purdue University, 610 Purdue Mall, West Lafayette, IN, United States of America, song50@purdue.edu

1 - Risk Equitable Routing and Prohibition Stratesis for Hazardous Materials Transportation
Ashrafur Rahman, Visiting Assistant Professor, Bunknell University, 116 Court Street, New Haven, CT, 06511, United States of America, arahman@engr.uconn.edu, Nicholas Lownes

A new risk measure for hazardous materials transportation is proposed. The new risk measure is used in mathematical modeling considering equity concept to suggest routing and prohibition strategies for hazmat transportation.

2 - Real-time Support System for Stranded Commuters Considering Traffic Conditions

Wenlong Yu, PhD Candidate, Graduate School for Creative Cities, Osaka City University, Room 408, 1-4-3 Sugimoto, Sumiyoshi-ku, Osaka, 558-0022, Japan, yule_tt@yahoo.co.jp, Hiroyuki Ebara, Raito Matsuzaki, Venkatesh Raghavan, Daisuke Yoshida

We propose a Real-time Support System based on GPS and wireless LAN function of mobile devices. In this system, we aim to support for stranded commuters in an earthquake disaster. We perform simulations with modeling systems considering traffic conditions.

3 - Psychological Benefits of Real-Time Travel Information under Heterogeneous Drivers

Dong Yoon Song, Purdue University, 610 Purdue Mall, West Lafayette, IN, United States of America, song50@purdue.edu, Srinivas Peeta

Psychological benefits of real-time travel information are affected by the heterogeneous characteristics of drivers. A modeling framework is proposed to accommodate the heterogeneity issue by introducing latent classes to represent different types of drivers. Driving simulator based experiments are used to analyze the behaviors and the effects of information provision.

Less-than-Truckload Optimization Problems

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Ming Ni, University at Buffalo (SUNY), Buffalo, NY, United States of America, mingni@buffalo.edu

1 - Solving the Integrated Shipment Routing Problem of a Less-than-truckload Carrier

Okan Orsan Ozener, Özyegin University, Istanbul, Turkey orsan.ozener@ozyegin.edu.tr

We study a less-than-truckload (LTL) transportation network and investigate the potential benefits of implementing an integrated solution approach for shipment routing throughout this network. In LTL transportation, shipments are first delivered to local hubs to be consolidated, then transferred to another hub, and finally sent to their destinations. This routing planning process involves three routing decisions: (i) from origins to hubs, (ii) between hubs, and (iii) from hubs to destinations. These decisions are usually handled in a sequential manner due to the complexity of these individual problems, which may result in suboptimal solutions. In this study, we develop an integrated framework for solving all of these decision problems simultaneously. We propose an optimization-driven approach that can efficiently handle large instances with thousands of loads and provides solutions with significant cost savings over the sequential approach.

2 - Freight Put Option-Based Collaboration for Less-than-Truckload Carrier Logistics

Choungryeol Lee, lee1210@purdue.edu, Srinivas Peeta

We propose an option-based paradigm for carrier-to-carrier collaboration to manage the uncertainty in operational demand and supply. This leads to a mutually beneficial situation for collaborative LTL freight carriers. Numerical experiments illustrate that carrier-to-carrier collaboration with freight put options has the potential to improve the profitability, thereby enhancing the reliability and resilience of the LTL freight system.

3 - Operational Optimization at Con-way Freight

Olga Raskina, Con-way Freight, 2211 Old Earhart Rd, Ann Arbor, United States of America, Raskina.Olga@con-way.com

Con-way Freight is a premium LTL carrier operating the largest LTL network in North America. We manage an extensive network comprised of hundreds of service centers, thousands of tractors, trailers, and drivers, and hundreds of thousands of distinct origin-to-destination combinations. Every day as we pick up customers freight we need to decide the most cost-efficient way to move it while maintaining high customer service standards. In this talk we discuss the challenges of the decision support process and implementation lessons learned.

4 - Order Fulfillment from Collaborative Local Stores

Ming Ni, University at Buffalo (SUNY), Buffalo, NY, United States of America, mingni@buffalo.edu, Ruixia (Sandy) Shi, Qing He, Jun Ru

Instead of building new expensive distribution center, utilizing the brick and mortar stores to fulfill online order is good fulfillment option. We introduce algorithm and mechanism that combine the new inventory policy within store warehouse and collaboration between stores to achieve affordable and effective delivery.

Advances in Traffic Flow Theory

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Jorge Laval, Associate professor, Georgia Institute of Technology, 790 Atlantic Dr. NW., Atlanta, GA, 30332, United States of America, jlaval3@ce.gatech.edu

1 - Stochastic Approximations for the Macroscopic Fundamental Diagram on Inhomogeneous Corridors

Jorge Laval, associate professor, Georgia Institute of Technology, 790 Atlantic Dr. NW., Atlanta, GA, 30332, United States of America, jlaval3@ce.gatech.edu

This paper proposes analytical estimates of the Macroscopic Fundamental Diagram using probabilistic methods to tackle networks with different block length and signal timing. It is found that the distribution of the MFD depends mainly on two dimensionless parameters, the average block size and the average red to green ratio.

2 - Probabilistic Model for Estimating Vehicle Trajectories using Sparse Mobile Sensor Data

Peng Hao, haop@cert.ucr.edu, Kanok Boriboons, Guoyuan Wu

A stochastic model is proposed to estimate the second-by-second trajectories using sparse mobile sensor data that is under low penetration rate and low sampling frequency. We investigate all possible driving mode sequences between data points. The likelihood of each scenario are quantified with mode-specific priori distributions. Detailed trajectories are reconstructed based on the optimal driving mode sequences. They are expected to improve the accuracy of mobility and emission evaluation.

3 - Real-Time Traffic State Estimation using a Second-order Lagrangian Model and Online Filtering Method

Zhouyang Zhou, evergreen8710@gmail.com, Kerem Demirtas, Pitu Mirchandani

Traditional approaches for the real-time traffic state estimation use Eulerian measurements. Recently, as the Lagrangian measurements become available, researchers in this area began to look at Lagrangian estimators but limited by first-order Lagrangian traffic flow models. In this study we first propose a new second-order Lagrangian traffic flow model, and then integrate it into the filtering framework for real-time traffic state estimation. Experimental analysis results show the effectiveness of the second-order Lagrangian traffic flow model and the new estimator.

Location Analysis

Sponsor: Location Analysis

Sponsored Session

Chair: Zvi Drezner, California State University, 800 N. State College, Fullerton, CA, 92834, United States of America, zdrezner@fullerton.edu

1 - A Case Study on the Location of Logistics Parks

Joy Bhadury, Professor, Univ of North Carolina at Greensboro, Dept of ISSCM, Bryan School, P.O. Box 26170, Greensboro, NC, 27402-6170, United States of America, j_bhadur@uncg.edu, Samuel Troy

This talk will focus on the results of a statewide project in North Carolina, USA. The objective was to locate high-capacity logistics parks in the southeastern region of the state. Project details including situational analysis, methodology and recommendations will be presented.

2 - An Efficient Approach for Solving Uncapacitated Facility Location Models with Concave Operating Cost

Robert Aboolian, Cal State San Marcos, 333 S. Twin Oaks Valley Road, San Marcos, United States of America, raboolia@csusm.edu, Emilio Carrizosa, Vanesa Guerrero

We consider the Uncapacitated Facility Location Problem with Concave Operating Cost (UFLPCOC), which is a nonlinear version of the UFLP. The total cost to be minimized is the sum of linear transportation costs and operating costs, which are non-decreasing concave functions of the demand at the facilities. An exact solution approach is presented. This approach is based on successive lower and upper bound improvements for UFLPCOC until convergence is obtained. Computational results are presented.

3 - A Location-Allocation Problem with Concentric Circles
Jack Brimberg, Royal Military College of Canada, Kingston, Ontario, Canada, Jack.Brimberg@rmc.ca, Zvi Drezner

We consider the problem of locating p circles to serve a set of demand points. Each demand point is serviced by the closest circle. The objective is to minimize the sum of weighted distances between demand points and their closest circle. A rigorous algorithm solved the largest tested problem with 1000 demand points in about 3.5 hours. The faster heuristic version solved it in about two minutes getting the same solutions.

4 - The Multidimensional Component Commonality Problem: Re-visiting Facility Location Problems.
Mozart Menezes, Associate Professor, University of Calgary, 2500 University Dr. NW, Calgary, AB, T2N1N4, Canada, mozart.menezes@utoronto.ca, Diego Ruiz-Hernandez, Renato Guimaraes

We investigate the component commonality problem. Different variations of a particular part may allow it to be used in different SKUs. The more SKUs a part can be used, the more unnecessary cost the part carries to each particular SKU. A SKU-specific part can be made to reduce the part cost to a minimum but increases complexity and fixed cost for certification. We model this problem as a facility location problem and take advantage of well-known approaches for solving real size problems.

Data Mining in Aviation

Sponsor: Aviation Applications

Sponsored Session

Chair: Yi Liu, University of California, Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States of America, liuyi.feier@gmail.com

1 - Categorization and Visualization of Safety Reporting Data using Topic Models and Tableau
Anil Yelundur, Technical Staff Member, MITRE Corporation, 7515 Colshire Drive, McLean, VA, 22102, United States of America, ayelundur@mitre.org, Danijela Nardelli, Michelle Harper

Text-based safety reporting data are often inconsistently categorized due to variations in the manual application of taxonomies. For automated categorization of such data; the team developed a multi-algorithm modeling process including NLP processing customized to aviation terminology, Principal Component Analysis and Latent Dirichlet Allocation using stochastic variational Bayes optimization. Tableau was used to visualize the topics and document categorizations.

2 - Predicting the Initiation of a Ground Delay Program
Yi Liu, University of California, Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States of America, liuyi.feier@gmail.com, Michael Seelhorst, Mogeng Ying, Alexey Pozdnukhov, Mark Hansen

In this work, we apply and compare three statistical techniques for predicting GDP initiation. Two types of data are used: current conditions and forecasts of future conditions. The methods are illustrated with a case study at EWR airport. Results from this research reveal the importance of each variable (such as actual weather variables) on GDP initiation and provide a means for flight operators to predict GDP initiation.

3 - Supporting Airline Revenue Management Decisions with Data-Driven Market Analysis
Catherine Cleophas, RWTH Aachen University, Kackertstr. 7, Raum 240, Aachen, 52072, Germany, catherine.cleophas@rwth-aachen.de, Claus Gwiggner

Airline revenue management uses demand forecasts to optimize offers. Performance measurement is difficult: Existing methods suffer from over-determination and rely on unrealistic system assumptions. We propose an approach comparing markets based on process data. It combines principal component analysis and clustering techniques to map the heterogeneity of markets. We validate our approach in simulation experiments and demonstrate its applicability on a large empirical data set.

4 - Ground Delay Program Analytics with Behavioral Cloning and Inverse Reinforcement Learning
Michael Bloem, Research Aerospace Engineer, NASA Ames Research Center, P.O. Box 1, Mail Stop 210-15, Moffett Field, CA, 94035-0001, United States of America, michael.bloem@nasa.gov, Nicholas Bambos

We used historical data to build behavioral cloning and inverse reinforcement learning models that predict hourly implementation of Ground Delay Programs (GDPs), a type of strategic air traffic management control. We will review the quality of the predictions and discuss insights the models provide into how and why GDPs are implemented. For example, the models suggest that GDP implementation decisions are primarily based on conditions now or conditions anticipated in the next couple of hours.

JFIG Paper Competition I

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: J. Cole Smith, Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, jcsmith@clemson.edu

Co-Chair: Shengfan Zhang, Assistant professor, University of Arkansas, United States of America, shengfan@uark.edu

1 - Competition Introduction
J. Cole Smith, Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, jcsmith@clemson.edu

The 2014 JFIG paper competition features paper submissions from a diverse array of talented junior faculty members. The prize committee evaluated submissions based on the importance of the topic, appropriateness of the approach, and significance of the contribution. After careful review, the prize committee selected a group of finalists to present their research in one of the two JFIG sessions. For information on the finalists and their papers, please refer to the online program.

2 - A Large-scale Multi-server Fork-Join Network with Non-exchangeable Synchronization
Guodong Pang, Penn State University, College of Engineering, University Park PA, United States of America, gup3@engr.psu.edu, Hongyuan Lu

We study a large-scale fork-join network of stations with multiple servers where tasks are only synchronized when all the tasks associated with the same job are completed, i.e., non-exchangeable synchronization. The main mathematical challenge is the resequencing of arrival orders after service completion at each service station. We present a new framework to analyze the queueing and synchronization processes when all service stations are operating in the many-server asymptotic regimes.

3 - Two-term Disjunctions on the Second-order Cone
Fatma Kilinc-Karzan, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh PA 15213, United States of America, fkilinc@andrew.cmu.edu, Sercan Yildiz

We study the convex hull of a two-term disjunction applied to second-order cone (SOC). By identifying the structure of tight minimal valid linear inequalities for the disjunction, and using conic duality, we introduce a technique on deriving closed-form expressions for convex inequalities describing the convex hull. Our study highlights that there are various cases when a single convex inequality is sufficient, when this inequality can be expressed in conic form, and as well as much more complicated cases where multiple convex inequalities are needed.

4 - Multistage Adaptive Robust Optimization for Electric Power Systems Operation

Andy Sun,Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA 30332, United States of America, andy.sun@isye.gatech.edu, Alvaro Lorca

The growing uncertainty associated with the increasing penetration of wind and solar power has presented new challenges to the operation of electric power systems. Motivated by this, we present a multistage adaptive robust optimization formulation for the critical daily operation of power systems under uncertain electricity load and renewable generation. We discuss the concept of simplified affine policy and develop an efficient solution method. Promising computational results will be shown.

Project Scheduling: Stochastic And Game Theoretic Aspects

Cluster: Scheduling and Project Management

Invited Session

Chair: Erik Demeulemeester, Professor, KU Leuven, FEB, KBI, Naamsestraat 69, Leuven, Belgium, Erik.Demeulemeester@kuleuven.be

1 - A Public-private Partnership Pipeline: The Government's Way to Go for Proper Incentive Creation?

Dennis De Clerck, KU Leuven, FEB/KBI, Naamsestraat 69, Leuven, 3000, Belgium, Dennis.DeClerck@kuleuven.be, Erik Demeulemeester

The risky features of public-private partnerships and the high bidding costs inhibit contractors from entering the tender. Governments favor mechanisms that might increase the competition. This paper investigates whether a project pipeline positively affects the contractors' bidding behavior. The output of the Nash equilibrium approximation algorithms supports that an increase in the number of projects lowers the required mark-up percentages but the effect on investment incentives is limited.

2 - An Oracle-based B&B Algorithm for Chance-constrained Programming with Applications to the RCPSP

Patricio Lamas, KU Leuven, Research Centre for Operations Managemen, Leuven, Belgium, Patricio.LamasVilches@kuleuven.be, Erik Demeulemeester

The chance-constrained resource-constrained project scheduling problem (C-C RCPSP) is a generalization of the traditional deterministic RCPSP, where the activity durations are random variables with known probability and the schedule is feasible with a given probability. We present a b&b algorithm for solving this complex problem, which is based on an optimization oracle for the deterministic RCPSP. Our algorithm can be applied in any chance-constrained problem with random right hand side.

3 - A New Set of Valid Inequalities for Chance Constraint Programs: An Application to Proactive RCPSP

Morteza Davari, KU Leuven, Research Centre for Operations Managemen, Leuven, Belgium, Morteza.Davari@kuleuven.be, Erik Demeulemeester, Patricio Lamas

Chance constraint programming has become an attractive topic in the field of stochastic optimization. In this paper, we propose a new set of valid inequalities for chance constraint programs. We formulate the proactive RCPSP as a chance constraint program. A branch and cut algorithm exists in the literature to solve this problem. Initial results show that the proposed set of inequalities improves the speed of this algorithm.

Modeling Co-creative Systems

Sponsor: Service Science

Sponsored Session

Chair: Ralph Badinelli, Professor, Virginia Tech, Dept. of Business Information Technology, Virginia Tech 0235, Blacksburg, VA, 24061, United States of America, ralphb@vt.edu

1 - Modeling Smart Service Systems with Analytics and Cognition

Haluk Demirkan, Associate Professor of Service Innovation & Business Analytics, Unviersity of Washington, 1900 Commerce Street, Box 358420, Tacoma, Wa, 98402-3100, United States of America, haluk@uw.edu, Jim Spohrer

Smart service systems can be characterized by the types of offerings to their consumers, the types of roles, and the types of returns they offer stakeholders, through improved use of technology, talent, or organizational and governance forms, which create (dis)incentives that (re)shape behaviors. This research presents Abstract Entity Interaction Outcome Universals (AEIOU) framework for innovation of smart service systems that enable value co-creation with analytics and cognitive systems.

2 - Integration Service Quality Gap in Service Network Systems

Stephen Kwan, Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States of America, stephen.kwan@sjsu.edu, Peter Hottum

Service providers often have to construct networks of partners to fulfill service obligations to customers. We introduce an integration service quality gap that represents the difference between customer service quality expectation and perceived service quality in his service journey in a service system network. The integration service quality gap is incorporated with traditional service quality gaps to form a more complete treatment of service quality metrics in such an environment.

3 - Multi-agent Control in Service Systems

Ralph Badinelli, Professor, Virginia Tech, Dept. of Business Information Technology, Virginia Tech 0235, Blacksburg, VA, 24061, United States of America, ralphb@vt.edu

This paper builds on previous research on the trajectories of service recipients through service system hypernetworks. These trajectories are guided by the client's decisions in evaluating and accepting or rejecting service propositions. We extend this research by considering similar decisions by the agents of resource integrators and service providers. The viability of service systems is examined as an outcome of how these multi-agent decisions influence the trajectory of the service.

Stochastic Models in Service Science

Sponsor: Service Science

Sponsored Session

Chair: Yan Xia, University at Buffalo, 342 Bell Hall, Buffalo, NY, 14260-2050, United States of America, yanxia@buffalo.edu

1 - Ambulance Dispatching, Redeployment and Reallocating

Seyed Amir Ali Nasrollah Zadeh, Clemson University, 206 Campus Drive, Apt. A, Central, SC, 29630, United States of America, snasrol@g.clemson.edu, Amin Khademi, Maria Mayorga

Larger cities, expensive medical cares and heavy traffics have led to an increasing number of medical emergency calls and associated costs. In this work we develop an optimization model to find near-optimal solutions to ambulance dispatching, redeployment and reallocation problem to minimize the total expected waiting time of patients. We calibrate our model using real data and compare our policies with current ones via a simulation model.

2 - Optimization of Imperfectly Timed Maintenance Actions

Kai He, Ph.d Student, University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, kah167@pitt.edu, Lisa M. Maillart, Oleg Prokopyev

We consider a class of maintenance optimization problems in which preventive maintenance (PM)actions may not be performed "on time." We assume that the time when PM is performed follows some known distribution about the prescribed time and formulate cost rate-minimizing models that anticipate this "noncompliant" behavior. We establish analytical relationships between the resulting policies and policies with perfect compliance for both age replacement and block replacement with minimal repair.

3 - Pricing Option-based Restoration for Stochastically Degrading Systems

Yan Xia, University at Buffalo, 342 Bell Hall, Buffalo, NY, 14260-2050, United States of America, yanxia@buffalo.edu, Murat Kurt, Osman Ozaltin

This talk addresses the problem to optimize the wholesale price of a restoration service for stochastically degrading systems. We model the system operator's maintenance problem as a Markov decision process, based on which we derive models that determine the operator's purchase decisions. The service provider's pricing problem is then modeled as a bi-level optimization problem, for which we provide an exact algorithm. We illustrate the efficiency of the algorithm through numerical study.

4 - Stocking and Pricing Policies of the Newsvendor Problem under Mean-Variance Considerations

Javier Rubio-Herrero, Rutgers University, 100 Rockafeller Rd, Piscataway, NJ, 08854, United States of America, javier.rubioherrero@rutgers.edu, Melike Baykal-Gursoy

We consider the classical newsvendor problem under a mean-variance criterion with two decision variables, namely price and stock quantity. The demand is assumed to be additive with respect to the price. We present conditions under which the objective function is concave and has a unique optimal solution. Furthermore, we provide numerical examples that aim to endorse the theoretical results herein explained and compare our results to others previously published.

Microfoundations of Innovation in Supplier Driven and Crowd Driven Contexts

Cluster: New Product Development

Invited Session

Chair: Anant Mishra, George Mason University, 5034 Dequincey Drive, Fairfax, Vi, 22032, United States of America, amishra6@gmu.edu

1 - Initiating and Sustaining Supplier Involvement in Development Projects: Behavioral Aspects

David Wuttke, EBS University, Konrad-Adenauer-Ring 15, EBS University, ISCM, Wiesbaden, De, 65187, Germany, david.wuttke@ebs.edu, Enno Siemsen, Karen Donohue

Using a combination of analytic models and laboratory experiments, we study the effectiveness of buyer contract mechanisms, including breach penalties and profit sharing, on incentivizing product innovation at the supplier level. Our results provide insight into how the mechanisms can be altered to better account for supplier-specific behavior.

2 - Do Incentives Help or Hurt Competition in Innovation Contests?

Anant Mishra, George Mason University, 5034 Dequincey Drive, Fairfax, Vi, 22032, United States of America, amishra6@gmu.edu, Cheryl Druehl, Jesse Bockstedt

Innovation contests allow firms to harness specialized skills and services from participants with diverse economic and cultural backgrounds to solve challenging business problems. In this study, we use data from a popular online logo-design contest setting and country-level archival data to examine the implications of incentives on the competitive environment in innovation contests.

3 - Staffing Decisions and Performance an Analysis of the Functional and Customer Domains of Experience

Juan Pablo Madiedo Montanez, IE Business School, Calle Maria de Molina, 12, 5ʃ, Madrid, Spain, jpmadiedo.phd2014@Student.ie.edu, Aravind Chandrasekaran, Fabrizio Salvador

This study examines the importance of accumulated levels of experience working on a specific functional domain and with a particular customer in a knowledge intensive work environment. We analyze the interplay among workers, managers and customers as sources of experience and its effect on task staffing decisions and performance. We use a dataset with information on over 4500 software maintenance tasks collected from a global IT and consulting corporation for testing our model.

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Paul Kantor, Professor, Rutgers/CCICADA, 4 Huntington St, New Brunswick, NJ, 08901, United States of America, paul.kantor@rutgers.edu

1 - Optimal Selection of Configurations to Test Radiation Detectors

Paul Kantor, Professor, Rutgers/CCICADA, 4 Huntington St, New Brunswick, NJ, 08901, United States of America, paul.kantor@rutgers.edu, Christie Nelson, Fred Roberts, Ashish Jain, Siddartha Dalal

The performance of radiation detectors (Portal and RIID) depends on scores of variables, and can be measured according to several criteria. This research presents an extension of Combinatorial Experimental Design (CED) to the efficient design of experiments. CED works well when outcomes are binary (PASS|FAIL) and inputs take only a few discrete values. This new approach combines CED with expert elicitation to maximize the aggregate benefit of a design, while controlling the cost of experiments

2 - Optimal Boat Allocations with Sharing

Brian Nakamura, CCICADA/DIMACS, Rutgers University, 96 Frelinghuysen Road., 4th Floor, CoRE Bldg., Piscataway, NJ, 08854, United States of America, bnaka@dimacs.rutgers.edu, Jacob Baron, Endre Boros, Chad Conrad, Robert DeMarco, Kevin Hanson, Paul Kantor, Curtis McGinity, Christie Nelson, Matthew Oster, Brian Ricks, Fred Roberts, James Wojtowicz, Wang Yao, Patrick Ball, Thomas Rader

The US Coast Guard (USCG) allocates boats to stations annually. We present a model that allows boat allocations where stations share boats. A key innovation is to characterize the problem in terms of "sharing paths." The model uses Mixed Integer Programming to capture a subtle set of constraints and finds a boat sharing plan that minimizes either number of boats or total cost. The underlying problem is NP-complete, but current USCG operations permit adequate solution on a large laptop.

3 - ACCAM: Simulating Stochastic Effects of Maintenance and Missions on Aircraft Availability for USCG

Curtis McGinity, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, curtis.mcginity@gmail.com, Endre Boros, Paul Kantor, Fred Roberts, Christie Nelson, Brian Ricks, Kevin Hanson, Patrick Ball, Chad Conrad, Thomas Rader, Brian Nakamura

We present a model and discrete event simulation of USCG Air Stations, accounting for the mission demands and maintenance procedures of USCG aircraft. The simulation provides aircraft availability distributions and mission performance metrics for varying Air Station scenarios. The model is novel in its renewal-based treatment of maintenance procedures, mitigating the need for modeling of subprocesses. Simulations are consistent with historical data and offer insights into hypothetical scenarios.

4 - Relevance Feedback: A Better Boolean Approach

Justin Del Vecchio, Research Scientist, CUBRC, 4455 Genesee St., Buffalo, NY, 14225, United States of America, delvecchio@cubrc.org, Paul Kantor, Endre Boros

Experiments use the PLAD learning system to infer Boolean queries from judged items, and we estimate the statistical significance of the patterns.

Challenges of Post-Disaster Humanitarian Logistics

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Felipe Aros-Vera, Rensselaer Polytechnic Institute, 110 8th st, Troy, NY, 12180, United States of America, arosvm@rpi.edu

1 - A New Method to Evaluate the Damage Degree and Forecast the Demand of the Disaster Areas

Buhao Li, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, China, lbh123@hust.edu.cn, Haijun Wang

Emergency logistics nowadays attracts great attention, but there are rarely papers concerning about the forecast of the disaster areas.We conduct a new method that clusters multiple sources of data about disaster areas,to evaluate damage of degree in disaster areas. Taking the degree of different disaster areas and the amount of total relief materials into consideration, we estimate the demand of the disaster areas.

2 - Real-time Optimization in Casualty Transportation Post-disaster

Armin Lüer-Villagra, PhD Candidate, Pontificia Universidad Catolica de Chile, Department of Electrical Engineering, Av. Vicuña Mackenna 4860, Santiago, 7820436, Chile, arminluer@gmail.com, Pamela P. Alvarez, Andres Bronfman

A problem in a post-disaster situation is health care in field and the movement of victims to medical facilities. This issue contains the complexities of disaster logistics. Based on real-time optimization models, this study applies a methodology to solve the problem of minimizing the response time and number of deaths from lack of medical care. The methodology considers prioritization of the affected people by the urgency in to be attended and different transport modes and medical centers.

3 - The Role of Access Restoration on Humanitarian Logistics
Felipe Aros-Vera, Rensselaer Polytechnic Institute, 110 8th St, Troy, NY, 12180, United States of America, arosvm@rpi.edu, Jose Holguin-Veras

This paper describes the problem of access restoration (AR) after disasters, develops a mathematical formulation capable of incorporating its main characteristics, and describes the role of AR in Humanitarian Logistics. The mathematical model uses deprivation cost functions to account for the impact on people by the decisions made in the process of AR. Numerical examples include a case study in Manhattan, NY.

Analyzing Social Networks and Social Media I

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Kang Zhao, Assistant Professor, University of Iowa, S224 PBB, Iowa City, IA, 52242, United States of America, kang-zhao@uiowa.edu

1 - Predicting User Engagement in Online Health Communities Based on Social Support Activities
Xi Wang, The University of Iowa, United States of America, xi-wang-1@uiowa.edu, Kang Zhao, Nick Street

Online health communities (OHCs) have become a major source of social support for people with health problems. This research tries to build a predictive model of members' engagement in OHCs. We are especially interested in whether different types of social support (e.g., informational support, emotional support and companionship) activities a user was involved in can contribute to such prediction. The outcome of study will have implications for the management and design of an OHC.

2 - User Analysis and Recommendation in Online Health Communities
Mi Zhang, Drexel University, 3141 Chestnut Street, Philadelphia, PA, 19104, United States of America, mz349@drexel.edu, Christopher Yang

Many online communities are developed to support communication between health consumers. We focus on QuitStop, a smoking-cessation forum, to investigate how users interact with each other, and recommend discussion topics for them. First, we analyze user interaction patterns and behaviors with qualitative analysis and social network analysis. Second, we use classification and recommendation techniques to detect user interests and discussion topics in the community, and recommend threads to users.

3 - Sociotechnical Behavior Mining: Challenges, Opportunities, and Beyond
Nitin Agarwal, Professor, University of Arkansas at Little Rock, 2801 S University Ave., EIT 553, Little Rock, AR, 72204, United States of America, nxagarwal@ualr.edu

Social media platforms have profoundly impacted the behavior and the lifestyle of humans revealing novel sociotechnical behaviors, e.g. "hacktivism", crowdsourcing, flash mobs, citizen journalism, "tweetcasting" etc. Although these behaviors have been widely observed, they haven't been scientifically explained. We examine these behaviors afforded by the social cyber systems, leveraging a truly interdisciplinary research with deep roots in social science theories and computational underpinnings.

Capacity Management in Operating Rooms and Clinics

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Vikram Tiwari, Assistant Professor of Anesthesiology, Vanderbilt University, 1211 21st Ave. S, MAB 403G, Nashville, TN, 37212, United States of America, vikram.tiwari@vanderbilt.edu

Co-Chair: Linda LaGanga, Director of Quality Systems & Operational Excellence, Mental Health Center of Denver, 4141 East Dickenson Place, Denver, CO, 80222, United States of America, linda.laganga@mhcd.org

1 - Patients Inpatient Preoperatively Account for Most Total Cancelled Operating Room Time
Franklin Dexter, The University of Iowa, 200 Hawkins Drive, Iowa City, IA, 52242, United States of America, franklin-dexter@uiowa.edu, Johannes Ledolter, Richard Epstein

At 21 US private hospitals, patients inpatient preoperatively represented 16.2% ± 0.5% of total operating room (OR) minutes but 49% ± 2% of total cancelled minutes. Results were insensitive to % of outpatients [preoperatively] making physical visit to preoperative clinic vs. only preoperative phone call ($P = 0.58$). At academic hospitals, patients inpatient preoperatively accounted for 22.3% ± 0.4% of scheduled minutes but most ($P < 0.0001$) total cancelled minutes (70% ± 2%).

2 - Predicting Daily Surgical Service Volume using Provider-Away Information
Vikram Tiwari, Assistant Professor of Anesthesiology, Vanderbilt University, 1211 21st Ave. S, MAB 403G, Nashville, TN, 37212, United States of America, vikram.tiwari@vanderbilt.edu, Warren Sandberg

Identifying available block time in advance is the first step in dynamically reallocating it to services that can rearrange their schedules to use it. Using a simulation methodology, we predict 6 weeks in advance, daily case volume for each surgeon, and the entire service, using historical data of case volume distributions, probability of surgeons' OR days, and information about surgeon availability. Results from model's selective implementation highlight the challenges and next steps.

3 - Multi-objective Operating Room Scheduling
Srimathy Mohan, Associate Professor, Arizona State University, Tempe, United States of America, Srimathy@asu.edu, Qing Li, Mohan Gopalakrishnan, John Fowler

This research models the operating room (OR) planning and scheduling problem as a mixed integer program with multiple objectives. A multi-objective simulation-optimization approach is developed for the problem to address uncertainties in surgery and recovery durations and patient no-shows. This approach guides the search of "Pareto optimal" solutions.

4 - Practical Application of a Scheduling and Overbooking Model in a Clinical Setting
Linda LaGanga, Director of Quality Systems & Operational Excellence, Mental Health Center of Denver, 4141 East Dickenson Place, Denver, CO, 80222, United States of America, linda.laganga@mhcd.org, Steve Lawrence, Ken Bellian, Don Penning

Patient no-shows continue to trouble outpatient and hospital service delivery. We build on our earlier research by applying our overbooking scheduling model in a hospital's scheduling practice to test the model's performance in improving productivity and reducing costs. We incorporate medical practice experience to develop realistic estimates of costs and their effect on the selection of high-performing scheduling alternatives.

Hilton- Union Sq 19

Patient Monitoring at Hospital and at Home

Sponsor: Health Applications

Sponsored Session

Chair: Benjavan Upatising, PhD, Research Scientist, Regenstrief Center for Healthcare Engineering, Purdue University, 203 S. Martin Jischke Drive, West Lafayette, IN, 47906, United States of America, benjavan@purdue.edu

1 - Practical Considerations in Black-box Models for Patient Monitoring

Bruce W. Morlan, MS Statistician, Health Care and Policy Research, Mayo Clinic, 200 First Street SW, Rochester, MN, 55905, United States of America, brucewmorlan@gmail.com, Matthew Johnson, Joel Hickman, James Naessens, Jeanne Huddleston, Santiago Romero Brufau

Gradient Boosted Models have proven useful to create complex models. We use GBM to create a black box algorithm for use in an automated alerting system. The model is to be used to increase monitoring on patients predicted to have the highest absolute risk. We explored the variables using univariate models, then Poisson models are used to create the final GBM ensemble model. This model is then reduced by a series of simplifications, and we tracked concordance to demonstrate the loss in fidelity.

2 - Diurnal Cycle and Insulin Dosing in the Intensive Care Unit

Ying Zhang, Massachusetts Institute of Technology, 32 Vassar Street, Room 32-257, Cambridge, MA, 02139, United States of America, yingz@mit.edu

Critically-ill patients normally experience stress-induced hyperglycemia, which could be controlled by IV insulin; however, blood glucose concentration has to be closely monitored and insulin dosage promptly adjusted to prevent acute hypoglycemia. Data from the ICUs at a tertiary teaching hospital suggest diurnal cycles in patient response to IV insulin. This study develops tools to extract patterns in these cycles and to assist clinicians in timely dosing adjustment during night shifts.

3 - Cost Comparison between Home Telemonitoring and Usual Care of Older Adults

Benjavan Upatising, PhD, Research Scientist, Regenstrief Center for Healthcare Engineering, Purdue University, 203 S. Martin Jischke Drive, West Lafayette, IN, 47906, United States of America, benjavan@purdue.edu, Walter K. Kremers, PhD, Paul Y. Takahashi, MD, MPH, Sharon L. Christ, PhD, Douglas L. Wood, MD, Yuehwern Yih, PhD, Gregory J. Hanson, MD

Older adults incur more healthcare expenses than any other age group, could home telemonitoring be a potential solution to reduce these costs? The analysis of direct medical cost was conducted based a 12 months randomized clinical trial. We compared the total cost as well as the inpatient, outpatient and ED costs between the telemonitored group and the group that received usual care.

4 - A General Framework to Automatically Extract Medical Knowledge

Yuan Luo, yuanluo@mit.edu, Peter Szolovits, Yu Xin, Ephraim Hochberg, Rohit Joshi

We propose subgraph augmented non-negative tensor factorization (SANTF) to automatically extract knowledge from EMRs. SANTF composes a tensor using patients, higher-order features (e.g., relationships among the medical concepts) and atomic features (e.g., words in the clinical narrative text). SANTF identifies the groups for patients and different feature types and simultaneously models group interactions. SANTF demonstrates improved clustering performance and better interpretable models.

Chair: Mariel Lavieri, Assistant Professor, University of Michigan, 1205 Beal Avenue, 2783 IOE, Ann Arbor, MI, 48105, United States of America, lavieri@umich.edu

Co-Chair: Greggory Schell, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, schellg@umich.edu

1 - Preference-Sensitive Risk Cutoff Values for Prenatal Integrated Screening Test for Down Syndrome

Jia Yan, Student, Georgia Institute of Technology, 755 Ferst Drive, Atlanta, GA, 30332, United States of America, jyan40@gatech.edu, Pinar Keskinocak, Turgay Ayer, Aaron Caughey

Down syndrome (DS) is the most common chromosomal abnormality. Currently a risk of 1/270 is commonly used in DS screening to identify high-risk women and recommend an invasive confirmatory test, such as amniocentesis. However, evidence suggests that this one-size-fit-all cutoff value does not reflect different preferences among pregnant women with respect to pregnancy outcomes. In this study, we assess the impact of women's preferences on optimal DS risk-cutoff-values of integrated screening.

2 - Optimal Copayment Restructuring for Hypertension Pharmacotherapy

Greggory Schell, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, schellg@umich.edu, Mariel Lavieri, Jeremy Sussman, Rodney Hayward

With increasing healthcare expenditures in the United States, employers, government agencies and insurers are looking for new cost containment methods, such as copayment restructuring. Using the principles of value-based insurance design, we develop an optimization model for determining the ideal hypertension medication copayment levels for a heterogeneous patient population serviced by an insurance provider.

3 - An Outbreak Prediction Model to Inform Intervention Policy

Lauren Gardner, University of New South Wales, UNSW, Sydney, 2052, Australia, l.gardner@unsw.edu.au, David Rey

We seek to identify the most likely infection patterns in a contact network when only a subset of the infection case reports are available. The problem is represented using a maximum likelihood model and formulated as an integer program. The objective of the model is to identify a set of most likely directed trees that spans to the set of known infected nodes, which may or may not include additional nodes. Simulated contagion episodes are used to evaluate the performance of the solutions.

4 - Optimal Treatment Policies for Pelvic Organ Prolapse in Women

Yueran Zhuo, Ph.D. Candidate, University of Massachusetts Amherst, 121 Presidents Drive, 226, Amherst, MA, 01003, United States of America, yzhuo@som.umass.edu, Senay Solak, Oz Harmanli

Pelvic organ prolapse (POP) is a prevalent disease impairing women's health and quality of life. We develop a quantitative approach for long term POP treatment planning to maximize the patient's expected quality of life. A Markov Decision Process framework is adopted to capture the chronic features of POP development. Both numerical and analytical analyses have been performed to derive general guidelines and assess their effectiveness for the treatment of POP.

Transplantation and Organ Allocation

Sponsor: Health Applications

Sponsored Session

Chair: Sommer Gentry, Associate Professor, United States Naval Academy, 572-C Holloway Road, Mailstop 9E, Annapolis, MD, 21402, United States of America, gentry@usna.edu

1 - Optimal Screening Strategies of Patients on the Kidney Transplant Waiting List

Alireza Sabouri, University of British Columbia, Vancouver, BC, V6T 1Z2, Canada, alireza.sabouri@sauder.ubc.ca, Tim Huh, Steven Shechter

The health condition of patients on the kidney transplant waiting list deteriorates while they are waiting for an organ arrival and hence they may no longer be suitable for transplant. Therefore, transplant centers screen waiting patients at various intervals to identify ineligible patients. We propose a model for finding screening strategies that minimizes the expected screening cost and the expected penalty cost associated with transplanting an organ to an ineligible patient.

2 - Exploring the Structure of the Kidney Paired Donation Pool

Wenhao Liu, PhD Candidate, Stanford University, 475 Via Ortega, Stanford, Ca, 94305, United States of America, owenliu@stanford.edu, Marc Melcher

We target to identify the truly hard-to-match pairs in a kidney paired donation pool. By applying a simple variation of PageRank algorithm, we manage to define a new measure of Paired Match Power that takes into considerations the global structure of the matching pool.

3 - Mitigating Information Asymmetry in the Liver Allocation System
Sepehr Nemati, Ivey School of Business, University of Western Ontario, 1225 Western Rd., London, ON, Canada, sproon@ivey.uwo.ca, Zeynep Icten, Lisa M. Maillart, Andrew Schaefer

We address the information asymmetry in the liver allocation system in the U.S. due to patients' gaming ability who may exploit the flexibility in the current health reporting requirements. We propose a model to simultaneously minimize measures of societal welfare associated with the information asymmetry, and data-processing burdens. We determine the exact frontier of Pareto-optimal updating requirements using clinical data.

4 - Redistricting to Reduce Geographic Disparity in Liver Allocation
Sommer Gentry, Associate Professor, United States Naval Academy, 572-C Holloway Road, Mailstop 9E, Annapolis, MD, 21402, United States of America, gentry@usna.edu, Dorry Segev

Studies have documented persistent geographic disparity in the allocation of livers by disease severity (MELD score). We partition the U.S. into optimal compact districts with the explicit goal of reducing disparity in MELD at transplantation, guided by years of interaction with the United Network for Organ Sharing. Our approach eliminates repeated cycles of suggesting and testing new policies by finding the policy most suited to the transplant community's values, determined a priori.

Dynamic Scheduling

Sponsor: Health Applications

Sponsored Session

Chair: Bjorn Berg, George Mason University, Fairfax, VA, United States of America, bberg2@gmu.edu

Co-Chair: Van-Anh Truong, Assistant Professor, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu

1 - A Simulation Based Approximate Dynamic Programming Approach to Multi-class, Multi-resource Surgical
Jonathan Patrick, Associate Professor, University of Ottawa, 55 Laurier Avenue, Ottawa, ON, K2G 3A6, Canada, patrick@telfer.uottawa.ca, Davood Astaraky

We present a model for scheduling in a multi-class, multi-resource surgical system. Given a master block schedule, we provide a surgical scheduling policy that seeks to minimize a combination of the lead time between patient request and surgery date, overtime in the operating room and congestion in the wards. We formulate it as a MDP model and develop a version of the Least Squares Approximate Policy Iteration algorithm and test our model on data from a local hospital.

2 - The Impact of Hourly Discharge Rates and Prioritization on Timely Access to Inpatient Beds
Hari Balasubramanian, University of Massachusetts Amherst, 160 Governors Drive Amherst MA 01003, Amherst, MA, 01002, United States of America, hbalasub@admin.umass.edu, Asli Ozen

We develop an empirically calibrated hospital-wide simulation model to represent a time-varying, multi-server queuing network. We use this model to demonstrate the impact on admission queues of (a) hourly discharge capacities, and (b) a dynamic, threshold-based prioritization rule.

3 - Fast Approximations for Online Scheduling of Outpatient Procedure Centers
Bjorn Berg, George Mason University, Fairfax, VA, United States of America, bberg2@gmu.edu, Brian Denton

We present a new model for online decision making for problems motivated by outpatient procedure centers. The dynamic extensible bin packing problem is formulated as a multi-stage stochastic integer program. We present insights into the optimal solutions as well as provide bounds for the problem. Results, including the evaluation of approximation methods, are presented as part of a case study based on a real outpatient procedure center.

Joint Session ICS/OPT: Global Optimization and Mixed-Integer Nonlinear Programming

Sponsor: Computing Society & Optimization

Sponsored Session

Chair: John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, On, K1S 5B6, Canada, chinneck@sce.carleton.ca

1 - Extending the Scope of Algebraic MINLP Solvers to Black- and Grey-box Optimization
Nick Sahinidis, John E. Swearingen Professor, Carnegie Mellon University, Department of Chemical Engineering, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, sahinidis@cmu.edu, David Miller, Alison Cozad

We propose a methodology to optimize in the absence of algebraic models. The methodology relies on the automatic learning of algebraic NLP and MINLP models from data. We rely on linear and nonlinear integer programming techniques for simultaneous determination of the parameters and structure of the unknown models. We also develop techniques that account for partial theoretical understanding of the system under study in an otherwise data-driven optimization approach.

2 - Parallelizing the Master Problem in Benders Decomposition
Alexandra M. Newman, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, anewman@mines.edu, Antony Tarvin, Wood Kevin

When (generalized) Benders decomposition (BD) is applied to solve a stochastic program (SP) or a min-max model, each with binary first-stage variables, explicit enumeration may solve the BD master problem. We parallelize that enumeration and demonstrate order-of-magnitude computational speedups on a two-stage SP and a (non-convex) network-interdiction problem; both single-cut and multi-cut master problems are accommodated. For certain problem types, we have broken the long pole in the BD tent.

3 - Tightening Concise Linear Reformulations of 0-1 Cubic Programs
Richard Forrester, Associate Professor of Mathematics, Dickinson College, 5 North Orange Street, Carlisle, PA, 17013, United States of America, forrestr@dickinson.edu

One of the most compact linear representations of 0-1 cubic programs is based on a repeated application of the linearization method for quadratic programs introduced by Glover. We develop a pre-processing step that strengthens the LP bound provided by this model. The proposed scheme involves using optimal dual multipliers of a partial level-2 RLT formulation to rewrite the objective function of the cubic program before applying the linearization. Extensive computational experience is provided.

4 - A Fast Heuristic for Global Optimization and MINLP
John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, On, K1S 5B6, Canada, chinneck@sce.carleton.ca, Mubashsharul Shafique

Steps in our heuristic: random initial points, rapid movement towards feasibility, clustering to identify disjoint feasible regions, simple search to improve cluster points, and local optimization. It is well-suited to large nonconvex models, and runs quickly due to parallelism and very few local solver launches. The algorithm is extended to MINLP by adding spatial and integer branching to return a solution using very few local optimizer launches. Promising empirical results are given.

Chair: Beibei Li, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, HbH 3026, Pittsburgh, PA, 15213, United States of America, beibeili@andrew.cmu.edu

1 - Network-biased Technical Change: Evidence from the Adoption of Social Media in a Consulting Organization
Lynn Wu, The Wharton School, 3730 Walnut St, JMHH 561, Philadelphia, PA, 19104, United States of America, wulynn@wharton.upenn.edu

Similar to skill-biased technical change (SBTC) in which information technology complements skilled and educated workers, network-biased technical change complements social capital. With the rapid adoption of enterprise social media tools, individuals with high network diversity can have greater return for using social media. At the same time, senior employees are worse off as social media

replace their deep organizational knowledge and eliminate their opportunity to arbitrage information.

2 - Zoom in iOS Clones: Examining the Antecedents and Consequences of Mobile App Copycats

Beibei Li, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, HbH 3026, Pittsburgh, PA, 15213, United States of America, beibeili@andrew.cmu.edu, quan wang

We examine the drivers and impacts of mobile app copycats based on 10,100 action game apps from iOS app store over 5 years. We find significant heterogeneity in the interactions between copycats and original apps. Non-deceptive copycats are reluctant to enter the market when the original app is popular and free. High quality copycats have a negative effect on original app downloads. Interestingly, low quality deceptive copycats have a positive effect, suggesting a positive spillover effect.

3 - Hiring Biases in Online Labor Markets: The Case of Gender Stereotyping

Jason Chan, NYU Stern School of Business, New York, NY, United States of Americajcc534@stern.nyu.edu, Jing Wang

The exponential growth of online labor markets holds important social and economic implications, as the hiring decisions made on these online platforms implicate the incomes of millions of workers worldwide. Using a novel proprietary dataset from a leading online labor platform, we investigate the impact of gender-based stereotypes on hiring outcomes using a matched sample approach and quasi-experimental technique. Interestingly, we find a robust hiring bias working in favor of female workers.

1 - Dynamic Assignment of Flexible Service Resources

Anant Balakrishnan, McCombs School of Business, University of Texas at Austin, 2110 Speedway, Austin, TX, 78712, United States of America, anantb@utexas.edu, Yalcin Akcay, Susan Xu

In service contexts that require dynamically deciding whether to accept incoming jobs and what resource to assign to each accepted job, harnessing the benefits of resource flexibility requires using effective methods for making these operational decisions. In this paper, we address the dynamic job acceptance and resource assignment problem for systems with general resource flexibility structure, and propose three optimization-based approximate policies.

2 - Managing an Available-to-Promise Assembly System with Dynamic Short-Term Pseudo Order Forecast

Long Gao, University of California, School of Business Administration, Riverside, United States of America, long.gao@ucr.edu, Susan Xu, Michael Ball

We study an order promising problem in a multi-class ATP system with pseudo orders, whose properties change dynamically over time. We show that the optimal order acceptance policy is characterized by class prioritization, resource imbalance-based rationing and capacity-inventory-demand matching. The value of the short-term forecast is high when resource is moderate and customer heterogeneity is high.

3 - Accelerating Phase I Clinical Trial through Efficient Patient Recruitment Process and Trial Design

Hui Zhao, Penn State University, Smeal College of Business, University Park, United States of America, huz10@psu.edu, Leon Xu, Susan Xu

80% of clinical trials run overtime, causing drug companies millions of dollars daily in delay to market. In this paper, we look at mitigating clinical trial inefficiency in Phase I trial. We formulate it as a Markov Decision Process and propose different strategies to conduct the trials in order to reduce Phase I time.

Topics in Stochastic Optimization

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Angelo Mancini, PhD Candidate, University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, amancini@chicagobooth.edu

1 - Optimality of Quasi-Open-Loop Policies for Discounted Semi-Markov Decision Processes

Angelo Mancini, PhD Candidate, University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, amancini@chicagobooth.edu, Dan Adelman

Quasi-open-loop (QOL) policies consist of Markovian decision rules that are insensitive to one component of the state space. We consider a semi-Markov decision process in which one state component is an exogenous multiplicative compound Poisson process, and provide an almost-everywhere condition on the reward function sufficient for the optimality of a QOL policy. In some cases, we can replace the almost-everywhere condition with a weaker one that holds only in expectation.

2 - Budget Allocation Strategies to Minimize Expected Operational Risk Losses in Financial Institutions

Yuqian Xu, NYU Stern School of Business, New York, United States of America, yxu@stern.nyu.edu, Jiawei Zhang, Michael Pinedo

This paper analyzes budget allocation strategies to minimize OpRisk losses in banks under deterministic and stochastic settings. We provide an alternative formulation of OpRisk that incorporates major investment variables. We show how decision scenarios influence the dominant power of investment parameters and provide some guidelines for banking regulation.

3 - Optimal A-B Testing

Nikhil Bhat, Columbia University, nbhat15@gsb.columbia.edu, Vivek Farias, Ciamac Moallemi

We consider the problem of A-B testing when the impact of the treatment is marred by a large number of covariates. Randomization can be highly inefficient in such settings, and thus we consider the problem of optimally allocating test subjects to either treatment with a view to maximizing the efficiency of our estimate of the treatment effect. Our main contribution is a tractable algorithm for this problem in the online setting.

4 - Exponential Approximations in Network Revenue Management

Christiane Barz, UCLA Anderson School of Management, 110 Westwood Plaza, None, Los Angeles, CA, 90095, United States of America, christiane.barz@anderson.ucla.edu, Dan Adelman, Canan Uckun

Although it is well-known that the value function in network revenue management is not linear, most of the literature on approximate dynamic programming is based on an affine approximation. We extend his work by allowing for exponential basis functions. In contrast to other work in approximate dynamic programming, we do not predetermine the basis functions but generate them dynamically for a given problem instance. Computational results show that our approach improves the bound significantly.

1 - Practical Algorithms for Graph Embedding from Unassigned Distance Lists

Phil Duxbury, Chairperson and Professor, Physics and Ast. Dept., Michigan State Univ., East Lansing, MI, 48824, United States of America, Duxbury@pa.msu.edu, Saurabh Gujarathi

The matrix completion problem is NP-hard for imprecise assigned distance geometry problems, and the unassigned variant of this problem adds an additional layer of combinatorial complexity. A recent publication by our group describes practical algorithms for constructing graph embeddings in the plane, using only unassigned distance lists. In this paper we extend these algorithms, and bounds on their performance, to graph embedding in three dimensions.

2 - The Small-Field Astrometric Point-Pattern Matching Problem

Claudio Santiago, Postdoctoral Researcher, Lawrence Livermore National Laboratory, 7000 East Ave, Livermore, CA, 94551, United States of America, pratas@gmail.com, Alberto Krone-Martins, Carlile Lavor

The small-field astrometric point-pattern matching problem is a fundamental problem in astrometry that can be described as finding the common stars in two given lists arising from different observations performed at different times. We devised an algorithm based on the normalization of distance matrices that can be used to identify stars that are common to both lists. Our approach consists of finding a suitable normalization factor that allows us to identify pairs of stars with equal distances.

Chair: Neng Fan, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, nfan@email.arizona.edu

1 - Assessing Complex Network Vulnerability under Cascading Failures

Yilin Shen, benoit.shen@gmail.com, My Thai

The assessment of network vulnerability is of great importance in the presence of unexpected disruptive events or adversarial attacks. We provide an in-depth probabilistic analysis for assessing the network vulnerability on the two well-known complex networks and show that, under random failures, power-law networks are no longer robust while small-world networks are more robust due to their homogeneous degree sequences. We also devise an effective approach to identify the most vulnerable nodes.

2 - Survivable Network Design with Vertex and Edge Connectivity Constraints

Elham Sadeghi, Graduate Research Assistant, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, sadeghi@email.arizona.edu, Neng Fan

In this talk, we present and prove several equivalent theorems to ensure a minimum-cost graph to be (k,l)-connected. A graph is (k,l)-connected if removal of certain numbers (related to k,l) of vertices and edges will not disconnect the graph. Based on these theorems, we present integer programming formulations and cutting plane algorithm to solve the minimum-cost network design problem.

3 - Analysis of Budget for Interdiction on Multicommodity Network Flows

Pengfei Zhang, Graduate Student, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, 85721, United States of America, pfzhang@email.arizona.edu, Neng Fan

In this talk, we concentrate on computing several critical budgets for interdiction on the multicommodity network flows in the case of worst-case arc failures, and studying the interdiction effects of the changes of budget. Numerical experiments are performed to verify our conclusions.

4 - Simulating the Dynamics of Networks via Optimization

Tiago Schieber, University of Florida - Center for Applied Optimization, University of Florida, Gainesville, FL, 32611, United States of America, tischieber@gmail.com, Martin Ravetti

The analysis of topological evolution of complex networks plays a crucial role in predicting their future. While an impressive amount of work has been done on the issue, very little attention has been so far devoted to the investigation of how information theory quantifiers can be applied to characterize networks evolution. With the objective of dynamically capture the topological changes of a network's evolution, we will present the Copycat model.

Optimization in Graphs and Digraphs

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Baski Balasundaram, Associate Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, baski@okstate.edu

1 - The Minimum Spanning k-core Problem with Bounded CVaR under Probabilistic Edge Failures

Juan Ma, Ph.D. Student, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, juan.ma@okstate.edu, Baski Balasundaram, Vladimir Boginski, Foad Mahdavi Pajouh

Given a non-negative integer k, a graph of minimum degree at least k is called a k-core. The concept of k-cores can be used to design resilient networks that preserve low diameter and high vertex-connectivity upon random graph component failures. This talk focuses on the minimum spanning k-core problem under probabilistic edge failures using the risk measure conditional-value-at-risk. Polyhedral reformulations and algorithms to solve the problem will be discussed.

2 - Network-Based Models for Optimization in Reliability

Kelly Sullivan, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, United States of America, ksulliv@uark.edu

Reliability of a system can be increased by adding redundant components. We seek to maximize the reliability of such systems subject to restrictions on the number and types of redundant components that can be installed. Representing the system as a binary decision diagram (a type of network) yields an exact mixed integer linear program for a general form of this problem. Computational results demonstrate that this approach is effective for structured (e.g., series-parallel) systems.

3 - Solving the Maximum Weighted Multiple Clique Problem: A Branch-Price-and-Cut Approach

Seyed Javad Sajjadi, University of South Florida, 4202 E Fowler Ave, Tampa, FL, 33620, United States of America, ssajjadi@mail.usf.edu, Bo Zeng, Xiaoning Qian

Deriving a collection of cliques with the maximum total weight in a general network where both nodes and arcs are weighted is considered and applied for biomarker identification in bioinformatics. An algorithm integrating column generation, branch-and-bound and cutting plane methods is developed for efficient computing. We also present numerical results on random and real-world networks.

4 - Maximum Degree-based Gamma-quasi-Clique Problem

Grigory Pastukhov, University of Florida, 303 Weil Hall, Gainesville, United States of America, gpastukhov@ufl.edu, Alexander Veremyev, Oleg Prokopyev, Vladimir Boginski

We consider the problem of finding the maximum-cardinality degree-based quasi-clique in a graph. A degree-based gamma-quasi-clique is a subgraph where the degree of each vertex is at least gamma times the highest possible degree. We prove the NP-completeness of the considered problem and propose an IP formulation and exact algorithms for solving this problem. Extensive computational experiments demonstrate that the proposed approaches perform very well on both random and real-world networks.

Large-Scale Nonlinear Optimization Algorithms

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: Frank E. Curtis, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, frank.e.curtis@gmail.com

1 - Orthant Based Method for L1 Regularized Optimization

Nitish Shirish Keskar, Northwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States of America, nitishkeskar2012@u.northwestern.edu, Andreas Waechter, jJorge Nocedal, Figen Oztoprak

The problem of minimizing a composite function consisting of a smooth loss and a non-smooth penalty has been studied extensively in the last few years. In this talk, we propose a new Orthant-based method for solving the L1 regularized problem. The algorithm proposed consists of a new active-set identification strategy which has a predictive-corrective loop allowing for rapid changes while maintaining descent properties. Comparisons and numerical results on standard test cases are presented.

2 - New Inexact Versions of the ADMM

Wang Yao, Student, MSIS and RUTCOR, Rutgers University, 100 Rockafeller Rd, Piscataway, NJ, 08854, United States of America, yaowang74@gmail.com, Jonathan Eckstein

We present three new, more practically verifiable approximate versions of alternating direction method of multipliers (ADMM). One version is based on Douglas-Rachford operator splitting and an existing inexact version of the proximal point algorithm, and requires one of the ADMM's two minimization steps to be exact. The other two versions are based on a Lagrangian splitting analysis and use absolute summable and relative error criteria, respectively. We also present numerical experiments.

3 - A Primal-Dual Active-Set Framework for Large-Scale Convex Quadratic Optimization

Zheng Han, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States of America, zhh210@lehigh.edu, Frank E. Curtis

We present a primal-dual active-set framework for large-scale convex quadratic optimization. The framework is flexible in that it allows multiple simultaneous changes in the active-set estimate during each iteration. By employing iterative methods and allowing inexactness to each reduced subproblem solve, our method is promising for large-scale optimization. Theoretical results for an important problem class and numerical results on a variety of problems illustrate the framework's efficacy.

4 - Handling Negative Curvature in Spectral Gradient Methods for Unconstrained Optimization

Wei Guo, Ph.D. Candidate, ISE department, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States of America, weg411@lehigh.edu, Frank E. Curtis

A gradient-descent method is proposed for unconstrained nonlinear optimization. Emphasis is placed on techniques used to compute appropriate step sizes when negative curvature is present. The method extends the well-known "two-point step size" method of Barzilai and Borwein and some of its variants. Global convergence is guaranteed under mild assumptions. Numerical results are presented to illustrate the benefits of the method in the presence of negative curvature.

Chair: Henry Wolkowicz, Professor, University of Waterloo, University of Waterloo, Waterloo, ON, N2L 3G1, Canada, hwolkowicz@uwaterloo.ca

1 - Geodesic Distance Maximization via Convex Optimization

De Meng, University of Washington, Electrical Engineering, Seattle, WA, United States of America, demeng@u.washington.edu, Maryam Fazel, Pablo Parrilo, Stephen Boyd

Given a graph with fixed edge weights, finding the shortest path, also known as the geodesic, between two nodes is a well-studied network flow problem. We introduce the Geodesic Distance Maximization Problem (GDMP), i.e., the problem of finding the edge weights that maximize the length of the geodesic, subject to convex constraints on the weights. We show that GDMP is a convex optimization problem for a wide class of flow costs and develop an ADMM for its solution.

2 - Robust Convex Relaxation for the Sparse Planted Clique Problem

Brendan Ames, Assistant Professor, University of Alabama, Department of Mathematics, Tuscaloosa, AL, 35487, United States of America, bpames@ua.edu

The planted clique problem seeks to distinguish between graphs containing a single large clique and random graphs. We present a convex relaxation for the planted clique problem under additive and deletive noise. Our relaxation, which can be thought of as nuclear norm regularized linear programming, can detect planted cliques with sizes matching the current state of the art. Moreover, when the noise is sparse, we show that we can detect significantly smaller planted cliques.

3 - Quadratic Programming and Semidefinite Programming Bounds for Vertex Separators

Henry Wolkowicz, Professor, University of Waterloo, University of Waterloo, Waterloo, ON, N2L 3G1, Canada, hwolkowicz@uwaterloo.ca, Ting Kei Pong, Hao Sun, Ningchuan Wang

We consider the problem of partitioning the nodes of a graph into k sets of given sizes in order to minimize the cut obtained by removing the k-th set. This problem is closely related to the graph partitioning problem. In this talk, we look at lower and upper bounds obtained from two convex relaxation techniques: the quadratic programming bounds based on recent successful bounds for the quadratic assignment problems, and semidefinite programming bounds obtained via lifting.

Optimal Control in Finance

Cluster: Optimization in Finance

Invited Session

Chair: Naveed Chehrazi, Assistant Professor, McCombs School of Business, 2110 Speedway Stop B6500, Austin, TX, 78705, United States of America, naveed.chehrazi@mccombs.utexas.edu

1 - Optimal Control of Multi-agent Consumption Patterns using Approximate Dynamic Programming

Greg Kaplan, Assistant Professor, Princeton University, Fisher Hall, Princeton, NJ, 08544, United States of America, gkaplan@princeton.edu, Jesus Fernandez-Villaverd, Erick Chen, Warren Powell, Daniel Jiang

We formulate and solve the multi-agent consumption problem using the modeling and algorithmic framework of approximate dynamic programming. The model captures accumulated assets, the state of the economy, wages, and current employment, along with the distribution of assets across the population. We use approximate dynamic programming to produce high quality policies without sacrificing the accuracy of the transition function.

2 - The Valuation of Storage

Long Zhao, McCombs School of Business, Austin TX 78705, United States of America, Long.Zhao@phd.mccombs.utexas.edu

We use moving boundary method to give the numerical optimal strategy of storage with transaction costs.

3 - Dynamic Credit-Collection Optimization

Naveed Chehrazi, Assistant Professor, McCombs School of Business, 2110 Speedway Stop B6500, Austin, TX, 78705, United States of America, naveed.chehrazi@mccombs.utexas.edu, Thomas Weber, Peter Glynn

We develop a dynamic model of consumer repayment behavior on delinquent credit-card loans using a marked point process. The intensity of this point process can be controlled by a sequence of impulses. A semi-analytic solution of the HJB equation is obtained.

1 - Fire Sale in Financial Networks

Haoshu Tian, Princeton University, PACM Fine Hall, Princeton, NJ, 08544, United States of America, htian@princeton.edu, Weinan E

Defaulting can be transmitted through two channels: inter-bank liability contagion and fire sale. When banks rush to sell the same asset, they may fall into a Nash equilibrium in which they sell the asset at an artificially low price to compete for liquidity. In this paper, a model that incorporates these two channels is developed and analyzed theoretically. An algorithm for finding the state in which both the market and the inter-bank liability network are in equilibrium is proposed and tested.

2 - Optimal Portfolio Selection under Counterparty Risk

Agostino Capponi, Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, 21218, United States of America, acappon1@jhu.edu

We develop a portfolio allocation framework to assess the impact of counterparty risk on optimal investment decisions. When purchasing CDS upfronts, the investor receives collateral from her protection seller and uses it to mitigate losses arising when the counterparty defaults. We find that the investor may not take any credit exposure and simply invests all his wealth in the money market account, depending on credit risk and contagion effects between reference entity and counterparty.

3 - The Ross Recovery Theorem and Quasi-Stationary Distribution

Yiwei Wang, The Chinese University of Hong Kong, William M. W. Mong Engineering, Shatin, N.T., Hong Kong - PRC, ywwang@se.cuhk.edu.hk, Nan Chen

We analyze the Ross recovery theorem in the presence of absorption state when all assets in the market devalue completely. We find an interesting relation between the recovery theorem and quasi-stationary distribution.

Chair: Amir Ali Ahmadi, Princeton University, 329 Sherrerd Hall, Dept. of Operations Research&Fin. Eng., Princeton, NJ, 08540, United States of America, a_a_a@princeton.edu

1 - Geometric Programming for Aircraft Configuration Design

Warren Hoburg, Assistant Professor, MIT Dept. of Aeronautics and Astronautics, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, whoburg@mit.edu

Modern aircraft represent some of the most complex, performance-driven engineering systems ever conceived and built. Surprisingly, many fundamental relationships and constraints on aircraft performance can be encoded via the feasible set of a geometric program. This observation gives us a reliable and efficient way to solve conceptual design problems, and may provide decision-makers with better understanding of tradeoffs, design spaces, and performance sensitivities.

2 - Optimal Resource Allocation for Network Protection against Spreading Processes

Victor Preciado, Assistant Professor, University of Pennsylvania, 3330 Walnut Street, Levine Hall 360, Philadelphia, PA, 19103, United States of America, preciado@seas.upenn.edu, Michael Zargham, Chinwendu Enyioha, Ali Jadbabaie, George Pappas

We study the problem of containing spreading processes in arbitrary directed networks by distributing protection resources throughout the nodes of the network. We consider two types of protection resources: (i) Preventive resources, and (ii) corrective resources. We study the problem of finding the cost-optimal distribution of resources throughout the nodes of the network. We show that the optimal resource allocation problems can be solved in polynomial time using Geometric Programming (GP).

3 - Maximizing a Sum of Sigmoids

Madeleine Udell, PhD Candidate, Stanford University, 350 Serra Mall, Stanford, CA, 94305, United States of America, udell@stanford.edu, Stephen Boyd

The problem of maximizing a sum of sigmoids over a convex constraint set arises in many application areas. We propose an approximation algorithm (using a branch and bound method) to find a globally optimal approximate solution to the problem. To illustrate the power of this approach, we compute the optimal positions which might have allowed the candidates in the 2008 United States presidential election to maximize their vote shares.

Stationarity in Many-server Queues

Sponsor: Applied Probability Society

Sponsored Session

Chair: Itai Gurvich, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu

1 - Heavy-traffic Limits for the Initial Content Process

Yunan Liu, NC State University, Raleigh, NC 27695, United States of America, A. Korhan Aras, Ward Whitt

In a queueing system with i.i.d having non-exponential service times, the state of the initial content can be described by specifying the elapsed service times of the remaining initial customers. We establish a heavy-traffic functional central limit theorem (FCLT) for the initial content process, assuming a FCLT for the initial age process, with the number of customers initially in service growing in the limit. For each time, including time 0, the conditional remaining service times, given the ages, are mutually independent but in general not identically distributed.

2 - Stochastic Comparison Approach to Multi-server Queues

David A. Goldberg, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, dgoldberg9@isye.gatech.edu

We prove several results for multi-server queues using a stochastic comparison approach. First, we demonstrate that there are two limiting sub-regimes embedded within the Halfin-Whitt heavy-traffic regime. We describe a novel lower bound for the FCFS M/G/n queue, which we combine with other bounds to characterize the qualitative properties of these sub-regimes. We conclude by discussing several open questions, and (time permitting) recent progress on queues with heavy tails and abandonments.

3 - A Flexible-server System in the Halfin-Whitt Regime: Tightness of Stationary Distributions

Alexander Stolyar, Bell Labs, Alcatel-Lucent, 600 Mountain Ave., 2C-322, Murray Hill, NJ, 07974, United States of America, Sasha.Stolyar@alcatel-lucent.com

We consider a so-called "N" flexible server system (as well as its generalization) under a priority discipline, in the Halfin-Whitt asymptotic regime. Tightness of diffusion-scaled stationary distributions is proved. The approach is based on constructing a single common Lyapunov function and deriving bounds on its derivatives.

4 - Diffusion Models and Steady-state Approximations for Exponentially Ergodic Markovian Queues

Itai Gurvich, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu

Motivated by queues with many-servers, we study Brownian steady-state approximations for continuous time Markov chains (CTMCs). Our approximations are based on diffusion models (rather than a diffusion limit). Within an asymptotic framework, in which a scale parameter n is taken large, a uniform Lyapunov condition is proved to guarantee that the gap between steady-state moments of the diffusion and those of the properly centered and scaled CTMCs, shrinks at a rate of the square root of n.

Sponsored Session

Chair: Hayriye Ayhan, Professor, Georgia Institute of Technology, School of ISyE, Atlanta, GA, 30332, United States of America, hayhan@isye.gatech.edu

1 - Dynamic Resource Management for Parallel Queues with Shared Pool of Flexible Servers

Ravi Kumar, PhD Candidate, Cornell University, 292 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, rk454@cornell.edu, Mark Lewis

We consider the problem of how servers can be dynamically allocated in a system with parallel queues and multiple demand streams. The system incurs holding costs, server usage cost and set-up cost for switching stations. A central controller has access to a fixed number of flexible servers and needs to dynamically decide how many servers to use and where to allocate their effort to minimize operating costs. We characterize the optimal allocation policy and develop practical heuristics.

2 - Combining Queueing and Scheduling Theories – A Flexible Server Study

Douglas Down, McMaster University, Department of Computing and Software, Hamilton, Canada, downd@univmail.cis.mcmaster.ca, Daria Terekhov, Tony Tran, Christopher Beck

Using an example of a flexible server model (where service times are known upon arrival), we discuss how one can use queueing-theoretic knowledge to help guide online scheduling. The result is a hybrid scheduling model that demonstrates better performance than standard online scheduling approaches. In addition to discussing performance, we discuss stability properties of various scheduling approaches, including our hybrid approach.

3 - Optimal Admission Control for Markovian Loss Systems of Two Stations

Daniel Silva, Georgia Tech, 755 Ferst Dr, Atlanta, GA, United States of America, dfsi3@gatech.edu, Bo Zhang, Hayriye Ayhan

Consider a system of two Markovian queues in tandem with finite buffers. Losses are incurred when a customer is rejected upon arrival to the first station or when the second station is full upon service completion at the first station. We present two special policies and give necessary conditions for these to be optimal. We also provide some results on the structure of the optimal policy. Finally, we present heuristic policies that yield near optimal cost performance.

4 - Processor Sharing in Non-Collaborative Queueing Networks

Tugce Isik, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332-0205, United States of America, tugceisik@gatech.edu, Sigrun Andradottir, Hayriye Ayhan

We study processor sharing (PS) in queueing networks where multiple servers cannot work at the same station. For tandem lines with two stations, two servers, and infinite buffers, we show that either a dedicated or a PS policy maximizes the throughput, and the optimal PS policy can be achieved as a limit of round-robin policies. For systems with general topology, we evaluate how the performance of round-robin policies depends on the quantum of time spent at each station and the buffer size.

1 - Wind Plant Design under Uncertainty

Katherine Dykes, NREL, 15013 Denver W Pkwy, Golden, CO 80401, United States of America, Katherine.Dykes@nrel.gov

Many sources of uncertainty affect wind plant performance and cost. This study looks at bringing those uncertainties upfront into the plant development process at the point of turbine selection and layout design. The result is the ability to optimize the plant cost of energy not just by minimizing a deterministic cost but an expected cost or even risk threshold. This work leverages new integrated wind plant modeling capability to explore optimization of wind plant design under uncertainty.

2 - A Bayesian Optimization Approach for Wind Farm Monitoring and Power Maximization

Jinkyoo Park, Ph.D Student, Stanford University, 473 Via Ortega, Stanford, CA, 94305, United States of America, jinkyoo.park@gmail.com, Kincho Law

The wakes formed by upstream wind turbines decrease the power outputs of downstream wind turbines by reducing wind speed, which results in deterioration of wind farm power. The total wind farm power can be improved by minimizing wake interference by coordinated control actions of wind turbines. In this study, we determine the optimal, coordinated yaw offset angles and induction factors for wind turbines by applying Bayesian optimization (BO), a data-driven statistical optimization algorithm.

3 - Data-driven Spatial-temporal Modeling of Local Wind Fields

Arash Pourhabib, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, arash.pourhabib@okstate.edu, Yu Ding, Jianhua Huang

Effective wind power system operation hinges on comprehending the near ground behavior of wind in a wind farm and particularly the wind speed. We present a data-driven spatial-temporal model for analyzing local wind fields. Our model, which is an extension of the Vector Autoregression (VAR) by imposing structure to the coefficient matrix, is constructed based on measurements coming from a large number of turbines in a wind farm, as opposed to aggregating the data into a single time-series.

4 - Spatial Modeling and Analysis for Wind Farms – Preliminary Investigation

Eunshin Byon, Assistant Professor, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, ebyon@umich.edu, Mingdi You, Giwhyun Lee, Judy Jin

This study focuses on developing analytical and statistical models for a wind farm with multiple wind turbines. In a wind farm, turbines in downwind rows in large-scale farms are impacted by wind speed deficit, thus capturing less energy (called wake effects). We quantify such under-performance of wind turbines in a wind farm.

1 - Optimal Hydroelectric Dispatching with Metaheuristic: A Genetic Algorithm and Ant Colony Comparison

Paulo Correia, Professor, University of Campinas, Energy Department, Fualculty of Mechanical Engineering, Campinas, SP, 13083-860, Brazil, pcorreia@fem.unicamp.br, Jessica Fernandes, Regiane Barros, Ieda Hidalgo

Usually, the units of a hydroelectric plants have the same design. However, circumstantial details, arising as them are manufactured and installed, result in actual different efficiency curves. Besides efficiency maximization, the dispatching could aim to minimize the units' start-up and shut-down. So the problem is formulated as a mixed integer non-linear multicriteria program. This paper discuss the results obtained with two approaches: genetic algorithm and ant colony.

2 - Optimization of Roof and Ground Greening Strategies to Mitigate the Urban Heat Island

Jean-Michel Guldmann, Professor Emeritus, The Ohio State University, 275 West Woodruff Avenue, COLUMBUS, OH, 43210, United States of America, guldmann.1@osu.edu, BumSeok Chun

The urban heat island (UHI), with temperatures in urban areas often much higher than in surrounding areas, induces heat stress, ozone formation, and increased power plant pollution and greenhouse gas emissions. A non-linear programming model, derived from a spatial statistical model estimated over a grid in downtown Columbus, Ohio, selects roof-top and ground areas for greening to maximize total temperature reduction in Columbus center, subject to a greening budget and other constraints.

3 - Risk-aware Load Shifting and Optimized Chiller Operation for Cooling Systems with Thermal Storage

Jeonghan Ko, Associate Professor, Ajou University, Korea and The University of Michigan-Ann Arbor, USA, Department of Industrial Engineering, Suwon-si, Gyeonggi-do, Korea, Republic of, jko@ajou.ac.kr, Yin Guo, Ehsan Nazarian, Kamlakar Rajurk

This research investigates the risk related to demand forecasting for production and inventory of chilled water in cooling systems. Thermal storage is used as chilled water inventory to reduce the peak loads of a cooling system, but increases the operation cost. We present new methods for robust demand prediction and optimal chilled water production and inventory. We also evaluate the trade-off between the peak demand reduction and operation cost increase.

4 - Utility-maximizing Financial Contracts for Distributed Rural Electrification

Todd Levin, Computational Engineer, Argonne National Laboratory, 9700 S. Cass Ave., Bldg. 221, Argonne, IL, United States of America, tlevin@anl.gov, Valerie Thomas

We develop a cost-benefit framework for extending rural electricity access. An economic model is developed to compare three financial mechanisms that make capital intensive electrification technologies more accessible in rural areas. These contracts are compared on their ability to increase consumer utility for a given cost to the provider. We show that a subsidy is preferred when the desired subsidization is high and that microloan and rental programs can profitably improve energy access.

Copper Mining Applications

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Timothy Matis, Associate Professor, Texas Tech University, PO Box 43601, Lubbock, TX, 79409, United States of America, timothy.matis@ttu.edu

1 - Optimizing Capacity and Production in Copper Mining

Melanie Ruegg, Graduate Student, Texas Tech University, Box 43061, Lubbock, Tx, 79409, United States of America, melanie.ruegg@ttu.edu, Pablo A. Miranda, Milton Smith, Jose Ceroni, Timothy Matis

The copper mining industry may be characterized as having capital intensive fixed costs, long planning horizons, and variability in returns due to market fluctuations. In this presentation, we will discuss research related to optimizing capacity planning and production policies under variability in profit margins for refined and concentrate product.

2 - Sustainable Mining

Stefan Voss, University of Hamburg, IWI - Von-Melle-Park 5, Hamburg, 20146, Germany, stefan.voss@uni-hamburg.de

Operations related to and in mining are nowadays unthinkable without efficient use of information technology and appropriate optimization methods. As the sustainable use of natural resources has achieved undoubted importance, we describe and classify processes and operations in sustainable mining and provide methods for their optimization. This refers to constructing a mine, running it, and finally shutting it down, also including energy efficiency, supply chain optimization and risk management.

3 - A Simulation Based Integrated Model to Evaluate Supply Chain Maintenance Planning Policies

Jose Ceroni, Pontificia Universidad Catolica de Valparaiso, Av. Brasil 2241, Valparaiso, Chile, jceroni@ucv.cl, Monica Lopez-Campos, Pablo A. Miranda

We propose an integrated approach to evaluate maintenance policies considering the spare parts supply chain, based on simulation of the maintenance system for a copper concentrate shipping operation. The model considers spare parts inventory costs and decisions, for evaluating combined strategies for maintenance and spare parts inventory. Analysis consists of a bi-objective evaluation of system performance indicators: spare parts inventory and supply costs, and equipment availability.

Parc - Lombard

Auctions and Trading Agents

Cluster: Auctions

Invited Session

Chair: Wolf Ketter, Professor, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, wketter@rsm.nl

1 - Impact of Mari on Multi-unit Sequential Dutch Auctions

Yixin Lu, Rotterdam School of Management, Erasmus University Rotterdam, Burgemeester Oudlaan 50, T9-16, Rotterdam, 3062PA, Netherlands, ylu@rsm.nl, Alok Gupta, Wolf Ketter, Eric van Heck

We examine the performance of two auction formats which are widely used for selling perishable goods, the traditional multi-unit sequential Dutch auction mechanism and a variation of it which involves an additional stage called "Mari" where non-winning participants can purchase goods at the same price as the winner in the previous round. Using a lab experiment, we show that the inclusion of Mari can significantly speed up the auction process at a negligible cost of allocative efficiency.

2 - Intelligent Virtual Power Plant Control: Electric Vehicles for Flexible Load Balancing

Micha Kahlen, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, kahlen@rsm.nl, Jan Dalen van, Wolf Ketter

We study an intelligent agent based trading strategy for the electricity wholesale market. This trading strategy schedules the charging of Electric Vehicles, as well as when electricity from the Electric Vehicles storage should be provided to the grid to meet peak load. Several Electric Vehicles are aggregated to a Virtual Power Plant that reacts in real-time to changing load conditions. We make an optimal tradeoff between Electric Vehicle driver's mobility needs and the exploitation of storage.

3 - An Ascending Dynamic Auction for Team-based Assignments

De Liu, University of Kentucky, 550 S Limestone St,, Lexington, KY, 40506, United States of America, de.liu@uky.edu

Many assignment problems involve assigning an object to a team of individuals. Examples include sending teams of workers to multiple project sites and assigning dorm rooms to students. I propose a dynamic ascending auction for assigning objects to teams of individuals.

Energy Management Analytics in the Demand Side

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Young Lee, Manager, IBM Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, ymlee@us.ibm.com

1 - Harnessing the Electric Load Flexibility of Energy-conscious Intelligent Transportation Systems

Mahnoosh Alizadeh, Postdoctoral Research Fellow, Stanford University, Packard EE Building, Room 372, 350 Serra Mall, Stanford, CA, 94305, United States of America, malizade@stanford.edu, Tara Javidi, Yueyue Fan, Hoi To Wai, Andrea Goldsmith, Anna Scaglione

In this talk, we model the electric vehicle trip planning and charge problem under dynamic traffic conditions and locational and time-varying electricity pricing. We discuss how load management strategies used by the power system operator could affect path planning problems solved by individual users or a social planner, and discuss the necessity of a joint view of intelligent transportation systems and the smart grid.

2 - Optimizing Energy Storage in Microgrids with Renewables

Arnab Bhattacharya, University of Pittsburgh, 1077, Benedum Hall of Engineering, Pittsburgh, PA, 15261, United States of America, arb141@pitt.edu, Jeffrey Kharoufeh

We consider the problem of optimally and dynamically procuring and storing energy in residential microgrids in the presence of renewable sources and dynamic pricing. A multi-stage, stochastic optimization problem is formulated to minimize a consumer's finite horizon electricity costs while accounting for uncertainties in distributed energy demand and intermittent supply.

3 - A Network Modelling Approach to Energy Efficiency Optimization in Industrial Systems

Niloofar Salahi, PhD Candidate, Rutgers The State University of New Jersey, 308 Green Hill Manor Dr, Franklin Park, NJ, 08823, United States of America, niloofar.salahi@gmail.com, Mohsen Jafari

This work focuses on energy efficiency optimization for industrial systems.The problem is formulated as a network optimization where nodes are interlinked by energy and performance dependencies.A node can represent a process, a machine or equipment.Solution to this model is energy efficiency share of each node.For illustration,a manufacturing facility with a production line and a technical building is used.The model integrates building energy dynamics with labor productivity and thermal comfort.

4 - A Data Driven Approach to Optimal Control of Building Energy Use

Seyed Vaghefi, PhD Candidate, Rutgers University, 96 Frelinghuysen Road, CoRE Building, Room 201, Piscataway, NJ, 08854, United States of America, vaghefi@rutgers.edu, Jack Brouwer, Yan Lu, Jianmin Zhu, Mohsen Jafari

We propose an optimal framework for forecasting and optimization of building energy consumption. It consists of two main phases. First, a set of offline data is used to construct an energy forecast model. Then, in the next phase, the model is fed into an optimal control strategy to find the optimal set points for a finite horizon. The optimization model is a Multi-objective Dynamic Programming that minimizes total energy cost as well as total deviation from thermal comfort bounds.

5 - Optimal Control of HVAC Systems for Demand Response

Young Lee, Manager, IBM Research, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, ymlee@us.ibm.com, Leo Liberti, Rui Zhang, Young Tae Chae, Raya Horesh

Building HVAC systems account for over 40% of the total energy consumption of buildings in the U.S. A method that dynamically computes the optimal control profile of HVAC Systems considering real-time electricity price, desired occupant comfort level, building operational schedule, weather forecast and thermal mass of buildings is presented. The control strategy can substantially reduce energy consumption and costs of HVAC systems in buildings.

■ SA73

Parc- Mission I

Real Options in the Energy Sector

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Afzal Siddiqui, University College London, Gower Street, London, United Kingdom, afzal.siddiqui@ucl.ac.uk

1 - Optimal Decision to Invest in an Engine-CHP Plant: A Real Options Approach in the Context of the German Regulatory Framework

Reinhard Madlener, Full Professor of Energy Economics and Management, RWTH Aachen University, FCN, Mathieustrasse 10, Aachen, 52074, Germany, RMadlener@eonerc.rwth-aachen.de, Freia Harzendorf

We develop a 2-dimensional real options model for the irreversible investment in an engine-CHP system. Fuel price and electricity price are subject to risk; heat revenues are assumed to be certain. On this basis of German Renewable Energies Act (EEG 2012) and Cogeneration Act (KWKG 2012) we determine and compare the investment in a natural gas- and a biogas-fired CHP plant by means of RO analysis. We also consider the biogas-fired engine-CHP plant as a 2-stage sequential investment option.

2 - Persist or Perish: Optimal Management of Alternative-Energy Technologies

Ryuta Takashima, Tokyo University of Science, 2641 Yamazaki, Noda, Chiba, 278-8510, Japan, takashima@rs.tus.ac.jp, Afzal Siddiqui

Policymakers have often backed alternative energy technologies, e.g., nuclear power, due to their relatively low operating costs and emissions. However, they have also been quick to respond to public perceptions about the safety of such plants by suspending construction or even decommissioning existing facilities. We address public concerns about physical plant risks along with stochastic market prices for energy by modelling investment in and decommissioning of alternative energy technologies.

3 - Investment and Capacity Sizing under Policy Uncertainty

Michail Chronopoulos, Norwegian School of Economics, Helleveien 30, Bergen, 5045, Norway, Michail.Chronopoulos@nhh.no, Verena Hagspiel, Stein-Erik Fleten

Frequent changes of support schemes and price uncertainty complicate investment decisions particularly when a firm must determine both the optimal time of investment and the size of a project. We analyse how investment timing and capacity sizing decision are affected by policy and price uncertainty for a project that can be completed in a single or multiple stages and find that policy uncertainty has an ambiguous impact on the required investment threshold and the corresponding optimal capacity.

4 - Anticipative Transmission Planning under Uncertainty

Afzal Siddiqui, University College London, Gower Street, London, United Kingdom, afzal.siddiqui@ucl.ac.uk, Trine Krogh Boomsma, Verena Hagspiel

Transmission system operators (TSOs) build transmission lines to take generation capacity into account. However, their decision is confounded by policies that promote renewable energy technologies. Thus, what should be the size of the transmission line to accommodate subsequent generation expansion? Taking the perspective of a TSO, we use a real options approach not only to determine the optimal timing and sizing of the transmission line but also to explore its effects on generation expansion.

■ SA74

Parc- Mission II

Market Issues for Hydro-Dominated Electricity Systems

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Ramteen Sioshansi, Assistant Professor, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, sioshansi.1@osu.edu

1 - Risk and Contracting in Hydro-dominated Electricity Markets

Andy Philpott, University of Auckland, Private Bag 92019, Auckland, New Zealand, a.philpott@auckland.ac.nz

Electricity markets with hydroelectricity are subject to energy shortages when there are low reservoir inflows. In perfectly competitive markets some of the risk of these shortages can be hedged by hydro generators trading contracts with agents with thermal plant that can perform a hydro-firming role, or with agents on the demand side. We examine the equilibrium outcomes of different types of contract when agents are endowed with coherent time consistent risk measures.

2 - Hydrothermal Scheduling with a Detailed Representation of River Channel Constraints

André Luiz Diniz, DSc, CEPEL - Brazilian Electric Energy Research Center, Av Horacio Macedo, 354, Cidade Universiteria, Rio de Janeiro, RJ, 21941911, Brazil, diniz@cepel.br

It is very important to have an accurate representation of reservoir cascades in power system operation, specially in predominantly hydro systems. We present a linear program to accurately model the river routing as well as several constraints - such as maximum level variation - along the water channels that connect reservoirs in cascade. Results for the short-term hydrothermal scheduling of the real large-scale Brazilian system show the high accuracy of our approach, with acceptable CPU times.

3 - Strategic Bidding for Price-Maker Hydro-Electric Producers

Steffen Rebennack, Colorado School of Mines, Division of Economics and Business, Golden, CO, United States of America, srebenna@mines.edu, Gregory Steeger, Luiz Barroso

Deregulation has led to the use of auction-based markets while a growing desire for efficient and renewable energy sources has rekindled modeling efforts in the energy sector. In this talk, we review and discuss approaches to maximize revenue in the production schedule for both single and multiple price-maker hydro-electric producers in a deregulated, bid-based market. We model the problem for a single price maker and for multiple price makers.

4 - Optimizing Offers for Cascaded Hydroelectric Generators in a Market with Centralized Dispatch

Ramteen Sioshansi, Assistant Professor, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, sioshansi.1@osu.edu

We examine the problem of offering generation and ancillary services from a set of cascaded hydroelectric units to a centrally dispatched market that does not account for watershed constraints. We formulate the problem as a stochastic bilevel optimization that maximizes generator profits under different demand and supply realizations. We use two numerical case studies to demonstrate the benefits of the proposed model.

■ SA75

Parc- Mission III

Simulation Optimization and Ranking and Selection

Sponsor: Simulation

Sponsored Session

Chair: Shane Henderson, Professor, Cornell University, School of ORIE, 230 Rhodes Hall, Ithaca, NY, 14850, United States of America, sgh9@cornell.edu

1 - A Comparison of Two Parallel Ranking and Selection Procedures

Eric Ni, Cornell University, 288 Rhodes Hall, Ithaca, NY, 14853, United States of America, cn254@cornell.edu, Shane Henderson, Susan Hunter

Traditional solutions to ranking and selection include two-stage procedures and sequential screening procedures. We migrate two representative procedures to a parallel computing platform to explore and compare their statistical validity, efficiency, and implementation in various settings. Inspired by the comparison results, we propose a framework for hybrid procedures that may further reduce simulation cost or guarantee to select a good system when multiple systems are clustered near the best.

2 - Feasibility Determination for Linearly Constrained Sets

Roberto Szechtman, Naval Postgraduate School, 1411 Cunnigham Rd, Monterey, United States of America, rszechtm@nps.edu, Enver Yucesan

We consider the problem of feasibility determination in a stochastic setting, where we wish to determine whether a system belongs to a given set based on a performance measure estimated through Monte Carlo simulation. We consider linearly constrained sets, and present a number of approaches that keep the expected number of incorrect determinations within a bound with certain probability. Our algorithms apply to random vectors with Gaussian, sub-Gaussian, and bounded support distributions.

3 - Selection of the Best through Sequential Subset Selection
L. Jeff Hong, Professor, Hong Kong University of Science and Technology, IELM Dept, HKUST, Clear Water Bay, Hong Kong - PRC, hongl@ust.hk, Weiwei Fan

Frequentist's formulations of selection-of-the-best problem include the indifference-zone (IZ) formulation and the subset-selection (SS) formulation. However, the first needs an IZ parameter that is often difficult to specify, and the second may result a subset that include more than one alternatives. To resolve such problems, we propose a sequential SS procedure based on the law of iterative logarithm. It does not need an IZ parameter but guarantees to select the best with a pre-specified PCS.

4 - Bias Issues in Simulation-based Stochastic Optimization
Peter Glynn, Stanford University, Huang Engineering Center 357, Stanford, CA, 94305, United States of America, glynn@stanford.edu

We discuss optimization bias and accompanying bias in the optimizer, in the setting of simulation-based optimization, both in the presence of parameter uncertainty in the underlying distributions and in its absence. We also introduce a new unbiased estimator for the optimum and its optimizer. This work is joint with Jose Blanchet,Danielle Davidian,Gerd Infanger,and Zeyu Zheng.

Planning and S&OP Processes

Sponsor: The Practice Track

Sponsored Session

Chair: Rob Hall, Managing Partner, End-to-End Analytics, 2595 E. Bayshore Rd., Suite 240, Palo Alto, CA, 94303, United States of America, rob@e2eanalytics.com

1 - How to Speed ERP Implementation and Reduce Time to ROI
Warren McCullough, Director, Sales & Operations Planning, NetApp, 495 East Java Drive, Sunnyvale, CA, 94089, United States of America, warrenm3@me.com

Executives have a compelling desire to limit project scope of an ERP implementation to core system of record functions, to avoid biting off too much too soon. But, unless key processes are included, it is much harder to get your ROI. By including these three key tangential processes: master data management, S&OP, and supply chain collaboration in your business requirements, you can help speed ERP system adoption and decrease time to achieve ROI from an ERP implementation.

2 - Delivering Effective and Robust Planning Tools using Excel
Rob Hall, Managing Partner, End-to-End Analytics, 2595 E. Bayshore Rd., Suite 240, Palo Alto, CA, 94303, United States of America, rob@e2eanalytics.com

Many businesses continue to rely on individualized Excel spreadsheets for their planning activities. Excel is ubiquitous, easy-to-use, flexible, and powerful business tool. But spreadsheets developed by individuals are notoriously error-prone, fragile, inefficient, and not scalable. However, it is possible to develop and deploy robust, standardized, and scalable Excel tools to the user community. I share a practical example of such an approach.

3 - Achieving Supply Chain Excellence at Sandisk Corporation
Shiva Esturi Sathyanarayan, Director II, Operations Management, Sandisk Corporation, 951 Sandisk Drive, Milpitas, CA, 95035, United States of America, Shiva.EsturiSathyanarayan@Sandisk.com, Bo Liao

We discuss how supply chain excellence towards improving inventory turns and customer service level at SanDisk Corporation is achieved through a postponement strategy coupled with business segmentation, prioritized replenishments for constrained supply, and improving supply chain visibility and response to exceptions.

Analytics Applications on Decision Making

Sponsor: Analytics

Sponsored Session

Chair: Juan Li, Research Scientist, Xerox Corporation, 800 Phillips Road, Webster, NY, 14580, United States of America, Juan.Li@xerox.com

1 - Dynamic Framework for the Design and Evaluation of Kidney Exchange (KE) Programs
Tulia Plumettaz, Xerox Corporation, 800 Phillips Rd, Bldg 128-257F, Webster, 14580, United States of America, Tulia.Plumettaz@xerox.com, Jay Sethuraman

Mechanisms are typically evaluated by their overall performance on a large exchange pool, based on which recommendations are drawn. We consider a dynamic framework to evaluate extensively used KE mechanisms. Our results suggest that some of the features that are critical in a mechanism in the static setting have minor impact in its long-run performance. Also features that are generally underestimated in the static setting turn to be relevant when we look at a dynamically evolving exchange pool.

2 - Exploration vs. Exploitation in the Information Filtering Problem
Xiaoting Zhao, Cornell University, Rhodes Hall, Ithaca, NY, 14850, United States of America, xz337@cornell.edu, Peter Frazier

We consider information filtering, in which we face a stream of items to voluminous to process by hand, and must rely on a computer system to automatically filter out irrelevant items. Modeled as a Bayesian sequential decision-making problem, we show how it may be solved to optimality using dynamic programming and a decomposition that exploits special problem structure. We then present an application of this method to a historical dataset from the arxiv.org repository of scientific articles.

3 - Condition-Based Spare Parts Inventory Management for Aircraft Engines
Jennifer K. Ryan, Associate Professor, Rensselaer Polytechnic Institute, 110 8th Street, Industrial & Systems Engineering, Troy, NY, 12180, United States of America, ryanj6@rpi.edu, Michelle Park, Robert Gao, Robert Tomastik, Ana Muriel

Lack of coordination between maintenance decision-making and the inventory management of spare parts can lead to increased inventory costs and unnecessary equipment downtime. To address this gap, we have developed a framework for incorporating real-time condition information into inventory decisions for spare parts that are subject to deterioration. While equipment condition monitoring is of relevance to many manufacturers, the application context of this research is commercial jet engines.

Stochastic Analytics Models and Methods

Sponsor: Analytics

Sponsored Session

Chair: Michael N. Katehakis, Rutgers University, Newark, NJ, United States of America, mnk@rutgers.edu

1 - Switching Curve Optimal Policy in an Infinite Server Farm Model
Herman Blok, PhD, Leiden University, Niels Bohrweg 1, Leiden, Netherlands, blokh1@math.leidenuniv.nl, Flora Spieksma

We wish to minimise the expected cost due to energy consumption. After completing service, a server can be put on standby and consume extra energy. Or turned off, which saves energy, but yields extra costs when turned back on. We model this as an MDP, which is challenging due to unbounded rates and transient policies. The only existing result concerns bounded jumps and discounted cost. We show how to carry these results to the unbounded model. We further exploit the model to get average results.

2 - Markov Decision Processes and Inventory Control
Eugene Feinberg, Distinguished Professor, Stony Brook University, Dept. of Applied Math. & Statistics, Stony Brook, NY, 11790, United States of America, eugene.feinberg@stonybrook.edu, Yan Liang

Recent results on Markov Decision Processes (MDPs) with general state and action sets provide direct tools for optimization of periodic review inventory systems. In this talk we describe general results on MDPs and their applications to particular inventory control problems.

3 - DES and RES Processes and their Explicit Solutions
Laurens Smit, Leiden University, Niels Bohrweg 2, Leiden, Netherlands, lsmit@math.leidenuniv.nl, Michael N. Katehakis, Flora Spieksma

We define and study the down entrance state (DES) and the restart entrance state (RES) classes of quasi skip free processes. We derive explicit solutions and bounds for the steady state probabilities of both processes. To motivate the applicability we present solutions for queueing and inventory problems. In addition we present a procedure to decompose Markov processes into separate thinned processes. We discuss applications when the thinned processes satisfy the DES and RES property and the original process does not.

4 - Dynamic Models Valuation and Utilization of Tax Loss Carryforwards and Carrybacks
Nilofar Varzgani, PhD Student, Rutgers Business School, 101 Bleeker Street, Newark, NJ, 07102, United States of America, nvarzgani@gmail.com, Michael N. Katehakis, Suresh Govindaraj

We present new models for valuation and utilization of tax loss-carryforwards (TCLFs) and carrybacks (TLCBs) under deterministic and stochastic tax code conditions. We investigate similarities between TCLFs and the existing literature on perishable inventory models and we provide an algorithmic discrete time framework for valuing TLCFs (TLCBs).

The Next 50 Years of Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Jim Matheson, Chairman, SmartOrg, Inc., 855 Oak Grove Ave Ste 202, Menlo Park, CA, 94025, United States of America, jmatheson@smartorg.com

1 - Decision Engineering – The Next 50 Years
Jim Matheson, Chairman, SmartOrg, Inc., 855 Oak Grove Ave Ste 202, Menlo Park, CA, 94025, United States of America, jmatheson@smartorg.com

The next 50 years of evolution: embedding sound decision processes throughout organizations, for big and little decisions, for exigent and routine, for strategic and operational, for situations dominated by value questions, by uncertainty or by complexity. In addition, all of these situations need to be supported by embedded software that does not often require power users, and that integrates the analytics on big data about the past with human judgments about the future. Create the future!

2 - Societal Decisions: The Next 50 Years?
Warner North, President and Principal Scientist, NorthWorks, Inc., 1715 Taylor Street, San Francisco, CA, 94133, United States of America, northworks@mindspring.com

Where will application of DA to societal decisions be in 50 years? I hope such application will have become part of standard decision support practice, along with accounting, cost-benefit analysis, and planning for acceptable safety. Improvements in education are needed, including probability theory and behavioral economics. Engineering of complex systems needs to be linked to DA. To some extent this has happened, but more linkage is needed.

3 - Healthcare Business Analytics and Decision Support: The Next 50 Years
Don Kleinmuntz, Professor of the Practice of Business Analytics, University of Notre Dame, 452 W Huron St, Chicago, Il, 60654, United States of America, don@kleinmuntzassociates.com

Healthcare businesses and organizations of all types are discovering opportunities presented by growing pools of detailed data, but are still at a relatively early stage of development and deployment. This talk will outline how more sophisticated decision tools and processes can transform healthcare service delivery, and also address the challenges these efforts are likely to encounter.

4 - Military Decision Making: The next 50 Years
Greg Parnell, Professor, Dept of Industrial Engineering, University of Arkansas, Fayetteville, AR, 72701, United States of America, gparnell@uark.edu, Terry Bresnick

Military planners must respond to opportunities and threats. New technologies and vast amounts of information will be available to military operators to perform their global missions. However, our adversaries will use asymmetric warfare including weapons of mass destruction/disruption using kinetic and cyber-warfare to achieve their objectives. Decision analysis will continue to provide insights about future military systems required to underwrite our national security in the next 50 years.

5 - Space and Security Decisions: The Next 50 Years
Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu

In the next 50 years, decision analysis will play an important role in space discovery and national security decisions. Space discovery decisions include asteroid recovery missions, long time horizons, uncertainty about asteroid composition, and real time decisions based on data that will be observed out in space. National security decisions will require cyber security considerations as well as ethical considerations and a wealth of data along with the decision process.

Military Applications of Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Michael J. Kwinn, Jr., Professor of Systems Engineering, Dept of Systems Engineering, US Military Academy, West Point, NY, 10996, United States of America, michael.kwinn@usma.edu

1 - Big Data's Role on Tomorrow's Battlefield – Lessons Learned from Operation Enduring Freedom
Brian Harris, Operations Research Analyst, Center for Army Analysis, 6001 Goethals Road, Fort Belvoir, VA, 22310, United States of America, brian.j.harris18.mil@mail.mil

The digitalization of the battlefield, and the proliferation of machine-generated data will greatly increase the volume, velocity, and variety of data available for analysis. This massive increase in available data offers a tremendous opportunity to provide more timely and extensive advice to commanders. This brief will examine specific challenges faced in Operation Enduring Freedom as well as technologies that will change the way analysts support future military operations.

2 - A Constructive Assessment Process Supporting Army Acquisition
Patrick J. Driscoll, Professor, U.S. Military Academy, Dept of Systems Engineering, Bldg 752 Mahan Hall, West Point, NY, 10996, United States of America, patrick.driscoll@usma.edu, Timothy Elkins, Michael Jaye

An user-focused assessment process was developed in response to disappointing system acceptance and use in deployed settings. The process - Warfighter Technology Tradespace Methodology (WTTM) - integrates multiple perspectives on constructed scales to assess technological performance, human systems integration, and logistics supportability factors to expose potential system vulnerabilities. Select results from a subset of over 400 systems will be presented and discussed.

3 - using Peer Support Groups to Reduce Suicides
Ashok Deb, Assistant Professor, US Army, 1568 Cherry Tree Drive, Clarksville, TN, 37042, United States of America, ashok.k.deb.mil@mail.mil

This research seeks to empower members of the DoD to work together to mitigate suicides by designing a Peer Support Group that will increase resilience and self-esteem within Service Members. By leveraging the Systems Design Process eight necessary components of the proposed Peer Support Group was identified. Each component was explored using analysis, statistics, surveys and review of previous research to determine the best recommendations for each of these components.

4 - Evaluating Geospatial Data Collection Tools for the Army
Megan Wilton, megan.catherine.anne.wilton@gmail.com, Alexandra Sutherland, Breawna Davis

This report will consider the tradeoffs associated with a number of geospatial data collection tools in order to recommend the most valuable and cost effective solution to the Army. Through the Systems Decision Process, a collaborative process that focuses on the needs and values of a stakeholder when dissecting and creating alternatives for a given initial problem, the BuckEye system will prove most valuable in the context of the guidelines set by our stakeholders.

Networks and Information

Cluster: Data and Information

Invited Session

Chair: Shayan Ehsani, Stanford University, MS&E Department, Stanford, United States of America, shayane@stanford.edu

1 - On the Socially-Optimal Design of Online Reviewing Platforms

Yiangos Papanastasiou, London Business School, Regent's park, London, United Kingdom, yiangosp@london.edu, Kostas Bimpikis, Nicos Savva

In an online reviewing platform, information on the quality of alternative service providers is both generated and utilized by the consumer population. Social inefficiency arises from the fact that information is generated as a byproduct of self-interested consumer behavior, rather than with the benefit of future consumers in mind. Within a classic multi-armed bandit framework, we study how this inefficiency relates to alternative policies of information-disclosure to the platform's users.

2 - Multi-retailer Inventory Problem with Batch Production

Hyun-Soo Ahn, University of Michigan, 701 Tappan St., Ann Arbor, MI, 48104, United States of America, hsahn@umich.edu, Yang Wang, Stefanus Jasin, Phil Kaminsky

Motivated by a problem in biopharmaceutical manufacturing, we consider a discrete time finite horizon inventory problem where several retailers place orders to meet stochastic demand, and in each period, the sum of order quantities across retailers must be a multiple of a standard batch size. We characterize structure of optimal policy, and develop data-driven heuristics with analytic bounds.

3 - Disruption and Diversification in Supply Chains

Alex Teytelboym, Postdoctoral Fellow, MIT, 77 Massachusetts Ave., 32-D632, Cambridge, MA, 02139, United States of America, t8el@mit.edu, Asuman Ozdaglar, Daron Acemoglu, Marco Scarsini

We analyze how supply chains form in the presence of shocks that can cause cascades of production disruption. Firms' inputs are imperfectly substitutable and input diversification is costly. Firms face a tradeoff between the cost of signing more input contracts and the possibility of production disruption. We show how the structure of input-output network affects firms' incentives and the efficiency of equilibria. We discuss the benefits of coordination in supply chain formation.

4 - Auctions with Dynamic Costly Information Acquisition

Negin Golrezaei, Marshall School of Business, University of Southern California, Los Angeles, United States of America, golrezae@usc.edu, Hamid Nazerzadeh

We study the mechanism design problem for the seller of an indivisible good in a setting where buyers can purchase the additional information and refine their valuations for the good. This is motivated by information structures in online advertising where advertisers can target users using cookie-matching services. For this setting, we propose a rich class of dynamic mechanisms, called Sequential Weighted Second-Price, which encompasses the optimal and the efficient mechanisms as special cases.

Robust Multiobjective Optimization

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Margaret Wiecek, Clemson University, Mathematical Sciences, Clemson, United States of America, wmalgor@clemson.edu

1 - Trade-Offs and Proper Optimality in Multiple-Criteria Optimization under Uncertainty

Anzhelika Lyubenko, Ph.D. Candidate, University of Colorado Denver, 1250 14th Street, Denver, CO, 80202, United States of America, anzhelika.lyubenko@ucdenver.edu, Alexander Engau

We present new results to characterize and compute objective trade-offs and a set of corresponding compromise solutions for multicriteria optimization problems that include elements of uncertainty. We compare our new solutions to those obtained from the alternative approaches of robust and stochastic programming on an example from financial portfolio optimization. We also summarize a few technical results that provide new theoretical insights into the closely related theory of proper optimality.

2 - Robust Biobjective Optimization with One Uncertain Objective

Andrea Raith, The University of Auckland, UniServices House, 70 Symonds St, CBD, Auckland, 1025, New Zealand, a.raith@auckland.ac.nz, Kenneth Kuhn, Anita Schöbel, Marie Schmidt

Standard robustness concepts are extended for biobjective optimization problems with one uncertain objective. The concepts are further refined to ensure robust efficient solutions are not dominated by another solution in all considered scenarios. We propose algorithms to identify robust efficient solutions for combinatorial problems and finitely many scenarios. Results of an application in modelling shipments of hazardous materials, a biobjective shortest path problem, are shown.

3 - Multiobjective Optimization under Uncertainty: Models and Robust Counterparts

Margaret Wiecek, Clemson University, Mathematical Sciences, Clemson, United States of America, wmalgor@clemson.edu, Erin Doolittle, Herve Kerivin

We study three models of uncertain multiobjective programs (MOPs): with uncertain coefficients in constraint functions, uncertain parameters converting MOPs into single-objective programs (SOPs), and uncertain objective functions. For each case, we propose a robust counterpart problem and reduce it into a computationally tractable deterministic MOP or SOP. We examine the relationships between the efficient sets.

■ SA83

Doing Good with Good OR - Student Paper Competition

Cluster: Doing Good with Good OR - Student Paper Competition

Invited Session

Chair: Carri Chan, Columbia University Business School, 3022 Broadway, Uris 410, New York, NY, United States of America, cwchan@columbia.edu

1 - Doing Good with Good OR Student Competition

Ruben Proano, Assistant Professor, Rochester Institute of Technology, Rochester, NY, United States of America, rpmeie@rit.edu

Doing Good with Good OR - Student Paper Competition is held each year to identify and honor outstanding projects in the field of operations research and the management sciences conducted by a student or student group that have a significant societal impact.

2 - Volunteer Engagement in the Age of Analytics: A Case Study with American Red Cross, Greater Chicago Region

Andrew Fox, Northwestern University, Evanston, IL, 60208, United States of America, AndrewFox2014@u.northwestern.edu, Tessa Swanson

Many nonprofit agencies require volunteers as a resource for achieving operational objectives. Recognizing that volunteers can engage or disengage from an organization with relative ease, we study volunteer scheduling and dispatch at American Red Cross, Greater Chicago Region. We develop baseline metrics, predictive modeling, and scheduling policies to optimize the opportunities in which volunteers engage with the organization.

3 - Smarter Tools for (Citi) Bike Sharing

Eoin O'Mahony, Cornell University, Ithaca, NY, United States of America, eoin@cs.cornell.edu

Bicycle sharing systems provide a low-cost, environment-friendly urban transportation option. Efficient management of these systems poses a bicycle rebalancing problem comprising three questions: where do bikes need to be, when must they be there, and how can they get there? I apply operations research techniques to yield practical answers to these questions; my solutions optimize current operations at NYC (Citi)Bike.

4 - Resource Allocation and Optimization for Advanced Voting in Gwinnett County

Mehran D'Souza, Georgia Institute of Technology, Atlanta, GA, United States of America, mehsd969@gatech.edu

We develop a decision support tool for the allocation of resources in a queueing network for advanced voting in Gwinnett County, Georgia. Resources include clerks, laptops, and voting machines. To illustrate this tool, we show that a reduction of 1.8 hours of average wait time for a presidential election can be achieved for about $6,000, which impacts roughly 40,000 voters.

Sunday, 11:00am - 12:30pm

■ SB01

Hilton- Golden Gate 6

DIME/PMESII 1

Sponsor: Military Applications Society

Sponsored Session

Chair: Dean Hartley, Principal, Hartley Consulting, 106 Windsong Ln, Oak Ridge, TN, 37830, United States of America, DSHartley3@comcast.net

1 - Understanding DIME/PMESII

Dean Hartley, Principal, Hartley Consulting, 106 Windsong Ln, Oak Ridge, TN, 37830, United States of America, DSHartley3@comcast.net

I introduce DIME/PMESII and tools to support understanding it. The US has been and will continue to be involved in DIME/PMESII situations. Understanding these situations is a prerequisite to dealing with them well – and they are difficult to understand. The Army has developed some tools that will be useful. We can convert these tools into enablers to allow fewer people to do more with fewer resources, support Institutional Memory retention, and leverage current information gathering tools.

2 - Best Practices for Irregular Warfare (IW) Data Quality Control

Jeff Appleget, Senior Lecturer, Naval Postgraduate School, 1411 Cunningham Road GL-239, Monterey, CA, 93943, United States of America, jaappleg@nps.edu

US DoDI 5000.61 mandates that "Models, simulations, and associated data used to support DoD processes, products, and decisions shall undergo verification and validation (V&V) throughout their lifecycles." This presentation identifies the challenges with finding, using, and the quality control of data for Irregular Warfare Methods, Models, and Tools (MMTs), and recommends best practices for DoD organizations to adopt to ensure that IW data is quality controlled.

3 - using Complex Adaptive Systems Research to Analyze Al Qaeda's Terror Network

Charlie Graham, American Military University, 111 W. Congress Street, Charles Town, WV, 25414, United States of America, charlie.c.graham@gmail.com, Philip Fellman

The US response to Al Qaeda, following the 9/11 attack on the World Trade Center, has to some extent diminished the centralized command of Al Qaeda. At the same time that Al Qaeda's central organization has been undermined, the Salafist jihad has expanded into a host of distributed cellular networks across allied organizations. We use social network theory and the computational tools of social network analysis to analyze the behavioral characteristics of these various organizations.

Strategies for Developing Inventions and Profiting from Them

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Leonardo Santiago, Associate Professor, Federal University of Minas Gerais, Escola de Engenharia da UFMG, Av. Antonio Carlos 6627. Pampulha, Belo Horizonte, MG, 31270901, Brazil, lsantiago@ufmg.br

1 - Selling a New Product: The Role of Customer Learning Externality and Incumbent Reaction

Bilal Gokpinar, Assistant Professor, University College London, Gower Street, London, United Kingdom, b.gokpinar@ucl.ac.uk, Yufei Huang, Onesun Steve Yoo

We study an entrepreneur's optimal sales resource allocation strategy when selling a new product/service to rational customers who differ in their revenue potential and the level of influence on each other. We then consider the case of competition between a newcomer and an incumbent, and study the newcomer's customer acquisition and the incumbent's customer retention strategies in the presence of customer learning externality.

2 - Strategies for Technologies with Weak Patent Rights Revisited

Leonardo Santiago, Associate Professor, Federal University of Minas Gerais, Escola de Engenharia da UFMG, Av Antonio Carlos 6627. Pampulha, Belo Horizonte, MG, 31270901, Brazil, lsantiago@ufmg.br, Henrique Rocha, Jose Heleno Faro

In this paper we focus on strategies companies can adopt in order to prevent imitation of their technological innovations. We develop a game theoretical model to assess the key variables that can impact the firm's strategies for value appropriation or inhibit competitors from entering into the market. The results hinge on the competitor's absorptive capacity, and on it's choice between the alternatives for competing with a patented innovation.

3 - Is There a Doctor in the House?: The Impact of Users on Medical Device Innovation

Sruthi Thatchenkery, Stanford University, MS&E Department, Stanford, United States of America, sruthi@stanford.edu, Riitta Katila, Michael Christensen, Stefanos Zenios

We explore the innovation impact that users have in new firms. While users frequently advice firms as members of advisory boards or as external consultants, and commercialize their inventions by founding firms, we know little about how young firms can effectively leverage users in various other organizational roles. We draw on an extensive custom-collected dataset of 268 surgical instrument firms over a 31-year period.

Business Model Innovation: Operations and Information Management Perspectives

Cluster: Business Model Innovation

Invited Session

Chair: Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, United States of America, jguajardo@haas.berkeley.edu

1 - The Risk-driven Business Model: Four Questions that will Define Your Company

Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, serguei.netessine@insead.edu, Karan Girotra

We discuss our take on business model innovation based on the book "The Risk-Driven Business Model: Four Questions that Will Define your Company" www.defineyourcompany.com. We make an argument that the field of Operations Management should be moving away from how to manage a company in a steady-state and towards innovation: taking company to a drastically new level.

2 - New Service Business Models - Problems and Opportunities

Kamalini Ramdas, London Business School, Regent's Park, London, United Kingdom, kramdas@london.edu

I will describe new business models in a variety of services in areas such as healthcare, education, tax, utilities and banking and identify common features within groups of business models, with a view to identifying research opportunities for operations management and innovation researchers in the area of business model innovation.

3 - From Problem Driven to Data Driven Research

David Simchi-Levi, Professor, MIT, 77 Massachusetts Ave, Room 1-171, Cambridge, MA, 02139, United States of America, dslevi@mit.edu

Increased computing power and the explosion of data are changing the way organizations capture data, analyze information and make decisions. These changes provide opportunities for our community to analyze extensive data so as to identify new models that drive decisions and actions. In this talk, I will presents my view on these opportunities and challenges.

4 - Randomized Field Experiments in Mobile Advertising and Mobile Coupons

Anindya Ghose, NYU, Stern School, New York, United States of America, aghose@stern.nyu.edu

We present results from randomized field experiments that measure the ROI of mobile marketing and promotions. In the first one, we explore cross channel synergies between web and mobile advertising. In another set of field experiments involving a location based app for smartphones, we measure user redemption behavior of geo-targeted mobile coupons.

■ SB04

Hilton- Continental 1

Topics in Operations with Marketing Incentives

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Guoming Lai, Assistant Professor, McCombs School of Business, University of Texas at Austin, 2110 Speedway, Austin, TX, 78712, United States of America, Guoming.Lai@mccombs.utexas.edu

1 - Search for Information on Multiple Products

Tony Ke, UC Berkeley, IEOR, Etcheverry Hall, Berkeley, CA, 94720, United States of America, kete@berkeley.edu, Zuo-Jun Max Shen, Miguel Villas-Boas

When a consumer considers a purchase in a product category, she can gather information sequentially on several products. We develop a framework for continuous search for information on choice set of multiple alternatives, and apply it to consumer search in product market. We solve for the optimal search, switch, and purchase or exit behavior analytically. We show interesting implications of how product valuations, information correlation among products, and size of choice set influence sales.

2 - Customer Acquisition and Retention: A Customer Life Time Value Approach to Quality and Capacity

Azin Farzan, Univesity of Southern California, Univesity of Southern California, Bridge 401, Los Angeles, CA, 90089, United States of America, afarzan@usc.edu, Yong-Pin Zhou

We analyze the optimal decision set for a service provider. The firm chooses both capacity and quality levels and also the marketing strategy and investment level to maximize profit. Because the nature of the consumer behavior is heavily dependent on the operations and marketing strategy, there is a natural tradeoff between these strategies. We model the effects of operations and marketing decisions on both the customer acquisition and retention processes and create an elaborate service model.

3 - Agility and Proximity Considerations in Supply Chain Design

Ho-Yin Mak, Assistant Professor, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong - PRC, hymak@ust.hk, Michael Lim, Zuo-Jun Max Shen

In the increasingly competitive online retailing market, competitive edge is built on short response times and high product availability. In this work, we investigate the impact of agility, the ability to responsively and flexibly allocate demand among stocking locations in the distribution network, on the optimal network configuration. Our results offer insights into optimal designs of agile supply chains that contrast sharply with classical results on conventional supply chains.

4 - Sourcing with Deferred Payment and Inspection

Guoming Lai, Assistant Professor, McCombs School of Business, University of Texas at Austin, 2110 Speedway, Austin, TX, 78712, United States of America, Guoming.Lai@mccombs.utexas.edu, Huaxia Rui

We study the deferred payment and inspection mechanisms for mitigating supplier product adulteration, with endogenous procurement decision and general defect discovery process. We derive the optimal deferred payment contract and the inspection equilibrium. We find that the deferred payment mechanism generally can outperform the inspection mechanism when either the market size is small or the profit margin is low.

Retail Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Zumbul Atan, Eindhoven University of Technology, School of Industrial Engineering, Eindhoven, Netherlands, Z.Atan@tue.nl

1 - Understanding the Risks and Benefits of Radio Frequency Identification (RFID) in Managing a Seasonal

Ozgen Karaer, Assistant Professor, Middle East Technical University, Department of Industrial Engineering, Universiteler Mah. Dumlupinar Bulvari #1, Ankara, 06800, Turkey, okaraer@metu.edu.tr

Achieving inventory record accuracy through RFID (Radio Frequency Identification Technology) facilitates correct replenishment in a retail environment, which is expected to increase sales. We study the RFID impact on in-season management of a retailer of a seasonal product. We demonstrate how inventory discrepancy could hurt the retailer's revenue and quantify the value of RFID in this respect. We also study an imperfect RFID scenario to show it could adversely affect the benefits.

2 - An Efficient Algorithm for Capacitated and Stochastic Assortment Planning

Alexander Huebner, Professor, Catholic University, Auf der Schanz 49, Ingolstadt, 85049, Germany, Alexander.Huebner@ku.de, Heinrich Kuhn, Sandro Kuehn

Increasing product variety in the retail trade is in conflict with the limited shelf space. We identify the underlying category planning problems and formulate a Newsboy-based capacitated assortment problem with stochastic demand and substitution. We develop an epsilon-exact procedure which is capable of solving problem instances of practical relevance. The numerical analyses show that out-of-assortment and out-of-stock substitution effects have a significant impact on profit and solution.

3 - Effect of Shelf Capacity on Backroom Operations

Nesim K. Erkip, Bilkent University, Department of IE, Ankara, 06800, Turkey, nesim@bilkent.edu.tr, Zumbul Atan

Most retailers use backrooms as extra storage space. Backrooms are necessary when inventories do not fit to the available shelf space. Excess inventories are placed to the backrooms and used to satisfy customer orders when shelf inventory is depleted. We study a retailer with limited shelf capacity. Assuming a continuous review (r,q) policy with a given q, we investigate the optimal reorder level when unsatisfied customer demands are lost or backordered.

4 - Inventory Control with Shelf Space Consideration

Zumbul Atan, Eindhoven University of Technology, School of Industrial Engineering, Eindhoven, Netherlands, Z.Atan@tue.nl, Nesim K. Erkip, Tom Van Woensel, Jan C. Fransoo

We consider a retailer with limited shelf space. Assuming continuous restocking from a backroom, we study retailer's optimal replenishment decisions and the optimal shelf capacity. The main determinants of the optimal solutions are investigated through sensitivity analysis.

Behavioral Research in Information Sharing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Saibal Ray, Professor, McGill University, Desautels Faculty of Management, Montreal, Canada, saibal.ray@mcgill.ca

Co-Chair: Jud Kenney, PhD Candidate, McGill University, Bronfman Building, 1001 rue Sherbrooke Ouest, Montreal, QC, H3A 1G5, Canada, jud.kenney@mail.mcgill.ca

1 - Information Sharing under Supply Uncertainty

Jud Kenney, PhD Candidate, McGill University, Bronfman Building, 1001 rue Sherbrooke Ouest, Montreal, QC, H3A 1G5, Canada, jud.kenney@mail.mcgill.ca, Saibal Ray, Jim Engle-Warnick

This study investigates the behavior of manufacturers and suppliers sharing information when supply chain uncertainty is dominated by supply instead of demand. We elicit beliefs of both manufacturer and supplier roles and compare how subjects distort their information as manufacturers and compensate for the distortion as suppliers.

2 - On the Learning Process of a Newsvendor with Censored Demand Information

Yingshuai Zhao, Ph.D. Candidate, Tsinghua University, Shunde Building, Tsinghua University, Beijing, China, zhao-ys08@mails.tsinghua.edu.cn, Xiaobo Zhao

We conducted an experimental study to explore the decision process in a fully censored-demand-information scenario. With censored information, participants had no demand distribution knowledge while they could only observe censored demand in every period. An efficient learning effect is verified and an exponential-type learning model based on the experimental data. We have found that the learning process could be influenced by both information and profit configurations

3 - Experimental Investigation of Salesforce Pricing Decisions

Rashmi Sharma, PhD Student, The Pennsylvania State University, Business Building, University Park, United States of America, ros5253@smeal.psu.edu, Saurabh Bansal, Elena Katok, Peter Rimshnick

We model salesforce pricing decisions under the uncertainty of getting a contract, and various incentive schemes. We identify three classes of projects with specific risk profiles, and the incentive schemes best suited for each. Subsequently, we test pricing decisions in a lab to identify behavioral factors that influence pricing decisions.

4 - How Team Personality, Dynamics and Material Work Flow Policies Affect Team Performance

David Cantor, Associate Professor, Iowa State University, 2340 Gerdin Business Building, Ames, IA, 50011, United States of America, dcantor@iastate.edu, Paula Morrow

Supply chain and organizational behavior scholars are interested in understanding how individual differences such as personality traits and cognitive ability affect team performance. The focus of this study is on examining how individual differences affect team performance in material flow lines. This study seeks to answer the following research questions: How do team personality and dynamics affect team performance? Do material work flow policies moderate this relationship?

Incentive and Contracting in Healthcare Networks

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Retsef Levi, MIT Sloan School of Management, 100 Main Street, E62-562, Cambridge, MA, 02139, United States of America, retsef@mit.edu

1 - Online Algorithms for Dynamic Multi-priority Allocation Scheduling

Xinshang Wang, Columbia Business School, New York, NY, United States of America, xw2230@columbia.edu, Van-Anh Truong

In a dynamic allocation scheduling problem, patients arriving in each period are either served in the current period, or placed in a queue. The trade-off for this problem is between overtime resource expenditure required for immediate service and patient waiting time. We introduce the first online scheduling algorithm which is 2-competitive, the best possible ratio for this class of problems. We use simulation results to test the performance of our algorithm and its variants.

2 - Efficiency of Revenue Sharing Joint Ventures with Capacity Investment Decisions

Cong Shi, Assistant Professor, University of Michigan, 2797 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, shicong@gmail.com, Wei Sun, Retsef Levi, Georgia Perakis

We study capacity planning problems with resource pooling in joint ventures under uncertainties. When resources are heterogeneous, there exists a unique efficient revenue sharing contract under proportional fairness. This optimal contract rewards every player proportionally to her marginal cost. When resources are homogeneous, there does not exist an efficient revenue sharing contract. We propose a provably good contract that rewards each player inversely proportional to her marginal cost.

3 - Risk Sharing Pricing Contract between Healthcare Networks

Retsef Levi, MIT Sloan School of Management, 100 Main Street, E62-562, Cambridge, MA, 02139, United States of America, retsef@mit.edu, Fernanda Bravo, Georgia Perakis, Gonzalo Romero

Motivated by the pricing of referrals in healthcare, we present a new pricing contract for a service-based business interaction. Here, one firm provides a service to another firm, whereas the demand for that service is a priori uncertain. The model includes firm's risk valuation with respect to demand uncertainty, such that the new contract allows for better risk sharing. By modeling firms' interaction in a game theoretic framework, we fully specify the contract for general demand distributions.

Hilton- Continental 7

Product Assortment: Theoretical and Experimental Developments

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Aydin Alptekinoglu, Penn State, Smeal College, University Park, PA, 16802, United States of America, aydin@psu.edu

Co-Chair: Ali Parlakturk, Associate Professor, Kenan-Flagler Business School, University of North Carolina at CH, Campus Box 3490, Chapel Hill, NC, 27599, United States of America, Ali_Parlakturk@kenan-flagler.unc.edu

1 - Dynamic Assortment Competition and the Role of Supply Chain Responsiveness

Victor Martinez de Albeniz, IESE Business School, Av. Pearson 21, Barcelona, 08034, Spain, valbeniz@iese.edu, Gurhan Kok

Fast fashion retailers can launch products inspired on popular trends and styles, while traditional retailers with longer lead times arrive late to the market for those items. We study dynamic assortment choices when retailers with different responsiveness capabilities compete. We find that shorter lead-times provide higher sales and higher margins. However, slow retailers may also benefit by entirely capturing the sales of products late in the product life cycle.

2 - The Effect of Contract Type on Retailer Product Choice

Anna Devlin, Assistant Professor, University of Alabama Huntsville, College of Business, Huntsville, Al, United States of America, anna.g.devlin@gmail.com, Wedad Elmaghraby, Rebecca Hamilton

In this research we study experimentally if the type of contract offered influences the level of risk a retailer engages in when making product decisions. We first test if contract type influences the retailer's decision between two products and then extend this to subsequent order quantity decisions.

3 - The Exponomial Choice Model

Aydin Alptekinoglu, Penn State, Smeal College, University Park, PA, 16802, United States of America, aydin@psu.edu, John Semple

We propose a new discrete choice model and explore its implications for assortment planning and pricing.

4 - Is Servicization a Win-Win Strategy?

Ali Parlakturk, Associate Professor, Kenan-Flagler Business School, University of North Carolina at CH, campus box 3490, Chapel Hill, NC, 27599, United States of America, Ali_Parlakturk@kenan-flagler.unc.edu, Vinayak Deshpande, Adem Orsdemir

We study profit and environmental implications of servicization, the practice of selling the functionality of the product rather the product itself. We contrast segmentation benefit of servicization to that of offering a product line.

Hilton- Continental 8

Operations Economics

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Gabriel Weintraub, Columbia Business School, gyw2105@columbia.edu

Co-Chair: Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu

1 - Network Effects in Conspicuous Consumption

Ruslan Momot, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Ruslan.MOMOT@insead.edu, Elena Belavina, Karan Girotra

We consider a firm selling goods to consumers who value the perception of the good by other consumers in their social network. Customers most value goods that their social connections are familiar with but are unable to acquire. Using recent advances in network games, we identify product launch and distribution strategies.

2 - Procurement Auctions for Differentiated Products: Design and Applications

Daniela Saban, Columbia University, Uris Hall, 4I, New York, United States of America, dhs2131@columbia.edu, Gabriel Weintraub

We study the problem of a procurement agency using an auction to build an assortment of differentiated products, offered by strategic suppliers and consumed by heterogeneous customers. This setting arises in "framework agreements" (FAs), commonly used in public and private procurement. Using mechanism design and auction theory, we propose recommendations to improve the design of FAs. We apply our results to the FAs run by the Chilean government to buy US$2 billion worth of goods per year.

3 - Managing Service Systems in Presence of Social Networks

Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Dennis Zhang

We study a service system with the presence of a social network. In our model, firms can differentiate resource allocations among customers, and customers learn the service qualities from the social network. We study the interplay among network structure, customer characteristics, and information structure, and characterize the optimal policy. We further calibrate our model with data from Yelp.com and quantify the value of social network knowledge empirically.

4 - The Economics of Uber

Gerard Cachon, Wharton University, Philadelphia, PA, United States of America, cachon@wharton.upenn.edu, Kaitlin Daniels, Ruben Lobel

Uber provides a market that matches "black car" drivers with passengers in need of transportation services. They are one of several recent companies contributing to a new "sharing economy" in which people earn revenue from their existing assets that otherwise would remain idle. This paper explores the impact of this new business model on the market.

Sustainable and Socially Responsible Supply Chains

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Sang Kim, Yale School of Management, 165 Whitney Ave, New Haven, CT, 06511, United States of America, sang.kim@yale.edu

1 - Measurement and Improvement of Environmental Performance under Voluntary versus Mandatory Disclosure

Basak Kalkanci, Associate Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, Basak.Kalkanci@scheller.gatech.edu, Erjie Ang, Erica Plambeck

When a firm exerts effort to evaluate its social & environmental impacts, it finds opportunities to reduce them (and hence its risks associated with future regulation). We investigate when a firm should learn and disclose its impact (accounting for the response from consumers and investors) and whether policy makers should mandate disclosure. Experimentally, we show that voluntary disclosure can boost sales.

2 - Design Incentives, Coalitional Stability, or Cost Efficiency? A Network Perspective on EPR

Luyi Gui, luyig@uci.edu, Atalay Atasu, Ozlem Ergun, Beril Toktay

Extended Producer Responsibility (EPR) is an environmental policy tool that mandates producers' financial responsibility for end-of-life treatment of their products. EPR has been regarded at its heart a policy to provide incentives for more environmentally-friendly design. We investigate the operational impact of collective EPR implementation on its product design outcome.

3 - Allocating Emissions among Co-Products: Implications for Procurement, Offsetting & Border Adjustment

Nur Sunar, University of North Carolina at Chapel Hill, Nur_Sunar@kenan-flagler.unc.edu, Erica Plambeck

A state with climate policy may impose a tax on imported products for greenhouse gas emissions that occur in production and transportation to its border (a so-called border adjustment) or a buyer may voluntarily commit to offset its upstream supply chain emissions. When a process yields co-products in ?xed proportions, how should emissions from the process be allocated among the co-products? We address that question from the perspective of a border adjustment policy maker and buyer, in turn.

4 - Managing a Responsible Supply Chain under Threat of Public Disclosure

Saed Alizamir, saed.alizamir@yale.edu, Sang Kim

We analyze a game-theoretic model in which a downstream supply chain member ("buyer") is penalized disproportionately due to a compliance violation by an upstream member ("supplier"). Buyer's ability to audit the supplier is limited, and she faces a risk of being publicly blamed after the supplier's violation is caught by a third party. Supplier exerts effort to enhance compliance in each period, but risks having his relationship terminated due to a stochastic compliance outcome.

Operational Issues in Agriculture

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Onur Boyabatli, Singapore Management University, 50 Stamford Road 04-01, Singapore, Singapore, oboyabatli@smu.edu.sg

1 - Mitigating the Impact of Product Return Regulations in the Hybrid Seed Industry

Sripad Devalkar, Indian School of Business, ISB Campus Gachibowli, Hyderabad, India, sripad_devalkar@isb.edu, Milind Sohoni, Saurabh Bansal

Existing laws dictate that a hybrid seed manufacturer will accept all unsold seeds from the retailer. In the US market, manufacturers accept orders twice in the season, with the first order guaranteed but not the second because of yield uncertainty. This leads to inflated retailer orders and high return rates. We explore supply chain contracts that address the problem of over ordering and high return rates.

2 - Corn or Soybean: Optimal Farm Space Allocation under Yield and Price Uncertainties

Onur Boyabatli, Singapore Management University, 50 Stamford Road 04-01, Singapore, Singapore, oboyabatli@smu.edu.sg, Yangfang Zhou, Javad Nasiry

This paper analyzes the farm space allocation decision between corn and soybean in a multi-period framework. In each period, the farmer decides the allocation with respect to yield and spot price uncertainties. The crop yield is (stochastically) larger when the same product is not grown in the same farm space for two consecutive periods. We characterize the optimal allocation policy and investigate the impact of yield and price uncertainties on the farmer's profitability.

3 - Global Sourcing under Exchange-rate and Demand Uncertainty

Shahryar Gheibi, Syracuse University, 721 University Avenue, Syracuse, NY, United States of America, sgheibi@syr.edu, Burak Kazaz, Scott Webster

We consider a firm's capacity reservation decisions in the presence of demand and exchange-rate uncertainty. After observing the exchange rate, the firm determines what capacity to utilize for manufacturing under demand uncertainty. We characterize optimal solutions as onshore sourcing, offshore sourcing, and two dual sourcing strategies with rationing and excess capacity. We show that exchange-rate uncertainty can even make the firm reserve capacity only at the more expensive source.

Strategic Behavior in Service Systems

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Amy Ward, Professor, USC, Marshall School of Business, BRI401H, Los Angeles, CA, 90089-0809, United States of America, amyward@marshall.usc.edu

1 - Compensation and Staffing to Trade off Speed and Quality in Large Service Systems

Dongyuan Zhan, PhD Student, USC, 2667 Ellendale Place, Apt 308, Los Angeles, CA, 90007, United States of America, Dongyuan.Zhan.2015@marshall.usc.edu, Amy Ward

Human servers often must trade off speed and quality. The faster they work, the more the quality may be compromised. For large service systems, we explore how the servers respond to compensation incentives and propose compensation and staffing design to minimize the system costs. We find that different optimal staffing regimes appear with different system cost structures.

2 - Leadership Structure and Free Riding in Team Projects

Morvarid Rahmani, Assistant Professor, Georgia Tech, 800 West Peachtree Street, N.W., Atlanta, GA, 30308, United States of America, Morvarid.Rahmani@scheller.gatech.edu, Guillaume Roels, Uday Karmarkar

In this paper, we consider a multi-agent project with finite deadline, as may arise, for instance, in consulting services. We investigate whether appointing a team leader helps alleviate or exacerbate free riding, relative to having team members making their effort decisions in a decentralized fashion. We find that appointing a team leader is beneficial when the project has high stakes and a short deadline.

3 - Trading Time in a Congested Environment

Luyi Yang, Booth School of Business, University of Chicago, 5807 S. Woodlawn Avenue, Chicago, IL, United States of America, luyi.yang@chicagobooth.edu, Laurens Debo, Varun Gupta

We consider an M/M/1 queueing system in which heterogeneous time-sensitive customers with private information about their delay costs trade their waiting positions through a profit-maximizing broker. We find that the broker's optimal mechanism would restrict trading among a pool of customers with moderate delay costs. These customers wait on average just as much as they would in a first-come-first-served system and they are indifferent to participation in trading.

4 - Skill and Capacity Management in Large-scale Service Marketplaces

Eren Cil, University of Oregon, 1208 University of Oregon, Eugene, OR, United States of America, erencil@uoregon.edu, Gad Allon, Achal Bassamboo

We characterize the optimal skill screening mechanism of a firm moderating a large-scale service marketplace where the ability of a service provider to cater customers, who can be of two classes, varies. We show that when the values that a service provider generates for each customer class are independent, the firm may need to refuse some of the service providers via its screening mechanism whereas this is never optimal when these values are perfectly correlated.

Choice Models in Revenue Management and Pricing II

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Hongmin Li, Assistant Professor, W.P. Carey School of Business, ASU, Tempe, 85287, United States of America, Hongmin.Li@asu.edu

Co-Chair: Tim Huh, Associate Professor, University of British Columbia, Sauder School of Business, Vancouver, BC, V6T 1Z2, Canada, tim.huh@sauder.ubc.ca

1 - Buy Now or Shop Around? Assortment Planning and Pricing with Search Cost

Ruxian Wang, Assistant Professor, Johns Hopkins Carey Business School, 100 International Dr, Baltimore, MD, 21202, United States of America, ruxian.wang@jhu.edu, Ozge Sahin

We consider assortment planning and pricing problems in the presence of consumer search cost. We show that the assortment problem with given prices is NP-hard and can be solved by dynamic programming. The multi-product pricing with search cost can be transformed to maximizing a set of unimodal single-variable functions of polynomial size. Finally, we investigate the effects of search cost in price competition.

2 - Quality Consistent Discrete Pricing and Assortment Optimization under the Nested Logit Model

James Davis, Ithaca, NY, United States of America, jamesmariodavis@gmail.com, David Williamson, Huseyin Topaloglu

We consider a joint assortment and pricing problem where relative product prices are constrained to match relative product quality. Each product price can be chosen from a discrete set of prices levels but higher quality products must have higher prices. We use the nested logit model to model purchase probabilities. Our objective is to choose an assortment of products, and quality consistent prices for those products, so that expected revenue is maximized.

3 - Quantity Pre-Commitment and Cournot Equivalence

Hongmin Li, Assistant Professor, W.P. Carey School of Business, ASU, Tempe, 85287, United States of America, Hongmin.Li@asu.edu, Amr Farahat, Tim Huh

Cournot equivalency established by Kreps and Scheinkman (1983) and Friedman (1988) indicates that the Cournot model applies when quantity and price decisions are sequential. However, the conditions they established preclude many commonly observed multi-product demand models. Our research expands the Cournot equivalency result to more general settings including the widely-adopted MNL demand model.

Topics in Pricing and Revenue Optimization

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Victor Araman, AUB, Beirut, Lebanon, va03@aub.edu.lb

1 - Revenue Models for Off-grid Energy Access

Ioana Popescu, Professor, INSEAD, Singapore, ioana.POPESCU@insead.edu, Bhavani Shanker Uppari, Serguei Netessine

One quarter of the world's population does not have access to electricity. Poor households spend up to half of their income, for about $37 billion/year on kerosene and biomass. Alternative technologies, such as solar-based solutions are healthier and offer greater value, yet they require significant one-time investments which are not affordable to people living on $2/day. We explore innovative approaches and alternative revenue models for serving this market, including a case study in Rwanda.

2 - Dynamic Pricing with Risk Sensitive Consumers and Social Learning

Mikhail Nediak, Assistant Professor, Queen's School of Business, 143 Union Str., Kingston, ON, K7L3N6, Canada, mikhail.nediak@queensu.ca, Jue Wang, Tanya Levina, Yuri Levin

We present a dynamic pricing model for a monopolist offering a durable product to risk-sensitive consumers. Consumers use social learning to determine the true quality of the product to make purchase decisions. We study the structure of the optimal pricing policy and evaluate the relative gains of offering free samples to high-influence individuals prior to the selling season. The proposed model of social learning is tested on a sample of recent movie data.

3 - Dynamic Pricing with Buybacks
Rene Caldentey, Professor, New York University, 44 West Fourth Street, 8-77, New York, NY, 10012, United States of America, rcaldent@stern.nyu.edu, Ying Liu, Guillermo Gallego

We consider a dynamic pricing revenue management problem in which the seller is able to buy back units from previous customers. These customers are willing to return their units as their private valuations change over time. The seller's problem is to dynamically adjust both selling and buyback prices to maximize total expected revenue. We study the impact of the return policy and show that the policy benefits both the seller and customers.

4 - Pricing a Non Perishable Product when Facing Varying Valuations
Victor Araman, AUB, Beirut, Lebanon, va03@aub.edu.lb

In many contexts, a buyer's valuation of a particular product changes over time due to more information gathered about the product or to other external factors. In this talk, we consider a seller looking at pricing through time a non perishable product facing consumers with varying valuations. The optimal pricing policy happens to be non tractable, yet interestingly simple periodic policies are proven to perform very well.

Empirical Market Design

Cluster: Matching and Market Design (in honor of Al Roth)

Invited Session

Chair: Ramesh Johari, Stanford University, Huang 311, Stanford, CA, United States of America, ramesh.johari@stanford.edu

1 - Quality Externalities and the Limits of Reputation in Two-Sided Markets
Steve Tadelis, Professor, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, United States of America, stadelis@haas.berkeley.edu, Chris Nosko

Using data from eBay, we argue that platforms can mitigate externalities by actively screening sellers and promoting the prominence of better quality sellers. Exploiting the bias in feedback, we create a measure of seller quality and demonstrate the benefits of our approach through a controlled experiment that prioritizes better quality sellers to a random subset of buyers. .

2 - On the Near Impossibility of Measuring the Returns to Advertising
Randall Lewis, Economic Research Scientist, Google Inc., 1600 Amphitheatre Parkway, Mountain View, CA, 94043, United States of America, randall@econinformatics.com, Justin Rao

Firms have a hard time measuring the causal impact of advertising expenditures on profit. In twenty-five online field experiments, individual-level sales are volatile relative to the per capita cost of a campaign—a small impact on a noisy dependent variable can generate positive returns. Experiments can need more than ten million person-weeks. Further, small selection biases can severely bias observational estimates. Weak informational feedback and technological advances shape ad marketplaces.

3 - Corporate Prediction Markets: Evidence from Google, Ford, and Firm X
Bo Cowgill, UC Berkeley, 1931 Diamond St Apt 3, San Francisco, CA, 94131, United States of America, bo.cowgill@gmail.com, Eric Zitzewitz

We examine data from prediction markets run by Google, Ford and Firm X (a large private materials company). Despite theoretically adverse conditions, we find these markets are relatively efficient, and improve upon the forecasts of experts at all three firms by as much as a 25% reduction in MSE. The most notable inefficiency is an optimism bias in the markets at Google and Ford. The inefficiencies that do exist become smaller over time for reasons we document.

4 - At What Quality and What Price? Inducing Separating Equilibria as a Market Design Problem
John Horton, Professor, NYU Stern School of Business, Kaufman Management Center, 44 West Fourth St, 8-81, New York, NY, 10012, United States of America, john.joseph.horton@gmail.com, Ramesh Johari

A tool to promote revelation of buyers' price/quality preferences was experimentally introduced into an online labor market. In the treatment cells of the experiment, upon posting a job, buyers chose what price/quality level they were seeking from sellers. We find that buyers readily reveal their preferences and that this revelation—-which itself was experimentally manipulated—-strongly induced seller-side sorting.

Routing Problems with Time Windows Constraints

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Shu Zhang, University of Iowa, IA, United States of America, shu-zhang-1@uiowa.edu

1 - A Branch-cut-and-price Algorithm for a Production-delivery Routing Problem
Iman Dayarian, École Polytechnique de Montréal and GERAD, Montréal, Québec, Canada H3C 3A7, iman.dayarian@gerad.ca, Guy Desaulniers

We study a rich production-delivery routing problem with time windows arising at a catering services company. The production part consists of assembling the meals to deliver. It considers release dates to ensure freshness of the products to be delivered and is also restricted by due dates incurred by the constructed routes. Delivery and production costs are minimized under various constraints. A cutting-edge branch-cut-and-price is proposed to solve real-life instances to optimality.

2 - Robust Inventory Routing with Flexible Time Window Allocation
Chengliang Zhang, Georgia Institute of Technology, 765 Ferst Drive, NW, Atlanta, GA, United States of America, czhang85@gatech.edu, George Nemhauser, Joel Sokol, Myun-Seok Cheon, Dimitri Papageorgiou

We study an inventory routing problem with delivery time windows for uncertain disruptions, where the length and placement of time windows are also decision variables. The goal is to generate robust routes and time windows to withstand the disruptions. We generate routes using robustness strategies, and determine time windows by solving a stochastic program that considers a set of disruptions and their recovery solutions. Extensive simulation results illustrate the benefits of our approach.

3 - The Cooperative Orienteering Problem with Time Windows
Melih Ozlen, School of Mathematical and Geospatial Sciences, RMIT University, Melbourne, Australia, melih.ozlen@rmit.edu.au, James Minas, Martijn Van der Merwe, John Hearne

We define a new class of the team orienteering problem; the cooperative team orienteering problem with time windows (COPTW). It is a generalisation that requires visits by multiple vehicles at the same time to collect the reward from a location. We present an efficient two-index mixed integer programming formulation of this problem that eliminates symmetry related inefficiencies. This new formulation of COPTW is demonstrated on a wildfire scenario from South Hobart, Tasmania, Australia.

4 - Dynamic Orienteering on a Network of Queues with an Application to Textbook Sales
Shu Zhang, University of Iowa, IA, United States of America, shu-zhang-1@uiowa.edu, Jeffrey W. Ohlmann, Barrett Thomas

Motivated by the daily decision making faced by textbook sales representatives, we study a variant of the orienteering problem with time windows in which the decision maker may experience uncertain wait times due to the existence of queues at customers. We formulate the problem as a Markov decision process with an objective of maximizing the expected profit. We examine dynamic solutions using a rollout policy framework and present computational results.

Logistics Planning under Disruptions

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Hector Carlo, University of Puerto Rico - Mayaguez, Industrial Engineering Department, Call Box 9000, Mayaguez, PR, 00681-9000, Puerto Rico, hector.carlo@upr.edu

1 - Robust Hazmat Network Design Problems Considering Risk Uncertainty
Longsheng Sun, Ph.D. Student, University at Buffalo (SUNY), Industrial and Systems Engineering, Buffalo, NY, 14260, United States of America, lsun4@buffalo.edu, Mark Karwan, Changhyun Kwon

We study robust network design problems for hazardous materials transportation considering risk uncertainty. Risk uncertainty is considered in two ways: (1) uncertainty on each link across all shipments, and (2) uncertainty on each link for each shipment. We propose a Lagrangian relaxation heuristic to solve subproblems within a heuristic framework.

2 - Hybrid Optimization Model for the Humanitarian Aid Distribution Problem

Jaime Mora Vargas, jmora@itesm.mx

This work presents a model for humanitarian aid distribution in order to minimize delays, considering non-satisfied demand and reaching for balanced distribution aftermath. The model proposed solves the involved routing and distribution problems thorough a hybrid optimization metaheuristic that combines integer lineal programming and simulated annealing algorithm. The proposed model considers that the capacity of humanitarian aid storage at Distribution Points to satisfy the next period's demand, also considers that all vehicles are able to travel through several routes in each period, visiting the same Distribution Point within a single period.

3 - Road Network Restoration Optimization after Major Disruptions

Hector Carlo, University of Puerto Rico - Mayaguez, Industrial Engineering Department, Call Box 9000, Mayaguez, PR, 00681-9000, Puerto Rico, hector.carlo@upr.edu, Wilson Alvarez, Suzanna Long, Thomas Shoberg, Steven Corns

This study presents a mathematical model and heuristics to optimize road network restoration in the aftermath of major disruptions. The optimization problem consists of simultaneously assigning and scheduling repair crews to service damaged or destroyed road elements to minimize the expected delivery times in the network.

Urban Logistics

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Tom Van Woensel, Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, t.v.woensel@tue.nl

1 - An Exact Method for the Fleet Composition Problem in Urban Areas

Anna Franceschetti, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, A.Franceschetti@tue.nl, Tom Van Woensel, Gilbert Laporte

We study the problem of managing a heterogeneous vehicle fleet for a logistics company which operates in an urban area subject to vehicle access restrictions. Using a continuous approximation approach we reduce the problem to an area partitioning problem. We propose an efficient procedure to find the optimal solution using dynamic programming. Our analytical results can be used to illustrate the tradeoffs between electric and diesel vehicles.

2 - Time-dependent Pollution Routing Problem with Path Flexibility in Mega-city Logistics

Yixiao Huang, Tsinghua University, Beijing, China, huangyx12@mails.tsinghua.edu.cn, Tom Van Woensel, Jean-Philippe Gross, Lei Zhao

Given the order of customers to visit, vehicles may choose different paths based on the traffic condition, in order to save fuel cost. The choice of paths, which is called path flexibility, is important in time-dependent vehicle routing. In this talk, we study the time-dependent pollution routing problem combined with a time-dependent shortest path problem, which is formulated as a two-stage stochastic mixed integer program. We construct the case study based on the network of Beijing urban area and historical traffic data.

3 - Heuristics for Same-day Delivery Routing

Jie Yang, Graduate Student, Northwestern university, 2145 Sheridan Road, Evanston, IL 60208, Evanston, Il, 60208, United States of America, jieyang2011@u.northwestern.edu, Diego Klabjan, Joe Schoenbeck

Same-day routing is a VRP problem including several extensions. We develop a VNS heuristic which has been tested on a real world dataset from a large big box retailer. We discuss the computational performance of the heuristic and conduct a business feasibility study.

4 - Ensuring Service Levels in Routing Problems with Time Windows and Stochastic Travel Times

Jan Fabian Ehmke, Assistant Professor, Freie Universitat Berlin, Garystr. 21, Berlin, 14195, Germany, JanFabian.Ehmke@fu-berlin.de, Ann M. Campbell, Timothy L. Urban

We explore how to route customers with a given service level in the environment of tight customer time windows and stochastic travel times. The service level defines the probability that each customer is visited within its time window. To be able to verify if the service level is satisfied, we investigate how arrival time distributions can be propagated throughout the tour given the presence of time windows. Computational experiments show how solutions change for different service levels.

5 - Branch-and-Price for a VRP with Time Windows Considering Driving and Working Hour Regulations

Tom Van Woensel, Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, t.v.woensel@tue.nl, Emrah Demir, Said Dabia

We consider restrictions on the amount of driving and working hours of truck drivers in the VRP model. A mathematical programming formulate is provided n and optimally solved using a specifically designed Branch-and-Price (B&P) algorithm. Results are presented.

■ SB24

Hilton- Union Sq 4

Mitigating Network Disruptions and Special Events

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Rui Ma, University of California, Davis, CA, United States of America, drma@ucdavis.edu

1 - Active Demand Management Network Design for Optimizing VMS Location and Diversion routing Plans

Monirehalsadat Mahmoudi, Arizona State University, Tempe AZ, United States of America, mmahmou2@asu.edu, Xuesong Zhou

Variable Message Signs (VMS) have been recognized as important tools for information provision about traffic conditions ahead on the highway such as incidents, construction, and special events. Since the installation, operation, and maintenance of a VMS is costly, this research focuses on finding an optimal set of locations for installing a limited number of VMS in a traffic network through path based and column generation approaches to minimize.the total travel costs of the system.

2 - Using Social Media to Assist Traffic Flow Prediction for Scheduled Sport Event

Ming Ni, Arizona State University, Tempe AZ, University at Buffalo (SUNY), Buffalo, NY, United States of America, mingni@buffalo.edu, Qing He, Jing Gao

User-generated contents from social networks can be mined to deduce useful information about present or future travelers' behavior. For planned sporting events, the rates at which social media are created about these will measure people's attention about different games. With help of topic modeling, sentiment analysis and rates of social media, methods are developed to incorporate social media features into traffic flow prediction at the event site.

3 - How Urban Traffic Pattern Evolves? A Case Study on Fix50 Project using Crowd-sourced Taffic Data

Rui Ma, University of California, Davis, CA, United States of America, drma@ucdavis.edu, H. Michael Zhang

We present methods for using crowd-sourced traffic data to measure urban traffic performances and study the changes in traffic patterns under major highway reconstructions. The recent Fix50 project in the Sacramento metropolitan area is used as a case study to demonstrate the proposed methods.

Transportation Network Assignment and Optimization

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Amit Kumar, Purdue University, West Lafayette, IN, United States of America, kumar44@purdue.edu

1 - Alternative Path Enumeration Algorithm for Public Transit Networks

Hector A. Vergara, Assistant Professor, Oregon State University, 204 Rogers Hall, Corvallis, OR, 97321, United States of America, hector.vergara@oregonstate.edu, SeJoon Park

Many people use transit networks of public transportation for commuting or travelling. Since public transportation networks are complex, it is difficult for a traveler to find optimal paths or alternative paths between origins and destinations when a limitation on travel time is considered. This research proposes a path enumeration algorithm that efficiently enumerates feasible alternative paths using a directed acyclic graph representation of the transit network. Results for randomly generated problem instances and a realistic test case are presented.

2 - Entropy Weighted Average Method for the Determination of Unique Path-flow Solution for Static Deterministic User Equilibrium Traffic Assignment Problem

Amit Kumar, Purdue University, West Lafayette, IN, United States of America, kumar44@purdue.edu, Srinivas Peeta

This study formulates entropy weighted user equilibrium (EWUE) to determine a unique path-flow solution to the static deterministic user equilibrium traffic assignment problem. The implementation simplicity of the EWUE represents an important benefit over the maximum entropy user equilibrium (MEUE) models proposed in the past. Computational experiments illustrate the characteristics of the EWUE solution.

3 - Estimating Link Travel Time Distribution Based on Network Entry/Exit Time Stamps of Trips

Kai Yin, Nomis Solutions, yinai1000@gmail.com, Wen Wang, Bruce X. Wang, Teresa Adams

We study the link travel time estimation problem on a road network, where each vehicle has a trip observation with entry and exit time stamp. Based on the observed trip travel times of individual travelers through the network, we aim to develop a framework to estimate the traffic conditions and learn the traffic patterns on roadway links. Therefore, a statistical framework is established under the likelihood principle. We examine the basic problem on how to extract travel time distributions from sufficient sample of trip observations, and then extend the model to the case with only partial information, where part of trip trajectories are unknown and we need to infer their traversed paths simultaneously. The latter shows a unified framework of statistical modeling and assignment optimization on a transportation network. Besides, we further investigate the Bayesian approach and its impact on the estimation results.

4 - Addressing the Observability Issue in Travel Demand Estimation

Yudi Yang, UC Davis, One Shields Avenue, Davis, CA, 95616, United States of America, ydyang@ucdavis.edu, Yueyue Fan

In this paper, we present a mathematical model for travel demand estimation that integrates multiple information sources. Through mathematical analyses, we identify critical information that is needed for ensuring the observability of the problem.

Location Models

Sponsor: Location Analysis

Sponsored Session

Chair: Oded Berman, Professor, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, berman@rotman.utoronto.ca

1 - Capacity and Location Decisions in the Presence of Congestion and Disruptions

Oded Berman, Professor, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, berman@rotman.utoronto.ca, Opher Baron, Yael Deutch

We study the problem of choosing the optimal number, capacities and locations of facilities recognizing that customers may be blocked due to a finite waiting room and facilities may fail due to disruptions. The goal is to minimize the total cost that consists of the costs of travel, blocking, capacities, disruptions and opening. We obtain structural results for special cases and develop algorithms and heuristics for solving the problem on a network.

2 - Practical Benchmarks for Location-Routing Decisions via Approximation Algorithms

Mozart Menezes, Associate Professor, University of Calgary, 2500 University Dr. NW, Calgary, AB, T2N1N4, Canada, mozart.menezes@utoronto.ca, Vedat Verter

Practitioners frequently tackle large scale location-routing problems, where a pair of good feasible solution and a lower bound on the solution of the problem, rather than exact solutions, are sufficient for them in making strategic decisions. We present a simple methodology to derive such benchmarks for assessing the current distribution network. We show that the proposed analytical framework is amenable to develop managerial insights for fairly sizeable location-routing problems.

3 - Lagrangian Decomposition for Large Inventory-Location Problems

Samir Elhedhli, Professor, Universiy of Waterloo, Waterloo, ON, Canada, elhedhli@uwaterloo.ca, Ahmed Saif

We decompose the inventory-location problem to an uncapacitated facility location problem and a number of single-variable concave minimization problems. We give a closed form expression for the optimal Lagrangian multipliers; and obtain a feasible solution and the Lagrangian bound in a single step. The approach outperforms the current literature in terms of problem sizes and computational time. For the first time, the solution of very large instances with 500 and 1000 nodes is provided.

4 - A Network Design Problem For Hazardous Materials Routing And Emergency Response Units Locating

Masoumeh Taslimi, PhD Candidate, University at Buffalo (SUNY), Industrial and Systems Engineering, Buffalo, NY, 14260, United States of America, masoumeh@buffalo.edu, Rajan Batta, Changhyun Kwon

Hazardous materials (Hazmat) transports remains regulated due to its potential risk to health, safety and environment. A bi-level Hazmat network design model is proposed to determine the available road network to Hazmat carriers and to locate the Hazmat emergency response units, simultaneously. The goal is to investigate risk equity and carriers decisions to minimize the associated transport risk.

Modeling Airline Coordination and Competition for Improving National Airspace System Performance

Sponsor: Aviation Applications

Sponsored Session

Chair: Vikrant Vaze, Assistant Professor, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States of America, vikrant.s.vaze@dartmouth.edu

1 - Impact of Emission Trading System on US Aviation: A Future Story

Yi Liu, University of California, Berkeley, 107 McLaughlin Hall, Berkeley, CA, 94720, United States of America, liuyi.feier@gmail.com, Vikrant Vaze, Antony Evans

Emission from aviation accounts for approximately 2% of the global total and its share of the pie is expected to increase in the future. Emission trading system as used in the European Union is a strategy to reduce emissions while allowing for considerable flexibility. In this study, we explore the impact that the emission trading system, if adopted in the US, may have on US aviation. The interesting aspects include impact on frequency, air fare and aircraft size.

2 - Efficiency, Equity and Reliability of Schedule Coordination at Congested US Airports

Alexandre Jacquillat, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-246, Cambridge, MA, 02139, United States of America, alexjacq@mit.edu, Vikrant Vaze, Amedeo Odoni

Schedule coordination at US airports can mitigate congestion but also constrains airline competition. We design and assess a schedule coordination mechanism that is non-monetary, efficient (minimizes interference with airline competition), equitable (balances fairly scheduling constraints across airlines) and reliable (meets delay reduction objectives). The approach considers operating stochasticity, the diversity of stakeholder incentives and the interdependencies of scheduling and operations.

3 - Performance-Based Air Traffic Management: Game Theoretic Models and Multi-Criteria Evaluation

Vikrant Vaze, Assistant Professor, Dartmouth, 14 Engineering Drive, Hanover, NH, 03755, United States of America, vikrant.s.vaze@dartmouth.edu, Antony Evans, Cynthia Barnhart

For designing airline-driven traffic management initiatives (TMI), we propose several mechanisms for collecting and combining airline inputs into implementable TMIs, e.g. averaging, voting and ranking. We propose multiple criteria for evaluating effectiveness of each approach, including profitability, system optimality, and equity. We apply a game-theoretic approach to examine the gaming potential and offer a broad evaluation of each approach, through theoretical and simulation-based insights.

4 - Integrated Airline Scheduling: Competition Effects from the Entry of the High-speed Rail

Luis Cadarso, Rey Juan Carlos University, Camino del Molino, s/n, Fuenlabrada, 28943, Spain, luis.cadarso@urjc.es, Vikrant Vaze, Cynthia Barnhart, Angel Marin

Airlines and high-speed rail are increasingly competing for passengers, which affects the number of served passengers and revenues. We develop an approach that generates airline schedules capturing the impacts of airlines' decisions on passenger demand. We evaluate scenarios involving the entry of high-speed rail, and validate our results using past market entries of high-speed rail. The developed model predicts the optimal decisions to retain passengers and to maximize profits.

JFIG Paper Competition II

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: J. Cole Smith, Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, jcsmith@clemson.edu

Co-Chair: Shengfan Zhang, Assistant professor, University of Arkansas, United States of America, shengfan@uark.edu

1 - Competition Introduction

J. Cole Smith, Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, jcsmith@clemson.edu

The 2014 JFIG paper competition features paper submissions from a diverse array of talented junior faculty members. The prize committee evaluated submissions based on the importance of the topic, appropriateness of the approach, and significance of the contribution. After careful review, the prize committee selected a group of finalists to present their research in one of the two JFIG sessions. For information on the finalists and their papers, please refer to the online program.

2 - Performance Guarantee of Modified (r, Q) Policies for Stochastic Multi-echelon Serial Inventory Systems

Ming Hu, Assistant Professor, Rotman School of Management, University of Toronto, 105 St George Street, Toronto ON, Canada, Ming.Hu@rotman.utoronto.ca, Yi Yang

We consider the classic continuous-review N-stage serial inventory system. Any shipment to each stage incurs a fixed cost and takes a nonzero lead time. Finding a good performance guarantee remains an open problem. We construct a simple, efficiently computable, heuristic policy within a class of modified echelon (r,Q) policies and provide good provably primitive-dependent performance bounds. The heuristic is even likely to numerically outperform the optimal integer-ratio echelon (r,Q) policies.

3 - Optimal Learning with Non-Gaussian Rewards

Zi DIng, University of Maryland, Department of Mathematics, College Park MD 20742, United States of America, zding@math.umd.edu, Ilya Ryzhov

We present a new theoretical characterization of the optimal "Gittins index" policy in multi-armed bandit problems with non-Gaussian, infinitely divisible reward distributions. Our approach probabilistically interpolates the sequence of discrete-time rewards by a continuous-time, conditional Levy process, and uses optimal stopping theory to relate the value function to a free-boundary partial integro-differential equation (PIDE). We state the PIDE for exponential and Poisson rewards, prove continuity and monotonicity of the solution, and discuss numerical issues.

4 - Unbalanced Random Matching Markets: The Stark Effect of Competition

Itai Ashlagi, MIT, 100 Main St., Cambridge MA, United States of America, iashlagi@mit.edu, Yash Kanoria, Jacob Leshno

We characterize the core in random matching markets with unequal numbers of men and women. We find that even the slightest imbalance leads to harsh competition on the long side. With high probability the core is small, in the sense that a vanishing fraction of agents have multiple stable partners. Further, under any stable matching, approximately, the short side "chooses" and the long side is "chosen". Simulations show that these features are observed even in small markets.

Planning and Scheduling Issues in Service and Manufacturing Systems

Cluster: Scheduling and Project Management

Invited Session

Chair: Chelliah Sriskandarajah, Professor, Mays Business School, Texas A&M University, 320Q, Wehner Building, College Station, TX, United States of America, chelliah@mays.tamu.edu

1 - Scheduling Unit-trains for Minimizing the Cost of Deadheading and Lite Train Movements

Manoj Vanajakumari, Associate professor, Texas A&M University, 3367 TAMU, College Station, TX, 77843, United States of America, manojuv@tamu.edu, William Oates, Chelliah Sriskandarajah

Unit trains operate between two stations that are not on regular routes. Railroad companies face challenges in scheduling unit trains which include ensuring the availability of locomotives at the origin stations for the train movement. We solve a unit-train scheduling problem for a major North American railroad company the solution methodologies, and results.

2 - Outpatient Appointment Scheduling under Patient No-Shows and Patient Heterogeneity

Seung Jun Lee, PhD Student, Texas A&M University, 320M Wehner Bldg. Tamu, College Station, TX, United States of America, sjlee@mays.tamu.edu, Gregory R. Heim, Yunxia Zhu, Chelliah Sriskandarajah

In this study, we study an outpatient appointment scheduling system under patient no-shows and patient heterogeneity with different policies (base model, overbooking, and open-access model). We evaluate and compare the performances of these proposed policies based on our block scheduling policy to provide optimal policies for outpatient clinics.

3 - U.S. Coin Supply Chain: Supply, Recycling and Inventory Management

Yiwei Huang, Mays Business School, Texas A&M University, 320R, Wehner Building, College Station, United States of America, yhuang@mays.tamu.edu, Neil Geismar, Chelliah Sriskandarajah

We investigate operational issues in the U.S. Coin Supply Chain and develop models to make the recirculation of coins more economical and efficient for the society. From the social perspective, we propose a coin exchange mechanism to coordinate the U.S. Coin Supply Chain and to minimize the societal cost of supplying coins nationwide.

4 - Increasing the Efficiency of Currency Supply within a Region in Banknote Supply Chain

Yunxia Zhu, Assistant Professor, Rider University, 2083 Lawrenceville Rd, Lawrenceville, NJ, 08648, United States of America, yuzhu@rider.edu, Chelliah Sriskandarajah, Subodha Kumar, Sara Rodriguez-Sanchez

We study the problem faced by regional banks in managing the currency supply in banknote supply chain with distinct features due to security concerns. After deriving a polynomial-time strategy to guarantee an optimal solution for the special bin-packing problem faced in this study, we provide an MIP formulation for this supply planning problem. We also propose four polynomial-time algorithms for deriving either optimal or near-optimal solutions for the problem under four different settings.

Online Reviews of Services: An Examination of Their Content, Structure and Impact

Sponsor: Service Science

Sponsored Session

Chair: Rebecca Hamilton, Associate Professor, University of Maryland, R.H. Smith School of Business, 3456 Van Munching Hall, College Park, MD, 20742, United States of America, rhamilto@rhsmith.umd.edu

1 - Online Reviews of Credence Services: Content, Credibility, and Usefulness

Shannon Lantzy, Doctoral Candidate, University of Maryland, 3330M Van Munching Hall, College Park, MD, 20904, United States of America, slantzy@rhsmith.umd.edu, Rebecca Hamilton, Katherine Stewart

We study the content, structure, and consumer perceptions of online reviews for credence services. We find credence reviews systematically differ from reviews of experience services and are more likely to contain unsupported claims. We experimentally examine consumer perceptions of reviews: consumers discount the credibility of credence claims of short, simple reviews but we expect more complex argument structure and inclusion of experience attributes in the review to attenuate this effect.

2 - Word-of-Mouth vs. Word of Health Inspectors: Evidence from Restaurant Reviews

Chenhui Guo, University of Arizona, 1130 E. Helen, Tucson, AZ, 85721, United States of America, chguo@email.arizona.edu, Paulo Goes, Mingfeng Lin

We study the effect of disclosing health inspection results on the word-of-mouth generated by consumers. Using data from a popular website for restaurant reviews around the time of a policy change, we exploit temporal and spatial variations to identify the effect on several important metrics of word-of-mouth.

3 - Dynamics of Social Tagging Networks: Insights for Retail Demand Forecast

P. K. Kannan, University of Maryland, Smith School of Business, College Park, MD, United States of America, PKannan@rhsmith.umd.edu, William Rand, Hyoryung Nam

Products and service experiences are related to ideas, concepts and beliefs, and as interest in those ideas, concepts and beliefs change so does consumer interest in those products/services. This presentation investigates whether the position of products on social tagging networks can predict sales dynamics in a retail context.

4 - Controlling for Self-Selection Bias in Customer Reviews

Dina Mayzlin, University of Southern California, 3660 Trousdale Parkway, ACC 306E, Los Angeles, CA, 90089-0443, United States of America, mayzlin@marshall.usc.edu, David Godes, Leif Brandes

Customers frequently use user online reviews as a valuable information resource before making a purchase. One critique of reviews as a source of information is the self-selection in the review process: consumers self-select into choosing whether to review a product, which suggests that reviews may be prone to the extremity bias. We propose a method to control for this bias.

Service Science in the Emerging Markets

Sponsor: Service Science

Sponsored Session

Chair: Qiang Qiang, Penn State Univ., 30 E. Swedesford Rd., Malvern, PA, 19355, United States of America, qzq10@psu.edu

1 - Quantifying the Bullwhip Effect in Service Supply Chain Networks of the Emerging Markets

Xiaowei Zhao, Tongji University, Dept of Management Science & Engineering, 1239 Siping Road, Shanghai, 200092, China, zhaoxiaowei119@126.com, Jiantong Zhang

In this paper, we quantify the bullwhip effect in service supply chain networks of the Emerging Markets. Our model includes two of the factors commonly assumed to cause the bullwhip effect in services: time delays and work backlogs. Then we propose a relative strategy with the fuzzy robust control method to reduce the bullwhip effect. Finally, an example is provided to illustrate the effectiveness of the proposed method.

2 - Competition of Online Shopping Malls with Logistics Investment

Yihong Hu, Assistant Professor, Tongji University, Economics and Management School,, No 1239, Siping Road, Shanghai, China, fox2002cn@gmail.com

We studies the competition between the online shopping malls based on price and logistics delivery service. The competition model between online shopping malls is constructed. The existence of Nash equilibrium is proved and the properties in the equilibrium is provided. The market structure analysis disclose that the total cost coefficient determines the winners in the competition.

3 - Rail Transit Passenger Behavior Model and Simulation in Emergencies Based on Multi-Agent System

Haifeng Zhao, Tongji University, Room 611,Block A, Tongji Building, No1. Zhangwu Road, Yangpu Distirct, Shanghai, 200092, China, hfzhao@tongji.edu.cn, Yi Dong

With the increasing population, rail transit is facing more frequent emergencies. The model, based on Multi-Agent System, is developed to establish passenger route choice algorithm and to describe the behavior of passengers. Through simulation, it finds that the conformity behavior of passengers will be disadvantageous to the evacuation, and the direction from external environment can reduce the influence of conformity. The result will provide theoretical basis of making the evacuation plan.

4 - International Financial Networks with Socially Responsible Investing

Ke Ke, Associate Professor, Central Washington University, 2400 S. 240th St, POBox 13490, Des Moines, WA, 98198, United States of America, kekegrace@yahoo.com

Although the research on SRI has increased significantly, the majority of them are focused on qualitative or empirical study. This research will extend my earlier paper (Qiang, Ke and Hu (2013)) regarding the modeling of financial networks with SRI to incorporate globalization and exchange rate risk. To be more specific, a framework for a multitiered international financial network with SRI will be developed where both the fund sources and the intermediaries are multicriteria decision-makers.

5 - Research on Dynamic SERVQUAL Model Based on QFD

Lixin Cui, Beijing Institute of Technology, Beijing, China cuilixin@bit.edu.cn, Renhe Shi

Both conventional SERVQUAL model and the QFD method have their own limitations. In this article,to constitute the dynamic SERVQUAL model based on QFD,we add the 22 dimensions of SERVQUAL model to the HOQ matrix,as well as the time dimension. This model combines customer requirements of service quality with technical methods of service enterprise. With the support of multi-period data, we can forecast dynamic customer requirements more effectively by using the GM(1,1) model with boundary value modified,which will provide support for the service enterprise to make efficient decisions.

Hilton- Union Sq 13

Technology Adoption and Innovation Management as a Search Process

Cluster: New Product Development

Invited Session

Chair: Raul Chao, University of Virginia, 100 Darden Blvd, Charlottesville, VA, 22902, United States of America, chaor@darden.virginia.edu

1 - Centrality and Misalignments in Complex New Product Development Projects

Javad Nasiry, Assistant Professor, HKUST, LSK Building, HKUST, Hong Kong, Hong Kong - PRC, nasiry@ust.hk, Michael Kirley, Mohsen Jafari Songhori

There are two forms of misalignments between product and organizational structures in complex new product development projects: interaction and interface misalignments. In a model of product design as a search on a rugged landscape, we model misalignments as design teams searching on a "perceived" rather than "real" landscape. We then study the effects of component centrality and misalignments on the project performance and convergence characteristics.

2 - Impact of Sequence and Timing of Information Technologies Adoption on Hospital Performance

Luv Sharma, The Ohio State University, 600 Fisher Hall, Columbus, OH, 43210, United States of America, sharma.154@buckeyemail.osu.edu, Aravind Chandrasekaran

This paper looks at the sequence of adoption of Health Information Technologies for 3600 US hospitals to identify ideal sequences of adoption. Deviations from the ideal sequences in terms of the order of adoption and the timing between adoption of technologies is conducted and performance implications studied.

3 - Knowledge Transfer in Product Development Projects
Wenli Xiao, Assistant Professor, University of San Diego, 5998 Alcala Park, San Diego, CA, 92110, United States of America, wenlixiao@sandiego.edu, Cheryl Gaimon

We use a dynamic model to explore a manager's pursuit of a new product development (NPD) project and an existing product improvement (EPI) project. A key feature of our model is the characterization of the knowledge transfer process from the NPD project to the EPI project. We identity the optimal knowledge development strategies for both projects and the optimal strategy for knowledge transfer. Lastly, we provide results in how different parameters impact the manager's optimal decisions.

4 - On the Effectiveness of Patenting Strategies in Innovation Races
Fabian Sting, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, fsting@rsm.nl, Jurgen Mihm, Tan Wang

Which inventions should a company patent? We develop an integrative framework of patenting strategies and contingencies for innovation races. Based on technology landscape simulations we identify competitive dynamics as the most salient determinant of the firm's patenting strategy. Thus our research contributes to establishing a contingency theory of patenting strategies.

Optimization and Modeling For Election Systems

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43210, United States of America, allen.515@osu.edu

1 - Convergent Algorithms for Satisfying Standards with Election System
Muer Yang, Assistant Professor, Opus College of Business, University of St. Thomas, 1000 LaSalle Ave, Minneapolis, MN, 55403, United States of America, yangmuer@stthomas.edu, Theodore Allen

We present methods for determining the minimum resources to meet service objectives using simulation both for individual systems (Straddling a Standard) and across multiple parallel systems (Service Constrained Minimax Optimization). We describe proofs of rigor and implications for President Obama's guarantee of less than 30 minutes of waiting time.

2 - Feasible Allocation thru Iterative Relaxations with Election Systems
Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43210, United States of America, allen.515@osu.edu, Muer Yang

We present an algorithm for minimizing the maximum waiting time across parallel systems. We describe the proof of its properties and its real world applicability in election systems. Also, results illustrate that dramatic reductions in computation times compared with greedy methods making the methods more usable.

3 - Methods for Estimating the Number of Deterred Voters in Elections
Shijie Huang, Performance Improvement Consultant, Carilion Clinic, P.O. Box 13367, Roanoke, VA, 24014, United States of America, skylovtata@gmail.com, Theodore Allen

This article proposes several methods for estimating the number of would be voters who are deterred from voting because of current or past waiting lines. The methods include linear regression, queuing-based imputation, and simulation-based imputation. We use data from recent elections in Florida and Ohio to illustrate and compare the alternative approaches.

4 - Sequential Kriging Optimization to Determine the Cost Effective Number of Early Voting Days
Sayak Roychowdhury, Graduate Research Associate, The Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, roychowdhury.6@osu.edu, Theodore Allen

We propose a simulation model of waiting lines, cost, and turnout as a function of the number of early voting days. Then, we describe results from optimizing this model using Sequential Kriging Optimization with objectives ranging from increasing turnout to reducing costs. We use data from real elections to illustrate.

Routing for Public Needs

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Burcu Keskin, Associate Professor, University of Alabama, 300 Alston Hall, Tuscaloosa, Al, 35487, United States of America, bkeskin@cba.ua.edu

1 - Optimizing Itineraries in Public Transportation with Walks between Rides
Bram De Jonge, University of Groningen, P.O. Box 800, 9700 AV, Groningen, Netherlands, b.de.jonge@rug.nl, Ruud Teunter

We optimize itineraries in public transportation, where we allow travelers to alternate rides with walks. We derive theorems for identifying a small subset of all possible walks that need to be considered, and test the results in a real-life setting for bus transportation in a medium sized city. It turns out that (a) only one per cent of all possible walks needs to be considered, and (b) that allowing walks reduces the travel time in 6 per cent of all cases by more than 10 per cent on average.

2 - School Bus Routing with Stochastic Demand and Duration Constraints
Hernan Caceres, Ph.D. Student in IE, University at Buffalo, 342 Bell Hall, University at Buffalo, Buffalo, NY, 14260-2050, United States of America, hernanan@buffalo.edu, Qing He, Rajan Batta

We propose a model of the school bus routing problem responding to the overbooking policies applied at a real-world school district, where the probability of a student using the bus varies from 22% to 77%. Overbooking is modeled via chance constrained programming, and it aims to improve their capacity utilization. Additionally, the uncertainty of travel time is also considered. The district-problem is partitioned into each school and solved sequentially, using column generation for each one.

3 - OAR Lib: An Open Source Arc Routing Library
Oliver Lum, Graduate Student, University of Maryland, College Park, 11604 Parkedge Drive, Rockville, MD, 20852, United States of America, oliver@math.umd.edu, Bruce Golden, Carmine Cerrone, Edward Wasil

We present computational results for a new Open Source Arc Routing Library (OAR Lib). This Java library provides an extensible graph architecture and solvers for problems in the field of arc routing. This library will allow researchers to begin writing their own code quickly.

4 - An Improved Formulation for the Maximum Coverage Patrol Routing Problem
Ibrahim Capar, Graduate Research Assistant, ISM Dept. 300 Alston Hall, 361 Stadium Drive, Tuscaloosa, Al, 35487-0226, United States of America, icapar@cba.ua.edu, Paul Rubin, Burcu Keskin

The main goal of the patrol routing problem is to maximize the coverage of critical highway stretches while ensuring feasibility of routes. By using the structural properties of the solution, we formulate an improved MIP that can solve large instances to optimality within seconds, where methods in literature failed to find provably optimal solutions. We show an average increase in coverage of 20% for the randomly generated instances provided in literature, with a best case increase over 46%.

Hilton- Union Sq 16

Decomposition Techniques for Network Design

Sponsor: Telecommunications

Sponsored Session

Chair: Bernard Fortz, Professor, Université Libre de Bruxelles, GOM CP212, Bld du Triomphe, Brussels, 1050, Belgium, bernard.fortz@ulb.ac.be

Co-Chair: Dimitri Papadimitriou, Pr. Eng. Research, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@alcatel-lucent.com

1 - Reliability-based Combined Network Design and Routing Optimization
Dimitri Papadimitriou, Pr.Eng.Research, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@alcatel-lucent.com, Bernard Fortz

The combined network design and routing problem with time-dependent demands generalizes the fixed charge network design problem. This problem can be formulated as a multi-period mixed integer optimization problem. As

decomposition techniques overcome the computational limit to solve such problem, we extend its formulation to account for failure patterns affecting installed arcs over time. We analyze the formulation with different reliability functions to derive the best arc replacement strategy.

2 - Lagrangian Decomposition for the Two-Level FTTx Network Design Problem

Andreas Bley, University of Kassel, Institute for Mathematics, Heinrich-Plett-Str. 40, Kassel, 34132, Germany, andreas.bley@mathematik.uni-kassel.de, Olaf Maurer, Ivana Ljubic

We address the design of a passive optical telecommunication network, where clients are connected via an intermediate level of distribution points to some central offices in a tree-like fashion. We discuss a Lagrangian algorithm that decomposes the problem based on the cost structure and solves the subproblems using advanced MIP techniques. Our computational results for realistic instances show that this approach yields high quality solutions and bounds requiring only little computing time.

3 - A Computational Comparison of Approaches to Lagrangian Duals: The Case Study of FC-MMCF

Enrico Gorgone, Université Libre de Bruxelles, Bld du Triomphe, 1040, Belgium, egorgone@ulb.ac.be, Bernard Gendron, Antonio Frangioni

The focus of this work is to compare a large set of approaches for solving Lagrangian duals of combinatorial problems. In particular we compare different nonsmooth optimization methods like (incremental, deflected, projected) subgradient-type algorithms and (disaggregated, generalized) bundle-type algorithms. We use as a test set the multicommodity capacitated network design problem (FC-MMCF), a problem arising in many different applications such as logistics and transportation.

4 - Spanning Trees with Variable Degree Bounds

Pedro Moura, Univ of Lisbon, Centro de InvestigaÁ„o Operacional, Bloco C6 - Piso 4- Campo Grande, Lisboa, 1749-016, Portugal, pmmoura@fc.ul.pt, Amaro de Sousa, Luis Gouveia, Mario Ruthmair

We study a generalization of the Degree Constrained Minimum Spanning Tree problem where we may install one of several transmission systems (TS) in each edge. We discuss a particular case in the design of wireless mesh networks where the degree of the endnodes of each edge depends on the TS installed on it and on the length of the edge. We propose 3 different models and compare them and the corresponding LP relaxations from a theoretical perspective as well as from a computational point of view.

Hilton- Union Sq 17

Analyzing Social Networks and Social Media II

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Kang Zhao, Assistant Professor, University of Iowa, S224 PBB, Iowa City, IA, 52242, United States of America, kang-zhao@uiowa.edu

1 - Early Prediction of Movie Success – Social Network Perspective

Michael Lash, The University of Iowa, michael-lash@uiowa.edu, Kang Zhao

Recently, the movie industry has seen tremendous growth. . While many previous studies have focused on gross revenue, this research addresses profitability, an aspect that is more important to investors. Our prediction leverages characteristics of actors and their social networks, as such information is usually available in early stages of movie production, when investment decisions are made. Our model can determine movie success with decent accuracy early on in the production process.

2 - Efficient Respondents Selection for Biased Survey using Online Social Networks

Jiaofei Zhong, Assistant Professor, University of Central Missouri, 121 E Hunt Ave, #301, Warrensburg, MO, 64093, United States of America, fayzhong08@gmail.com, Minhyuk Lee, Deying Li, Yingshu Li, Alade Tokuta, Donghyun Kim

Online social networks provide rich sources of data for us to learn about our society, and online surveys are an essential tool for many applications. One important issue is to select a good respondent group so that the survey result is reliable. We investigate the use of online social network to form a biased survey respondent group that is useful for certain applications. We present a new optimization problem MIkCDSP, show its NP-hardness, and introduce a greedy approximation algorithm for it.

Hilton- Union Sq 18

Data-Driven Research in Healthcare

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Masha Shunko, Purdue University, 403 W. State Street, West Lafayette, IN, 47906, United States of America, mshunko@purdue.edu

1 - Evaluation of Inventory Technologies for Operating Rooms

Vera Tilson, Simon School, University of Rochester, Rochester, NY, United States of America, vera.tilson@simon.rochester.edu, Greg Dobson, Abraham Seidmann

After labor, supply chain costs are the second-largest expense for hospitals, constituting up to 40% of the total operating budget. According to a recent PWC study perioperative services account for approximately 61% of these costs. We examine the issue of supply and inventory planning in operating rooms, and evaluate the benefits of standardization and of using technologies such as bar codes and RFIDs.

2 - Ranking Healthcare

Ping H. Huang, Research Scientist, Regenstrief Center for Healthcare Engineering, Purdue University, West Lafayette, IN, 47906, United States of America, huang74@purdue.edu

Many initiatives call for the dissemination of transparent data based on the assumption that it will lead to cost-effective healthcare. As healthcare providers face large volumes of data, they require decision-making assistance to become informed decision-makers. We develop a ranking method that accounts for multiple criteria but avoids the bias of assigning weight for each criterion. Our illustrated examples include hospital rankings for patients as well as patient stratification for providers.

3 - Impact of Ambulance Diversion Ban on Emergency Departments' Length of Stay

Ahmad Ashkanani, Purdue University, Krannert School of Management, 403 W. State Street, West Lafayette, IN, 47907, United States of America, aashkana@purdue.edu, Masha Shunko, Ping H. Huang

Emergency department (ED) crowding poses a serious threat to the access and quality of health care in the US. Many EDs use ambulance diversion (AD) practices in an effort to alleviate ED crowding. The state of Massachusetts (MA) issued a statewide ban in 2009 ending the AD practice. We study the impact of the AD ban on ED length of stay using 2008 and 2009 ED data from MA.

4 - Managing Hospital Inpatient Bed Capacity through Partitioning Care into Focused Wings

Thomas Best, Doctoral Candidate, The University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, tbest@chicagobooth.edu, David Meltzer, Burhaneddin Sandikci, Donald Eisenstein

We provide an optimization framework to support a hospital administrator, who chooses between pooling inpatient demand and bed capacity, and forming specialized wings to focus on narrow ranges of care types. Specialized wings not only provide advantages from focused care, but also allow the protection of beds for high utility care types. Using data from an urban teaching hospital and a national database, we discuss our model's solutions and managerial insights.

■ SB39

Hilton- Union Sq 19

Decision-Making for Population Health Outcome Interventions

Sponsor: Health Applications

Sponsored Session

Chair: Monica Gentili, University of Salerno, Via Giovanni Paolo II n. 132 - 84084, Fisciano (SA), Italy, mgentili@unisa.it

1 - A Standard Acquisition Charge Model for a National Kidney Exchange Program

Andrew Schaefer, William Kepler Whiteford Professor, The University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, schaefer@pitt.edu, Amin Dehghanian

Kidney exchange is a rapidly growing approach to solve the shortage of kidneys for transplantation. A major challenge to establish a national kidney exchange program is the establishment of the proper incentives for transplant centers to participate. We develop a mathematical program that explores payment strategies and maximizes a social welfare criterion subject to individual rationality and incentive compatibility constraints of transplant centers.

2 - Diffusion of Information in Diabetes Care

John Birge, Jerry W. and Carol Lee Levin Professor of Operations Management, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu, Vishal Ahuja

We evaluate the changes in prescription patterns of an anti-diabetic medication during the time period when health warnings were issued by FDA related to drug. Using data on diabetic patients from the Department of Veterans Affairs, we identify the regional variation in the prescription patterns to study the diffusion of information and examine operational factors that promote physician learning.

3 - The Impact of Geographic Access on Severe Health Outcomes for Pediatric Asthma

Erin Garcia, Georgia Institute of Technology, Atlanta, GA, 30332, United States of America, egarcia3@gatech.edu, Nicoleta Serban, Julie Swann

Access to medical care and severe pediatric asthma outcomes vary with geography. We measure geographic access to primary and asthma specialist care using mathematical optimization models and estimate the association between outcomes and access in the presence of other factors using logistic regression. The model is used to project the reduction in severe outcomes with improvement in access. To gain maximum benefit interventions should be targeted to areas with the greatest potential improvement.

4 - Chemotherapy Capacity Planning

Leah Weber, Operations Research Scientist, BC Cancer Agency, 600 W 10th Ave, Vancouver, BC, V5Z 4E6, Canada, leah.weber@bccancer.bc.ca, Claire Ma, Antoine Sauré, Emma Liu, Martin Puterman

Chemotherapy treatment within Canada is in high demand and there are currently insufficient resources to meet demand in a timely manner, leading to long wait times for new patient appointments and, consequently, the potential for the patient's disease to progress further. In order to ensure demand for treatment is met in a timely manner, we are developing a long-term resource planning strategy for the BC Cancer Agency that will aid in matching staffing requirements with demand levels.

Appointment Scheduling

Sponsor: Health Applications

Sponsored Session

Chair: Van-Anh Truong, Assistant Professor, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu

1 - Optimal Advance Scheduling

Van-Anh Truong, Assistant Professor, Columbia University, 500 West 120th St, New York, NY, 10027, United States of America, vt2196@columbia.edu

The dynamic assignment of advance appointments has been considered to be especially challenging due to its high-dimensionality. For a canonical model with two patient classes, we derive an elegant characterization of an optimal policy and an efficient algorithm to compute the policy exactly. We introduce the property of successive refinability, which allows advance schedules to be easily computable and under which there is no cost to the system to making advance commitments to patients.

2 - Managing Customer Arrivals in Service Systems with Multiple Servers

Christos Zacharias, New York University, Stern School of Business, New York, NY, 10012, United States of America, czachari@stern.nyu.edu

We analyze a discrete multi-server queueing model for scheduling customer arrivals in service systems with parallel servers. Theoretical and heuristic guidelines are provided for the effective practice of appointment overbooking to offset no-shows. The benefits of resource-pooling are demonstrated in decreasing operational costs and increasing customer throughput.

3 - Managing Patient Admissions in a Neurology Ward

Saied Samiedaluie, Post-Doctoral Fellow, University of British Columbia, E204 - 4500 Oak Street, Vancouver, BC, V6H 3N1, Canada, samiedal@mail.ubc.ca, Beste Kucukyazici, Vedat Verter, Dan Zhang

We study patient admission policies in a neurology ward where there are multiple types of patients with different medical characteristics. We formulate this problem as an infinite-horizon average cost dynamic program and propose an efficient approximation scheme. The computational results from applying our model to a neurology ward show that dynamic policies generated by our approach can reduce the overall deterioration in patients' health status compared to several static policies.

Hilton- Union Sq 21

Healthcare Modeling for Efficient Policy Decisions

Sponsor: Health Applications

Sponsored Session

Chair: Sze-chuan Suen, Stanford University, 117 Encina Commons, Stanford, United States of America, ssuen@stanford.edu

1 - Cost-effectiveness of Oral PrEP as HIV Prevention for Injection Drug Users in the United States

Cora Bernard, PhD Student, Stanford University, 9074 Great Dome Ct, Fair Oaks, CA, 95628, United States of America, clb210@stanford.edu, Chris Weyant, Margaret Brandeau, Jeremy Goldhaber-Fiebert, Douglas K. Owens

The US Centers for Disease Control and Prevention recently recommended oral pre-exposure prophylaxis (PrEP) for HIV prevention among at-risk individuals in the US. We use a dynamic compartmental model combined with an economic model to assess the cost-effectiveness of PrEP in the US IDU population. We evaluate cost-effectiveness as function of level of risk behavior and adherence to PrEP.

2 - Cost Effectiveness of Sofosbuvir-based Treatment for Hepatitis C in U.S. Incarcerated Populations

Shan Liu, Assistant Professor, Industrial and Systems Engineering, University of Washington, UW Box 352650, Seattle, Wa, 98195-2650, United States of America, liushan@uw.edu, Daena Watcha, Mark Holodniy, Jeremy Goldhaber-Fiebert

The prevalence of chronic hepatitis C virus (HCV) infection is estimated at 12-35% among U.S. incarcerated populations, where we assessed the cost-effectiveness of newer sofosbuvir-based therapy. We developed a decision-analytic Markov model that included the natural history of chronic HCV and combinations of treatment options both in and out of prisons; and the possibility of reinfection. We found sofosbuvir-based therapy is cost-effective for long and short-term incarcerated individuals.

3 - Cost-effectiveness of Rapid Diagnostics and Care Systems Improvements for Tuberculosis in India

Sze-chuan Suen, Stanford University, 117 Encina Commons, Stanford, United States of America, ssuen@stanford.edu, Kimberly Babiarz, Eran Bendavid, Jeremy Goldhaber-Fiebert

We evaluated the cost-effectiveness of novel drug susceptibility testing technologies, private patient referrals to more effective public clinics (PPM), and combinations of these policies in India. Using a dynamic transmission microsimulation model, we found that rapid TB and drug susceptibility testing provide benefits at costs below 3-times India's per-capita GDP. The combination of PPM with rapid drug susceptibility testing provides benefits at costs below 1-time per-capita GDP.

4 - Cost-effectiveness of Multiple Sclerosis Disease-modifying Therapy: Accounting for Patient Risk

Allie Leeper, Stanford University, 475 Via Ortega, Stanford, United States of America, allie105@stanford.edu, Alexandra Goodyear, Douglas K. Owens, Jeremy Goldhaber-Fiebert

Objective: We assess cost-effectiveness of glatiramer acetate (GA) and dimethyl fumarate (DMF) for patients with multiple sclerosis using a microsimulation model to account for variation in patient risk for long-term disability. Results: At full prices, both drugs yield health benefits at high costs relative to no drug. For clinical cases where drug therapy is indicated, DMF costs $99,000 per QALY gained compared to GA. Both drugs yield better value for money for high-risk patients.

Stochastic Models on Medical Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: F. Safa Erenay, University of Waterloo, 200 University Ave. CPH 4323, Waterloo, ON, N2L 3G1, Canada, ferenay@uwaterloo.ca

1 - Evaluate the Importance of Different Clostridium Difficile Sources in Hospital Setting by Agent Base

Biao Wang, PhD Candidate, University of Waterloo, 200 University Avenue, Waterloo, ON, Canada, b67wang@uwaterloo.ca, Kenneth McKay, William Ciccotelli

An agent based simulation of C. Difficile spread in a public hospital is developed using data from the hospital and literature. The simulation results suggest that the admission of asymptomatic patients in the ward could be the major source of hospital acquired C. difficile infection (CDIs). This observation is consistent with recent findings in the literature that diverse sources might exist for the hospital acquired CDI transmission.

2 - Optimal Design of the Annual Influenza Vaccine with Manufacturing Autonomy

Osman Ozaltin, Assistant Professor, North Carolina State University, Industrial and Systems Engineering, Raleigh, United States of America, oyozalti@ncsu.edu, Oleg Prokopyev, Andrew Schaefer

Seasonal influenza is a major public health concern, and the first line of defense is the flu shot. We propose a bilevel multi-stage stochastic mixed-integer program that maximizes societal benefit of the flu shot under autonomous profit maximizing manufacturers. Calibrated over publicly available data, our model returns the optimal flu shot composition and timing in a stochastic and dynamic environment. We derive analytical results, and perform extensive numerical experiments.

3 - Colonoscopy Surveillance for Metachronous Colorectal Cancer Prevention and Early Detection

F. Safa Erenay, University of Waterloo, 200 University Ave. CPH 4323, Waterloo, ON, N2L 3G1, Canada, ferenay@uwaterloo.ca, Oguzhan Alagoz, Adnan Said

Colorectal cancer (CRC) survivors have high risk of developing metachronous CRC (MCRC). We developed a discrete-event simulation model and compared the effectiveness of possible colonoscopy surveillance policies for MCRC prevention and early-diagnosis in a cost-utility analysis setting based on data from MAYO Clinic, Rochester. We derived the Pareto-efficient policies in the spectrums of MCRC risk, total cost, total quality adjusted life years, and expected number of required colonoscopies.

1 - Multidimensional Piecewise Linear Approximation Strategies for Nonlinear Programs

Leon Lasdon, University of Texas, Austin, TX, United States of America, lasdon@utexas.edu, Anant Balakrishnan, Vivek Vasudeva

Piecewise linear approximation (PLA) solves NLP's by approximating the non-linear functions by piecewise linear interpolations over a grid, imposing adjacency conditions on the grid point weights, and solving the resulting MILP. This has been extended to nonseparable functions of several variables. We discuss features and computational experience with our implementation of PLA, including grid shapes, speeding up the MILP, and problem reformulations. The approach has promise in finding near-optimal solutions of nonconvex NLP's and MINLP's.

2 - Piecewise-linear Approximations for MIQCP and Global Optimization of Electrical Power Flow Problems

James Foster, Postdoctoral Research Associate, University of Wisconsin/WID, Wisconsin Institute for Discovery, 330 North Orchard Street, Madison, WI, 53715, United States of America, jfoster@discovery.wisc.edu, Natashia Boland, Hamish Waterer

We present a novel global optimization approach to solving nonconvex power flow optimization problems. We describe a systematic approach to constructing minimal-error piecewise-linear approximations of the two-dimensional paraboloid function using the framework of the Delaunay triangulation and majorization theory. This analysis is applied to the problem of creating disjunctive outer approximations of indefinite quadratic constraints using MIP models with a limited number of integer variables.

3 - Generating Multi-row Simplex Cuts on Higher Dimensional Spaces

Emre Yamangil, Graduate Assistant, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, emreyamangil@gmail.com, Endre Boros

We consider the problem of generating a lattice-free convex set to find a valid inequality that minimizes the sum of its coefficients for multi-row simplex cuts. We formulate this problem as a fixed-dimensional semi-infinite disjunctive program on higher dimensional spaces. We investigate equivalent simplifications of this problem for efficiency and conclude with a numerical study on MIPLIB that shows improvement at the root gap.

1 - Peer Influence in Academic Performance

Pedro Ferreira, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, United States of America, pedrof@cmu.edu, Ryan Turner, Rodrigo Belo

We track the usage of the wi-fi network on a college campus by engineering students to define networks of friends – those students that log to the same access point at the same time for most of the academic year. Using a panel with 3 years of data, we show that friends' grades influence one's grades. This result is obtained using randomization to separate the effect of peer influence from homophily and from other potentially unobserved covariates that might lead to correlation in grades.

2 - Reducing Medical Bankruptcy through Crowdfunding: Evidence from GiveForward.com

Jason Chan, Stern School of Business, New York, NY, United States of America, jcc534@stern.nyu.edu, Gordon Burtch

This paper examines the potential of medical crowdfunding in reducing bankruptcy. Medical crowdfunding is a relatively recent phenomenon where patients reach out to their social network for monetary support towards medical causes. We combine proprietary fundraising data with bankruptcy filing records in our analyses and find that medical crowdfunding reduce the financial burden faced by individuals on the brink of bankruptcy. This relationship is robust to alternative model specifications.

3 - Value of Following Network and User Interest in Social Advertising Targeting

Hyelim Oh, McGill University, Montreal, Canada, hyelim.oh@mail.mcgill.ca, Animesh Animesh, Alain Pinsonneault

This study investigates how firms can improve the effectiveness of social advertising by leveraging the viral features of social media platforms and social media analytics. Specifically, we focus on individual-level content retransmission decisions and examine how dyadic properties between a sender and receiver on Twitter networks affect the likelihood of a receiver's retweet decisions. Our preliminary findings show that latent homophily predicts the likelihood of a receiver's retweet decision.

4 - An Empirical Investigation of the Role of Basic and Social Features in the use of Online Music Sites

Genevieve Bassellier, Associate Professor, McGill University, Desautels Faculty of Management, 1001 Sherbrooke St. W., Montreal, Qu, H3A 1G5, Canada, genevieve.bassellier@mcgill.ca, Zachary Krastel, Jui Ramaprasad

This study examines users' perceptions of online music site features and their impact on use. We focus on two types of features: basic site features, e.g. the size of the song catalog, and social features that enable interaction amongst users and artists. We examine the impact of these features on different types of use for different types of sites. Preliminary results support the notion that not all features are created equally, which has significant implications for the design of such sites.

5 - A Brief History of Stenting: Antecedents of Organizational Technology Adoption and Abandonment

Brad Greenwood, University of Maryland, United States of America, brad.n.greenwood@gmail.com, Ritu Agarwal, Rajshree Agarwal, Anand Gopal

We investigate how factors which influence organizational adoption of technology also influence the decision to abandon technology after its efficacy is questioned. Using a census of 1.4 million patients admitted to Florida hospitals, results indicate that pecuniary incentives will retard the abandonment of technology, if it can still be leveraged for economic gain. However, incentives to adhere to scientific norms dominate these economic motives (resulting in an accelerated abandonment).

Sponsored Session

Chair: Tony Cui, Associate Professor of Marketing, University of Minnesota, 321 19th Ave S, Ste 3-150, Minneapolis, MN, 55455, United States of America, tcui@umn.edu

1 - Cognitive Hierarchy in Capacity Allocation Games

Yinghao Zhang, Assistant Professor, Salisbury University, Perdue Hall 333, 1101 Camden Avenue, Salisbury, MD, 21804, United States of America, YXZHANG@salisbury.edu, Tony Cui

We experimentally study the capacity allocation game with the proportional allocation rule. The orders made by the subjects are significantly different from the Nash equilibrium. The data also suggests heterogeneities among the subjects. We propose a behavioral model to explain the phenomenon based on the Cognitive Hierarchy (CH) theory, in which decision makers are cognitively heterogeneous. The model coincides with the experimental observations and fits the data quite well.

2 - A Model of Bounded Cognition in Forecasting with Implications for Operations Management

Jordan Tong, Assistant Professor of Operations and Information Management, University of Wisconsin-Madison, Wisconsin School of Business, Madison, WI, United States of America, jtong@bus.wisc.edu, Daniel Feiler

We leverage psychological micro-foundations to analytically model bounded cognition in three forecasting tasks critical to operations management: the single forecast, the mth arrival time forecast, and the l-time demand forecast. For each task, we derive the distribution of behavior and the biases due to bounded cognition. Finally, we focus on the model's application to the well-studied newsvendor problem, including structural estimations and out-of-sample tests using existing empirical data.

3 - Information Sharing, Advice or Delegation: What Leads to Higher Trust in a Distribution Channel?

Upender Subramanian, Assistant Professor of Marketing, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, upender@utdallas.edu, Ozalp Ozer, Yu Wang

Many retailers solicit support from manufacturers in the form of information about market conditions, or advice about retail decisions, or even request manufacturers to make decisions on their behalf. Often such support is not explicitly governed by contracts, raising concerns about manufacturer opportunism. Using analytical and behavioral methods, we show how and why — contrary to predictions from standard theory — one form of support leads to more trust and cooperation than others.

4 - Is it Really Dumb to be a Dumber? Competitive Analysis of Hierarchically Strategic Firms

Tony Cui, Associate Professor of Marketing, University of Minnesota, 321 19th Ave S, Ste 3-150, Minneapolis, MN, 55455, United States of America, tcui@umn.edu, Zuhui Xiao

Research has suggested firms may have different levels of strategic reasoning capabilities. Incorporating hierarchical strategic capabilities into a duopoly model, we find that a less strategic firm may benefit from its limited strategic capability when competing with a more strategic firm, although the strategic firm can respond specifically towards the less strategic firm's decisions but not vice versa. A lab experiment provides empirical supports for theoretical predictions.

Chair: Akshay Gupte, Assistant Professor, Clemson University, Martin O-321, Dept. of Math Sciences, Clemson, SC, United States of America, agupte@clemson.edu

1 - On the Equate-and-Relax Procedure for LPCCs

Jean-Philippe P Richard, University of Florida, 303 Weil Hall P.O. Box 116595, Gainesville, FL, 32611, United States of America, richard@ise.ufl.edu, Mohit Tawarmalani, Trang Nguyen

We study the problem of generating cuts for linear programs with linear complementarity constraints (LPCCs) from simplex tableaux of their LP relaxations. We show that the convex hull of a suitably defined single-complementarity corner relaxation can be derived through a constructive equate-and-relax procedure. This result also holds when side constraints are added and can be used to generate cuts for problems with multiple complementarity constraints using a generalization of split disjunctions

2 - Integer Quadratic Programming is in NP

Marco Molinaro, Georgia Tech, Ferst Drive, Atlanta, United States of America, marco.molinaro@isye.gatech.edu, Santanu Dey

We prove that Integer Quadratic Programming (IQP) is in NP. The decision version of IQP is the following problem: Given one quadratic inequality and a system of linear inequalities in n variables where all data is rational, decide whether there exists an integral vector that satisfies all these inequalities. We prove that if the system of inequalities is integer feasible, then there exists one integer feasible solution whose size is bounded by a polynomial function of the size of the instance.

3 - A Trust Region Method for Solving Grey-box MINLP

Claudia D'Ambrosio, CNRS & LIX, Ecole Polytechnique, Batiment A. Turing, Palaiseau CEDEX, 91128, France, dambrosio@lix.polytechnique.fr, Ky Vu, Andrew Conn, Claire Lizon, Leo Liberti

We aim at solving grey-box MINLP problems with binary variables, i.e., mixed integer nonlinear optimization problems where the objective function is the sum of smooth functions given in closed form and of a black-box. We propose a trust region method with adjoined local branching type constraints that define the trust region for the binary variables. Both theoretical aspects and computational results on applications like smart building design and oil reservoir engineering are discussed.

4 - New MIP and SDP Approaches to the Floor Layout Problem

Joseph Huchette, MIT Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, huchette@mit.edu, Juan Pablo Vielma, Santanu Dey

The floor layout problem is central to VLSI: given a rectangular floor, find the best configuration of N rectangular boxes on the floor. The boxes must have a certain area, but their widths and heights can be varied. We present new MILP formulations for the problem, offering nontrivial LP relaxation bounds. We investigate incorporating existing SDP formulations into the MILP solution process as a cut generator, and we present extensive computational results for our formulations and techniques.

1 - A Two-stage Ambiguous Stochastic Generalized Network Flow Model for Water Allocation

Güzin Bayraksan, Associate Professor, Ohio State University, 1971 Neil Ave., Columbus, OH, 43210, United States of America, bayraksan.1@osu.edu

We present a two-stage stochastic generalized network flow model for water allocation. The distributional ambiguity is modeled by considering all distributions that are sufficiently close to a nominal distribution with respect to a phi-divergence (e.g., Chi-sq. distance, Kullback-Leibler divergence, etc.). We integrate forecasts from different sources of uncertainty and examine the value of additional data.

2 - Sensor Deployment for Stochastic Traffic Congestion Observation

Siqian Shen, Assistant Professor, University of Michigan, 2793 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, siqian@umich.edu, Zhili Zhou

Under random traffic flows, we deploy sensors to cover all congested arcs. We minimize congested arcs subject to a chance constraint on flow losses. We generalize the cut-based flow inequalities and prove that they are facets of the MIP reformulation. Computational studies use data in Singapore, and show the effectiveness of integrating sensor deployment with traffic congestion minimization.

3 - Chance-constrained Multi-terminal Network Design Problem

Yongjia Song, Virginia Commonwealth University, 1015 Floyd Ave, Richmond, VA, 23284, United States of America, yjsong.pku@gmail.com, Minjiao Zhang

We study a chance-constrained multi-terminal network design problem, which is a stochastic variant of Steiner tree problems. We study formulations using valid inequalities that require different separation efforts. We conduct a computational test to show their performance.

4 - Efficient Methods for Vulnerability Assessment in Uncertain Networks

Thang Dinh, Assistant Professor, Virginia Commonwealth University, 401 West Main Street, Room 4244, P.O. Box 843019, Richmond, VA, 23284, United States of America, tndinh@vcu.edu, My Thai

We aim to identify the most critical elements whose removal maximizes the disruptive effect in terms of connectivity. We show that computing expected connectivity in uncertain networks is intractable and propose an FPRAS to estimate the connectivity with an arbitrary accuracy. Further, we propose an efficient two-stage stochastic programming and efficient solving methods to identify critical elements.

Stochastic Programming - A Mix of Recent Results

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Ruediger Schultz, University of Duisburg-Essen, Faculty of Mathematics, Forsthausweg 2, Duisburg, D-47048, Germany, ruediger.schultz@uni-due.de

1 - Risk Averse Routing in Single-VRP with Simultaneous Delivery and Stochastic Pickup

Nadine Wollenberg, nadine.wollenberg@uni-due.de, Walter Rei, Michel Gendreau, Ruediger Schultz

The talk addresses risk averse routing decisions. A stochastic extension of the vehicle routing problem with simultaneous delivery and pickup is presented. Delivery quantities are fixed and units to be picked up are a priori unknown. For the single vehicle case, the stochastic model is formulated as a two-stage stochastic program with recourse and solved by means of the integer L-shaped method. Solutions of different stochastic mean-risk models are examined and compared to the risk neutral case.

2 - Sufficient Conditions for Metric Regularity and Stability of Stochastic Dominance Constraints

Matthias Claus, Universitat Duisburg-Essen, Forsthausweg 2, Duisburg, 47057, Germany, matthias.claus@uni-due.de, Ruediger Schultz

Minimizing a disutility function under first-order stochastic dominance constraints for random variables arising as optimal values of stochastic programs with linear recourse leads to an optimization problem with uncountably many chance constraints. Metric regularity of the contraint function is the key to stability of the solution set mapping subject to perturbations of the underlying probability measure. The talk is on verifiable sufficient conditions based on a local linear growth.

3 - Semidefinite Sochastic Programming in AC Power Flow

Tobias Wollenberg, University of Duisburg-Essen, Faculty of Mathematics, Forsthausweg 2, Duisburg, D-47048, Germany, tobias.wollenberg@googlemail.com

Considering the AC load flow problem under uncertainty of infeed from renewables and customers' power demand leads us to specific semidefinite stochastic programs. Basic structures of these models are studied and a decomposition algorithm for their solution is proposed.

4 - Stochastic Programming with PDE Constraints in Shape Optimization with Random Load

Ruediger Schultz, University of Duisburg-Essen, Faculty of Mathematics, Forsthausweg 2, Duisburg, D-47048, Germany, ruediger.schultz@uni-due.de

Shape optimization with linearized elasticity and random loading has attracted research in stochastic programming only fairly recently. Typical paradigms from stochastic programming, to be discussed in the talk, such as the recourse idea or mean-risk objectives as well as dominance constrained constraints have their counterparts in shape optimization under uncertainty.

Risk-averse Optimization in Networks

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Pavlo Krokhmal, Associate Professor, University of Iowa, 3131 Seamans Center, Iowa City, IA, 52242, United States of America, krokhmal@engineering.uiowa.edu

1 - Risk Averse Strategic Planning of HVDC Grids

Bo Sun, University of Iowa, 3131 Seamans Center, Iowa City, IA, 52242, United States of America, bo-sun-1@uiowa.edu, Yong Chen, Pavlo Krokhmal

We consider the problem of risk-averse strategic planning of high-voltage direct current (HVDC) grids, which offer significant advantages over traditional AC transmissions. We discuss the problem of long-term planning of HVDC grids that incorporate sources of renewable energy. Risks of power shortages are controlled using nonlinear higher-moment coherent risk (HMCR) measures. Solution methods for the resulting mixed-integer programming problems and computational case studies are presented.

2 - Two-stage Stochastic Maximum Clique Problem

Maciej Rysz, University of Iowa, 3131 Seamans Center, Iowa City, IA, 52242, United States of America, maciej-rysz@uiowa.edu, Pavlo Krokhmal, Eduardo Pasiliao

We consider the problem of determining the largest "robust" clique in a stochastic graph, where links between nodes may randomly fail or "appear". The "robustness" of a complete subgraph is defined as its repairability after observable random changes to the graph's topology. A two-stage stochastic programming model is formulated, and a graph-based branch-and-bound algorithm is proposed. Numerical experiments illustrate computational effectiveness of the proposed method.

3 - On Incremental Network Design under Uncertainty

Nathaniel Richmond, University of Iowa, 3131 Seamans Center, Iowa City, IA, 52242, United States of America, nathaniel-richmond@uiowa.edu, Pavlo Krokhmal, Dmytro Matsypura

We consider the incremental network design problem, where the goal is to improve an existing network by building new arcs, given that only one arc can be built at a time, the arc budget is limited, and at each time step the desired network characteristic (e.g., a shortest path between two nodes) is minimized. Previous studies have shown this problem to be NP-hard. A stochastic extension of the problem is presented, and the theoretical and computational properties of its solutions are discussed.

1 - Competitive Equilibrium in Electricity Markets with Price Fluctuation Penalty

Ermin Wei, MIT, Cambridge, MA, United States of America erminwei@mit.edu, Azarakhsh Malekian, Asuman Ozdaglar

We develop a flexible model of competitive equilibrium in electricity markets involving heterogeneous users with shiftable demand. The resulting equilibrium prices and quantities may feature undesirably high price volatility over time. To control this, we introduce an explicit penalty term on the price fluctuation and provide a distributed market implementation thereof. We analyze the connection between consumer utility properties and the price fluctuation at equilibrium.

2 - Modeling Evolution of Social Networks with the Node Prominence Profile

Nitesh Chawla, Associate Professor, University of Notre Dame, 384 Nieuwland Science Hall, Notre Dame, IN, 46556, United States of America, nchawla@nd.edu

Both preferential attachment and triadic closure properties are important in defining the growth of a network. As the node's influence and relative position in the neighborhood increases, it impacts the local network structure. We use the concept of prominence, which captures trade-offs between preferential attachment and triadic closure. We develop a method for predicting prominence and network evolution, and demonstrate its effectiveness over multiple social networks.

3 - Distributional Robust Network Design Problems
Zhihao Chen, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48105, United States of America, czhihao@umich.edu, Siqian Shen

We investigate network design problems under uncertain demand; the true distribution is unknown but historical data is available. We use candidate distributions whose moments are close enough to the empirical moments and find the optimal solution under the worst-case distribution. We will compare the performance of the distributionally robust approach against a stochastic approach where the distribution is intelligently guessed, and also examine the effect of correlated demands on this approach.

4 - Detecting Cliques of Maximum and Minimum Centrality
Chrysafis Vogiatzis, University of Florida, chvogiat@ufl.edu

We consider the problem of finding the most and least "influential" or "influenceable" cliques in graphs based on three classical centrality measures: degree, closeness, and betweenness. In addition to standard betweenness,, we also consider its optimistic and pessimistic versions. We discuss their computational complexity and develop linear 0-1 programming formulations. Finally, we demonstrate the performance of the formulations, and provide some interesting insights based on the results.

Chair: Amir Ali Ahmadi, Princeton University, 329 Sherrerd Hall, Dept. of Operations Research & Fin. Eng., Princeton, NJ, 08540, United States of America, a_a_a@princeton.edu

1 - An Input/Output Approach to Predicting and Engineering Emergent Network Behavior
Murat Arcak, Professor, UC Berkeley, Cory Hall, Berkeley, United States of America, arcak@berkeley.edu

Analytical and computational tools for certifying the stability and performance of feedback systems are applicable only to moderate size problems. We will present a compositional approach that exploits input-output properties of the subsystems and their interconnection structure to analyze large-scale systems. We will present a large-scale optimization technique to select important local properties to certify global objectives.

2 - Optimal Sampling-Based Motion Planning under Differential Constraints
Marco Pavone, Professor, Stanford University, 496 Lomita Mall, Room 261, Stanford, CA, 94305, United States of America, pavone@stanford.edu, Edward Schmerling

We present a thorough theoretical framework to assess optimality guarantees of sampling-based algorithms for robot motion planning under differential constraints. Our analysis yields convergence rate bounds - a first in the field. We exploit this framework to design and analyze two novel sampling-based algorithms that are guaranteed to converge, as the number of samples increases, to an optimal solution. Our focus is on driftless control-affine and on linear affine dynamical models.

3 - Robust to Dynamics Optimization (RDO)
Amir Ali Ahmadi, Princeton University, 329 Sherrerd Hall, Dept. of Operations Research&Fin. Eng., Princeton, NJ, 08540, United States of America, a_a_a@princeton.edu, Oktay Gunluk

We introduce a new type of robust optimization problems that we call "robust to dynamics optimization" RDO. The input to an RDO problem is twofold: (i) a mathematical program (e.g., an LP, SDP, IP), and (ii) a dynamical system (e.g., a linear, nonlinear, discrete, or continuous dynamics). The objective is to maximize over the set of initial conditions that forever remain feasible. We initiate an algorithmic study of RDO and demonstrate tractability of some important cases.

Sponsored Session

Chair: Robert Freund, Professor, MIT, Sloan School of Management, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, rfreund@MIT.EDU

1 - Boosting in Regression: Computational Guarantees and Regularization via Subgradient Optimization
Paul Grigas, MIT Operations Research Center, E40-130, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, pgrigas@mit.edu, Rahul Mazumder, Robert Freund

We present a novel subgradient descent framework for interpreting boosting methods in linear regression that yields new convergence and computational guarantees. Our framework includes both the incremental forward stagewise regression algorithm and boosting methods for lasso. Our results draw on existing theory of first-order methods in convex optimization as well as new extensions of this theory in the setting of linear regression.

2 - An Optimal Stochastic Incremental Gradient Method for Convex Optimization
George Lan, Assistant Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, glan@ise.ufl.edu

We present a novel stochastic primal-dual incremental gradient method and show that it can achieve the optimal O(1/k^2) rate of convergence for deterministic smooth optimization. The cost per iteration for this algorithm is comparable to stochastic / incremental gradient methods. Our work thus provides a positive answer to the open question regarding whether there exists an optimal incremental gradient method for convex optimization.

3 - An Accelerated Randomized Coordinate Descent Method for Strongly Convex Composite Optimization
Qihang Lin, Assistant Professor, The University of Iowa, 21 East Market Street, PBB S380, Iowa City, IA, 52245, United States of America, qihang-lin@uiowa.edu, Lin Xiao, Zhaosong Lu

We propose an accelerated randomized block-coordinate descent method for minimizing the sum of a smooth convex function and a block-separable convex function. The algorithm is developed based on the technique of randomized estimate sequence. Compared to existing coordinate descent methods, our method guarantees a linear convergence rate when the problem is strongly convex and its complexity has a better dependence on the condition number of the problem.

4 - An Extended Frank-Wolfe Method, with Application to Low-Rank Matrix Completion
Robert Freund, Professor, MIT, Sloan School of Management, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, rfreund@MIT.EDU, Paul Grigas, Rahul Mazumder

We present an extension of the Frank-Wolfe method that is designed to induce near-optimal solutions on low-dimensional faces of the feasible region. In addition to computational guarantees for the method, we present computational results for large-scale low-rank matrix completion problems that demonstrate its usefulness in providing order-of-magnitude speed-up in computing low-rank near-optimal solutions.

Systemic Risk

Cluster: Optimization in Finance

Invited Session

Chair: Ciamac Moallemi, Barbara and Meyer Feldberg Associate Professor of Business, Columbia Business School, 3022 Broadway, Uris 416, New York, NY, 10027, United States of America, ciamac@gsb.columbia.edu

Co-Chair: Garud Iyengar, Columbia University, S.W. Mudd 314, 500W 120th Street, New York, NY, 10027, United States of America, garud@ieor.columbia.edu

1 - Information Contagion in Financial Networks
Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris 418, New York, NY, 10027, United States of America, alirezat@columbia.edu, Jennifer La'O

We analyze how incomplete information about the viability of bank assets may affect the fragility of the financial system. We show that fluctuations in expectations can be amplified and lead to systemic crises. Fragility depends both on the topology of the network as well as the structure of higher-order beliefs. Our results have implications for regulatory policies such as mandatory disclosure policies and stress tests.

2 - Measuring and Allocating Systemic Risk
Patrick Cheridito, Princeton University, 204 Sherrerd Hall, Princeton, NJ, United States of America, dito@princeton.edu

This paper develops a framework for measuring, allocating and managing systemic risk. SystRisk, our measure of total systemic risk captures the a priori cost to society for providing tail-risk insurance to the financial system. Our allocation principle distributes the total systemic risk among individual institutions according to their size-shifted marginal contributions.

3 - A Structural Model for Asset-based Contagion and Systemic Risk
Chen Chen, ShanghaiTech University, Shanghai, Shanghai, China, cc3136@columbia.edu, Garud Iyengar, Ciamac Moallemi

We develop a structural model for the analysis of systemic risk in financial markets based on asset-based contagion. Specifically, we describe a mechanism of contagion where exogenous random shocks to agents in an economy force portfolio rebalancing. This creates an endogenous chain reaction as agents trade in reaction to price changes. Our approach allows us to quantify the effect of attributes such as leverage and portfolio diversity on asset-based contagion.

4 - Optimal Capital Requirements in Interbank Networks
Jong Soo Hong, PhD Student, Duke Univ Fuqua School of Business, 4225 Larchmont Rd 527, Durham, No, 27707, United States of America, jongsoo.hong@duke.edu, David Brown

We consider a network of banks, with connections representing interbank liabilities, and study the problem of optimally trading off between capital reserves and systemic risk. In a model without default costs, the problem may be formulated as a stochastic linear program. Default costs and fire sales externality make the problem much more challenging, and we discuss approximation methods based on dual approach. We demonstrate the methods on an example using data from a central bank.

Financial Engineering & Risk Management

Sponsor: Financial Services Section

Sponsored Session

Chair: Martin Haugh, Columbia University, 500 West 120th Street, Room 332, New York, NY, 10027, United States of America, mh2078@columbia.edu

1 - Systemic Risk and Preventive Policies
Agostino Capponi, Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, 21218, United States of America, acappon1@jhu.edu

We provide a data driven network study to assess the effect of preventive policies for mitigating systemic risk in multi-tiers interbanking networks. Using balance sheet data from the Federal Reserve Call Report as well as interest rates from the Board of Governors H15 release, we calibrate the rules followed by the agents. Capital-to-asset and reserve-to-deposit ratio policies impact the structure of the system, with systemic risk switching from being generated by tier 2 to tier 3 institutions.

2 - Large Deviations for Affine Diffusion Processes on the Canonical State Space
Wanmo Kang, Professor, KAIST, 291 Daehak-ro, Yuseong-gu, Daejeon, Korea, Republic of, wanmo.kang@kaist.edu, Chulmin Kang

We approach this problem in two different ways. In the first approach, we first prove the large deviation principle for finite dimensional distributions, and then use it to establish the sample path large deviation principle. The second approach exploits the exponential martingale method of Donati-Martin et al. for the squares of Ornstein-Uhlenbeck processes. We provide an application to importance sampling of affine diffusion models.

3 - Datebase Monte Carlo Metamodeling
Imry Rosenbaum, Northwestern University, Evanston, United States of America, ImryRosenbaum2016@u.northwestern.edu, Jeremy Staum

Simulation metamodeling creates computational efficiency in applications such as financial risk management. However, metamodels based on function approximation need to be validated, which uses up analysts' time. Database Monte Carlo (DBMC) has been used for variance reduction in simulation. We explore the application of DBMC to construct metamodels that do not require validation.

4 - Information Relaxation Bounds for Infinite Horizon Stochastic Dynamic Programs
David Brown, Duke University, 100 Fuqua Drive, Durham, United States of America, dbbrown@duke.edu

We study infinite horizon MDPs with discounted costs and develop a general approach for calculating performance bounds using information relaxations. We discuss ways to make the approach computationally manageable on problems with large state spaces and study the quality of the resulting bounds. We demonstrate the method on an application involving dynamic scheduling for a multiclass queue.

Integer Nonlinear Programming and Applications – I

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Monique Guignard, Professor, University of Pennsylvania, OPIM Dept., the Wharton School, 3730 Walnut Street, Philadelphia, PA, 19104-6340, United States of America, guignard_monique@yahoo.fr

1 - Multi-objective MINLP Optimization for the Aircraft Collision Avoidance Problem
F. Javier Martin-Campo, Universidad Complutense de Madrid, Department of Statistics and Operations, Office N227, Building 1, Pozuelo de Alarcon (Madrid), 28223, Spain, javier.martin.campo@ccee.ucm.es, Laureano Escudero, Antonio Alonso-Ayuso

The aircraft collision avoidance problem consists of providing a configuration for a set of aircraft flying in a certain air sector such that every conflict situation is avoided (being the violation of the safety distances to be kept in flight). To do so, three different maneuvers may be performed. Three different multi-objective methods have been applied to the proposed MINLP model. A broad computational experiment will be presented to compare the performance of the models and the methods.

2 - The Generalized Trace Ratio Optimization Problem
Said Hanafi, Professor, Universite de Valenceinnes, Valenciennes, France, Said.Hanafi@univ-valenciennes.fr, Yousef Saad, Raca Todosijevic, Mohammed Bellalij

Recently Ngo et al, 2012, show that the trace ratio optimization problem can be solved efficiently using the Lanczos procedure, a good initialization, and an approximation of an eigenvector computed by the Newton procedure. We propose a new Generalized Trace Ratio Optimization problem and a new formulation of the cell formation problem. We propose a hybrid approach using Singular Value Decomposition techniques to produce an initial feasible solution and heuristic to improve it.

3 - Evaluation and Analysis of CDAP Heuristics via Discrete Event Simulation
Frederick Abiprabowo, Graduate Student, University of Pennsylvania, frabi@wharton.upenn.edu

Although the bilinear 0-1 Crossdock Door Assignment Problem (CDAP) is proven to reduce operational costs, little is known regarding its effects on certain performance metrics, such as item cycle time. To evaluate CDAP's efficiency in a holistic crossdocking environment, we designed a discrete event simulation and used an adaptation of the CHH heuristic to solve CDAP. The performances of Static and Dynamic CDAP assignments compare favorably with the door assignments used by a commercial company.

4 - using Fractional Optimization to Accelerate Column Generation
Laurent Alfandari, ESSEC, 1 Avenue Bernard Hirsch, Cergy, France, alfandari@essec.fr

Column Generation (CG) is often efficient to solve the linear relaxation of large-size integer LPs. We diversify criteria to select the columns with a subproblem based on a ratio criterion. The subproblem is a non-linear 0-1 fractional optimization program, which is polynomial under some specified conditions. Mixing this criterion with the classic negative reduced cost criterion enabled to accelerate CG in the numerical experiments conducted.

1 - Heavy-Traffic Limits for a Fork-Join Network in the Halfin-Whitt Regime

Guodong Pang, Penn State University, College of Engineering, University Park, PA, United States of America, gup3@engr.psu.edu, Hongyuan Lu

We study a fork-join network of stations with multiple servers and non-exchangeable synchronization under the FCFS discipline, where all service stations are in the Halfin-Whitt regime. Tasks are only synchronized if all the tasks associated with the same job are completed. We show FLLN and FCLT for the number of tasks in each waiting buffer for synchronization, jointly with the number of tasks in each parallel service station and the number of synchronized jobs.

2 - Virtual Allocation Policies for Many-Server Queues with Abandonment

Jiheng Zhang, HKUST, Clear Water Bay, Hong Kong, Hong Kong - PRC, jiheng@ust.hk, Zhenghua Long

We study a multiclass many-server system with generally distributed patience times. We establish fluid approximations and study the long-term behavior of the fluid model under a family of non-preemptive policies. The equilibrium state of the fluid model connects to a nonlinear program which helps to identify a lower bound of the long-run expected holding and abandonment cost, and design a policy to achieve such a lower bound when the patience time distributions have decreasing hazard rate.

3 - An Analysis of a Large-Scale Machine Repair Model

Petar Momcilovic, University of Florida, Weil Hall, Gainesville, FL, United States of America, momcilovic@ufl.edu, Amir Motaei

A machine repair model under general operating/repair distributions is considered in the Quality-and-Efficiency Driven asymptotic (QED) regime: both the number of machines and the number of repairmen are large, while the capacity and offered load relate via the square-root staffing rule. Process-level convergence of the number of broken machines is established — the limit is in terms of the corresponding tractable infinite-repairmen process, a stationary centered Gaussian process.

4 - Patience Time Based Scheduling in Multi-class Service Systems

Achal Bassamboo, Northwestern University, 2001 Sheridan Rd., Evanston, IL, United States of America, a-bassamboo@kellogg.northwestern.edu, Ramandeep Randhawa

We consider multiclass queueing systems in which customers have generally distributed patience times. We study optimal scheduling that utilizes the customers' patience distribution.

Systemic Financial Risk

Sponsor: Applied Probability Society

Sponsored Session

Chair: Kay Giesecke, Stanford University, Huang Engineering Center, Stanford, United States of America, giesecke@stanford.edu

1 - Interacting Particle Methods for Conditional Distributions

Tomoyuki Ichiba, University of California Santa Barbara, South Hall 5508, University of California, Santa Barbara, CA, 93106, United States of America, ichiba@pstat.ucsb.edu, Mike Ludkovski

We discuss importance sampling approaches to approximating conditional distribution of multidimensional Markov processes, given rare events, in order to compute conditional expectations of functionals of the processes under the worst-case scenarios of financial systems. Examples include Brownian motions with reflections, heavy tailed jump processes and diffusion processes of mean-field type. With the time-reversal of interacting particle system we improve the empirical importance sampling.

2 - Systemic Risk in the Repo Market

Alexander Shkolnik, UC Berkeley, Berkeley, CA, United States of America, ads2@stanford.edu

The repo (repurchase agreement) market is a crucial part of the US financial infrastructure. The complex inter-connectedness of financial institutions and the practice of rehypothecation, the re-use of repo collateral, amplify its inherent systemic risk. In contrast to static models in prior literature, we propose and analyze a dynamic model of a networked repo market. We illustrate the complex phenomena exhibited by the model and study its stability properties using the Lyapunov method.

3 - Modelling Financial Systemic Risk – Network Effect and Liquidity Effect

Nan Chen, The Chinese University of Hong Kong, 609 William Mong Engineering Building, Hong Kong, Hong Kong - PRC, wyu@se.cuhk.edu.hk, Xin Liu, David Yao

The goal of our study is to investigate how two channels of risk transmission, interbank liability network and market liquidity, interact to propagate individual defaults to a system-wide catastrophe. We formulate the model as an optimization problem with equilibrium constraints and derive the solution via a partition algorithm. The analysis and numerical experiments underscore the importance of the market liquidity in the formation of systemic risk.

Condition Monitoring and Degradation Modeling

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Liu Xiao, IBM Research, Singapore, Singapore, liuxiao@sg.ibm.com

Co-Chair: Nan Chen, Assistant Professor, National University of Singapore, 1 Engineering Drive 2, Singapore, Singapore, isecn@nus.edu.sg

1 - A Hierarchical Model for Lithium-Ion Battery Degradation Prediction

Xin Xu, ph.d Student, NUS, BLK E1-07-19,ISE,NUS, Singapore, Singapore, xuxin@nus.edu.sg, Nan Chen

This paper presents a new point of view to analyze the lithium-ion battery degradation by using the detailed discharging profiles to characterize the degradation process. A hierarchical model combining discharging process and degradation process is proposed based on this idea. With this model, the End-of-Discharging prediction and Remaining-Useful-Life prognostics can be realized in one framework.

2 - Imperfect Condition-based Maintenance under Performance-based Logistics

Yisha Xiang, Assistant Professor, Sun Yat-sen University, 135 W. Xingang Rd., Guangzhou, 57025, China, xiangysh@mail.sysu.edu.cn, David Coit

In this study, we consider a heterogeneous population, and allow for unit-to-unit heterogeneity in degradation paths within all subpopulations through the incorporation of random effects. We further propose a condition-based maintenance model under a profit-centric approach for the degradation process of our interest , and compare the optimal policies and costs/profits under the traditional cost-minimization and the new profit-centric approaches.

3 - Joint Mixed Effects Logistic Regression for Rescue Inhaler Usage Prediction in SAM Systems

Junbo Son, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, json5@wisc.edu, Patricia Brennan, Shiyu Zhou

To effectively manage the asthma as a chronic disease, a statistical model based on the everyday patient monitoring is crucial. Also, a significant individualization is desirable to provide a patient-level prediction for key health indicators such as the rescue inhaler usage. Taking advantages from smart asthma management (SAM) systems, we propose an individualized prognostic model that has a form of extended logistic regression. Its promising features are shown in both simulation and case study.

4 - Predictive Maintenance for Data Centre Cooling System

Liu Xiao, IBM Research, Singapore, Singapore, liuxiao@sg.ibm.com

A condition-based maintenance approach is proposed for data centre cooling system. The statistical model is developed based on the first law of thermodynamics. The method has been tested and validated using real data. Our case study shows that the model successfully generates the early warning signal 2 to 3 weeks before the cooling system failure.

Chair: Eunshin Byon, Assistant Professor, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, ebyon@umich.edu

1 - Reliability of Systems with Spatially Distributed Units

Elsayed Elsayed, Distinguished Professor, Rutgers University, Department of Industrial and Systems Eng, Rutgers University, Piscataway, NJ, 08854, United States of America, elsayed@rci.rutgers.edu, Dingguo Hua

The reliability of systems with spatially distributed units have emerged as an important topic in aerospace and military industries. In this paper, we investigate spatially distributed k-out-of-n pairs:G balanced systems with different requirements. Reliability and other metrics such as time to a specified failure are estimated.

2 - Performance Evaluation of Wind Turbines using Wind Power Curves

Hoon Hwangbo, Texas A&M University, 3131 TAMU, College Station, TX, 77845, United States of America, hhwangbo@tamu.edu, Andrew Johnson, Yu Ding

Performance of a wind turbine embodies a lot of internal and external variation. To control for external variation, we align different annual datasets with similar aerodynamic conditions. Then, we apply a method developed based on Convex Nonparametric Least Squares to provide two measures for evaluating internal change of a wind turbine. One measure is for efficiency and another is for variability; together they can account for the performance change of a wind turbine over time.

3 - Optimal Replacement in Partially-Observed Environments

Jeffrey Kharoufeh, Department of Industrial Engineering, University of Pittsburgh, Pittsburgh, PA, 15261, United States of America, jkharouf@pitt.edu

We address the problem of optimally replacing a component that resides in an uncertain environment. Two models are formulated using a partially-observed Markov decision process framework. The first model ignores downtime costs, while the second includes this cost explicitly. For both models, it is shown that a threshold replacement policy is optimal with respect to the cumulative level of degradation. These thresholds depend on the decision maker's assessment of the environmental conditions.

4 - Reliability Assessment of Wind Turbine using Stochastic Simulations

Youngjun Choe, Ph.D. Candidate, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, yjchoe@umich.edu, Nan Chen, Eunshin Byon

As simulation models become more realistic, reliability evaluation remains challenging due to the high computational cost of each simulation replication. We provide computationally efficient methods for reliability evaluation using stochastic simulations that generate random outputs given a fixed input. A new sampling method has been devised and validated using aeroelastic simulators developed by the U.S. National Renewable Energy Laboratory.

1 - A Multistage Stochastic Optimization of the Supply Chains of Biofuels

Yongxi Huang, Assistant Professor, Clemson University, 314 Lowry Hall, Clemson University, Clemson, SC, United States of America, yxhuang@clemson.edu, Fei Xie

A multistage stochastic programming model is developed for a multi-year biofuel supply chain design and planning under time dynamics and uncertainty of feedstock supply. We then use block-separable property to transform the problem to an equivalent two-stage stochastic program. We decompose it into tractable subproblems using the nested decomposition method and generate maximal bender cuts in the iterative process to improve the rate of convergence. We present numerical implementations.

2 - Incorporating Sustainability Concepts into Hybrid Ethanol Supply Chain

Iddrisu Awudu, NDSU, 26 University Village, Fargo, ND, United States of America, Iddrisu.Awudu@my.ndsu.edu, Atif Osmani, Jun Zhang

We develop a framework for the modeling and analysis of a hybrid generation biofuel supply chain (HGBSC) with economic, social, and environmental sustainability concepts. A two-stage stochastic mixed integer linear programming (SMILP) approach is used with the Sample Average Approximation (SAA) algorithm. Analyses of the results conclude that incorporating sustainability concepts into the supply chain provide the HGBSC with visibility and managed expectations of profit realization.

3 - Optimizing Biomass Co-Firing Decisions in Coal Fired Power Plants

Hadi Karimi, Mississippi State University, PO Box 9542, Mississippi State, MS, 39762, United States of America, hadi.karimi.00@gmail.com

This paper provides an optimization model to aid with biomass co-firing decisions in coal fired power plants. Co-firing impacts plant's logistics-related costs, capital investments, plant efficiency, and tax credit collected. We develop a linear MIP model to capture the relationships that exists between biomass usage and the corresponding costs and savings due to production of renewable electricity. We test the impact of the model proposed on renewable electricity production using a case study.

4 - Life Cycle Optimization with Functional Unit for Sustainable Supply Chain Design and Operations

Fengqi You, Assistant Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60201, United States of America, you.fengqi@gmail.com, Dajun Yue

We propose a life cycle optimization framework for the sustainable supply chain optimization considering the concept of "functional unit" under economic and environmental criteria. This modeling framework integrates LCA with multiobjective optimization and measures the system's performance based on a standard quantity of functional unit associated with final products. We also present tailored algorithms for efficiently solving the resulting mixed-integer linear fractional programming problems.

Open Pit Mining and Logistics

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Alexandra M. Newman, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Open Pit Mine Production Scheduling with Stockpiling

Mojtaba Rezakhah, PhD Student, Colorado School of Mines, 1500 Illinois Street, Golden, CO, 80401, United States of America, mrezakha@mymail.mines.edu, Alexandra M. Newman, Vitaliy Krasko

We present several ways of considering stockpiling in open pit mine production scheduling, including (i) individual stockpiles for each block, (ii) homogenously mixed stockpiles, and (iii) binned stockpiles with pessimistic grade estimates. These models are formulated for a currently operational mine and compared to results without stockpiling in order to assess the benefits of stockpiling and to analyze the relationship between milling capacity and stockpiling value.

2 - Production Scheduling for Open Pit Mine Planning: Comparing New and Traditional Approaches

Marcos Goycoolea, Associate Professor, Universidad Adolfo Ibanez, School of Business, Santiago, Chile, marcos.goycoolea@uai.cl, Eduardo Moreno, Daniel Espinoza, Orlando Rivera

Mathematical programming (MP) methods were first proposed for the open pit production scheduling in the late 60s. Despite this, only in the last years has MP been a viable option for solving this problem due to the tremendous size of real planning instances. Instead, mine planners have relied on a heuristic known as the Nested Pit (NP) method. In this talk we describe a new MP approach, and compare it on real instances to Whittle, a market-leading mine-planning software using the NP method.

3 - Optimization of the Immediate Term Execution Schedule in Open Pit Mining

Ryan Miles, Principal Advisor, AngloGold Ashanti, 6300 South Syracuse Way, Suite 500, Centennial, CO, 80111, United States of America, rmiles@anglogoldashanti.com

Operations research in the mining industry has historically sought to optimize an extraction schedule that maximizes net present value over the long run (years-decades). This formulation evaluates the optimal extraction sequence in the immediate term (0-30 day outlook) to support production and maintenance supervisorial decisions based on blasted rock inventory locations and the availability of critical heavy mining equipment (i.e. loaders, shovels, haul trucks, and mineral processing).

4 - Logistic System Analysis for the Mining Company LKAB

Mikael Rönnqvist, Professor, Université Laval, Département de Génie Mécanique Pavillon, 1065, avenue de la Médecine, Québec, QU, G1V 0A6, Canada, mikael.ronnqvist@gmc.ulaval.ca, Patrik Flisberg, Dick Carlsson

LKAB is a large iron ore mining company and a world-leader in pellet manufacturing. It produces more than 20 million tons and this is increasing considerably over the next years. An important part of its logistic is to use trains to transport material and products. This system has a number of bottlenecks that may be critical. We present OR models of the transportation ranging from strategic down to operational planning. We present a number of case studies and analysis of these.

Auctions and Markets for Information

Cluster: Auctions

Invited Session

Chair: Dirk Bergemann, Yale University, 30, Hillhouse Avenue, Cowles Foundation, New Haven, Co, 06511, United States of America, dirk.bergemann@yale.edu

1 - Robustness and Multidimensional Mechanism Design

Gabriel Carroll, Stanford University, 579 Serra Mall, Stanford, CA, 94305, United States of America, gdc@stanford.edu

We consider a robust multidimensional screening problem. A monopolist sells several goods simultaneously to a buyer with additive valuation. The seller knows the marginal distribution of values for each good, but not their joint distribution. Any mechanism for selling the goods is evaluated by its worst-case expected revenue over all joint distributions consistent with the seller's knowledge. The main result is that it is optimal to simply post a price for each good separately.

2 - Selling Cookies

Dirk Bergemann, Yale University, 30, Hillhouse Avenue, Cowles Foundation, New Haven, Co, 06511, United States of America, dirk.bergemann@yale.edu, Alessandro Bonatti

We analyze data pricing and targeted advertising. Advertisers seek to tailor their spending to the value of each consumer. A monopolistic data provider sells cookies about individual consumers' preferences. We characterize the set of consumers targeted by the advertisers and the optimal monopoly price of cookies. The price of data decreases with the reach of the database and increases with the fragmentation of data sales. We characterize the optimal policy for selling information.

3 - Surveying and Selling: Belief and Surplus Extraction in Auctions

Benjamin Brooks, Princeton University, 001 Fisher Hall, Princeton, NJ, 08540, United States of America, babrooks@princeton.edu

I consider a seller who is highly uncertain about demand for the good he is selling. All the seller knows is that values are private and beliefs are derived from a common prior. The seller wants to guarantee himself as large a revenue-share of the efficient surplus as possible. This goal is achieved by running a modified second-price auction, in which the seller collects additional information in order to calibrate a reserve price.

4 - Reserve Prices in Internet Advertising Auctions: A Field Experiment

Michael Schwarz, Yahoo! Labs, Sunnyvale, CA, United States of America, mschwarz@yahoo-inc.com, Michael Ostrovsky

We present the results of a large field experiment on setting reserve prices in auctions for online advertisements, guided by the theory of optimal auction design suitably adapted to the sponsored search setting. Consistent with the theory, following the introduction of new reserve prices revenues in these auctions have increased substantially.

Co-Chair: Ross Baldick, Professor, The University of Texas at Austin, 1 University Station TX, C0803, Department of Electrical & Computer Engg, Austin, TX, 78712, United States of America, baldick@ece.utexas.edu

1 - A Graph-theoretic Computational Method for Emerging Power Optimization Problems

Ramtin Madani, Columbia University, 120th St, New York, NY, 10027, United States of America, rm3122@columbia.edu, Javad Lavaei, Ghazal Fazelnia, Somayeh Sojoudi

We study a general power optimization using a convex relaxation named semidefinite programming (SDP). The existence of a rank-1 matrix solution to the SDP relaxation enables the recovery of a global solution of the original problem. We show that the SDP relaxation has a solution whose rank is upper bounded by a parameter, named the graph complexity of the network. This number will reduce to 2 after sparsification. The results of this talk will be demonstrated on Polish and New England systems.

2 - Capturing User Behavior in the Smart Grid: Prospect Theory Meets Energy Management

Walid Saad, Virginia Tech, Perry St, Blacksburg, VA, United States of America, saad.walid@gmail.com, Narayan Mandayam, H. Vincent Poor

Active customer participation is seen as an integral part of the emerging smart grid. However, despite the foreseen technological benefits of user-centric grid features such as demand-side management, to date, their widespread adoption in practice remains modest. To shed light on this challenge, we explore the potential of prospect theory, a Nobel-prize winning theory, as a decision-making framework that can help understand how risk and uncertainty can impact the decisions of smart grid users.

3 - Pricing Mechanisms for Control

Desmond Cai, California Institute of Technology, Pasadena, CA, United States of America, wccai@caltech.edu, John Ledyard, Adam Wierman, Steven Low

We propose a mechanism for a principal to purchase the right to control the amount of consumption by a group of agents. Such a mechanism could be applicable when the principal is more efficient at managing the consumption of the agents than the agents themselves. Our scheme has applications in demand-side management, where a utility company could manage the power consumption of its end-use customers in conjunction with wholesale prices, to reduce overall energy costs of its end-use customers.

4 - Optimal Simultaneous Energy Consumption and Regulation Provision under Real-time Stochastic Prices

Mahdi Kefayati, The University of Texas at Austin, 2501 Speedway ENS 506A, Austin, TX, 78712, United States of America, kefayati@utexas.edu, Ross Baldick

The power trajectory followed by flexible loads need not be bound to a specific trajectory. Therefore, such loads can respond to prices or ancillary services commands. We propose an optimal policy for simultaneous energy consumption and regulation provision under the assumption that regulation provision requires capacity reservation. We show that the optimal policy admits a piecewise linear form which can be computed efficiently.

Parc- Mission I

New Paradigms in Transmission Expansion Planning

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Enzo Sauma, Associate Professor, Pontificia Universidad Catolica de Chile, Santiago, Chile, esauma@ing.puc.cl

1 - Scalable Decomposition Algorithms for Solving Stochastic Transmission Investment Planning Problems

Francisco Munoz, Analytics, Sandia National Laboratories, 1700 Indian Plaza Dr NE APT 5, Albuquerque, United States of America, elpanchomunoz@gmail.com, Jean-Paul Watson

We describe a scalable decomposition algorithm to solve real-sized investment-planning models taking into account the uncertainties that result from the increasing penetration of renewable energy technologies, as well as from long-term market and regulatory conditions. An application of our algorithm is illustrated using a 240-bus network representation of the WECC. We discuss its performance when implemented in both the Red Mesa supercomputer and a commodity multi-core workstation.

2 - Robust Transmission and Generation Expansion Planning

David Pozo, Pontificia Universidad Catolica de Chile, Avendia Vicuna Mackenna #4860, Raíl Deves Hall, 3rd floor, Macul, Santiago, Chile, davidpozocamara@gmail.com, Enzo Sauma, Javier Contreras

We present a robust model for a market-based transmission and generation expansion. In a first stage, transmission expansion decisions are taken. Afterwards, the optimal generation expansion among all generation companies is taken and finally, the market equilibrium is at the third stage. The second and third stages depict an EPEC. Manifold equilibria are possible with different costs for the system. We solve a robust version considering the worst-case equilibria solution of the EPEC problem.

3 - Transmission Planning for Reducing Emissions

Masood Jabarnejad, PhD Student, Auburn University, 333 East Magnolia Ave. APT 44, Auburn, AL, 36830, United States of America, masood@auburn.edu, Jorge Valenzuela

Dynamic thermal rating enhances the capability of in-service transmission lines and transmission switching reduces the electricity generation cost by temporarily removing inefficient transmission lines out of service. In this presentation, we propose an optimization model to integrate both approaches to better utilize wind energy and therefore reduce emissions.

4 - Real Option Approach in Transmission Expansion Planning under Uncertainty

Alvin Henao-Perez, Universidad del Norte, Km 5 Via Antigua a Puerto Colombia, Barranquilla, Colombia, henaoa@uninorte.edu.co, Enzo Sauma

Transmission Expansion Planning (TEP) is full of uncertainties and often analyzed from a probabilistic-choice or robustness point of view, under reliability and economic criteria. Because of the transmission investment features, it is useful to analyze the value of adding flexibility in the TEP. This study estimates this value using a multinomial decision tree to handle uncertainties related with load growth and electricity generation expansion, under a maximization of economic welfare criterion.

Chair: Anthony Papavasiliou, Assistant Professor, Catholic University of Louvain, Voie du Roman Pays 34, Office b.114, CORE, Louvain la Neuve, 1348, Belgium, anthony.papavasiliou@uclouvain.be

1 - Efficiency Losses of Zonal Network Management under Large-Scale Renewable Energy Integration

Anthony Papavasiliou, Assistant Professor, Catholic University of Louvain, Voie du Roman Pays 34, Office b.114, CORE, Louvain la Neuve, 1348, Belgium, anthony.papavasiliou@uclouvain.be

We quantify the efficiency losses of zonal market clearing followed by counter-trading due to unit commitment that ignores Kirchoff's laws and congestion within zones. We focus on how these inefficiencies are exacerbated by uncertainty in the presence of large-scale renewable energy integration. The market coupling model is compared to an ideal stochastic unit commitment benchmark. We present results for Central Western Europe (CWE).

2 - Look-Ahead Security Constrained Optimal Power Flow via Proximal Message Passing

Sambuddha Chakrabarti, Graduate Student, The University of Texas at Austin, 1 University Station C0803, Department of Electrical & Computer Engg, Austin, TX, 78712, United States of America, sambuddha.chakrabarti@gmail.com, Matt Kraning, Eric Chu, Ross Baldick, Stephen Boyd

We present here a fully decentralized algorithm, the Proximal Message Passing to solve the Look Ahead SCOPF where we represent the post contingency states and formulate a restoration scheme, limiting the post fault line temperature and line current rise to within safe values and ensuring system security with respect to the next set of contingencies through ramp rate constraints on generators. This method will enable us to implement a dynamic optimal transmission switching plan as well.

3 - Service Pricing and Multiplicity of Equilibria in Short Term Power Markets with Wind

Yves Smeers, Professor Emeritus, Université Catholique de Louvain, Ctr Operations Research & Econometrics, Voie du Roman Pays 34, L1.03.01, B-1348, Louvain-la-Neuve, B-1348, Belgium, yvessmeers@me.com, Sebastian Martin

We consider a two-settlement short-term power market of the European type (separation of the PX dealing with energy and TSO dealing with services). Wind is currently supported by different means, some of them being an improper pricing of the services that it implies. We show that this can lead to a multiplicity of equilibria, which can be interpreted as an unnecessary volatility introduced by the market design.

4 - A Mechanism Design Model for Firming Intermittened Renewable Generation with Curtailable Demand

Clay Campaigne, Dept of Industrial Engineering and Operations Research, University of California, Berkeley, Berkeley, CA, 94720, United States of America, clay.campaigne@gmail.com, Shmuel Oren

We characterize the one-period optimal policy, for an aggregator who owns a portfolio of stochastic renewable energy resources but must commit in day-ahead to a quantity of power with a linear penalty for shortfall from the commitment The aggregator can contract with retail customers for reductions from their baselines so as to hedge its supply. The counterfactual baselines are private information which are elicited in the contracting process.

Simulation Modeling for Anaysis

Sponsor: Simulation

Sponsored Session

Chair: Lee Schruben, lees@berkeley.edu

1 - Capturing the Impact of Input Model Uncertainty in Stochastic Models and Analysis: Lessons Learned

Russell Barton, Pennsylvania State University, 210E Business Building, Pennsylvania, United States of America, rrb2@psu.edu, Wei Xie, Barry Nelson

Discrete event simulations are driven by input models fitted with finite data. This presentation will highlight the difficulties in characterizing the impact on output analysis for the general case, the progress that has been made in special cases, and the broader implications for many stochastic modeling and optimization settings.

2 - Optimal Selection of the Most Probable Multinomial Alternative

David Goldsman, Professor, Georgia Tech, Stewart School of Indust & Sys Engr, Atlanta, GA, 30332-0205, United States of America, Sman@isye.gatech.edu, Craig Tovey, Anton Kleywegt, Eric Tollefson

We present selection procedures based on linear and mixed-integer linear programs that find the multinomial cell having the highest probability. Our procedures are optimal in the sense that they minimize the number of observations taken to achieve a certain probability of correct selection.

3 - Vamp1re: A Single Criterion for Evaluating Confidence-Interval Procedures

Bruce Schmeiser, Emeritus Professor, Purdue University, School of Industrial Engineering, West Lafayette, United States of America, bruceschmeiser@gmail.com, Ying-chieh Yeh

Confidence-interval procedures are classically evaluated using actual coverage probability and expected half width. We argue for a single criterion, based on Schruben's coverage function when sample size is constant. We extend the criterion to procedures with stopping rules.

4 - Effective Simulation Warm-up for a Neonatal Intensive Care Unit

Emily Lada, SAS Institute, World Headquarters, SAS Campus Drive, Cary, NC, 27513, United States of America, Emily.Lada@sas.com, Anup Mokashi, James Wilson

In simulating a neonatal intensive care unit subject to constraints on the available computing budget for generating certain key responses, effective warm-up is required to compute accurate point and confidence-interval estimates of, for example, the expected number of admissions per year as well as the long-run average length of a patient's stay. Techniques for steady-state simulation analysis (N-Skart and SBatch) are adapted to this problem.

Cloud Infrastructure Planning and Optimization

Sponsor: The Practice Track

Sponsored Session

Chair: Thomas Olavson, Google, 1300 Crittenden Lane, Mountain View, CA, 94306, United States of America, tolavson@google.com

1 - Machine Fleet Planning in an Internal Resource Economy

John Bossert, Sr Quantitative Analyst, Google, 1300 Crittenden Lane, Mountain View, CA, 94306, United States of America, bossert@google.com

Google recently began transforming its compute infrastructure allocation process from centralized planning to an internal resource economy under which each product area purchases capacity options. I describe several machine fleet planning problems arising within this environment, and then formulate as a dynamic bin-packing the problem of assigning capacity options sold against a datacenter campus to specific clusters within that campus.

2 - Improving the Efficiency of Resource Provisioning and Utilization in Cloud Computing

Chen Peng, Sr Quantitative Analyst, Google, 1300 Crittenden Lane, Mountain View, CA, 94306, United States of America, cpeng@google.com, Chao Ding

We provide an overview of various resource provisioning and efficiency problems encountered at Google in operating one of the largest cloud computing infrastructures in the world—-such as capacity provisioning ratios of different resource dimensions, impact of heterogeneous machine configurations, smart job scheduling by leveraging the statistical properties of workload, etc.

3 - Panel Discussion: Cloud Infrastructure Challenges and Opportunities

Moderator: Brian Eck, Quantitative Analyst, Google, Inc., 1300 Crittenden, Building CL3, Office 2S5, Mountain View, CA, 94043, brianeck@google.com, Panelists: Cathy Xia, Ilyas Iyoob, Thomas Olavson, Muntazir Mehdi

This panel will include representatives from industry and academia, to discuss topics in leveraging Operations Research techniques for managing Cloud Infrastructure.

Stochastic Models in Health Care

Sponsor: Applied Probability Society

Sponsored Session

Chair: Nilay Argon, University of North Carolina, Department of Statistics and Operations, Chapel Hill, NC, 27599, United States of America, nilay@unc.edu

1 - Modeling the Effect of Nurse as a Transmitter on Hospital Acquired Infections

Lerzan Ormeci, Associate Professor, KoÁ University, Istanbul, Turkey, LORMECI@ku.edu.tr, Evrim Gunes, Onder Ergonul, Amin Khoshkenar

We analyze the role of nurse in hospital acquired infection dynamics in an intensive care unit. An analysis of a dataset reveals that the infection status of a patient is significantly influenced by her neighbors' infection status and length-of-stay. We develop a Markov chain model to represent the interactions between a nurse and patients, where factors such as nurse-to-patient ratio, nurse's hand-washing behavior, contact rate and probability of contamination during a contact are included.

2 - Optimal Allocation of Physician's Time when Patient Utility is Heterogeneous

Balaraman Rajan, Simon Business School, University of Rochester, CS 4-339 Carol Simon Hall, Rochester, NY, 14627, United States of America, balaraman.rajan@Simon.Rochester.edu, Tolga Tezcan, Abraham Seidmann

We analytically investigate the strategic decisions of a medical specialist who treats patients visiting from a significant distance. We find that a revenue maximizing specialist spends more time with the patients, partially to compensate for their travel ëcost', and thus sees fewer patients than a welfare maximizing one. We extend our model to investigate how telemedicine technology influences the specialist's decisions and his service level.

3 - Scheduling Series Patients in a Healthcare Facility

Siyun Yu, PhD Candidate, UNC Chapel Hill, BB26 Hanes Hall, UNC Chapel Hill, Chapel Hill, NC, 27599, United States of America, yusiyun@live.unc.edu, Vinayak Deshpande, Vidyadhar Kulkarni

Many healthcare patients, requiring services such as physical therapy, are considered as ëseries' patients, which means that they are scheduled for a series of appointments. They are classified according to the number, frequency and the duration of the sessions they need. We develop a multi-class queuing network model to determine the number of appointment slots for the new patients as well as the returning patients to either assure reasonable waiting times or minimize the total operating cost.

4 - Priority Assignment under Non-linear Cost Functions

Nilay Argon, University of North Carolina, Department of Statistics and Operations, Chapel Hill, NC, 27599, United States of America, nilay@unc.edu, Huiyin Ouyang, Serhan Ziya

Consider a queueing system with two types of customers, each incurring a non-linear cost depending on its type and waiting time in the queue. The controller has information only on the order of arrivals of customers and their types. For such a system, we identify sufficient conditions under which first-come-first-serve, last-come-first-serve, or priority policies are optimal. A numerical study compares these policies with more complex ones that use information on the waiting times.

Decision Analysis and Behavioral Research

Sponsor: Decision Analysis

Sponsored Session

Chair: Detlof von Winterfeldt, Professor, University of Southern California, Dept of Industrial & Systems Engineering, Olin Hall of Engineering, Los Angeles, CA, 90089, United States of America, detlof@aol.com

1 - Improving the Practice of Decision Analysis with Prescriptive Behavioral Economics

Ralph Keeney, Professor Emeritus, Duke University, 401 Hilton-Lombard, #704, San Francisco, CA, 94111, United States of America, KeeneyR@aol.com

Behavioral economics focuses on the biases and errors of human decisions. Prescriptive behavioral economics involves experiments with decision-makers facing their own real decisions to improve the procedures and techniques for the process of decision-making and the use of decision analysis. The goal is higher quality decisions for individuals and groups.

2 - Behavioral Analytics: A Framework for Exploring Judgments and Choices in Large Data Sets

Gilberto Montibeller, London School of Economics, Houghton Street, London, United Kingdom, G.Montibeller@lse.ac.uk

The increasing availability of large data sets that store users' judgments and choices provides a fertile ground for Business Analytics. Behavioral Decision Research has much to offer to analytics, but its fragmented nature often prevents decision analysts to use its full power. In this paper we thus propose a framework to explore such data sets, Behavioral Analtyics, which can support behavioral data mining and behavioral data learning (joint work with I Durbach).

3 - Convergent Validation of a Methodology for Eliciting Trade-offs for Protected (sacred) Values

Richard John, Associate Professor, University of Southern California, RTH 310, University Park, Los Angeles, CA, 90089, United States of America, richardj@usc.edu, Heather Rosoff, Kenneth Nguyen

We describe a methodology for eliciting trade-offs in highly political contexts, involving potentially protected values. We apply this methodology to two different security contexts: Air Travel and Cyber Privacy. A decision problem is constructed, including an additive MAU model. The elicitation uses sequential binary choices to obtain weights based on indifference between pairs of alternatives. Convergent validation is reported comparing different sets of trade-offs and swing weights.

4 - Biases that Matter for Decision Analysis (and those that don't)

Detlof von Winterfeldt, Professor, University of Southern California, Dept of Industrial & Systems Engineering, Olin Hall of Engineering, Los Angeles, CA, 90089, United States of America, detlof@aol.com

A large number of biases in judgment and decision making have been discovered since the early 1970s. Some of these biases matter, because they affect the elicitation the inputs to a decision analysis. Others don't matter, either because they do not commonly occur in decision analysis or because they can easily be overcome.

Decision Analysis in Integrated Care (Healthcare and Social Care)

Sponsor: Decision Analysis

Sponsored Session

Chair: Lea Deleris, IBM, Dublin Research Lab, Dublin, Ireland, lea.deleris@ie.ibm.com

1 - The Role of Decision-analytic Modeling in Early-stage Health-economic Assessments of Medical Devices

Jan Pietzsch, President & CEO, Wing Tech Inc., 228 Hamilton Ave., 3rd floor, Palo Alto, CA, 94025, United States of America, jpietzsch@wing-tech.com

Medical technology innovations can contribute to meaningful advances in patient care. At the same time, the financial burdens on healthcare systems continue to increase, requiring the demonstration of a clear clinical and economic value proposition. In this talk, we review the critical role of decision-analytic modeling can play in early-stage health-technology assessment, and illustrate opportunities and challenges based on the discussion of two recent medical device assessments.

2 - Clinical Trials for Pharmaceuticals: To Repeat, or Not to Repeat?

John Cavallaro, Technical Director, Portfolio & Asset Strategy, Bristol-Myers Squibb, P.O. Box 4000, Princeton, NJ, 08543, United States of America, john.cavallaro@bms.com, David Swank

Reports that early pharmaceutical clinical trial results are not very predictive of later success have led some to propose repeating successful early phase trials before proceeding. Using a decision analytic framework, we modeled the decision to repeat, continue, or abandon a clinical program as function of the trial costs, market value, and success probabilities. Our results show that only under very specific conditions is it optimal to repeat trials after early success.

3 - A Model for Vulnerability Indexes in Social Care

Lea Deleris, IBM, Dublin Research Lab, Dublin, Ireland lea.deleris@ie.ibm.com, Robert Shorten, Fabian Wirth, Shravan Sajja

We describe a model that we have developed to provide care workers with a multidimensional vulnerability dashboard to help them understand the current and upcoming problems of the citizens that they manage. Our model is built upon a Bayesian network representation of the factors affecting vulnerabilities and a Markov Chain model capturing the evolution over time. All vulnerabilities are measured with the same metric which means that it is possible to compare across categories and across persons.

4 - Improving Investment Decisions at Hospitals through System Dynamics and Decision Analysis

Christian Wernz, Virginia Tech, 205 Durham Hall, Blacksburg, 24061, United States of America, cwernz@vt.edu, Hazhir Rahmandad, Alba Rojas-Cordova, Arash Baghaei Lakeh, Hui Zhang, Anthony Slonim

Hospital executives have to make capital investment decisions that account for multiple stakeholders and organizational objectives, risk and limited budgets. Furthermore, the long-term, organization-wide effects of an investment are difficult to predict. In response, we have developed a decision support method that integrates system dynamics with the simple multi-attribute rating technique (SMART). We tested and validated our approach with hospital executives for the Da Vinci surgical robot.

The Role of Information in Dynamic Games

Cluster: Data and Information

Invited Session

Chair: Kostas Bimpikis, Assistant Professor, Stanford GSB, 655 Knight Way, Stanford, United States of America, kostasb@stanford.edu

1 - Learning Product Features from Consumer Reviews

Davide Crapis, Columbia Business School, 434 West 120th Street, New York, NY, United States of America, dcrapis16@gsb.columbia.edu, Alireza Tahbaz-Salehi, Costis Maglaras

In the context of learning from on-line reviews, we study a model in which a good is represented by an attribute vector and the respective quality vector is unknown. Consumers are heterogeneous with respect to their preferences for the various attributes. First, when consumers observe only one-dimensional reviews, they do not learn the product quality. Second, when reviews are multi-dimensional, we characterize how different assumptions on the population of consumers affect the learning outcome.

2 - Information Provision in Dynamic Innovation Tournaments

Kostas Bimpikis, Assistant Professor, Stanford GSB, 655 Knight Way, Stanford, United States of America, kostasb@stanford.edu, Mohamed Mostagir, Shayan Ehsani

Tournaments are suited for settings that feature a high degree of uncertainty. Participants learn about the underlying environment from their competitors' gradual progress. On the other hand, information about the status of competition may adversely affect effort provision from the laggards. Thus, the tournament's information provision mechanism is critical for its success. The paper suggests a number of design guidelines with the objective of maximizing the probability of reaching the end goal.

3 - Strategic Trading in Informationally Complex Environments

Nicolas Lambert, Assistant Professor of Economics, Stanford University, Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States of America, nlambert@stanford.edu, Mikhail Panov, Michael Ostrovsky

We study trading behavior and properties of prices in informationally complex markets in the Kyle 85 model. We allow for arbitrary correlations among the random variables involved in the model: the value of the asset, the signals of strategic traders, the signals of the market maker, and the demand from noise traders. We characterize the unique linear equilibrium, illustrate its properties, and use this characterization to study the informational efficiency of prices as the market grows large.

4 - Network Resilience against Epidemic Spread

Kimon Drakopoulos, MIT, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, kimondr@mit.edu, John Tsitsiklis, Asuman Ozdaglar

We study the problem faced by a network defender when an epidemic is evolving on a known network. We assume that the network defender has full information on the state of the epidemic and can allocate curing rates to nodes under a budget constraint. The goal is to minimize the expected extinction time of the epidemic. We find necessary and sufficient conditions on the graph structure under which curing policies that achieve sublinear extinction time exist.

Choice Behavior in MCDM

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Hannele Wallenius, Professor, Aalto University, Otaniementie 17, Espoo, Finland, Hannele.Wallenius@Aalto.fi

1 - Pricing New Services using Utility Functions

Outi Somervuori, Aalto University, P.O. Box 11000, Aalto, 00076, Finland, outi.somervuori@aalto.fi, Merja Halme

Choice-based conjoint analysis is used to set prices of new services available for a trial period in an airport relaxation area. 300 passengers evaluated the services with different prices. The results allow to assess optimal prices for the different services and the value of different product profiles for the respondents. The study was ordered by the company managing Finnish airports. Its results will be compared with a study employing incentive-based conjoint analysis.

2 - Emotional-Motivational Responses Predicting Choices: A Neurophysiological Investigation

Jyrki Wallenius, Professor, Aalto University, P.O. Box 11000, Aalto, 00076, Finland, Jyrki.Wallenius@Aalto.fi, Outi Somervuori, Pekka Korhonen, Murat Köksalan, Niklas Ravaja

We examined how emotional attachment to a choice option predicts choices and mediates the endowment effect and the emotional-motivational responses to trade-off choices. The participants made win-win and trade-off choices between product packages in neurophysiological study. The results suggest that approach motivation and emotional attachment mediate the endowment effect. In addition, high trade-off difficulty was associated with increased withdrawal motivation and negatively valenced arousal.

3 - Linear Model Prediction for Cognitive Skill Subgroups in Multiple Criteria Decision Making

Tommi Pajala, Aalto University, Laaksolahdentie 49, Espoo, 02730, Finland, tommi.pajala@aalto.fi, Pekka Korhonen, Jyrki Wallenius

We predicted choices in a four-criteria pairwise MCDM problem with a linear value function model with the epsilon formulation (Korhonen et. al., 2012). We investigated whether the Cognitive Reflection Test score is related to the predictive power, but no effects were found. Most subjects were inconsistent with their importance of criteria, questioning the usefulness of eliciting judgments of importance. The model predicted 81,7 % of choices, outperforming comparison models.

4 - Difficulties in Making Rational and Consistent Choices

Pekka Korhonen, Professor, Aalto University, School of Business, Aalto, FI, 11000, Finland, Pekka.Korhonen@Aalto.fi, Niklas Ravaja, Outi Somervuori, Jyrki Wallenius

We present the results of an experiment with the aim to study, whether the choices of subjects are rational and consistent. If not, "why not"? The choice problems consists of 2-3 criteria and 3, 4, and 6 alternatives. Pilot study revealed that the subjects had difficulties in making rational and consistent choices. We will repeat the experiment with a larger group with an aim to look for explanations to findings. The study is based on the use of two sets of criteria: utilitarian and hedonistic.

Doing Good with Good OR - Student Paper Competition

Cluster: Doing Good with Good OR – Student Paper Competition

Invited Session

Chair: Ruben Proano, Assistant Professor, Rochester Institute of Technology, Rochester, NY, United States of America, rpmeie@rit.edu

1 - Doing Good with Good OR - Student Paper Competition

Carri Chan, Columbia University Business School, 3022 Broadway, Uris 410, New York, NY, United States of America, cwchan@columbia.edu

Doing Good with Good OR - Student Paper Competition is held each year to identify and honor outstanding projects in the field of operations research and the management sciences conducted by a student or student group that have a significant societal impact.

2 - Optimizing Vaccine Allocation for Pandemic Influenza

Hsin-Chan Huang, The University of Texas at Austin, 204 E. Dean Keeton Street, Stop C2200 ET, Austin, TX, 78712-0292, United States of America, neo.huang@utexas.edu, Bismark Singh

With the Texas Department of State Health Services, we develop a web-based decision-support tool to optimize vaccine allocations during an influenza pandemic. Our allocation is proportionally fair for user-specified target populations. Using 2009 H1N1 data, we show how reserving a small percentage of doses can achieve fair coverage, while most vaccines are allocated based on healthcare provider requests.

3 - Global Supply Chain Optimization – United Nations World Food Program

Yuvraj Singh, Georgia Institute of Technology, Atlanta, GA, United States of America, yuvrajasr7@gmail.com, Lakshmi Gadepalli, Maria Ayers, Ashfaque Kachwala, Tahsin Munir, Gabriel Rodriguez, Cane Punma

The MCNF model arrived at an optimal solution under 5 minutes for WFP's largest operation. Doubling operation size resulted in a processing time of 13 minutes ensuring the capacity of the model. The optimal solution indicates potential savings of $34 million. Essentially, this model quantifies the value of a centralized decision-making process with proper visibility of every decision's impact.

4 - Optimizing Mobile Blood Collection: Application in Turkey
Feyza Sahinyazan, McGill University, Montreal, QC, Canada, feyza.sahinyazan@mail.mcgill.ca

Effective use of bloodmobiles is helpful in increasing the number of donors and donation frequencies. Since bloodmobiles can reach potential donors with limited time and means of transportation, they can attract more donors than fixed points. In our project, we propose a new cost efficient and easy-to-implement mobile blood collection system based on the practices of Turkish Red Crescent (TRC).

Sunday, 1:30pm - 3:00pm

Organizational Issues in Technology Management

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Zhijian Cui, Assistant Professor of Operations and Technology Management, IE Business School, Calle de Maria de Molina, 12, Madrid, 28006, Spain, zhijian.cui@ie.edu

1 - Buyer and Supplier Coordination for Knowledge Outsourcing under Information Asymmetry
Jaesoek Lee, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Jaeseok.Lee@scheller.gatech.edu, Cheryl Gaimon

This paper examines coordination between a buyer and a supplier for knowledge outsourcing under information asymmetry. Optimal decisions include the buyer's levels of knowledge insourcing and outsourcing, and the supplier's price for knowledge. This paper shows that the buyer's absorptive capacity, the scope of the knowledge development project, and the information structure are key drivers of the optimal solutions and payoffs in equilibrium.

2 - Optimal Search for the Best Alternative: An Experimental Approach
Gulru Ozkan, Clemson University, Department of Management, 120B Sirrrine Hall, Clemson, SC, 29634, United States of America, gulruo@clemson.edu, Fred Switzer, David Hall, Jeremy Hutchison-Krupat

Using a behavioral approach, we examine the strategy of decision makers who search for the best alternative to develop into a new product. The impacts of facing a set of radical or incremental set of alternatives and the level of time-sensitivity on the evolution of decision makers' performances are analyzed.

3 - To Adapt or Disrupt? Performance Objectives as Drivers of Innovation Strategies
Fabian Sting, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, fsting@rsm.nl, Murat Tarakci

We use agent-based simulations to explain why and when firms opt for an adaptive or a disruptive innovation strategy. We propose that a firm prefers adapting to the landscape when its objectives are based on improving its performance, whereas a firm follows a disruptive innovation strategy if it prioritizes performance relative to competitors. We also find that a firm's innovation strategy choice is contingent on its competitors' orientations and on the market's receptivity to disruptions.

4 - Focused or Flexible Targets? How Organizational Design Influences the Definition of Success
Jeremy Kovach, Georgia Tech, 800 West Peachtree NW, Atlanta, GA, United States of America, Jeremy.Kovach@scheller.gatech.edu, Stelios Kavadias

We analyze how stakeholder metrics are used to define success and determine the implementation of a strategic initiative, given the organizational design. We recognize the dual role of performance metrics: they communicate the target outcomes (i.e., which outcomes are considered "successful"), and they incentivize the organizational impetus (i.e., stakeholder effort commitment). We find that the same initiative might admit different definitions of success in different organizational structures.

Business Model Innovation in Cleantech Markets

Cluster: Business Model Innovation

Invited Session

Chair: Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, United States of America, jguajardo@haas.berkeley.edu

1 - Business Models and System Performance: Empirical Evidence from the U.S. Solar Energy Market
Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, United States of America, jguajardo@haas.berkeley.edu

We empirically analyze the relationship between business models and system performance in the U.S. solar energy market, characterizing the drivers and mechanisms by which different business models affect system performance.

2 - Competition and Externalities in Green Technology Adoption
Charles Thraves, MIT, 70 Pacific Street APT 255B, Cambridge, United States of America, cthraves@mit.edu, Maxime Cohen, Georgia Perakis

We study competition among suppliers for green technologies with government subsidies to the consumers. We quantify who benefits from competition and when, as well as the impact of environmental externalities. The results differ depending on demand uncertainty and supplier asymmetry but also can be affected by the presence of externalities. We show that competition hurts suppliers and benefits the government but not always the consumers.

3 - Effects of Buyer Safeguards on Prices for New, Used, and Remanufactured Products
Necati Tereyagoglu, Assistant Professor of Operations Management, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Necati.Tereyagoglu@scheller.gatech.edu, Ramanath Subramanyam, Ravi Subramanian

Using detailed transaction-level data, we explore how seller- and product-specific attributes influence the seller decision to allow returns and how the presence of this safeguard influences prices paid for new, used, and remanufactured products. We find evidence that the effect of this safeguard varies across these product types. Our findings have implications for research on secondary markets and closed-loop supply chains.

4 - The Potential of Servicing as a Green Business Model
Vishal Agrawal, Georgetown University, 37th and O streets, Washington, D.C., United States of America, va64@georgetown.edu, Ioannis Bellos

In recent years, manufacturers in various industries have begun to orient their practices towards selling the use of the product as opposed to selling the product itself. We investigate the economic and environmental implications of the manufacturer's design and pricing decisions under different forms of servicizing business models.

Strategic Decision Making in Manufacturing & Service Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Muge Yayla-Kullu, RPI Lally School of Management, 110 8th Street, Troy, NY, 12180, United States of America, YAYLAH@rpi.edu

1 - Optimal Design of Channel Effort

Haresh Gurnani, University of Miami, United States of America, haresh@miami.edu, Mike Wang, Sammi Yu Tang

Customers buying certain products may lack functional knowledge and need additional help after purchase. This entails an inconvenience cost for them and handling costs to the provider. The retailer (or manufacturer) can invest in pre-sales effort; customers still needing help may receive after sales support. We study the service channel design problem with different structures and show that the retailer would even be worse off if the manufacturer chooses to share the cost of service effort.

2 - The Effect of Targeted Coupons on Quality Choices, Pricing Decisions and Market Segmentation

Amit Eynan, Professor, University of Richmond, 1 Gateway Rd, Richmond, VA, 23173, United States of America, aeynan@richmond.edu, Benny Mantin

A manufacturer who faces customers with heterogeneous willingness to pay based on quality can segment the market by offering multiple products at different qualities and prices. Buyers will self-select the product that maximizes their utility. We investigate the effect of manufacturer's targeted marketing efforts in the form of coupons on his quality and price choices, the optimal product line and corresponding profit.

3 - Serving Heterogeneous Buyers through Price and Effort Differentiation

Guangwen Kong, Assistant Professor, University of Minnesota, 111Church Street SE, MINNEAPOLIS, MN, 55455, United States of America, gkong@umn.edu, Hao Zhang, Sampath Rajagopalan

We consider optimal pricing of outsourced services such as web design to two types of consumers with different valuations for service quality. Two different scenarios are considered with public and private quality where the service provider's effort is hidden. We compare and contrast different pricing schemes in terms of profits and quality offered to both types of consumers and identify the benefits and costs of hidden effort. We provide managerial guidelines for pricing of services.

4 - A Pricing Survey for Utility Estimation on Household Electricity Consumption

Osman Kazan, Assistant Professor, Tulane University, okazan@tulane.edu

Consumers' surveys are generated and carried out to estimate utility functions for electricity consumption in US households. The consumers are asked to schedule daily household activities in different pricing schemes: constant and dynamic. Utility of unit of electricity is estimated, and used in Time-of-Use electricity pricing models. Optimal pricing difference between peak and off-peak hours can be employed by the marketing departments of power utilities.

5 - National Culture and Service Quality

Muge Yayla-Kullu, RPI Lally School of Management, 110 8th Street, Troy, NY, 12180, United States of America, YAYLAH@rpi.edu, Praowpan Tansipong, Adelina Gnanlet, Christopher M. McDermott, Jeffrey F. Durgee

This is a large-scale theory-building study of the impact of national culture on service quality outcomes. Because of the interactive role employees play in service operations, their behaviors often affect the customer's experience directly. Employee behaviors are often a function of the culture in which they are born and raised. This paper examines how a nation's culture impact service operations through employees' actions and how these relationships change in different segments of a market.

Innovation in the Supply Chain

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Cheryl Druehl, George Mason University, 4400 University Drive, Fairfax, United States of America, cdruehl@gmu.edu

1 - Predicting High-tech Innovation Failures: Empirical Analysis of Big Data on Medical Device Recalls

Ujjal Mukherjee, PhD Student, University of Minnesota, 1261 Gibbs Avenue, Saint Paul, MN, 55108, United States of America, mukh0067@umn.edu, Kingshuk Sinha

With increasing technological complexities of products, firms are becoming increasingly vulnerable to the risk of failure of technological innovations while in use in the marketplace. Hence, what is of significance is to be able to detect early signals of such failures, both internal and external to a firm. The central question that serves as the motivation for this paper is: Can user-level feedback related to episodic adverse events in the market predict product-level innovation failure?

2 - The Agency Model for Digital Goods

Yinliang (Ricky) Tan, Doctoral Student, University of Florida, 355A Stuzin Hall, PO Box 117169, Gainesville, Fl, 32611, United States of America, yinliang.tan@warrington.ufl.edu, Janice Carrillo

Recently, the agency model exploited by publishers in the e-book industry has been highlighted in the press as a result of the U.S. Department of Justice's (DOJ) lawsuit against Apple, Inc. We investigate the strategic impact of the agency model in comparison with the prevalent wholesale and fixed price models by formulating a dual channel model of distribution accommodating sales of both traditional and digital goods.

3 - Modularity, Mass Customization, & Innovation Performance: The Role of Structural Sophistication

Xenophon Koufteros, Jenna & Calvin R. Guest Professor in Business Administration, Texas A&M University, Mays Business School, INFO Department, College Station, TX, 77843-4217, United States of America, XKoufteros@mays.tamu.edu, Cornelia Droge, Shawnee Vickery, Roger Calantone

We investigate relationships among modularity, mass customization, and innovation performance and explore whether the structural sophistication of a product moderates these relationships.Product modularity is modeled as antecedent to process modularity; both are modeled as antecedent to mass customization, and all three are modeled as antecedent to innovation performance.The hypotheses are tested using structural equations modeling augmented by bootstrapping based on a sample of 109 companies.

4 - Innovation across the Supply Chain

Cheryl Druehl, George Mason University, 4400 University Drive, Fairfax, VA, United States of America, cdruehl@gmu.edu, Janice Carrillo, Juliana Hsuan

Innovation is an integral part of every firm's ongoing operations. Beyond product innovation, supply chain innovations offer a unique source of competitive advantage. We synthesize recent research on innovation in the supply chain, specifically, innovative supply chain processes such as collaborations with customers and suppliers to create new product and process innovations, open innovation, and globally distributed innovation. We conclude with potential areas for future research.

Topics in Sustainable Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Chien-Ming Chen, Nanyang Business School, Nanyang Technological University, 50 Nanyang Ave., Singapore, 639798, Singapore, cmchen@ntu.edu.sg

1 - Supply Chain Strategies and Carbon Performance: The U.S. Manufacturing Sector

Chien-Ming Chen, Nanyang Business School, Nanyang Technological University, 50 Nanyang Ave., Singapore, 639798, Singapore, cmchen@ntu.edu.sg, Maria Montes-Sancho

We empirically test how operational capabilities and strategies can jointly influence environmental and market performances, and whether broadening the scope of environmental assessment to include the supply chain will alter the aforementioned relationship. We find that manufacturers pursuing a broadly defined lean strategy with high operational leanness and a parsimonious process structure tend to attain better direct and supply-chain carbon performances.

2 - Greenhouse Gas Reduction: Why Do Firms Differ?

Jason Nguyen, Carlson School of Managment, University of Minnesota, nguy1762@umn.edu, Karen Donohue, Rachna Shah

We use the CDP data set to empirically investigate the impact of firms' and industry characteristics on firms' choices of different strategies for reduction of greenhouse gas emissions.

3 - Investment in Environmental Process Improvement in Response to Regulation

Cheryl Gaimon, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Cheryl.Gaimon@scheller.gatech.edu, Markus Biehl, Ravi Subramanian

We analyze a firm's dynamic investment in environmental process improvement (EPI) to reduce waste and its toxicity in response to regulatory penalties and subsidies. The firm minimizes the costs incurred for investing in EPI (less subsidy), the production cost, and the penalty for waste and toxicity. We show that a firm's investment in EPI over time differs substantially in response to penalties versus subsidies and, thus, demonstrate the impact of regulatory choices on dynamic firm behavior.

4 - An Empirical Investigation of Firms' Waste Reduction Efforts under Changing Perceptions of Hazard

Wayne Fu, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, United States of America, Wayne.Fu@scheller.gatech.edu, Ravi Subramanian, Basak Kalkanci

Governments and NGOs provide public information on the potential hazards of industrial chemicals. However, there is limited research on the relationship between this information and firms' waste reduction efforts. We empirically investigate the relationship between changes in assessed hazards of chemicals and firms' waste reduction efforts for these chemicals. We also examine how differences in waste reduction efforts relate to chemical, firm, and market characteristics.

From Data to Assessments and Decisions: Epi-Spline Technology

Cluster: Tutorials

Invited Session

Chair: Johannes Royset, Naval Post Graduate School, Monterey, CA 93943, United States of America, joroyset@nps.edu

Co-Chair: Ignacio Rios, Research Associate, Universidad de Chile, Department of Industrial Engeneering, Universidad de Chile, Santiago, Chile, ignacio.rios.u@gmail.com

1 - From Data to Assessments and Decisions: Epi-Spline Technology

Johannes Royset, Naval Postgraduate School, Monterey, CA 93943 United States of America, joroyset@nps.edu

Analysts in every field face the challenge of how to best use available data to estimate performance, quantify uncertainty, and predict the future. The data is almost never "just right," but rather scarce, excessive, corrupted, uncertain, and incomplete. External information derived from experiences, established "laws," and physical restrictions offer opportunities to remedy the situation and should be utilized. Applications in sustainable energy, natural resources, image reconstruction, financial planning, uncertainty quantification, and reliability engineering are rich with problems where decisions rely on data analysis under such circumstances. We address these problems within a framework that identifies a function that according to some criterion best represents the given data set and satisfies constraints derived from the data as well as external information. Epi-splines provide the linchpin that allows us to handle shape restrictions, information growth, and approximations.

The Impact of Workload and System Factors on Patient Outcomes

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Anita Tucker, Harvard Business School, Morgan Hall, Soldiers Field, Boston, MA, 02163, United States of America, atucker@brandeis.edu

1 - Life is All about Timing: Differences in Treatment Quality for Trauma Patients

David Anderson, Assistant Professor, Baruch College, Zicklin School of Business, 1 Bernard Baruch Way, New York, NY, 10010, United States of America, david.anderson@baruch.cuny.edu, Guodong Gao, Bruce Golden

Using data from the National Trauma Data Bank, we find that patients arriving at the hospital overnight (6 PM – 6 AM) receive significantly lower quality care than those who arrive during the daytime. We find that the inferior care overnight is likely due to limited availability of high-quality resources, and not unobserved heterogeneity, disruptions in circadian rhythms, or delays in receiving treatment. This leads to higher mortality, surgical complication rates, and longer length of ICU stay.

2 - Empirical Analysis of Ambulance Diversion: Policy Change in Los Angeles County

Eric Park, Kellogg School of Management, Northwestern University, Evanston, IL, United States of America, eric-park@kellogg.northwestern.edu, Sarang Deo, Itai Gurvich

We study the effect of a policy change that was intended to reduce ambulance diversions in LA County, CA. We find that the new policy succeeded in its purpose of reducing the time emergency departments (EDs) spent on diversion but did not reduce the fraction of ambulances being diverted. A possible explanation for this outcome, identified by our empirical analysis, is a combination of operational process improvement EDs underwent in response to the policy change and neighboring ED effect.

3 - Decomposing the Effect of Workload on Patient Outcomes: An Empirical Analysis of a Maternity Unit

Michael Freeman, Judge Business School, University of Cambridge, Cambridge, CB2 1AG, United Kingdom, mef35@cam.ac.uk, Nicos Savva, Stefan Scholtes

In this paper, we use a detailed dataset from the delivery unit of a major teaching hospital to better understand how workload impacts quality. We consider two mechanisms: direct impact through deterioration in the quality of task execution and indirect through the choice of care pathway. Our results provide a better understanding of how workload affects quality in service settings.

4 - Reducing Hospital Readmissions by Integrating Empirical Prediction with Resource Optimization

Jon Stauffer, Indiana University, 1309 E. Tenth Street, Bloomington, United States of America, stauffer@indiana.edu, Jonathan Helm, Kurt Bretthauer, Adel Alaeddini, Ted Skolarus

17% of Medicare patients are readmitted within 30 days of discharge. Post-discharge monitoring is effective in reducing readmissions but is currently done ad-hoc. We develop a large scale optimization and decomposition approach for weakly-coupled network flow problems to design optimal post-discharge monitoring plans and allocate capacity for post-discharge patient visits.

Hilton- Continental 7

Supply Risk Management/Inventory Control

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Xin Chen, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, xinchen@illinois.edu

1 - Supply and Demand Functions in Inventory Models

Qi Feng, Professor, Purdue University, Krannert School of Management, West Lafayette, IN, 47907, United States of America, AnnabelleFeng@purdue.edu, George Shanthikumar

The existing inventory literature focuses on almost surely linear supply/ demand functions, which limits the applicability of the models. We provide a unified approach to analyze general supply / demand functions. By transforming the problem into one in a higher dimension, we show many of the seemingly highly (almost sure) nonlinear functions are linear in the stochastic sense. We derive properties of the profit function and optimal policy for a general class of random supply/ demand functions.

2 - Dual Sourcing under Supply Capacity Uncertainty

Zhan Pang, Lancaster University, Management School, Lancaster, LA1 4YX, United Kingdom, z.pang@lancaster.ac.uk, Xin Chen

We study the optimal policies of a periodic-review dual-sourcing inventory system with demand and supply capacity uncertainty. The replenishment lead times can be arbitrary. To perform the structural analysis for this problem, we develop a transformation technique and some new preservation properties of L-natural-convexity. We show that these properties can be readily applied to characterize the optimal policy. We further show that dual-index policies are optimal under certain conditions.

3 - Dynamic Inventory Management with Total Minimum Commitments and Two Supply Options

Xiting Gong, Assistant Professor, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong - PRC, xtgong@se.cuhk.edu.hk, Tong Wang, Sean Zhou

We study a dynamic inventory control problem for a firm who operates under a total minimum commitment (TMC) contract with two supply options. Under such a contract, the cumulative order quantity from either supply or from both supplies over a finite horizon must be at least as large as a given quantity. Using a decomposition technique and multimodularity, we characterize the firm's optimal inventory control policy under different TMC contracts.

4 - Managing Component Allocation for Assemble-to-Order (ATO) Manufacturing

Qiong Wang, Associate Professor, University of Illinois at Urbana-Champaign, 117 Transportation Builiding, 104 South Mathews Avenue, Urbana, IL, 61801, United States of America, qwang04@illinois.edu, Martin I Reiman, Haohua Wan

We study the allocation policy of Reiman and Wang, which is asymptotically optimal in minimizing the long-run average cost of ATO inventory systems with identical lead times. We show asymptotic optimality of their policy extends to other problems, e.g., maximizing the discounted profit of ATO production/inventory systems. By allowing continuous review, the policy never stops serving high-value demands, but may withhold components from low-value ones, which we prove is sometimes necessary.

Hilton- Continental 8

Competition and Coordination in Supply Chains

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Robert Swinney, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27516, United States of America, robert.swinney@duke.edu

1 - Dynamic Bargaining in a Supply Chain with Asymmetric Demand Information

Lauren Lu, Associate Professor, University of North Carolina - Chapel Hill, Kenan-Flagler Business School, Chapel Hill, NC, 27599, United States of America, lauren_lu@unc.edu, Qi Feng, Guoming Lai

We analyze a dynamic bargaining game in which a seller and a buyer negotiate over quantity and payment to trade for a product. Both firms are impatient, and they make alternating offers until an agreement is reached. The buyer is privately informed about his type, which can be high or low: the high-type's demand is stochastically larger than the low-type's. We characterize the equilibrium and generate insights into how demand forecasting accuracy affects firm profitability.

2 - Cournot Competition in Networked Markets

Kostas Bimpikis, Assistant Professor, Stanford GSB, 655 Knight Way, Stanford, United States of America, kostasb@stanford.edu, Shayan Ehsani, Rahmi Ilkilic

We consider competition among firms in a networked environment. A bipartite graph determines which subset of markets a firm can supply to. We show that the resulting game has a unique equilibrium for any network. We identify a close connection between equilibrium quantities and supply paths in the underlying network. We proceed to study the impact of new entry and mergers on firms' profits and consumer welfare.

3 - Coordination of a Two-Level Supply Chain with Multiple Shipments by Inventory Subsidizing Contracts

Shi Chen, Assistant Professor, University of Washington, Foster School of Business, Foster School of Business, ISOM Department, Box 353226, Seattle, WA, 98195, United States of America, shichen@uw.edu, Hau Lee, Kamran Moinzadeh

Consider a supply chain involving a supplier-retailer relationship and assume that the supplier can stock and deliver the product in multiple shipments for one season. We derive the retailer's optimal order quantities driven by the end-season and within-season critical ratios. The optimal contract requires adjusting both the wholesale price and the retailer's effective inventory holding cost. The contract can be implemented by either a direct subsidizing scheme or a delayed payment scheme.

4 - Supply Chain Models with Preferred Retailer Privy to Supplier's Inventory Information

Hamed Mamani, Assistant Professor, University of Washington, Foster School of Business, ISOM Department, Seattle, WA, 98195, United States of America, hmamani@uw.edu, Kamran Moinzadeh, Apurva Jain

In a supply chain consisting of a supplier and several retailers, some of the retailers have preferred status, providing them with information about the supplier's inventory level. Preferred retailers, thus, can be proactive and inflate their orders when supply gets short. We study the dynamics of such supply chains as a Stackelberg game where retailers react after the supplier has fixed his strategy. We evaluate outcome of the resulting game with solution of the centralized problem.

Sustainable Operations Management with Public Interest

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Nicholas C. Petruzzi, University of Illinois at Urbana-Champaign, 350 Wohlers Hall, 1206 S. 6th Street, Champaign, IL, 61820, United States of America, petruzzi@illinois.edu

Chair: Michael Lim, Assistant Professor, University of Illinois, Champaign, IL, 61822, United States of America, mlim@illinois.edu

1 - Productively using Waste as By-Product

Mustafa Tongarlak, Assistant Professor, Bogazici University, Department of Management, Bebek, Istanbul, Turkey, tongarlak@boun.edu.tr, Deishin Lee

Firms can often make productive use of their waste stream. In some cases, for example, profitable by-products may be created from the waste stream. We compare the profitability and social welfare of two scenarios: when the firm converts its excess product into by-product, and when it donates its excess product.

2 - The Economic Value of Market Information for Farmers in Developing Economies

Ying-Ju Chen, Berkeley- IEOR, 4121 Etcheverry Hall, Berkeley, United States of America, chen@ieor.berkeley.edu, Chris Tang

To alleviate poverty, various non-governmental organizations (NGOs) and for-profit companies have developed different ways to distribute information about market price, crop advisory and farming technique to farmers. Will information create economic value for farmers? We construct a stylized model in which farmers face an uncertain market price (demand) and must make production decisions before the market price is realized. We examine the interplay between private and public signals.

3 - Efficient Feed In Tariff Policies for Renewable Energy Technologies

Saed Alizamir, Yale School of Management, New Haven, CT, United States of Americasaed.alizamir@yale.edu, Peng Sun, Francis de Vericourt

Feed-in-tariff (FIT) policies aim at driving down the cost of renewable energies by fostering learning and accelerating the diffusion of green technologies. This paper provides insights and guidance into designing cost-efficient and socially-optimal FIT programs. We characterize the structure of the optimal policy for the social welfare objective as well as when the objective is achieving a capacity target at minimum cost. Our proposed policies are in contrast with the current practices of FIT.

4 - Municipal Groundwater Management: Optimal Allocation and Control of a Renewable Resource

Michael Lim, Assistant Professor, University of Illinois, Champaign, IL, 61822, United States of America, mlim@illinois.edu, Nicholas C. Petruzzi, Karthik Murali

Through a stylized dynamic optimization formulation, we study a municipality's problem of allocating renewable groundwater in the presence of water transfer opportunities through two prominent mechanisms. We establish and characterize dynamic threshold polices that govern the export/import decisions of a given municipality. We also address the increasing trend of privatization of water supply systems. Throughout, we assess the resulting allocation equilibria in the spirit of triple bottom line.

Computational Issues and the Relationships Between Related Models

Cluster: Data Envelopment Analysis

Invited Session

Chair: Tim Anderson, tim.anderson@pdx.edu

1 - Parallel DEA in R

Tim Anderson, Portland State University, Portland, OR, United States of America, tim.anderson@pdx.edu, Tom Shott

This work builds upon past research to provide an open source R package for doing DEA in R. Computational results are provided.

2 - Technology Forecasting using DEA in the Presence of Infeasibility

Dong-Joon Lim, PSU/ETM, 625 SW Jackson St. Apt.975, Portland, OR, 97201, United States of America, tgno3.com@gmail.com

As a predictive use of DEA, Technology Forecasting using DEA (TFDEA) measures the rate of frontier shift by which the arrival of future technologies can be estimated. This study develops an extended TFDEA model that can handle infeasibility based on the modified super-efficiency model proposed by Cook, et al. The application of LCD technology forecasting shows the proposed approach makes a reasonable forecast for formerly infeasible targets as well as a consistent forecast for feasible targets.

3 - A Parallel DEA Implementation for Massive Data Sets

Tom Shott, Graduate Student, Portland State University, 4110 SE Hawthorne Blvd., #113, Portland, OR, 97214, United States of America, tshott@pdx.edu

Software enabling processing of massive data sets is presented. Running on a high-performance parallel cluster the software processes 10K's of DMU's with 20X speedup. The software uses preprocessing (early DMU classification including geometric techniques) and computational techniques (starting basis, preferred solution sets) for high performance analysis. The theoretical foundations, implementation tradeoffs and current performance of the software implementation in R are discussed.

4 - Dynamic Network Data Envelopment Analysis-DEA on Evacuation Performance

Kostas Triantis, Professor, ISE Department-Virginia Tech, 7054 Haycock Rd, Room 428, Falls Church, VA, 22043, United States of America, triantis@vt.edu, Oscar Herrera-Restrepo, Praveen Edara, Pamela Murray-Tuite, Joseph Trainor

This paper proposes a theoretical representation of a slacks-based dynamic network DEA approach for measuring evacuation performance when a ramp closure strategy is considered. It includes an integrated conceptual framework that incorporates stakeholder perspectives, evacuation-related systems and processes. The approach allows for the discovery of potential performance improvement actions that can inform the definition of future requirements of transportation evacuation strategy designs.

Operations and Finance Interface

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Saif Benjaafar, Distinguished McKnight University Professor Professor, University of Minnesota, 111 Church St SE, Minneapolis, MN, 55455, United States of America, saif@umn.edu

1 - Inventory Models with Tail Constraints

Rene Caldentey, Professor, New York University, 44 West Fourth Street, 8-77, New York, NY, 10012, United States of America, rcaldent@stern.nyu.edu

We propose a methodology for the optimal selection of inventory decisions for a company that faces tail risk constraints. We apply our methodology to some standard operations problems including the popular newsvendor model and a supply chain procurement/inventory problem.

2 - Inventory, Risk Shifting, and Trade Credit

Jiri Chod, Boston College, 140 Commonwealth Ave, Chestnut Hill, MA, 02459, United States of America, jiri.chod@bc.edu

We show that the use of trade credit prevents risk-seeking behavior often associated with debt financing. We consider a financially constrained retailer procuring inventory of two products under uncertain demand. With bank financing, the retailer overinvests in the riskier product where riskiness depends on salvage value, profit margin, mean demand, and demand volatility. A retailer relying on trade credit chooses the first-best inventory, for which he is rewarded by a lower cost of borrowing.

3 - On the Impact of Input Price Variability and Correlation in Stochastic Inventory Systems

David Chen, University of Minnesota, 111 Church Street, Minneapolis, MN, 55455, United States of America, chen2213@umn.edu, Saif Benjaafar, William Cooper

For inventory systems with stochastic demand and stochastic input prices, we show that higher input price variability in the sense of the convex order always leads to lower expected cost. We also find that expected cost is increasing in price correlation over time and decreasing in price correlation across components. We present numerical results that provide insights on how various parameters influence the effects of price variability and correlation.

Hilton- Franciscan B

Retail Operations

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Santiago Gallino, Tuck School of Business, 100 Tuck Hall, Hanover, NH 03755, United States of America, santiago.gallino@tuck.dartmouth.edu

1 - Detecting Stock-outs based on Transaction Data

Marcelo Olivares, Assoc. Professor, Columbia University, Broadway 3027, New York, NY, United States of America, molivares@columbia.edu

This work combines techniques from statistical process control and discrete choice models of demand to develop a real-time system to detect stock-outs in supermarket shelves. The method can be designed to attain a desirable level of false alarms, which is key to facilitate the adoption of the system by store employees. We tested our methodology by running a pilot study where actual shelf availability was monitored for several products with more than 4500 visual inspections.

2 - Intelligent Assortment Expansion for an Online Retailer

Youran Fu, Doctoral Candidate, The Wharton School, 532.4 Jon M. Huntsman Hall, 3730 Walnut St., Philadelphia, PA, 19104, United States of America, youranfu@wharton.upenn.edu, Marshall Fisher

We work with a Chinese e-retailer to develop optimal assortment expansion. The e-retailer believed they could just carry everything but many SKUs they added only became stale inventory. We view a SKU as a set of attributes, and apply both the multinomial logit model and the model developed by Fisher and Vaidyanathan (2012). With sales history data, the latter shows an overall better fit. It is implemented for the imported beer category, increasing the success rate of new SKUs from 24% to 83%.

3 - Size and Prepack Optimization to Minimize Lost Sales and Logistics Costs at an Apparel Retailer

Gurhan Kok, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, gurhan.kok@duke.edu, Yunus Emre Koç, Ozgur Sivrikaya

Pre-pack optimization is a common problem in fashion retailing. Retailers pack multiple sizes of the same product (style) into the same package to minimize warehouse costs. We develop a stochastic inventory model based evaluation system for determining the optimal package configurations and the procurement amount of each package type. Live controlled experiments demonstrate a 10% increase in gross margin after taking into account a 5% increase in sales and slight increase in logistics costs.

4 - Increasing Retail Sales via Improved Store Staffing: An Empirical Study with Implemented Results

Marshall Fisher, The Wharton School, University of Pennsylvania, 3730 Walnut Street, Room 542, Philadelphia, PA, 19104, United States of America, fisher@wharton.upenn.edu, Serguei Netessine, Santiago Gallino

We analyzed 30 months of a retailer's history on store-month sales and potential sales drivers to measure the impact of store selling staff level on revenue. We identified a third of the stores where our analysis indicated that increasing staffing would increase sales. The retailer confirmed this finding via a 16 store test which showed that a 10% increase in sales staff resulted in a 9.9% sales increase, and was highly profitable. The retailer is now implementing our finding in other stores.

Choice Models in Revenue Management and Pricing III

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Maarten Oosten, Senior Manager Advanced Analytics Optimization Services, SAS Institute, SAS Campus Drive, Cary, NC, 27513, United States of America, maarten.oosten@sas.com

Co-Chair: Matt Maxwell, SAS Institute Inc., 500 SAS Campus Dr, Cary, NC, 27513, United States of America, Matt.Maxwell@sas.com

1 - Estimation of Choice-Based Revenue Management Models

James Lemieux, Senior Research Statistician Developer, SAS Institute, 100 Sas Campus Dr, Cary, NC, 27617, United States of America, James.Lemieux@sas.com

Estimation of choice-based revenue management models is made difficult when non-purchasers are missing. Talluri and van Ryzin (2004) overcome this limitation by using an EM algorithm. Newman et al (2012) proposed an alternative based on marginalizing the parameters under the assumption that choice is multinomial logit. This paper discusses the technical difficulties in implementing these techniques and proposes an extension that improves the arrival rate estimate in certain circumstances.

2 - Assortment Planning under the Multinomial Logit Model with Totally Unimodular Constraint Structures

James Davis, jamesmariodavis@gmail.com, Guillermo Gallego, Huseyin Topaloglu

We consider constrained assortment optimization problems where product purchase probabilities are governed by the multinomial logit model and the constraint structure can be captured by a totally unimodular matrix. This is a general framework that captures a variety of capacity constraints and discrete pricing problems. We develop a linear program for these problems and use it to develop purely combinatorial algorithms and gain insight into the structure of optimal solutions.

3 - Customer Choice Model Optimization with Overlapping Consideration Sets

Matt Maxwell, SAS Institute Inc., 500 SAS Campus Dr,, Cary, NC, 27513, United States of America, Matt.Maxwell@sas.com

Customer Choice Model (CCM) based revenue management has become increasingly attractive due to recent market changes which weaken traditional demand model assumptions; however, there are still significant optimization challenges for revenue management given a CCM. In particular, optimization algorithms frequently become intractable when multiple market segments have overlapping consideration sets. We discuss heuristic methods used to overcome this difficulty and compare their performance.

4 - Launch Price Optimization for Pharmaceutical Products

Bahadir Aral, Sr Operations Research Specialist, SAS Institute, SAS Campus Drive, Cary, NC, 27513, United States of America, bahadir.aral@sas.com

Pharmaceutical companies face unprecedented pressure to stay profitable in a difficult global pricing environment that increasingly demands the ability to respond swiftly (and smartly) to changing government requirements. A myriad of price referencing rules complicate the already difficult business and mathematical challenges of achieving optimal launch sequences and prices across all markets. This presentation will describe challenges with the problem , a novel approach to the launch optimization problem, including management of the scheduling and pricing components simultaneously while allowing for extensive what-if analysis to identify the most appropriate course of actions.

Topics in Revenue and Capacity Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Dan Zhang, University of Colorado at Boulder, 419 UCB, Boulder, CO, 80309, United States of America, dan.zhang@colorado.edu

1 - Investing in a Shared Supplier in a Competitive Market: Stochastic Capacity Case

Anyan Qi, The University of Texas at Dallas, 800 W. Campbell Rd., Richardson, TX, 75080, United States of America, axq140430@utdallas.edu, Amitabh Sinha, Hyun-Soo Ahn

We consider what happens when two competing firms invest in a shared supplier's capacity under two common forms of restrictions: the investing firm has exclusive use of the invested capacity, or first priority in having the firm's order fulfilled. We model firms' investment and production decisions as a two-period game, characterize the equilibrium capacity investment outcomes, and analyze the impact of the spillover effect.

2 - Delivering Guaranteed Display Advertising under Reach and Frequency Requirements

Ali Hojjat, PhD Candidate, University of California Irvine, Paul Merage School of Business, SB 332, Irvine, CA, 92697, United States of America, hojjats@uci.edu, John Turner, Suleyman Cetintas, Jian Yang

We propose a new modeling framework for scheduling guaranteed display advertising in which advertisers demand a specific number of unique users (reach) that each see the ad campaign at least a certain number of times (frequency). We integrate a novel user-level approach into a common aggregate planning schema which allows us to construct a solution and at the same time account for smooth delivery of ads over time, diversity of ads seen by each user, and other desirable factors.

3 - Preorder-contingent Pricing vs Preorder-contingent Production in Advance Selling

Fuqiang Zhang, Washington University, Olin Business School, St. Louis, United States of America, fzhang22@wustl.edu, Mike Wei

Motivated by emerging industry practices, this paper studies the effectiveness of two new advance selling strategies when facing strategic consumers. We show that compared to the traditional advance selling strategy, preorder-contingent production can significantly improve firm profit, while preorder-contingent pricing does not yield much benefit.

4 - A Model of Consumer Loyalty Reward Programs

Dan Zhang, University of Colorado at Boulder, 419 UCB, Boulder, CO, 80309, United States of America, dan.zhang@colorado.edu, Yacheng Sun

Despite the prevalence of loyalty reward programs in the retail and service industries, there is an ongoing debate on whether and when such programs are profitable. We consider a monopolistic firm selling to forward-looking consumers who are heterogeneous in product valuations and purchase frequencies. For each purchase, a consumer earns a reward that expires after a fixed number of periods. We discuss managerial implications of the model.

1 - Matching in Networks

Michael Ostrovsky, Associate Professor of Economics, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States of America, ostrovsky@stanford.edu

In this talk, I will present results on the existence and properties of stable outcomes in trading networks.

2 - Matching with Peers in School Choice

Atila Abdulkadiroglu, Professor, Duke University, 213 Social Sciences Building, Durham, NC, 27708, United States of America, atila.abdulkadiroglu@duke.edu

We develop a theory for matching of students to schools with peers and study various matching mechanisms with field data.

3 - Endogenous Preferences and the Role of the Mechanism in School Choice

Estelle Cantillon, Senior Research Fellow, Université Libre de Bruxelles (ECARES), 50, av FD Roosevelt, CP 114, Brussels, 1050, Belgium, Estelle.Cantillon@ulb.ac.be

We consider a school choice model where preferences over schools are endogenous because students care about the quality of their peers. In such a setting, the mechanism affects the degree of preference polarization. We show how mechanisms can be designed to reduce polarization and improve the distribution of ranks of assigned schools in students' preferences. A policy change in the city of Ghent (Belgium) provides a test for the predictions of the theory.

4 - Evidence of Strategic Behavior in Hospital Claims Reporting

Hamsa Bastani, Stanford University, Stanford, Stanford, United States of America, hsridhar@stanford.edu, Mohsen Bayati, Stefanos Zenios, Joel Goh

We provide evidence from Medicare claims data that hospitals engage in upcoding behavior when reporting hospital-acquired infections that are no longer reimbursed by Medicare. In particular, we show that hospitals sometimes mark a hospital-acquired infection as present-on-admission, presumably in order to collect greater reimbursement.

Traffic Flow Modeling and Management

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Nikola Markovic, University of Maryland, Civil & Environmental Engineering, College Park, MD, United States of America, nikola@umd.edu

1 - Integrated Methodology for Online Calibration of Real Time Simulation Based Dynamic Traffic Assignment

Hossein Hashemi, Southern Methodist University, 3101 Dyer St, Room 203, Dallas, TX, 75205, United States of America, shashemi@smu.edu, Khaled Abdelghany, Ala Alnawaiseh

We present a methodology for online calibration of real-time traffic network simulation models. The methodology integrates time-dependent demand estimation and traffic flow propagation adjustment. The performance of the methodology is examined using a real-world application in which a real-time traffic network state estimation model is implemented for the US 75 Corridor in Dallas, Texas.

2 - Evasive Flow Capture: Optimal Location of Weigh-in-Motion Stations, Tollbooths, and Security Checkpoints

Nikola Markovic, University of Maryland, Civil & Environmental Engineering, College Park, MD, United States of America, nikola@umd.edu, Ilya Ryzhov, Paul Schonfeld

The flow-capturing location-allocation problem (FCLAP) consists of locating facilities in order to maximize the number of flow-based customers that encounter at least one of these facilities along their predetermined travel paths. The FCLAP literature assumes that, if a facility is located on a predetermined path of a flow of customers, that flow is considered captured. However, existing models for the FCLAP do not consider targeted users who behave non-cooperatively by changing their travel paths to avoid fixed facilities (such as weigh-in-motion stations used to detect and fine overweight trucks). We propose, for the first time, the evasive flow capture problem (EFCP), analyze its structural properties, present modeling techniques for reducing computational cost, and show a case study based on a real-world transportation network.

Optimization and Disaster Management

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Anuj Sharma, Assistant Professor, Iowa State University, Iowa, Ames, IA, 50011, United States of America, anujs@iastate.edu

1 - Characterization of Social Networks in Humanitarian Projects

Gloria Cecilia Urrea Castaño, PhD Student, University of Lugano, Via Giuseppe Buffi 13, Lugano, 6900, Switzerland, Sebastian Villa Betancur, Paulo Goncalves

When different organizations from distinct sectors are involved in humanitarian projects, complex relations arise creating unique structures. By analyzing 794 humanitarian projects and using exponential random graph models, we are able to (1) better understand the interactions among humanitarian actors and (2) identify the specific generative mechanisms and attributes that characterize the different structures emerging in humanitarian networks.

2 - Modeling the Dynamic Resource Allocation Problem for Large-Scale Transportation Network Evacuation

Xiaozheng He, NEXTRANS, 3000 Kent Ave, West Lafayette, IN, 47906, United States of America, seanhe@purdue.edu, Hong Zheng, Srinivas Peeta

This study addresses the dynamic resource allocation problem for large-scale transportation network evacuation in two aspects. First, we adapt the spatial-queue model to describe evacuation traffic flow dynamics such that the problem size can be reduced significantly. Second, a decomposition scheme is developed to improve the computational efficiency for the problem.

3 - Resilience of Networked Infrastructure with Evolving Component Conditions

Reza Faturechi, Senior Systems Engineer, Optym, 505 SW 2nd Ave, Gainesville, Fl, 32601, United States of America, reza.faturechi@gmail.com, Eyal Levenberg, Elise Miller-Hooks

The problem of evaluating and maximizing the resilience of a networked infrastructure given component performance deterioration, along with improvements due to maintenance under given maintenance policies, is modeled as a stochastic optimization problem. The effects of capturing deterioration and maintenance in resilience quantification are assessed for a specific case study.

4 - Designing Blackout Resilient Traffic Network using Hybrid Power Generation

Anuj Sharma, Assistant Professor, Iowa State University, Iowa, Ames, IA, 50011, United States of America, anujs@iastate.edu, Mo Zhao

During power outages, traffic control signals and ITS devices are unable to assist in traffic management. This paper develops a design optimization model to find the trade-off between traffic network reliability and investment on emergency power. The effectiveness of hybrid emergency power using wind and solar energy is investigated.

Rich Vehicle Routing Problems I

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Baoxiang Li, TUE, Eindhoven, Netherlands, b.li@tue.nl

1 - using SA to Solve the VRP Problem with Capacity and Time Constraints in Non-Euclidean Networks

Alejandro Garcia del Valle, Professor, University of Coruña, Dept Economic Analysis and Management Sc, Ferrol, C, 15403, Spain, agvalle@udc.es, Javier Faulin, Diego Crespo Pereira, Rosa Rios Prado

In this paper we first analyze the behavior of the Simulated Annealing based on the quality of solutions used as a starting point, then we implement this method to solve the problem of designing the delivery routes with capacity constraints and time windows with a maximum time in each route, for non-Euclidean dispersed networks. Finally we analyze and discuss the results of our research.

2 - Designing Split Pickup Collection Routes with Operational Constraints

Zhijie Dong, Cornell University, Ithaca, NY, United States of America, zd57@cornell.edu, Mark Turnquist

We develop an extension of the Split Delivery Vehicle Routing Problem (SDVRP) that includes constraints on the number of routes visiting any customer and the total number of customers receiving split service. These constraints are important for development of collection routes for inbound materials being shipped to a manufacturing plant. An effective heuristic solution method is developed for the extended problem formulation and application to logistics operations in the automotive industry is demonstrated.

3 - Improving Profitability of Vehicle Routing Problems through Advanced Analytics

Dauwe Vercamer, Universiteit Gent, Belgium Dauwe.Vercamer@UGent.be, Dirk Van den Poel, Michel Gendreau, Philippe Baecke

Based on a real case in door-to-door sales, the study assesses whether revenue predictions coming from transactional data can effectively be used to improve fleet schedules. To do this, two different customer selection models are compared. In the static model, customers are first chosen based on the revenue predictions and then routed through a VNS. The dynamic model uses the predictions in an orienteering problem. Initial results show that the dynamic approach is the most profitable.

4 - Hierarchical Optimization Modeling of Vehicle Routing Problem in Urban Supply Chains
Yiou Wang, Penn State, State College, PA, United States of America
Terry Friesz, Tao Yao, Hongcheng Liu, Ke Han

This research proposes a novel bi-level extension of vehicle routing problem (VRP) by formulating it into a Stackelberg game that takes into account the congestion as a result of freight activities among the background passenger traffic in urban freight planning. The model incorporates the VRP with static user equilibrium traffic assignment as a lower level. Numerical experiment on variant problem sizes show that the routing decisions from the bi-level formulation outperform decisions from the classical VRP formulation.

5 - An Adaptive Large Neighborhood Search Heuristic for the Share-a-Ride Problem
Baoxiang Li, TUE, Eindhoven, Netherlands, b.li@tue.nl,
Dmitry Krushinsky, Tom Van Woensel

The Share-a-Ride Problem (SARP) aims at minimizing the cost of serving a set of passengers and parcels using a set of homogeneous vehicles. We propose an Adaptive Large Neighborhood Search (ALNS) heuristic for the SARP. Furthermore, we study the problem of determining the time slack of the SARP scheduling. The solution approach is tested on three sets of realistic instances. The performance of our heuristic is benchmarked against an MIP solver and DARP test instances.

Traffic and Emissions Modeling

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Xuesong Zhou, Associate Professor, Arizona State University, School of Sustainable Engineering and th, Tempe, AZ, United States of America, xzhou74@asu.edu

1 - Emission and Signal Optimization
Tao Yao, Penn State, State College, PA, United States of America
tyy1@engr.psu.edu, Y. Sun, Terry Friesz, K. Han

We propose a mathematical program wherein combining the dynamic user equilibrium, emission constraints and the decision variables that are the signal timing plans at all intersections.. The continuum signal model is an efficient and effective alternative of the so-called on-and-off signal models frequently employed in signal optimization problems.

2 - Traffic Signal Prediction for Engine Stop-start System
Jianfeng Zheng, University of Minnesota, Minneapolis,
United States of America, zheng220@umn.edu, Henry X. Liu

Engine stop-start system, which shuts down and restarts an engine to reduce idling time when a vehicle stops, has become a common feature of vehicles nowadays. In this work, we propose a prediction model to predict vehicle stopping time at signalized intersections, aiming at better controlling engine stop-start system with traffic signal information. The feasibility and potential of the proposed method are demonstrated with a field example.

3 - System-optimal Traffic Routing Plans for Agents with Goals: Travel Time, Energy Cost and Emission Impacts
Jiangtao Liu, ASU, Tempe, AZ, United States of America
jliu215@asu.edu, Xuesong Zhou, Srinivas Peeta

Reducing energy consumption and pollutant emission from traffic systems is a practically important issue for urban network planners. Based on a set of queue and kinematic wave models, this talk will discuss a few analytical models for estimating the energy cost and emission impacts under different traffic states. Both non-linear and linear programming models are constructed to provide system-optimal routing plans for agents with various goals.

4 - Finding Green System Optimal Routing Policies through a Multi-Scale Dynamic Path Flow Assignment Model
Chung-Cheng Jas Lu, jasoncclu@gmail.com

This talk will discuss a problem of finding system optimal eco-routing or green routing flows that minimize total vehicular emission in a network. A mesoscopic dynamic network loading model that tightly links Newell's simplified kinematic wave and car-following models is proposed to facilitate an internally consistent dynamic traffic assignment for temporally cross-resolution and spatially multi-scale emission modeling.

Hilton- Union Sq 5

Flexible Transit and Ride-Share Systems

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Shadi Djavadian, Ryerson University, 350 Victoria Street, Toronto, Canada, shadi.djavadian@ryerson.ca

1 - Benefits of Recourse in the Stochastic Dial-A-Ride Problem
Neza Vodopivec, Graduate Assistant, University of Maryland, 1173 Glenn Martin Hall, University of Maryland, College Park, MD, 20742, United States of America, nvodopivec1@gmail.com,
Elise Miller-Hooks, Paul Schonfeld

DARP considers optimal schedules for door-to-door shared ride services. Few investigations incorporate the stochastic nature of real-world travel times, and none start from the premise that operators will wish to use means beyond their own fleets to minimize customer inconvenience. In this presentation, we investigate the handling of uncertain travel times by taxi and other recourse options.

2 - Agent Based Equilibrium Simulation Model to Evaluate Flexible Transit System Designs
Shadi Djavadian, Ryerson University, 350 Victoria Street, Toronto, Canada, shadi.djavadian@ryerson.ca, Jaeyoung Jung,
Joseph Y.J. Chow

We design and develop an agent based transportation simulation tool which evaluates the equilibrium demand for flexible transit service designs that cannot be determined analytically. Alternatives evaluated include different service types (fixed route, flex-schedule versus pure demand-responsive service) and dispatch algorithms. This work bridges the gap between service simulation models that ignore schedule-based demand interactions and activity-based models like MATSim that do not exhibit robust transport service simulation components. The simulation model is applied to two different settings in Ontario: London and Oakville, to demonstrate effectiveness.

3 - Minimum Number of Cars a City Needs in a Fully Coordinated Vehicle Sharing System
Monirehalsadat Mahmoudi, ASU, Tempe, AZ,
United States of America, mmahmou2@asu.edu, Xuesong Zhou

By introducing the concept of shared autonomous vehicles and ride sharing, we will address the following key questions: How many cars a city should use to support the overall transportation activity demand/desires, at different levels of coordination and pre-trip scheduling? How many parking lots and road infrastructure are required? We present a holistic optimization approach for synchronizing travel activity schedules, transportation services, and infrastructure on urban networks.

4 - Algorithms for Routing in Peer-to-peer Ride-share Systems
Neda Masoud, University of California, Irvine, CA,
United States of America, R. Jayakrishnan

The current ride-matching techniques in peer-to-peer ridesharing systems are rather preliminary and don't allow taking advantage of the full potential of the ridesharing systems. This paper formulates the multi-hop peer-to-peer ride-matching problem and proposes algorithms to solve the problem efficiently.

Location Optimization I

Sponsor: Location Analysis

Sponsored Session

Chair: Alan Murray, Professor, Drexel University, Center for Spatial Analytics and Geocomp, College of Computing and Informatics, Philadelphia, PA, 19104, United States of America, amurray@drexel.edu

1 - Mitigating Urban Heat Island Effects through Strategic Park Siting
Yujia Zhang, ASU, ASU, Tempe, United States of America,
yzhan169@asu.edu, Kailai Wang, Alan Murray

The paper develops an approach for optimizing the cooling benefits of urban parks. A multi-objective spatial model is introduced accounting for area, shape and surrounding land cover of parks.

2 - Modeling Framework for Strategic Airline Network Design
Armin Lüer-Villagra, PhD Candidate, Pontificia Universidad Catolica de Chile, Department of Electrical Engineering, Av. Vicuña Mackenna 4860, Santiago, 7820436, Chile, arminluer@gmail.com, Guillermo Latorre-Níñez, Vladimir Marianov

We study the effect of different network policies in terms of strategic performance indicators on airlines. We formulate a location-network design problem, in which a company must locate their management and maintenance facilities in existing airports, together with deciding routes and the capacity allocation both on arcs (airplanes) and nodes (airports), minimizing costs, subject to an aggregated level of service constraint. The results suggest a strong impact of these policies.

3 - Spatial Strategy Development for Network Containment
Tony Grubesic, Professor, Drexel University, 3141 Chestnut St, Philadelphia, PA, 19104, United States of America, grubesic@drexel.edu, Alan Murray

This paper details location models to support containing, isolating and canalizing spatial flows to diminish the distribution of known and potential threats. Strategies for enhancing monitoring activities are discussed and public policy implications are discussed.

4 - Cournot-Stackelberg Games in Competitive Delocation
Diego Ruiz-Hernandez, Associate Professor, University College for Financial Studies, Serrano Anguita 9, Madrid, 28004, Spain, d.ruiz@cunef.edu, Javier Elizalde

During economic crises, the number of commercial facilities decreases. Many firms need to reduce their network minimizing the market share lost. We address the problem of facilities closing in a duopolistic market considering three ways of behaviour: myopic, Cournot and Stackelberg competition. We present a binary integer programming formulation, and provide an algorithm to find the non-cooperative solutions. The existence of Nash equilibrium is empirically tested.

Advanced Analytics: Applications to Solve Aviation System Level Problems

Sponsor: Aviation Applications

Sponsored Session

Chair: Philippe Bonnefoy, Lead Associate, Booz | Allen | Hamilton, 22 Batterymarch Street, Boston, MA, 02109, United States of America, bonnefoy_philippe@bah.com

1 - Game Theoretic Based Decision Analytics: Applications to the Aviation and Aerospace Markets
Philippe Bonnefoy, Lead Associate, Booz | Allen | Hamilton, 22 Batterymarch Street, Boston, MA, 02109, United States of America, bonnefoy_philippe@bah.com, Alice Fan, Gregory Raiffa

New game theoretic models that combine Bayesian Networks and Level-K solution concepts can help to better capture inherent uncertainties in the complex systems and (2) strategic interactions between decision makers. These models were applied to; (1) the aviation market by modeling and evaluating airlines' equipage of NextGen technology adoption under various policy scenarios and (2) the aerospace market to model the strategic interactions involving aircraft acquisitions.

2 - The Impact of Aircraft Design Reference Mission on Fuel Efficiency In The Air Transportation System
Brian Yutko, Post-Doctoral Associate, MIT, 9 Newbury Street, Somerville, MA, 02144, United States of America, byutko@mit.edu

There currently exists a large mismatch between commercial aircraft design capability (payload and range) and the way they are typically operated in the global system. This research proposes a new way of thinking holistically about the optimization of aircraft design capability, network structures, and operational techniques. Preliminary results indicate that there is a significant pool of potential fuel burn savings (~30-40%) that can be realized without new technology or fuels.

3 - Opportunities for Cruise Altitude and Speed Optimization in US Domestic Airline Operations
Luke Jensen, Research Assistant, MIT, 10 Landers St Apt 3, Somerville, MA, 02143, United States of America, ljensen@mit.edu

Operational strategies to reduce aircraft fuel consumption can mitigate costs and environmental impacts on a short time horizon. Most prior research has focused on lateral track optimization to achieve these benefits. This talk examines the system fuel burn reduction potential resulting from an alternative strategy, cruise speed and altitude optimization, in domestic US airline operations. Potential benefits, applications, and barriers to implementation are discussed.

4 - Encouraging Change in Air Traffic Control: A Game Theoretic Application
Nicole Adler, Hebrew University of Jerusalem, Mount Scopus, Jerusalem, 91905, Israel, msnic@huji.ac.il, Eran Hanany

Drawing on lessons from the airline and airport sectors, it would appear necessary to change both the market structure and regulatory environment of the air traffic control sector in order to achieve the goals of SESAR and NextGen. Using a network flow quadratic program within a congestion game, we analyse potential regulatory and ownership typologies in order to determine how to encourage the air traffic control sector to adopt the new technologies that have been developed over the last decade.

"Just the Facts" Papers in Strategy

Cluster: Strategy Science

Invited Session

Chair: Myles Shaver, U of MN, 321-19th Ave S, Suite 3-365, Minneapolis, MN, 55455, United States of America, mshaver@umn.edu

1 - Marked for Life?: Temporary Mobility Constraints and Entrepreneurship Decisions by Foreign Graduates
Martin Ganco, Assistant Professor, University of Minnesota, 321 - 19th Avenue South, #3-365, Minneapolis, MN, 55455, United States of America, mganco@umn.edu

I study the effects of individuals facing a constraint when making initial employment decision post-graduation. I design a quasi-experiment by examining the effect of timing of green card that was not received through employment sponsorship in the context of foreign graduates of U.S. universities in science and engineering. I find that individuals who are more constrained are more likely to start a growth-oriented business and are less likely to enter a field not related to their degree.

2 - Geographic Proportional Representation of Female-Owned Businesses: Survival and Performance Outcomes
Michele Williams, Assistant Professor, Cornell University, 393 Ives Hall Faculty Building, Ithaca, NY, 14853, United States of America, mwilliams@cornell.edu, Arturs Kalnins

Analyzing survival duration of one million proprietorships and revenues of six thousand lodging proprietorships, we find a robust positive relationship between the proportional representation of female-owned proprietorships and both the survival duration and revenue performance of female-owned proprietorships, relative to male-owned proprietorships. We address endogeneity via instrumental variables.

3 - The Impact of Collusive Non-poaching Agreements, Mobility and Innovation
Ajay Bhaskarabhatla, Assistant Professor, Erasmus School of Economics, Burgemeester Oudlaan 50, PO Box 1738, Rotterdam, 3061XN, Netherlands, bhaskarabhatla@ese.eur.nl, Deepak Hegde

This study investigates the impact of secret bilateral agreements among select firms in Silicon Valley to not actively solicit each other's employees. Using US patent grant data during 1995-2009 and a differences-in-differences methodology, we find that inventor mobility declined among the colluding firms relative to others during the period of collusion. We also find that the individual inventor productivity and invention quality at the colluding firms declined during the period of collusion.

Scheduling in Maritime Logistics

Cluster: Scheduling and Project Management

Invited Session

Chair: Xiangtong Qi, HKUST, Dept of IELM, HKUST, Hong Kong, Hong Kong - PRC, ieemqi@ust.hk

1 - Optimal Algorithm for the General Quay Crane Double-cycling Problem

Chung-Yee Lee, Professor, The Hong Kong University of Science and Technology, Clear Water Bay, Kowloon, Hong Kong, Hong Kong - PRC, cylee@ust.hk, Ming Liu, Chengbin Chu

This paper studies quay crane double-cycling problem. We show that it can be formulated as a flow shop scheduling problem with series-parallel precedence constraints, thus allowing it to be solved polynomially. This also answers the optimal question regarding the computaitonal complexity of the problem.

2 - New Solution Methods for the Continuous Berth Allocation Problem

Zhou Xu, Hong Kong Polytechnic University, Hong Kong, Hong Kong - PRC, lgtzx@polyu.edu.hk, Chung-Yee Lee

Port operators today are struggling to enhance efficiency through better utilization of berth spaces. In this paper, we have developed novel solution methods for a continuous berth allocation problem, based on a new lower bound of the optimal solution, a new heuristics, and a new exact algorithm. Computational results show that compared with existing methods, our methods can solve more instances to optimal, and generate better near-optimal solutions and lower bounds.

3 - The Impact of Slow Ocean Steaming on Delivery Reliability and Fuel Consumption

Jiheng Zhang, HKUST, Clear Water Bay, Hong Kong, Hong Kong - PRC, jiheng@ust.hk, Chung-Yee Lee, Hau Lee

Slow steaming has become a widely adopted practice as a way to reduce bunker costs and carbon footprints. In this paper, we propose a model to quantify the relationship among shipping time, bunker cost and delivery reliability. Moreover, we verify our model and results via numerical experiments by using actual data from a large ocean carrier in Hong Kong. Our findings lead to a simple and implementable policy with a controlled cost and guaranteed delivery reliability.

4 - Disruption Recovery for Berth Allocation

Xiangtong Qi, HKUST, Dept of IELM, HKUST, Hong Kong, Hong Kong - PRC, ieemqi@ust.hk, An Zhang

We consider berth allocation after the terminal is disrupted with multiple waiting vessels. While the terminal has the objective of reducing the queue quickly, the container transshipment among the vessels should also be respected as much as possible. We treat and solve the problem as scheduling with soft precedence constraints. The work is supported by a grant from the Research Grants Council of the HKSAR T32-620/11.

Delivering Services Over the Digital Media

Sponsor: Service Science

Sponsored Session

Chair: Tuck Siong Chung, Nanyang Tech. U., Nanyang Bus. School, Singapore, 639798, Singapore, ATSChung@ntu.edu.sg

1 - An Integrated Model of Online Rating Decision: Role of Pre-Purchase Expectation and Post-Purchase Experience

Tuck Siong Chung, Nanyang Tech. U., Nanyang Bus. School, Singapore, 639798, Singapore, ATSChung@ntu.edu.sg

The authors developed a three stage sequential decision model that links expectation disconfirmation with post consumption rating decisions in the online context. They empirically examine the proposed model in a controlled laboratory setting and find that disconfirmation plays an important role in rating behaviors. They show via a simulation study that the proposed model can successfully recreate a range of distributional and evolutionary characteristics of online rating environment that are commonly found in real life.

2 - Digital Brand Delight - Structure, Causes and Consequences of Brand Delight in a Digital Environment

Markus Lenkar, University of Koblenz-Landau, Institute for Management, Germany, markus.lenker@audi.de

The Digitization greatly changed the behavior of customers. Purchase decisions for a car are strongest influenced by the websites of a brand. To differentiate from competitor, brands have to create emotional relationships to their customers. Two empirical Studies in cooperation with a German premium car manufacturer identify influencing factors of website quality and online brand experiences on brand delight. Overall, this research Shows how Brands can attain brand delight in an online environment and clarifies its effects on consumer behavior.

3 - Combining Quantitative and Text Mining Approaches for Win Prediction of IT Outsourcing Bids

Hamid R. Motahari-Nezhad, IBM Almaden Research Center, 650 Harry Road, San Jose, United States of America, motahari@us.ibm.com, Daniel Greenia, Taiga Nakamura, Aly Megahed

Information technology service providers, as IBM, design and propose bids to potential clients in an effort to win high-valued outsourcing information technology contracts. Several project factors contribute to whether the deal is won or lost. In this work, we develop and combine quantitative and text analytics approaches that predict and prioritize the winning deals among a given list of on-going deals. We present a real-world case study that shows the practical impact of using our model.

Accelerate Service Innovations with Data Mining and Machine Learning

Sponsor: Service Science

Sponsored Session

Chair: Mu Qiao, Research Staff Member, IBM Almaden Research Center, 650 Harry Road, San Jose, CA, 95120, United States of America, mqiao@us.ibm.com

1 - Team Recommendation for IT Strategic Outsourcing Services

Mu Qiao, Research Staff Member, IBM Almaden Research Center, 650 Harry Road, San Jose, CA, 95120, United States of America, mqiao@us.ibm.com, Daniel Greenia, Rama Akkiraju, Taiga Nakamura, Haibin Liu, Hamid R. Motahari-Nezhad, Stephen Dill

In IT strategic outsourcing services, it is critical to have competent deal teams to design competitive service solutions and respond to clients' request for proposals swiftly. We present a team recommendation framework for finding the best deal team for a given set of job roles using a machine learning approach. It takes into account diverse individual and team level features, and can accommodate various cost or feature functions. We show the recommendation results in a real business scenario.

2 - End-to-end Real-time Proactive Cloud Management Analytics

Rong Liu, IBM Research, 1101 Kitchawan Rd, Ossining, NY, 10598, United States of America, rliu@us.ibm.com, Jeaha Yang, Juhnyoung Lee

As the complexity of cloud computing increases and software components are deeply interconnected, it is challenging for customers to manager their applications on cloud to achieve true self-service. Here we propose an end-to-end approach that allows customers to actively monitor their systems on cloud. This approach aggregates and analyzes data/events from software stacks on cloud, proactively alert customers potential failures, and recommend actions to remedy failures of their applications.

3 - using Social Network Analysis to Improve the Incident Handling in IT Services

Zhe (Jay) Shan, University of Cincinnati, Cincinnati, Ohio zhe.shan@uc.edu, Rong Liu

In a complex IT environment, the diagnosis of application-level incidents is very difficult. Therefore, matching incident cases with appropriate SMEs is one of the key challenges in IT service industry. In this work, we propose to use the social network information mined from historical communication information among SMEs to improve the case dispatch system. This analysis can not only identify the expertise similarity and complementarity among SMEs, but also their collaboration patterns.

1 - SEDD: Disaster Diagnostic and Evaluation System

J.Tinguaro Rodriguez, Complutense University of Madrid, Plaza de Ciencias 3, Madrid, 28040, Spain, jtrodrig@mat.ucm.es, Begona Vitoriano, Javier Montero

A decision support system to assess consequences of disasters with the very first available information is presented in this work. This DSS, refered as SEDD, is based on a rule-based learning model focused on interpretability. Moreover, among its main features, SEDD's methodology enables an expressive representation of uncertainty and knowledge of predicted consequences of disasters, as well as to include decision maker's attitude and requirements inside its learning and inference procedures.

2 - Integrating Real Time Data into Logistical Models: A Case Study from Typhoon Haiyan

Kezban Yagci Sokat, PhD Candidate, Nortwestern University, 2145 Sheridan Road, Room C210, Evanston, IL, 60208, United States of America, kezban.yagcisokat@u.northwestern.edu, Irina Dolinskaya, Karen Smilowitz, Jennifer Chan

We present a first-hand experience of collecting, analyzing and integrating real time data into logistical models. Using the recent Philippines Typhoon Haiyan as a case study, we analyze how dynamically emerging data can be collected, processed and used in humanitarian logistical decisions.

3 - Logistics for Rural Development: A Model for Photovoltaic Rural Electrification in Morocco

Begona Vitoriano, Associate Professor, Complutense University of Madrid, Faculty of Mathematical Sciences, Plaza de las Ciencias, 3, Madrid, 28040, Spain, bvitoriano@mat.ucm.es, Luis Miguel Carrasco, Luis Navarte, M. Teresa Ortuño, F. Javier Martin-Campo

Photovoltaic electrification for rural development has experienced a scale change in terms of size of the programmes developed, with thousands of solar home systems, and long operation and maintenance service periods. Planning and cost evaluation of maintenance operations is crucial for these decentralized systems. So far it has not been done properly, leading to poor performance of these services. A model for these purposes will be shown, applied to a real case on a province of Morocco.

1 - Global Health: Optimizing the Use of Scarce Resources

Eva Lee, Professor & Director, Georgia Institute of Technology, Ctr for OR in Medicine & Healthcare, Atlanta, GA, 30332, United States of America, eva.lee@gatech.edu

This work is joint with Tanzania public health ministry and CDC. Public health in developing countries is often underfunded and has limited resources. The healthcare systems have to explore strategies that allow them to serve the largest population with regular needs such as pregnancy screening, childhood vaccination, HIV and TB tests. We describe a decision support system that helps to improve hospital throughput and maximize the population served.

2 - Factors Influencing Healthcare Disparities in Breast Cancer Patients: A Review

Diana Prieto, Western Michigan University, 4601 Campus Drive, Kalamazoo, MI, 49008, United States of America, diana.prieto@wmich.edu

In the United States, there is a large body of research about factors influencing healthcare disparities in breast cancer patients. We conducted a systematic review to determine the factors that have been rarely investigated, and to identify the relationships between factors and endpoints with respect to the different treatment and post-treatment options for breast cancer. We will also discuss the modeling frameworks that are currently used to investigate the factors.

3 - Modified Network Model to Estimate HIV Transmissions in the US

Stephanie Sansom, CDC, Atlanta, GA, United States of America sos9@cdc.gov, Chaitra Gopalappa, Paul Farnham

Individual-based network models can simulate interactions among individuals and are suitable for modeling infectious diseases such as HIV. However, fitting network models can require long computational times, which may make them unsuitable for simulating large populations. We present a modified network model designed to overcome this limitation. We apply the model to the US population to estimate annual HIV incidence and transmission rates.

4 - Dynamic Network Disease Modeling of the Synergistic Transmission of HIV and HSV2

Yao-Hsuan Chen, CDC, 1600 Clifton Rd, Atlanta, United States of America, xhj1@cdc.gov, Thomas Gift, Samuel Friedman, Joel Sokol

The purpose of the study was to test the hypothesis that contact dynamics and contact network structures are important to closely predict the spread of sexually transmitted diseases (STDs). Our work supported the hypothesis that considering the underlying contact dynamics as well as network structures was important for making optimal disease prevalence predictions. Our results also demonstrated the need to model the data sampling process when validating against real-world data.

1 - GUB Covers and Power-Indexed Formulations for Wireless Network Design

Fabio D'Andreagiovanni,f.dandreagiovanni@gmail.com, Carlo Mannino, Antonio Sassano

We propose a pure 0-1 formulation for the wireless network design problem, i.e., the problem of configuring a set of transmitters to provide service coverage to a set of receivers. In contrast with classical mixed integer formulations, where power emissions are represented by continuous variables, we consider only a finite set of power values. This has two major advantages: it better fits the usual practice and eliminates the sources of numerical problems that heavily affect continuous models.

2 - The Two-level Diameter Constrained Spanning Tree Problem

Luis Gouveia, Professor, University of Lisbon, Centro de Investigacao Operacional, Bloco C6 - Piso 4- Campo Grande, Lisbon 1749-016, Portugal, legouveia@fc.ul.pt, Markus Leitner, Ivana Ljubic

We introduce the Two-Level Diameter Constrained Spanning Tree Problem (2-DMSTP). We first observe that any feasible solution to the 2-DMSTP can be viewed as a DMST that contains a diameter constrained Steiner tree. This observation allows us to prove graph theoretical properties related to the centers of each tree which are then exploited to develop mixed integer programming formulations, valid inequalities, and symmetry breaking constraints.

3 - Multipath Wireless Network Coding: An Augmented Potential Game

Vinod Ramaswamy, Texas A&M University, College Station TX 77843, United States of America, vonod83@tamu.edu, Natarajan Gautam, Vinith Reddy, Srinivas Shakkottai, Alex Sprintson

We consider wireless networks in which multiple paths are available between each source and destination. We allow each source to split traffic among all of its available paths, and we ask the question: How do we attain the lowest possible number of transmissions per unit time to support a given traffic matrix? Traffic bound in opposite directions over two wireless hops can utilize the "reverse carpooling" advantage of network coding in order to decrease the number of transmissions used. We call such coded hops "hyper-links." With the reverse carpooling technique, longer paths might be cheaper than shorter ones.

4 - Branch-and-price Algorithm for the Resilient Multi-level Hop-constrained Network Design

Fernanda S.H Souza, Federal University of Minas Gerais, Belo Horizonte 31270-010, Brazil, fernandasumikahojo@gmail.com, Michel Gendreau, Geraldo R. Mateus

In this work, we investigate the Resilient Multi-level Hop-constrained Network Design (RMHND) problem, which consists of designing hierarchical telecommunication networks, assuring resilience against random failures and maximum delay guarantees in the communication. Three mathematical formulations are proposed and algorithms based on the proposed formulations are evaluated.

Methods and Models for Large Social Networks

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Bin Zhang, University of Arizona, McClelland Hall, Room 430, P.O. Box 210108, Tucson, AZ, 85721, United States of America, binzhang@arizona.edu

1 - Large-scale Social Identity Linkage via Heterogeneous Behavior Modeling

Siyuan Liu, Research Scientist, Carnegie Mellon University, Forbes Ave 5000, Pittsburgh, PA 15217-1011, United States of America, siyuan@cmu.edu, Shuhui Wang, Feida Zhu, Jinbo Zhang, Ramayya Krishnan

We study the problem of large-scale social identity linkage across different social media platforms. We propose HYDRA, a solution framework which consists of three key steps: (I) modeling heterogeneous behavior; (II) constructing structural consistency graph; and (III) learning the mapping function by multi-objective optimization. Extensive experiments demonstrate that HYDRA correctly identifies real user linkage across different platforms.

2 - Price Discounts and Peer Effects in Information Goods: A Randomized Experiment

Rodrigo Belo, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA 15217-1011, United States of America, rbelo@cmu.edu, Pedro Ferreira, Miguel Matos

We analyze the role of word-of-mouth (WoM) and its relationship with price promotions on a video-on-demand (VoD) platform of a major telecom operator. We design, implement and analyze the outcomes of a randomized experiment aimed at studying the effect of price discounts on movie sales. We find that promoted movies increased short-term sales at the expense of non-discounted titles. We also find that WoM generated by purchases in our experiment accounted ~50% of all WoM generated by consumers.

3 - The Evolution of Generative Architecture of an Open Ecosystem: A Case of WordPress

SungYong Um, Temple University, 1810 North 13th Street, Philadelphia, PA19122, United States of America, sungyong.um@temple.edu, Bin Zhang, Youngjin Yoo, Sunil Wattal

We study the evolutionary pattern of an open digital ecosystem. We use text mining techniques on the source code of WordPress plug-ins created from 2004 to 2012, and extract all Application Programming Interface (API) data used in these plug-ins. We observe that the plug-in network eventually evolves into a hierarchical structure, which is induced by the generative feature of digital elements.

Systems Engineering and Public Health

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Saeideh Fallah-Fini, Assistant Professor, California State and Polytechnic University, Pomona, 3801 W. Temple Ave, Pomona, CA, 91768, United States of America, sfallahfini@csupomona.edu

1 - Dynamics of Obesity Interventions inside Organizations

Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu, Hazhir Rahmandad, Sally Bullock, Alice Ammerman

A large number of obesity interventions from upstream (policy) to downstream (individual) have been put forward to curb the obesity trend in the US but not all those interventions have been successful. In this study, we aim to understand how effectiveness of organizational level obesity interventions depends on dynamics of Adoption, Implementation, and Maintenance (AIM) of the interventions. Using a dynamic simulation model, we show how small changes in AIM can make a big difference in impact.

2 - An Agent-based Model to Assess the Role of the Food Environment on Body Mass Index in Children

Mehdi Jalalpour, Assistant Professor, Civil And Environmental Engineering, Cleveland State University, 1960 East 24th Street, Cleveland, OH, 44115, United States of America, M.Jalapour@csuohio.edu, Amii Kress, Thomas Glass

An agent-based model is proposed to assess the role of the food environment on body mass index (BMI). Children, ages 10-15 from 2 boroughs in Pennsylvania were used for validation. Spatial information was imported from GIS, and children data are from electronic health records. The model simulates food foraging outside the home, accounting for peer influences. The model is calibrated to BMI after 3 years.

3 - A Dynamic Model for Health Screening: Understanding Long Term Trends in Screening Mammography

Ozge Karanfil, PhD Candidate, Alfred P. Sloan School of Management, MIT, Sidney-Pacific NW 86-815, Cambridge, MA, United States of America, karanfil@mit.edu, John Sterman

In this study we develop the first explicit and integrated, broad boundary feedback theory around the dynamics of medical screening. The theory includes a decision theoretic core around costs and benefits including the fundamental tradeoff between sensitivity and specificity; and feedbacks that condition guidelines and the actual practice. To provide context we use the mammography case as a motivating example, but our model is generic and applicable to other contexts such as the PSA screening.

4 - Modeling the Potential Community-Wide Benefits of a Jail Based Screen-Treat Program for Chlamydia

Ozgur Araz, Assistant Professor, Department of Health Promotion, Social, & Behavioral Health, University of Nebraska Medical Center, Omaha, NE, 68198-4365, United States of America, ozgur.araz@unmc.edu, Brock Hanisch, Ruth Margalit

Sexually Transmitted Infections (STIs) remain a major health burden within the United States. The US jail population is disproportionately impacted by STIs and thus serves as a key point of access for screening and treatment for this transient and high-risk population. To aid in implementing an opt-out screen-and-treat policy at the Douglas County Jail we developed a systems model that incorporates the mathematical epidemiology of Chlamydia.

Medical Decision Making

Sponsor: Health Applications

Sponsored Session

Chair: Anahita Khojandi, University of Tennessee, Knoxville, TN, 37996, United States of America, khojandi@utk.edu

1 - Screening for Hepatocellular Carcinoma under Limited Resources: A POMDP Approach

Elliot Lee, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, 48105, United States of America, elliotdl@umich.edu, Mariel Lavieri, Michael Volk

We model the problem of allocating a limited screening capacity across a panel of patients at risk for developing hepatocellular carcinoma as a partially observable markov decision process. We seek to utilize biological information gathered sequentially over time to shift resources towards patients of higher risk. We present structural properties of this problem, and draw conclusions about more efficient screening behaviors.

2 - Valuing Paired Kidney Exchanges: A Stochastic Game Approach

Murat Kurt, Assistant Professor, University at Buffalo (SUNY), 309 Bell Hall, University at Buffalo(SUNY), Buffalo, NY, 14260-2050, United States of America, muratkur@buffalo.edu, Andrew Schaefer, Utku Unver, Mark Roberts

Paired kidney exchanges (PKE) help alleviate the disparity between the supply and demand of kidneys for transplantation. We formulate patients' transplant timing decisions in a prearranged PKE as a non-zero sum stochastic game and compute a socially optimal equilibrium using a mixed integer linear programming formulation of the resulting equilibrium constraints. We use clinical data to present computational results that illustrate how the exchanges can be valued using their timings.

3 - MDP Model for Asymptotic Intracranial Aneurysm Treatment Selection under Risk Aversion

Vera Tilson, Simon School, University of Rochester, Rochester, NY, United States of America, vera.tilson@simon.rochester.edu, David Tilson

We use a finite-horizon MDP model to find optimal treatment plans for patients diagnosed with asymptomatic intracranial aneurysm. We consider two distinct criteria: (a) maximizing the expected number of life years in good health, and (b) maximizing the expected utility for number of years in good health. Use of alternate patient-selected criteria leads to recommendations that vary from a previously published recommendations in several scenarios.

4 - Dynamic Abandon/Extract Decisions for Failed Cardiac Leads

Anahita Khojandi, University of Tennessee, Knoxville, TN, 37996, United States of America, khojandi@utk.edu, Lisa M. Maillart, Oleg Prokopyev, Mark Roberts, Samir Saba

When a cardiac lead fails, physicians implant a new lead and may opt to extract the failed lead and/or any previously abandoned leads. Because the risk of extraction increases in lead age, physicians may extract leads to reduce the future risk of mandatory extraction, due to either infection or limited space in the vein. We use SMDP models for various cardiac devices to obtain patient-specific, lifetime-maximizing extraction policies and compare their performance to that of several heuristics.

Scheduling Problems in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Narges Hosseini, Postdoc, Mayo Clinic, 200 1st St. SW, Rochester, MN, 55901, United States of America, Hosseini.Narges@mayo.edu

1 - Elective Case Rescheduling on the Day of Surgery

Robert Allen, Clemson University, Clemson, SC, United States of America, rallen3@g.clemson.edu, Kevin Taaffe

Operating room (OR) rescheduling is the process of adjusting the surgery schedule when the current schedule is subjected to disruptions on the day of surgery. Of particular importance is when, and which rescheduling method should be used to update the scheduling and tracking systems. Discrete event simulation was used to simulate surgical cases in the OR and to test different rescheduling policies and case updating policies for their effectiveness.

2 - Scheduling Coordinated Respirology Lab-clinics to Maximize the Service Level under Stochastic Time

Farzad Zaerpour, University of Calgary, Haskayne School of Business, 118, 3420, 50th Street, NW, Calgary, AB, T3A 2E1, Canada, farzad.zaerpour@haskayne.ucalgary.ca, Diane Bischak, Mozart Menezes

In respirology outpatient clinics, a patient's lab tests must be completed just before the clinic appointment, but patients scheduled into a given clinic will require different amounts of testing time. We develop a MIP-based approach for assigning doctors to clinic slots so that the likelihood of a patient not completing testing in time for the clinic appointment is minimized. Using a pre-processing technique, we avoid the approach of simulation within optimization.

3 - An Algorithm for Advance Surgical Scheduling

Narges Hosseini, Postdoc, Mayo Clinic, 200 1st St SW, Rochester, MN, 55901, United States of America, Hosseini.Narges@mayo.edu, Kal Pasupathy, Jeanne Huddleston

Spine surgeries are common and highly profitable. Based on Mayo Clinic, we developed a model to effectively schedule these surgeries. That includes a predictive model to accurately forecast surgical durations, and an algorithm that presents multiple solutions to the scheduling problem that minimizes the overall cost while meeting additional constraints. Offering multiple solutions gives the flexibility for scheduling convenient times and that is highly important in patient centered institutions.

Medical Decision Making: Research by Bonder Scholars

Sponsor: Health Applications

Sponsored Session

Chair: Pooyan Kazemian, PhD Candidate, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, pooyan@umich.edu

1 - Optimal Policies for Arteriovenous Fistula Creation for Patients on Hemodialysis

Reza Skandari, PhD Candidate, University of British Columbia, 2053 Main Mall, Vancouver, V6T-1Z2, Canada, reza.skandari@sauder.ubc.ca, Steven Shechter, Nadia Zalunardo

To deliver Hemodialysis (HD), patients need to have a vascular access. The gold standard for delivering HD is via Arteriovenous Fistula (AVF). Due to AVF creation failure, limited lifetime of a functional AVF, and limited places to create an AVF, patients may use an inferior access substitute called Central Venous Catheter (CVC). We characterize conditions under which the patient should or should not be referred for AVF creation, under total lifetime and quality adjusted lifetime metrics.

2 - Improving HIV Early Infant Diagnosis Supply Chains in Sub-Saharan Africa

Jonas Jonasson, London Business School, Regent's Park, London, Regent's P, United Kingdom, jjonasson.phd2010@london.edu, Jérémie Gallien, Sarang Deo

Most countries in sub-Saharan Africa experience delays in HIV early infant diagnosis (EID). We develop a two-part modeling framework to generate operational improvements in EID networks and evaluate their impact on public health. For the case of Mozambique, we estimate that the interventions of optimally re-assigning clinics to labs and optimally re-allocating diagnostic capacity would result in 11% and 22% shorter turnaround times and 4% and 7% more infants starting treatment, respectively.

3 - Optimal Strategy for Hepatocellular Carcinoma Surveillance in Hepatitis C Patients

Qiushi Chen, Georgia Institute of Technology, Atlanta, GA, United States of America, chenqiushi0812@gatech.edu, Jagpreet Chhatwal, Turgay Ayer

The practice guidelines recommend surveillance for HCC, the main type of liver cancer, in high-risk hepatitis C patients every 6-12 months. However, the optimal surveillance interval is controversial. We present a mixed-integer programming-based approach to evaluate the cost-effectiveness of routine and dynamic policies. We found that dynamic outperform routine policies.

4 - Dynamic Personalized Monitoring and Treatment Control of Chronic Diseases

Pooyan Kazemian, PhD Candidate, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, pooyan@umich.edu, Jonathan Helm, Joshua Stein, Mark Van Oyen, Mariel Lavieri

We develop an innovative modeling framework for chronic disease patients to help guide clinicians to quickly detect disease progression and adjust the treatment plan over time to limit disease progression. The model is able to (1) optimize the time interval between sequential monitoring tests; (2) specify the best set of tests to take during each patient's office visit; and (3) provide target values for the controllable disease risk factors. Glaucoma is discussed as a case study.

Network Epidemics: Theory Advancements and Applications

Sponsor: Health Applications

Sponsored Session

Chair: Benjamin Armbruster, Northwestern University, 2145 Sheridan Rd., IEMS, Evanston, Il, 60208, United States of America, armbruster@northwestern.edu

1 - Theoretical Results for Disease Spread on Networks

Benjamin Armbruster, Northwestern University, 2145 Sheridan Rd., IEMS, Evanston, IL, 60208, United States of America, armbruster@northwestern.edu

There are few theorems in this area. I summarize existing results and present new theoretical results on (1) the role of heterogeneity; (2) the speed of spread on dynamic networks (a formula involving only the degree, infection rate, and relationship duration); (3) the optimal targeting of nodes and links to reduce spread; and (4) the convergence to mean-field models.

2 - A Model of Partnership Formation and Dissolution to Study HIV Transmission among Young MSM (YMSM)

Ekkehard Beck, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, ekkehardbeck2015@u.northwestern.edu, Benjamin Armbruster

We introduce a discrete-time agent-based network simulation model of HIV/STI transmission and partnership formation and dissolution among YMSM using ego-centric network data of an ongoing longitudinal cohort study in Chicago. Results show that network position, age mixing, and race assortative mixing significantly impact HIV spread among YMSM. Additionally, sexually transmitted infections account for 13.7% of all HIV infections with rectal STIs accounting for more than 2/3 of these infections.

3 - Epidemics of Hepatitis C among Drug Injectors – The Role of Network Dynamics

Alexander Gutfraind, Research Assistant Professor, University of Illinois at Chicago, 1603 W. Taylor Street, MC 923, Chicago, IL, 60612, United States of America, agutfraind.research@gmail.com, Basmattee Boodram

People who inject drugs (PWID) are the highest risk population for Hepatitis C virus (HCV) infections in the US. Using multiple datasets collected in Chicago we constructed and validated a detailed agent-based model for this epidemic. Using this model we found that network dynamics and disease dynamics contribute to the spread of HCV in different time scales.

Software and Tools for Large-Scale Optimization

Sponsor: Computing Society

Sponsored Session

Chair: Jonathan Eckstein, Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, jeckstei@rci.rutgers.edu

1 - Scenario Generation from Forecasts

David Woodruff, UC Davis, One Shields Ave, Davis, CA, 95616, United States of America, dlwoodruff@ucdavis.edu

I will describe the work of a team of researchers that have created software to create scenarios based on point forecasts for input to large-scale stochastic programming problems. Experience with data for the stochastic unit commitment problem will be used to illustrate.

2 - Massively Parallel Branch-and-Bound with PEBBL

Jonathan Eckstein, Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, jeckstei@rci.rutgers.edu, Cynthia Phillips, William Hart

PEBBL is an object-oriented C++ library and software framework for implementing serial and parallel branch-and-bound algorithms. This talk describes PEBBL and its application to a machine learning problem, using a problem-specific combinatorial bound. On a large inifiband cluster, the application exhibits essentially linear speedup through 6,144 processor cores on our most difficult problem instance.

3 - Mixed-Integer Lower Bounds for Progressive Hedging

Jean-Paul Watson, Distinguished Member of Technical Staff, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185-1326, United States of America, jwatson@sandia.gov, Jonathan Eckstein, David Woodruff

Nonconvexities and time limits may cause the progressive hedging (PH) algorithm to terminate in the mixed-integer case with a feasible solution, but no corresponding lower bound. We describe new methods to obtain lower bounds using both the information prices generated by PH and bundling methods. We additionally discuss experimental results and supporting open-source software implemenations.

4 - New Parallel Programming Languages for Optimization Research

John Chinneck, Professor, Carleton University, Systems and Computer Engineering, 1125 Colonel By Drive, Ottawa, On, K1S 5B6, Canada, chinneck@sce.carleton.ca, Stephane Ernst

New optimization algorithms that do not take into account parallel execution are handicapped since multi-core machines are now everywhere, including on desktop PCs. For a recent project we searched for a programming language that has three characteristics: (i) easy to program, (ii) simple facilities for dealing with parallelism, and (iii) fast compilation and execution. Two free languages satisfied these criteria: Google's Go, and Julia. We assess these languages for optimization research.

Sponsored Session

Chair: Subodha Kumar, Carol and G. David Van Houten, Jr. '71 Professor, Mays Business School, Texas A&M University, Wehner 301F - 4217 TAMU, College Station, TX, 77843, United States of America, skumar@mays.tamu.edu

1 - Network Effects in Healthcare Information Exchanges

Emre Demirezen, Assistant Professor, Binghamton University Suny, Binghamton University Suny, 4400 Vestal Parkway East, Binghamton, NY, 13902, United States of America, edemirezen@binghamton.edu, Subodha Kumar, Arun Sen

Based on our interactions with three different healthcare information exchange (HIE) providers based in US, we study two models with network effects. The first one deals with the start-up HIEs; whereas in the second model, we analyze established HIE providers that also offer value-added services. We present several results and insights for HIE providers, healthcare practitioners, and policy-makers.

2 - Opportunistic Data Sharing: Co-opetition between Personalizing and Non-personalizing Firms

Abhijeet Ghoshal, University of Illinois, 1206 S. Sixth St, 446, Champaign, Il, 64820, United States of America, abhi@illinois.edu, Subodha Kumar, Vijay Mookerjee

We present a co-opetition model where a personalizing firm and a non-personalizing firm compete for the same set of customers while sharing data when it is mutually beneficial to them. The customer balances her purchases from the two firms in order to maximize her surplus. We provide conditions when the non-personalizing firm shares its data with the personalizing firm and the latter uses the data. Several interesting managerial insights are also provided regarding the data sharing equilibrium.

3 - ConSequence: Managing Fading Ads during a User Visit

Zhen Sun, University of Texas at Dallas, 800 W. Campbell Rd., Richardson, TX, 75080, United States of America, zhen.sun@utdallas.edu, Milind Dawande, Vijay Mookerjee, Ganesh Janakiraman

A fad is an ad that disappears if the visitor does not click on it after a given length of time. The withdrawn ad could be replaced by another ad. The goal of this paper is to choose a sequence of ads to display, such that the expected revenue is maximized.

4 - Coordination under Competition

Cheng Nie, Ph.D. Student, University of Texas at Dallas, 800 West Campbell Road, MC 1.406E, Richardson, TX, 75080, United States of America, cheng.nie@utdallas.edu, Vijay Mookerjee, Milind Dawande

Information sharing between various locations of a multi-location firm always seems beneficial for the firm. However, the duopolistic competition between firms might render this intra-firm information sharing harmful. We build a model to show that ignorance is bliss when firms compete with each other. The main lesson we learn is that a local-level competition between firms will change to a fiercer global-level competition when intra-firm information sharing is allowed.

Chair: Mirko Kremer, Professor, Penn State University, 460 Business Building, University Park, PA, United States of America, muk22@smeal.psu.edu

Co-Chair: Masha Shunko, Purdue University, 403 W. State Street, West Lafayette, IN, 47906, United States of America, mshunko@purdue.edu

1 - Impact of Observational Learning in a Congested Multi-Server Environment

Chen Jin, Northwestern University, Apt. 29 No. 2544 Prairie Ave., Evanston, IL, 60201, United States of America, chenjin2011@u.northwestern.edu, Laurens Debo, Mirko Kremer, Seyed Iravani

We study customers'queue selection behavior and its impact in a congested multi-server system with quality variation among servers and information asymmetry among customers who make decision based on the queue allocation across all servers observed upon arrival and their own private information (possessed by informed customers only). We show due to the presence of informed customer, the average welfare of uninformed can be worse off in some cases and we also found evidence in the experiment.

2 - Strategic Capacity Management When Customers Have Boundedly Rational Expectations

Tingliang Huang, Assistant Professor, UCL, Department of MS&I, Gower Street, London, WC1E 6BT, United Kingdom, t.huang@ucl.ac.uk, Qian Liu

The existing capacity rationing literature typically assumes that customers are able to form rational expectations about a firm's fill rate. In contrast, in this paper we ask: would strategic capacity rationing be optimal when customers have boundedly rational expectations?

3 - How do Delay Announcements Impact Customer Behavior: Experimental Study

Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Achal Bassamboo, Mirko Kremer

Delay announcements are prevalent in service systems. This paper is among the first experimental work studying how customers react to explicit and realtime waiting time information on anticipated delays. In particular, we are interested in studying how such announcements impact customers' beliefs about the anticipated waiting times.

4 - Experimental Study on State-dependent Productivity of Non-discretionary Tasks

Hao Zhang, Tsinghua University, Shunde Building 519A, Beijing, 100084, China, statistics.zhang@gmail.com, Xiaobo Zhao, Qi-Ming He

We conduct a 2 x 2 crossover laboratory experiment to investigate the impact of queue-length on performance at individual level. It shows that under the setting of non-discretionary task, different treatments of queue-length lead to the same average service time. However, queue-length influences participants' dynamic service times: a jump effect occurs when queue-length changes from zero to a positive value.

Joint Session OPT/ENRE: Mixed-integer Robust Optimization Models and Applications in Electric Power Systems

Sponsor: Optimization/Integer and Discrete Optimization & Energy Natural Resources and the Environment

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - Multistage Adaptive Mixed-Integer Optimization

Angelos Georghiou, Research Associate, ETH Zurich, Physikstrasse 3, ETL K 12, Zurich, CH-8092, Switzerland, angelosg@control.ee.ethz.ch, Dimitris Bertsimas, John Lygeros

In recent years, decision rules have been established as the preferred solution method for addressing the computationally demanding, multistage adaptive optimization problems. Despite their success, existing decision rules (a) are typically constrained by their a priori design and (b) do not incorporate in their modelling adaptive binary decisions. In this talk, we present a methodology for the near optimal design of continuous and binary decision rules using mixed-integer optimization.

2 - Dynamic Uncertainty Sets for Robust Unit Commitment and Economic Dispatch

Alvaro Lorca, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, alvarolorca@gatech.edu, Andy Sun

Power systems with a large penetration of renewable energy sources require innovative methods for dealing with the high uncertainty in their supply of electricity. In this talk we present adaptive robust optimization models for robust unit commitment and economic dispatch, using the concept of dynamic uncertainty sets for capturing the temporal and spatial correlations of uncertain parameters. We also discuss solution methods and present computational experiments.

3 - Adaptive Robust Optimization for Generation Maintenance via Sensor Based Condition Monitoring

Murat Yildirim, Geogia Tech, Atlanta, GA, United States of America murat@gatech.edu, Nagi Gabraeel, Andy Sun

We provide an adaptive robust optimization model to determine the optimal generation maintenance scheduling by leveraging sensor health monitoring data and considering network constrained unit commitment decisions. We develop solution algorithms and conduct computational experiments that demonstrate the advantages of our proposal over traditional approaches that use periodic and reliability based maintenance models.

4 - A Cutting Plane Method for Robust Mixed Integer Programming

Anna Danandeh, University of South Florida, 4202 E Fowler Ave, Tampa, Fl, United States of America, annadanandeh@mail.usf.edu, Bo Zeng

Robust optimization is one of the reliable methods to hedge against the uncertainty. However, solving this problem is computationally challenging. In this work, we intend to describe a polynomially solvable algorithm that strengthens cover inequalities via a robust lifting function and derives strong cuts valid for the convex hull of the robust knapsack set.

1 - Linear Coupling of Gradient and Mirror Descent: A Novel, Simple Interpretation of Nesterov's Accelerated Methodand Mirror Descent

Zeyuan Allen-Zhu, Massachusetts Institute of Technology, CSAIL, Cambridge, MA, United States of America, zeyuan@csail.mit.edu, Lorenzo Orecchia

Almost all first-order methods rely on two standard algorithmic steps: gradient-descent and mirror-descent steps. We observe that the convergence of the two steps are complimentary, and obtain a simple reinterpretation of Nesterov's accelerated gradient method by expressing it as a linear coupling of the two. This complementary view lets us design new first-order (deterministic and stochastic) methods in a conceptually easier way, and facilitates two recent breakthroughs in approximately solving packing and covering LPs in nearly-linear time. These breakthroughs heavily relies on the linear couplings of (full or stochastic) gradient and mirror descent steps.

2 - Stochastic Mixed Integer Programming with Log-exponential Convex Risk Measures

Pavlo Krokhmal, Associate Professor, University of Iowa, 3131 Seamans Center, Iowa City, IA, 52242, United States of America, krokhmal@engineering.uiowa.edu, Alexander Vinel

We consider stochastic nonlinear mixed integer programming problems that involve log-exponential convex risk measures. Two solution approaches are discussed, which include a branch-and-bound method that relies on polyhedral approximations of nonlinear log-exponential constraints, and a branch-and-cut that employs nonlinear lifted cuts. Numerical experiments on portfolio optimization problems are presented.

3 - Tradeoff between Storage and Transport in Merchant Energy Trading on a Network

Selvaprabu Nadarajah, Assistant Professor, University of Illinois at Chicago, Liautaud Graduate School of Business, selvan@uic.edu, Nicola Secomandi

Merchant energy trading across wholesale markets and time can be represented as a network where storage and transport assets compete for capacity. We model this competition as a Markov decision problem and leverage structural analysis to develop an ADP policy. We find that the tradeoff between storage and transport is difficult to manage, as sequential storage and transport trading is considerably suboptimal. Our ADP policy is instead near optimal and more efficient than a practice-based method.

4 - The Knowledge Gradient Policy using a Sparse Additive Belief Model

Yan Li, Princeton University, Sherrerd Hall, Charlton St., Princeton, NJ, 08544, United States of America, yanli@princeton.edu, Han Liu, Warren Powell

We propose a sequential learning policy for ranking and selection problems with high dimensional sparse belief functions. We derive a knowledge gradient policy for sparse linear model with group Lasso penalty and generalize it to the nonparametric additive model and functional ANOVA model. Theoretically, we provide the estimation error bounds. Empirical experiments show that the algorithm efficiently learns the correct sparsity structure and outperforms the knowledge gradient for a linear model.

1 - Cut Generation in Optimization Problems with Multivariate Risk Constraints

Simge Kucukyavuz, Associate Professor, The Ohio State University, 210 Baker Systems Building 1971 Neil Ave, Columbus, OH, 43210, United States of America, kucukyavuz.2@osu.edu, Nilay Noyan, Xiao Liu

We give alternative mixed-integer programming formulations and algorithms for cut generation problems arising in optimization under multivariate risk constraints. We give the complete linear description of a non-convex substructure common in these cut generation problems. We present computational results that show the effectiveness of our proposed models and methods.

2 - Polyhedral Study of Chance Constrained Program – Implications of Bilinear Representation

Bo Zeng, Assistant Professor, University of South Florida, 4202 E Fowler Ave, Tampa, FL, 33620, United States of America, Bzeng@usf.edu, Kai Huang, Ming Zhao

Based on the non-popular bilinear formulation, we derive strong formulations and polyhedral results for chance constrained program. Our work includes a convex hull description of a subset, a set of cutting planes and separation algorithms. Our results lead to a great computational improvement.

3 - A Computational Comparison of Algorithms for Solving Two-stage Stochastic Mixed-integer Programs

Yunwei Qi, Ohio State University, 766 Saratoga Ave, San Jose, CA, 95129, United States of America, qi.47@osu.edu

This presentation focuses on solving two-stage stochastic programs with general mixed integer decision variables in both stages. We compare different decomposition algorithms in which the first stage approximation is solved using a branch-and-bound tree with ancestral Benders' cuts and the second stage convexification uses branch and bound tree with multi-term disjunctive cuts or Gomory cuts to obtain approximations of the second stage mixed-integer programs.

4 - Two-stage Stochastic Programs with Mixed Binary Recourse Function

Kuo-Ling Huang, Northwestern University, 2145 Sheridan Rd, Evanston, IL, United States of America, jupiters1117@northwestern.edu, Kibaek Kim, Sanjay Mehrotra

We study two-stage stochastic programs with mixed binary recourse function. We present a Benders decomposition method with lift-and-project cuts in the second stage. A practical algorithm based on this method is implemented in a software package named iOptimize. Computational results are also given in this talk.

1 - Detecting Sybil Nodes in Social Networks: A Fractional Programming Approach

Chrysafis Vogiatzis, University of Florida, chvogiat@ufl.edu

As online social networks become bigger and more widespread, they also become more prone to Sybil attacks. In its most basic form, a perpetrator creates multiple identities and tries to form bonds with honest users in order to disperse information, affect elections, and intercept messages. We formulate the problem as a ratio problem, and derive its complexity. We conclude by proposing different approaches to tackling the problem, and showing some preliminary computational results.

2 - Uncovering the Effect of Dominant Attributes on Community Topology in Facebook Networks

Soundar Kumara, Allen E. Pearce/Allen M. Pearce Professor, The Pennsylvania State University, 222 Leonhard Building, Industrial Engineering, University Park, PA, 16802, United States of America, skumara@psu.edu, YI-SHAN SUNG

Community structure does not only point to structural patterns but also reflects functional associations. Since one node may contain multiple attributes, it is difficult to identify the dominant attributes, having definitive effects on community formation. We obtain communities using a clustering game and elaborate the process to identify the dominant attributes. We test our method on 100 Facebook networks to enable an integrating observation on how the offline lives infer online consequences.

3 - Finding a Maximum k-club using the k-clique Formulation and Lazy Cuts

Esmaeel Moradi, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078-5018, esmaeel@ostatemail.okstate.edu, Baski Balasundaram

A subgraph of diameter at most k is called a k-club, which includes clique as a special case when k equals 1 and is a relaxation when k is larger than 1. It can be used to model low-diameter clusters in graph based data mining applications and social network analysis. In this talk, we present a branch-and-cut algorithm for the maximum k-club problem using the k-clique formulation as a linear programming relaxation. In this algorithm, the constraints are applied in a lazy fashion.

4 - On Imposing Connectivity Constraints

Austin Buchanan, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, buchanan@tamu.edu, Yiming Wang, Sergiy Butenko

In many clustering and network design applications, one wants to impose connectivity constraints. To this end, we study the connected subgraph polytope—the convex hull of subsets of vertices that induce a connected subgraph. Extra emphasis is placed on special cases where the maximum weight connected subgraph problem is polytime solvable and admits a compact extended formulation.

Chair: Bahar Cavdar, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, baharca@gatech.edu

1 - A CIP Approach for the Computation Time-Limited Vehicle Loading and Routing Problem

Bahar Cavdar, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, baharca@gatech.edu, Joel Sokol

In large instances of vehicle loading and routing problems where cutoff times limit the time available for computing solutions, good heuristic methods are unable to run until completion. We demonstrate a computation-implementation parallelization (CIP) approach that generates improved solutions and allows companies to trade off the benefit across three dimensions: shorter routes, later cutoff times, and earlier dispatch times.

2 - Arc Routing to Restore Post-Disaster Road Network Connectivity

Sibel Salman, Associate Professor, Koc University, Rumelifeneri Yolu, Sariyer, Istanbul, Turkey, ssalman@ku.edu.tr, Vahid Akbari

We find coordinated routes for road clearing teams to repair damaged roads and restore the network connectivity in shortest time after a disaster. The multi-vehicle problem combines arc routing, network design and scheduling aspects. We propose an effective constructive heuristic algorithm that processes a relaxed mixed integer programming solution.

3 - Supply Chain Network and Firm Returns

Jing Wu, PhD Student, University of Chicago Booth School of Business, 5050 S Lake Shore Dr 3417S, Chicago, IL, 60615, United States of America, wujing@chicagobooth.edu, John Birge

This paper investigates the effects of supply chain connections on firm performance, as reflected in stock returns, at two interaction levels, first-order from directions and second-order from systemic exposures through the network.

4 - Supply Chain Network and Systematic Risk

Jing Wu, PhD Student, University of Chicago Booth School of Business, 5050 S Lake Shore Dr 3417S, Chicago, IL, 60615, United States of America, wujing@chicagobooth.edu, John Birge

We study the systematic risk at different positions of the supply chain network, and find that under the goal of profit maximization, both manufacturing firms and logistics firms have incentive to increase the number of connections to the upstream firms which results in lower risk for the manufacturing firms but higher risk for the logistics firms.

Methods in Nonlinear Optimization

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: Katya Scheinberg, Lehigh University, 200 West Packer Ave,, Bethelehem, PA, 18015, United States of America, katyas@lehigh.edu

1 - Alternating Linearization Methods for Quadratic Least-Square Problem

Xi Bai, Lehigh University, 200 West Packer Avenue, Bethlehem, PA, 18015, United States of America, xib210@lehigh.edu, Katya Scheinberg

Second-order least square problems have arisen widely in binary optimization, portfolio optimization, etc.. In this talk, we propose an alternating linearization framework to solve this set of problems which are potentially nonconvex. We show the effectiveness of our technique in terms of both theory and numerical experiments in the application of risk parity optimization in portfolio management.

2 - using Probabilistic Regression Models in Stochastic Derivative Free Optimization

Ruobing Chen, Ph.D. Candidate, Lehigh University, 200 West Packer Ave., Bethlehem, PA, 18015, United States of America, ruc310@lehigh.edu, Katya Scheinberg

We consider the use of probabilistic regression models in a classical trust region framework for optimization of a deterministic function, only having access to noise-corrupted function values. Contrasting to traditional requirements on the poisedness of sample sets, our models are constructed using random samples while providing sufficient quality of approximation with high probability. We discuss convergence proofs of proposed algorithm based on error bounds from machine learning literature.

3 - Convergence Rates of Line-Search and Trust Region Methods Based on Probabilistic Models

Katya Scheinberg, Lehigh University, 200 West Packer Ave,, Bethelehem, PA, 18015, United States of America, katyas@lehigh.edu, Coralia Cartis

We examine traditional unconstrained optimization methods such as line search and adaptive regularization methods with cubics and extend them to the case where the first or second order models are random and have random "quality". Under assumptions that the "quality" is sufficiently good with probability >1/2 we derive expected convergence rates for these methods for nonconvex, convex and strongly convex cases. We give a general unified framework and its analysis based on random processes.

Optimization, Variational Inequality Problems, and Games: Uncertainty, Imperfect Information, and Distributed Computation

Sponsor: Optimization/ Linear and Conic Optimization

Sponsored Session

Chair: Uday Shanbhag, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16803, United States of America, udaybag@engr.psu.edu

1 - Empirical Centroid Fictitious Play: Strong Convergence in a Distributed-Information Setting

Brian Swenson, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, United States of America, brianswe@andrew.cmu.edu, Soummya Kar, Jo„o Xavier

Empirical Centroid Fictitious Play (ECFP) is an adaptation of the well-known Fictitious Play (FP) algorithm that is well-suited to implementation in large games. However, a shortcoming of ECFP (and FP) is that learning occurs only in the weak sense of convergence in empirical beliefs —- players' period-by-period strategies do not necessarily converge to equilibrium. The paper presents a distributed-information implementation of ECFP that converges in the latter stronger sense.

2 - Variational Inequality Problems: Addressing Uncertainty and Imperfections in Information

Uma Ravat, University of Illinois at Urbana-Champaign, 1832 Orchard Place #c, Urbana, United States of America, ravat1@illinois.edu, Uday Shanbhag

We consider the solution of variational inequality problems complicated by uncertainty and imperfect information. We examine the role of learning and how it may be combined with solution techniques. Preliminary algorithmic and numerical results will be provided.

3 - On the Resolution of Misspecified Convex Optimization Problems

Hesamoddin Ahmadi, Student, Penn State University, 107 Holderman Hall, University Park, PA, 16802, United States of America, hza108@psu.edu

We consider a misspecified optimization problem that requires minimizing of a convex function f (x;q*) in x over set X where q* is an unknown vector but can be learnt by a distinct learning problem. We develop joint first-order schemes for computation and learning and provide rate statements.

1 - Data Driven Portfolio Optimization

Victor DeMiguel, London Business School, London, England, United Kingdom, avmiguel@london.edu

To compute efficient mean-variance portfolios, an investor needs to estimate the mean and the covariance matrix of asset returns, but due to estimation error the resulting portfolios typically perform poorly out of sample. In this talk, we discuss several approaches proposed in the recent literature to overcome these difficulties, including robust optimization and estimation, shrinkage estimation, Bayesian estimation, and norm constraints.

2 - Money Management with Performance Fees

Daniel Mitchell, Assistant Professor, Singapore University of Technology and Design, 20 Dover Drive, Singapore, Singapore, dan.mitchell@utexas.edu, Kumar Muthuraman, Sheridan Titman

Hedge fund contracts are generally characterized by a flat fee, a performance fee and what are know as high-water-mark provisions. This paper describes and characterizes these contract features and analyzes how they influence the hedge fund's risk choices. We model the hedge fund's portfolio choice as a stochastic control problem with hybrid discrete and continuous controls. We develop a computational method to solve this class of problems and prove its convergence.

3 - A Multiclass Queueing Model of Limit Order Book Dynamics

Hua Zheng, Columbia Business School, 3022 Broadway, Uris 4S, New York, NY, 10027, United States of America, hzheng14@gsb.columbia.edu, Costis Maglaras, Ciamac Moallemi

We formulate and solve a problem of limit and market order placement in a limit order book to optimally buy a block of shares over a short, predetermined time horizon. We use the structure of the optimal execution policy to propose a microstructure model of market impact, which we estimate using trade data and highlight its increased accuracy over "macro" market impact models.

Sponsored Session

Chair: Justin Sirignano, Stanford University, 3 Gibbs Court, Irvine, CA, 92617, United States of America, jasirign@stanford.edu

1 - Efficient Risk Analysis for Mortgage Pools and MBS

Justin Sirignano, Stanford University, 3 Gibbs Court, Irvine, CA, 92617, United States of America, jasirign@stanford.edu, Kay Giesecke

Typical mortgage pools of interest are very large and computationally expensive to simulate. We develop a dynamic law of large numbers and dynamic central limit theorem in order to tractably calculate pool loss and prepayment distributions for a broad class of models. Computational cost is often several orders of magnitude less than simulation of the actual pool with a similar level of accuracy.

2 - Robust Rare Event Analysis and Computations

Jose Blanchet, Associate Professor, Columbia University, Rm. 323, School of Engineering, 500 West 120th Street, New York, NY, 10027, United States of America, jose.blanchet@columbia.edu

We discuss a systematic approach which allows to broaden the applicability of optimal rare-event simulation algorithms which are often designed under somewhat restrictive assumptions. We discuss several examples, one of them is the problem of performing risk analysis of Gumbel copula models, exploiting strongly efficient algorithms for t-copula models.

3 - Dynamic Credit Swap Selection under Funding Costs

Agostino Capponi, Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, 21218, United States of America, acappon1@jhu.edu

We develop a dynamic optimization framework to assess the impact of funding costs on credit swap investments. A default risky investor can purchase CDS upfronts, borrow at a rate depending on her credit quality, and invest in risk-free money market account. Contagion effects make the optimal strategy coupled with the value function. We show that the latter can be recovered as the solution of a nonlinear HJB equation whose coefficients admit singular growth.

Sponsored Session

Chair: Veronica Piccialli, University of Rome Tor Vergata, via del Politecnico 1, Rome, Italy, piccialli@disp.uniroma2.it

1 - Embedding SpeeDP Algorithm within a Branch & Cut Method for Solving the Large Max Cut Instances

Laura Palagi, Associate Professor, Sapienza University of Rome, Via Ariosto 25, Roma, 00185, Italy, palagi@dis.uniroma1.it, Maryam Salami, Veronica Piccialli, Giovanni Rinaldi

We design an algorithm that provides solutions to Max-Cut along with a guaranteed optimality error. We consider embedding algorithm SpeeDP, a fast method for the solution of low-rank semidefinite programming relaxations of unconstrained {-1,1} quadratic problems, into a Brach&Cut method which uses a Lagrangian relaxation of the additional cut constraints. We run it on very large graphs to verify the effectiveness of SpeeDP with respect to standard SDP solver.

2 - A Feature Ranking Method for Nonlinear Regression

Veronica Piccialli, University of Rome Tor Vergata, via del Politecnico 1, Rome, Italy, piccialli@disp.uniroma2.it, Luca Bravi, Marco Sciandrone

Feature selection (FS) allows to identificate relevant features on big amount of data. By exploiting the concept of inversion of a neural network, we reformulate the FS problem as a global optimization problem involving smooth concave approximations of the zero-norm. The effectiveness of the proposed strategy is proved by an extensive experimentation on synthetic data and real world problems.

3 - Exploiting Nonlinear Structure in Global Optimization

Sven Leyffer, Dr., Argonne National Laboratory, 9700 South Cass Ave, Argonne, United States of America, leyffer@mcs.anl.gov

We present a new approach to generate tight and tractable convex relaxations of nonconvex functions based on exploiting group-partial separability. We demonstrate this approach in the context of two classes of powerful relaxation techniques: semi-definite relaxations and the reformulation-linearization technique. In both cases, we derive tight relaxations that can be solved orders of magnitude faster than traditional techniques that do not exploit the nonlinear structure.

Data-driven Decisions in Healthcare

Sponsor: Applied Probability Society

Sponsored Session

Chair: Mohsen Bayati, Stanford Graduate School of Business, Stanford, CA, 94305, United States of America, bayati@gsb.stanford.edu

1 - using Uncertain Markov Chains to Assess Cost-effectiveness of Medical Innovations

Joel Goh, joelgoh@stanford.edu, Sundeep Singh, David Moore, Stefanos Zenios, Mohsen Bayati

A common problem with using Markov chains in medical cost-effectiveness studies is that estimates of the transition matrix of the chain may be imprecise. We present an optimization-based approach for assessing the effect of this imprecision and apply it to studying the cost-effectiveness of fecal immunochemical testing (FIT) as a screening modality for colorectal cancer. We show that despite the larger uncertainty, FIT is highly cost-effective relative to colonoscopy.

2 - The Big Data Newsvendor

Cynthia Rudin, MIT Sloan School of Management, 100 Main Street, Cambridge, MA, 02139, United States of America, rudin@mit.edu, Gah-Yi Vahn

We investigate the newsvendor problem when one has n observations of p features related to the demand as well as past demands. Both small (sparse) data ($p/n = o(1)$) and big data ($p/n = O(1)$) are considered. We solve the problem as a high dimensional nonparametric quantile regression problem and provide theoretical guarantees on predictive performance.

3 - Improving the Prediction of Emergency Department Waiting Times

Erjie Ang, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States of America, erjieang@stanford.edu, Michael Aratow, Sarah Kwasnick, Mohsen Bayati, Erica Plambeck

Using data from San Mateo Medical Center, we develop an easy method to predict waiting time at the ED accurately. We further explore how to present wait time information to potential patients. Combining behavioral experiments, econometric and machine-learning methods, we develop a new objective function to determine the best wait time message to present to patients. We compare the performance of our objective to those generated by traditional accuracy based objective functions.

4 - Improving Hospital Queueing with Future Information

Kuang Xu, MIT, 77 Massachusetts Ave., Cambridge, United States of America, kuangxu@mit.edu, Carri Chan

With an increase in availability of patient data, new predictive models are being developed. This begs the questions: How can forecasts and predictions of the future be used to improve the efficiency and effectiveness of healthcare delivery? We examine a class of queueing models and admissions control problems in emergency departments. We show, both analytically and via simulations, that system efficiency can be substantially improved by the access to (limited) future information.

Palaniappa Krishnan, University of Delaware, Newark, DE , United States of America, baba@udel.edu

INFORMed's Annual Cased Competition is an opportunity fir INFORMS Members to showcase their efforts in the classroom. Cases are often later published.

2 - Idiopathic Pulmonary Fibrosis Case

David Kopcso, Professor of Mathematics and Information Technology, Babson College, 1 College Drive, Wellesley, MA, United States of America, kopcso@babson.edu, Howard Simon, Annie Gao

InterMune Inc. is a developer of pharmaceutical products for the treatment of idiopathic pulmonary fibrosis (IPF), a lung disease. Pirfenidone, a non-steroid hormone, was a product at which InterMune had been looking closely as a promising new drug for IPF treatment. Marnac, Inc. held the rights to pirfenidone in the US while KDL GmbH held the European rights. InterMune needs to decide if it should license pirfenidone. The decisions can be viewed from Marnac's perspective which supplies an introduction to a simple two-alternative decision analysis. An expanded view of the decision process that needs to be followed for FDA approval offers potential hedging insights, such as offering a license to InterMune. Lastly, InterMune may or may not be interested in adopting the FDA approval risk by accepting the license offer from Marnac and KDL GmbH.

3 - Developing a Business Model to Improve Energy Sustainability of Existing Buildings

Baris Tan, Professor of Operations Management, Koç University, Rumelifeneri Yolu Sariyer, Istanbul, 34450, Turkey, btan@ku.edu.tr, Yahya Yavuz, Emre N. Otay, Emre Camlibel

The case study introduces the business model of Energy Saving Companies (ESCO) by using the setting of improving energy efficiency of existing buildings at a university campus. Identifying and investing in the right energy saving technologies within a given budget help the adoption of energy efficiency measures in existing buildings. A mathematical programming approach can be used to select the right energy efficiency measures among all the available ones to optimize financial or environmental benefits subject to budgetary and other logical constraints in single- and multi-period settings. In order to implement this approach, one should determine all the relevant energy efficiency measures for the campus and their expected cost, energy, and environmental benefits together with their investment costs. The case reports how these measures are identified by using engineering measurements and modeling, how a mathematical model is developed and used to select the energy efficiency measures within a budget to optimize environmental and financial objectives, and how the solution is used to develop a business model to offer investments in energy.

4 - Storage Assignment in a Unit-load Warehouse

Yun Fong Lim, Associate Professor, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, yflim@smu.edu.sg, Marcus Ang

This case describes a challenge faced by YCH Group, a leading third-party logistics provider in Singapore. In 2012, the company had started an ambitious plan to construct a US$159 million logistics hub. With 1.5 million square feet of warehouse space and a million square feet of office space, it would house YCH Group's headquarter, as well as research, training, and warehousing facilities. To keep pace with their fast expansion, it was crucial for YCH to increase their profitability. A key area to boost their profit was to improve the efficiency of the storage and retrieval operations of their unit-load warehouse. To achieve this, one approach was to use mathematical modeling (linear programming). The case requires students to make valid assumptions before they can formulate a linear programming model to find an efficient storage assignment policy for the warehouse. The case then directs the students to compare the performance of this policy with other heuristic policies using historical data. This case reinforces the students' skills in data processing, mathematical modeling, and numerical computation. After completing the case, the students will be able to: (1) Forecast mean demands with the data. (2) Build an appropriate linear programming model for the storage assignment problem, and evaluate the model's solutions using the data. (3) Perform sensitivity analysis on the parameters. This case can be used in undergraduate and graduate classes to illustrate the effectiveness of different policies for storage assignment in a unit-load warehouse.

5 - VASTA Wireless – Push vs. Pull Distribution Strategies
Yao Zhao, Associate Professor, Rutgers University, 1 Washington Street, Newark, NJ, 07102, United States of America, yaozhao@andromeda.rutgers.edu

VASTA is one of the largest wireless services (voice and data) carriers in the United States, and is well known for its reliable national network and superior customer service. In the fiscal year of 2009-2010, VASTA suffered a significant inventory write-off due to the obsolescence of handsets. VASTA was carrying a huge amount of inventory (~$2 Billion) in its national distribution system with a majority held at 2000+ stores to satisfy consumer demand at stores. To address this challenge, the company is thinking to change the current "push" inventory strategy which pushes inventory to stores towards a "pull" strategy that pulls the inventory of handsets from stores to three distribution centers (DCs), and uses the stores only as showrooms. Customers visiting stores will have their favorite phones delivered to their homes overnight from the DCs free of charge. Although the pull strategy has been used in the furniture industry and consumer electronics (for instance, by Apple), it was never attempted by VASTA and other US wireless carriers by 2010.

6 - Advertising Analytics
U.K. Bhattacharya, Indian Institute of Management Indore, Rau, Pigdamber, Indore 453556, India, utpalb@iimidr.ac.in

The case "Advertising Analytics" introduces various key issues to connect large set of data in order to take appropriate advertising decisions. The motivation of the case is to decide the number of advertisements in various newspapers and optimal allocation of budget to the different media in order to maximize the reach to the target customers . Here the advertising media has been considered as various newspapers. Based on the popularity and number of circulation five important newspapers have been chosen for advertising purpose. The case setting is typical for dealing with both single criterion and multi-criteria decision making situations. Main focus of this case is to carry advertiser's messages to the target market in order to improve the quality and conversion ratio of the intake.

1 - Statistical Metamodeling and Computer Experiments of Large-scale Cardiac Models
Dongping Du, University of South Florida, 4202 E Fowler Ave, ENG302, Tampa, FL. United States of America, dongpingdu@mail.usf.edu, Hui Yang

Cardiac voltage-gated sodium (Nav) channel plays significant roles in cardiac electrical signaling. Model of Nav channels involves greater levels of complexity. Traditional optimization methods have encountered many difficulties, even infeasible, for model calibration. We developed a new statistical metamodeling approach for computer experiments and optimization of Nav channels. The approach achieves superior performance for modeling the glycosylated and controlled kinetics of Nav channels.

2 - Classification of Additive Manufacturing (AM) Part Quality using Graph Laplacian Topology Modeling
Zhenyu Kong, Associate Professor, Virginia Tech, 1145 Perry Street, Blacksburg, VA, 24061, United States of America, zkong@vt.edu, Prahalad Rao

We present a graph Laplacian connectivity-based approach that can classify AM part quality in terms of dimensional integrity and surface roughness. Using empirical data we show that graph Laplacian topological invariants can unambiguously detect part quality deviations. Because the presented approach uses point cloud and image information obtained from non-contact scanners, it can significantly enhance the status quo of metrology in AM.

3 - Bayesian D-Optimal Design of Experiments with Quantitative and Qualitative Responses
Lulu Kang, Assistant Professor, Illinois Institute of Technology, 10 W 32nd Street, E1-208, Chicago, IL, 60616, United States of America, lkang2@iit.edu, Ran Jin, Xinwei Deng

Systems with quantitative and qualitative (QQ) responses are widely encountered in many applications. Experiments are conducted to study such systems. Classic experimental design methods are not suitable for such experiments. A Bayesian D-optimal design method is developed for quantitative and binary qualitative responses. Both noninformative and informative conjugate prior distributions are considered. Iterative point-exchange search algorithm is developed.

4 - An Efficient Emulator for Multivariate Gaussian Processes using a Pairwise Fitting Approach
Qiang Zhou, Assistant Professor, City University of Hong Kong, Kowloon, Hong Kong - PRC, q.zhou@cityu.edu.hk, Yongxiang Li

Multivariate Gaussian process may be used for modeling multiple response systems for information sharing, yet the computation can be prohibitive when there is a large number of response levels. In this work, we propose a computationally efficient multivariate GP model which permits a pairwise fitting scheme with great scalability.

System Informatics and Control: Learning from Complex Data

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Arash Pourhabib, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, arash.pourhabib@okstate.edu

1 - Weak Hierarchical Lasso: Efficient Algorithms and Applications
Jieping Ye, Associate Professor, Arizona State University, Tempe, AZ, 85287, United States of America, jieping.ye@asu.edu

We consider weak hierarchical Lasso, a sparse interaction regression model, which produces sparse and hierarchical structured estimator by exploiting the Lasso penalty and a set of hierarchical constraints. We show how to efficiently solve the challenging non-convex weak hierarchical Lasso formulation based on a key observation that the associated proximal operator admits a closed form solution. Finally, we present numerical experiments to demonstrate the efficacy of the proposed algorithm.

2 - Learning for Wireless Systems with Orientation-Aware Devices and Structured Antenna Patterns
Jean-Francois Chamberland, Associate Professor, Texas A&M University, 3128 TAMU, ECE Department, College Station, TX, 77843, United States of America, chmbrlnd@tamu.edu, Gregory Huff

Wireless communication systems employ link adaptation and scheduling to exploit the diversity afforded by fading channels in multi-user environments. The emergence of reconfigurable antenna systems, together with the wide availability of orientation information in smartphones, offers new ways to improve performance. The power of these new modalities can be harnessed through a machine-learning framework, which seeks to exploit past observations in predicting suitable modes of operation.

3 - Extracting Sparse Patterns from High-dimensional Data using Gaussian Mixture Models
Yang Zhao, Ph.D. Student, City University of Hong Kong, 83 Tat Chee Ave, Kowloon, Hong Kong - PRC, yangzhao9-c@my.cityu.edu.hk, Kwok Leung Tsui, Abhishek Shrivastava

Gaussian mixture model (GMM) is widely used for learning the latent structure in data. Though effective in many applications, GMMs show poor performance in high-dimensional setting. We propose regularized parameter estimation for learning the GMM. The regularization ensures a positive definite inverse covariance matrix and captures important correlation information between features. We demonstrate the performance of the estimate through various datasets.

4 - Embedded Synthetic Data Generation for Imbalanced Two-class Classification
Arash Pourhabib, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, arash.pourhabib@okstate.edu, Yu Ding

We propose an algorithm for two-class classification problems when the number of training instances in one of the classes is so low that the conventional classification algorithms become ineffective in detecting the minority class. We present a modification of the kernel Fisher discriminant analysis in which synthetic data points are generated iteratively. The novelty of the proposed method is that synthetic data generation is embedded in the algorithm.

Simulation Optimization and Sequential Sampling Rules

Sponsor: Simulation

Sponsored Session

Chair: Peter Frazier, Assistant Professor, Cornell University, 232 Rhodes Hall, Ithaca, NY, 14853, United States of America, pf98@cornell.edu

1 - New Methods for Choosing Parameters for Sampling Rules

Dashi Singham, Naval Postgraduate School, Mail Code: OR, Operations Research Dept, Monterey, United States of America, dsingham@nps.edu, Michael Atkinson

Sampling rules for simulation experiments depend on a number of parameters: desired precision and confidence in the output, underlying variance of data, and constraints on the number of samples. We analyze the relationships between these parameters by using a new measure of reliability for cumulative mean behavior that extends the traditional notions of coverage.

2 - Parallelized Bisection Method: Effectively using Asynchronous Information

Stephen Pallone, Cornell University, 290 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, snp32@cornell.edu, Peter Frazier, Shane Henderson

We consider a one-dimensional bisection method for finding the zero of a monotonic function, where the function can be evaluated asynchronously in a parallel computing environment. Using dynamic programming, we characterize the Bayes-optimal policy for sequentially choosing points at which to query the function. Our results provide insight on how evaluation times, risk preferences, and computational budget affect the trade-off between search space reduction and a desirable query distribution.

3 - Optimal Sampling Laws for Multi-objective Simulation Optimization on Finite Sets

Susan Hunter, Assistant Professor, Purdue University, School of Industrial Engineering, West Lafayette, IN, 47907, United States of America, susanhunter@purdue.edu, Guy Feldman, Raghu Pasupathy

Consider the context of selecting Pareto-optimal systems from a finite set of systems based on multiple stochastic objectives. We seek a characterization of the asymptotically optimal sample allocation that maximizes the rate of decay of the probability of misclassification, i.e., the probability a Pareto system is falsely estimated as non-Pareto, or a non-Pareto system is falsely estimated as Pareto. We discuss recent advances in solving this problem, including a solution for two objectives.

Land Use, Conservation and Sustainability

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Hayri Onal, Professor, University of Illinois, United States of America, h-onal@illinois.edu

1 - Designing a Dynamic Reserve Problem under Stochastic Uncertainties

Nahid Jafari, University of Georgia, Athens, GA, United States of America, nahid.jafari@uga.edu, Clinton Moore

Conservation agencies tasked with reserve design need a dynamic decision system that provides guidance for short-term decision opportunities while focusing on a long-term objective of assembling the best set of protected areas possible. We outline an approach that provides optimal actions that account for stochastic behaviors in future funding levels, land prices, and lands lost to conservation use, given land protection status, constraints, and objectives related to ecological value and cost.

2 - Landscape Sustainability and Optimum Management of Military Training Areas

Hayri Onal, Professor, University of Illinois, United States of America, h-onal@illinois.edu, Scott tweddale, Philip Woodford, James Westervelt

Training-induced land degradation, especially formation of gullies, reduces the ability of training lands to support the scheduled training activity in military installations and poses serious risk for the personnel and training equipment. We present a dynamic optimization/simulation model which determines the optimal timing, location and amount of land repairs for a given annual training schedule and budget constraints. Empirical results suggest that a preemptive repair schedule would be best.

3 - Optimal Harvest Schedules with Endogenous Road Maintenance Costs

Kai Ross, PhD. Student, University of Washington, Loew Hall 304, Seattle, WA, 98195, United States of America, mailkaiross@gmail.com, Weikko Jaross, Sandor Toth

Forest roads constitute the greatest financial and environmental cost to forestry. They degrade over time incurring extra costs and must be rebuilt to standard prior to timber haul. We propose an integer program that integrates road maintenance with harvest scheduling. The model captures both the road reconstruction costs that increase the longer a road is in disuse and the fixed cost savings that arise with the spatiotemporal coordination of harvests and road maintenance.

4 - An Optimisation Approach to Bushfire Fuel Management

Dmytro Matsypura, The University of Sydney, Sydney, Australia, dmytro.matsypura@sydney.edu.au, Oleg Prokopyev

Bushfires represent a real and continuing problem that has a major impact on people, wildlife and the environment. One way to reduce the severity of their effect is through fuel management. We propose a methodology to address the problem of optimal resource allocation for bushfire fuel management subject to landscape connectivity and stochastic fuel regeneration. In this work we draw inspiration from the literature on robust optimisation, network interdiction and critical element detection.

Topics in Underground Mine Planning

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Alexandra M. Newman, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Moving Toward Holistic Mine Scheduling

Barry King, PhD Student, Colorado School of Mines, 1500 Illinois Street, Golden, CO, 80401, United States of America, barking@mymail.mines.edu

Currently, open pit and underground mine production schedules are generated separately and then melded together a posteriori in a suboptimal fashion. We present a unified open pit and underground schedule that provides a holistic view of the entire deposit. Our primary focus is creating a generic underground mine formulation that pairs well with the standard open pit formulation.

2 - using an Open Pit Production Scheduling Algorithm on an Underground Mine Scheduling Model

Andrea Brickey, PhD Candidate, Colorado School of Mines, 1500 Illinois Street, Golden, CO, 80401, United States of America, abrickey@mymail.mines.edu, Alexandra M. Newman

Open pit mine production scheduling has advanced since the 1960's, while its underground counterpart is still relegated primarily to manual scheduling methods. We present the application of an algorithm (Bienstock-Zuckerberg) that can be applied to precedence-constrained knapsack problems with the structure exhibited by open pit mine planning problems, to determine an underground production schedule with ventilation considerations, and compare the results with more traditional solution methods.

3 - Open Pit to Underground Transition Depth Determination through Production Scheduling Optimization

Kadri Dagdelen, Professor, Colorado School of Mines, Mining Engineering Department, 1600 Illinois Street, Golden, CO, 80401, United States of America, kdagdele@mines.edu, Ismail Traore

The transition depth from open pit to underground in a mining complex is a critical engineering problem with significant economic implications. This paper will present an iterative method based on mixed integer programing optimization of production scheduling of open pit and underground operations where net present value of production from combine operations are maximized at each iteration. The optimum depth is determined from a set of solutions corresponding the highest NPV.

4 - Underground Mine Access Design to Maximise the Net Present Value

Kashyapa Sirinanda, Graduate Student, University of Melbourne, Melbourne, Australia, kash.s@Student.unimelb.edu.au

We consider a modified Steiner tree problem in which the tree has construction costs associated with edges and values associated with nodes. The objective is to maximise the total discounted cash flows, or Net Present Value (NPV). An application of this problem occurs in underground mining. We propose an efficient iterative algorithm to optimally locate a single degree-3 Steiner point to maximise the NPV. This algorithm converges and the Steiner point is unique for realistic design parameters.

Incentive Auctions

Cluster: Auctions

Invited Session

Chair: Robert Day, University of Connecticut, 2100 Hillside Road, U-1041, Storrs, CT, United States of America, Bob.Day@business.uconn.edu

1 - The Use of Optimization in the Spectrum Incentive Auctions

Karla Hoffman, George Mason University, Fairfax, VA, United States of America, khoffman@gmu.edu, Rudy Sultana, Tony Coudert, Brian Smith

Optimization will be employed in a variety of ways in the upcoming FCC ncentive auction. It will used to determine the clearing target (i.e. the amount of spectrum to be acquired), to check whether a set of TV stations could be packed within a specific band of spectrum, to determine the final channel assignment for those TV broadcasters that remain on the air, and, possibly, to help set prices during the auction. A brief overview of the optimization problems will be presented.

2 - Feasibility Checking for Spectrum Reallocation

Kevin Leyton-Brown, Professor, University of British Columbia, 2366 Main Mall, Vancouver, BC, V6T1Z4, Canada, kevinlb@cs.ubc.ca, Alexandre Frechette

The FCC's upcoming incentive auction gives rise to a computational problem which is dubbed "feasibility checking": determining whether there exists a way of reassigning a given subset of television stations to different frequencies so that they can all broadcast in a reduced spectrum band without harmfully interfering with each other. This talk will describe recent efforts towards addressing this problem, and will emphasize both the methods used and the empirical performance achieved.

3 - Deferred-Acceptance Auctions and Radio Spectrum Reallocation

Paul Milgrom, Stanford University, 903 Cottrell Way, Stanford, CA, 94305, United States of America, pmilgrom@gmail.com, Ilya Segal

Deferred-acceptance auctions choose allocations by an iterative process of rejecting the least attractive bid. Any deferred acceptance auction with threshold pricing is weakly group strategy-proof, can be implemented using a clock auction, and leads to the same outcome as the complete-information Nash equilibrium of the corresponding paid-as-bid auction. A paid-as-bid auction with a non-bossy bid-selection rule is dominance solvable if and only if it is a deferred acceptance auction.

Energy Storage for Grid Integration of Renewable Energy

Sponsor: Energy, Natural Resources & the Environment/ Energy

Sponsored Session

Chair: Audun Botterud, Energy Systems Engineer, Argonne National Laboratory, 9700 S. Cass Ave., Argonne, IL, United States of America, abotterud@anl.gov

1 - Siting and Sizing of Distributed Battery Energy Storage

Hrvoje Pandzic, University of Zagreb Faculty of Electrical Engineering and Computing, Unska 3, Zagreb, Croatia, hrvoje.pandzic@ieee.org, Daniel Kirschen

A three-stage method to identify the optimal locations and capacities of distributed storage is proposed. In the first stage, the optimal storage locations are determined. In the second stage, storage units are installed at these locations and their optimal energy and power ratings are determined. In the final stage, the optimal operation of the storage is simulated to quantify the benefits that it would provide by reducing congestion.

2 - Grid Level Energy Storage for Integration of Renewable Energy

Audun Botterud, Energy Systems Engineer, Argonne National Laboratory, 9700 S. Cass Ave., Argonne, IL, United States of America, abotterud@anl.gov, Prakash Thimmapuram, Emil Constantinescu, John Birge, Canan Uckun, Kevin Gallagher

We present initial results from a project where we are developing an analytical framework to evaluate the potential benefits of energy storage for grid integration of renewable energy. Numerical weather predictions are used to characterize the spatio-temporal characteristics of wind and solar resources. We formulate and solve operational decision problems for the grid system operator as well as for an energy storage owner, considering different storage technology solutions.

3 - Strategies for Mitigating the Reduction in Economic Value of Variable Generation at High Penetration

Andrew Mills, Staff Research Associate, Lawrence Berkeley National Laboratory, 1 Cyclotron Rd, MS90-R4000, Berkeley, CA, 94720, United States of America, admills@lbl.gov, Ryan Wiser

Previously, we quantified a decline in the marginal economic value of wind and PV with increasing penetration levels. We use the same model and data to evaluate options to stem the decline in value of these technologies. The largest increase in the value of wind comes from increased geographic diversity. The largest increase in the value of PV comes from assuming that low-cost bulk power storage is an investment option. Other attractive options include real-time pricing and technology diversity.

4 - Modeling Energy Storage as an Enabler of Ultra-low Carbon Power Systems

Jesse Jenkins, PhD Student, Engineering Systems Division / Research Assistant, MIT Energy Initiative, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room E40-369, Cambridge, MA, 02139-4307, United States of America, jessedj@mit.edu, Fernando de Sisternes

Reaching an ultra-low carbon electricity system will rely on an emissions free source of flexibility for power systems operations. Absent such a source, operational and economic constraints will limit the penetration of renewable electricity, nuclear power, or a combination thereof. We use a capacity expansion model with unit commitment constraints to explore the impact of storage on the optimal mix of low-carbon electricity sources in renewable, nuclear, or hybrid renewable-nuclear systems.

Parc- Mission I

Policy Analysis and Planning in Energy Sector

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Yihsu Chen, UC Merced, 5200 North Lake Road, Merced, CA, United States of America, ychen26@ucmerced.edu

1 - Cooperation in Regional Electricity Market Based on Tradable Green Certificate Offering

Yingjue Zhou, Oklahoma State University, Stillwater, OK, United States of America, yingjue.zhou@okstate.edu, Tieming Liu

We study the cooperation between green/black suppliers in regional electricity markets. The green supplier has random power shortage. To attract the black supplier to build response capacity and cover the shortage, the green supplier offers tradable green certificate to the black supplier. We find the cooperation model reaches the global optimum capacity. In a decentralized model without cooperation, the capacity investment is less than the global optimum.

2 - Selection of Climate Policies under Current Knowledge of Uncertainties

Massimo Tavoni, Fondazione Eni Enrico Mattei (FEEM), Corso Magenta 63, Milan, Lo, 20123, Italy, massimo.tavoni@feem.it, Valentina Bosetti, Laurent Drouet

In the present paper we use the best available knowledge to model the key risks and uncertainties affecting the cost of mitigating greenhouse gases emissions, the future change of climate and its economic impact on societies. We derive robust climate policies, in terms of carbon budgets, consistent with different preferences for dealing with these risks and uncertainties. Results indicate that different preferences can lead to significantly different carbon budgets.

3 - Multi-sector Model of Inter-temporal Permit Banking under Imperfect Competition

Makoto Tanaka, GRIPS, 7 Chome-22-1 Roppongi, Tokyo, Japan, mtanaka@grips.ac.jp, Yihsu Chen

This paper develops a multi-sector model of inter-temporal permit banking under imperfect competition. The permit price rises at a higher rate than the discount rate. Under a declining emissions cap system, the dominant firm has an incentive to suppress the permit prices when buying the permits in early periods, and then inflate the permit prices when selling them in later periods. Numerical results of the California case are broadly consistent with the analytical conclusion.

4 - Pollution Regulation and Market Structure
Francois Giraud-Carrier, Assistant Professor, University of Illinois Springfield, College of Business and Management, One University Plaza, UHB MS 4021, Springfield, IL, 62703, United States of America, fgira2@uis.edu, Krishnan Anand

We develop an integrated pollution-production model to study the interactions between strategic firms operating under pollution regulations and the regulator when markets are imperfect. Our model incorporates the firms' emissions, abatement technologies, the damage from pollution, and three popular regulatory mechanisms—Cap, Cap-and-Trade, and Tax. We analyze the effect of these mechanisms on firms, consumers and society, and derive important implications for the regulator.

Strategic and Complementarity Models in Energy Markets

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Jalal Kazempour, Postdoctoral fellow, Johns Hopkins University, 3400 N Charles St. Mechanical Eng. Dep., Latrobe 223, Baltimore, MD, 21218, United States of America, skazemp1@jhu.edu

1 - Strategic Forward Trading and Technology
Heikki Peura, London Business School, Regent's Park, London, United Kingdom, hpeura@london.edu, Derek Bunn

Forward trading in electricity markets is usually driven by hedging motives, but may also result from strategic considerations. In increasingly technologically diverse markets, the flexibility and reliability of production technologies may influence not only spot prices but also the nature of forward trading. We develop a theoretical model to study the impact of these factors and their interactions on spot and forward market equilibria, with implications on both firm strategy and market design.

2 - The Value of Demand Response in Day-ahead and Real-time Markets: A Stochastic Equilibrium Model
Venkat Prava, PhD Student, Johns Hopkins University, 108 W 39TH ST APT 10, BALTIMORE, MD, 21210, United States of America, vprava1@jhu.edu, Ben Hobbs, Jalal Kazempour

We analyze the value of demand-side operational flexibility in a two-settlement wind-integrated electricity market (including day-ahead and real-time). To this end, a stochastic equilibrium model is characterized through a simultaneous clearing of day-ahead and real-time markets. Wind power uncertainty in each market is represented by a separate set of scenarios. The upward and downward demand responses are considered in both markets.

3 - Imperfect Demand-side Response to Wind Power Integration: A Complementarity Model
Ali Daraeepour, Duke University, A327 LSRC, Box 90328, Durham, NC, 27708, United States of America, a.daraeepour@duke.edu, Jalal Kazempour, Antonio J. Conejo, Dalia Patino-Echeverri

Demand-side behavior (strategic or competitive) affects clearing of wind-integrated electricity markets. We investigate this impact using a bilevel optimization model (as a complementarity approach) whose upper-level represents the expected utility maximization problem of a strategic consumer under wind-power production uncertainty and whose lower-level represents the clearing of day-ahead and real-time markets. We also explore the effects of wind power penetration and volatility levels.

4 - Modelling Strategic Interaction between Russia and Ukraine in Natural Gas Trade: Application of MPEC
Chi Kong Chyong, University of Cambridge, k.chyong@jbs.cam.ac.uk, Ben Hobbs

We formulate a mathematical problem with equilibrium constraints where Russia acts as a leader in both strategically investing in transportation capacity to ensure security of supply as well as supplying gas to Ukraine. Ukraine in turn is a follower and decides on investment in its transit capacity to serve Russian gas transit to Europe as well as investing in alternative routes to diversify away from Russian gas imports. We test the model with N-1 scenarios for Ukraine's major transit routes.

Efficient Learning in Stochastic Optimization

Sponsor: Simulation

Sponsored Session

Chair: Ilya Ryzhov, Assistant Professor, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, iryzhov@rhsmith.umd.edu

1 - Forgetful Bayes and Myopic Planning: Human Learning and Decision Making in a Bandit Setting
Shunan Zhang, University of California San Diego, s6zhang@mail.ucsd.edu, Angela Yu

We study how humans negotiate the tension between exploration and exploitation in a multi-armed bandit task. By comparing human behavior to a variety of models that vary in their representational and computational complexity, we found that subjects' choices are best captured by a "forgetful" Bayesian iterative learning model in combination with a partially myopic decision policy known as Knowledge Gradient, outperforming the optimal Bayesian learning and risk minimization and other heuristics.

2 - An Inverse Reinforcement Learning Model of Human Behavior in Social Media
Sanmay Das, Associate Professor, Washington University in St. Louis, sanmay@seas.wustl.edu, Allen Lavoie

How do humans change their behavior in response to feedback in social media? We introduce a model for how humans learn in response to different types of feedback, and validate our model on data from the social news website Reddit. Our model combines the behavioral reinforcement learning model of Erev and Roth with a Hierarchical Dirichlet Process model of preferences, and significantly outperforms all known baselines in predicting users' future behavior.

3 - Hierarchical Bandits with Infinitely Many Arms: Properties and Heuristics
Alessandro Arlotto, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, alessandro.arlotto@duke.edu, Noah Gans, Stephen E. Chick

We study hierarchical bandit models with a finite number of subpopulations and infinitely many arms in each subpopulation. The statistics of each subpopulation are unknown, and they are modeled as independent draws from some known hyperprior distribution. The statistics of each arm are also unknown, and modeled as independent draws from the subpopulation distribution to which the arm belongs. In this talk, we discuss properties of this model and propose sampling schemes that perform well.

4 - The Local Time Method for Targeting and Selection
Ilya Ryzhov, Assistant Professor, University of Maryland, Robert H. Smith School of Business, College Park, MD, 20742, United States of America, iryzhov@rhsmith.umd.edu

We present the new targeting and selection (T&S) model, in which the goal is to find a simulation design that is maximally similar to a pre-specified target, a problem with applications in simulation validation and the design of competitive events. We also present a novel method for this problem based on the expected local time of a Brownian approximation. The method exhibits interesting parallels to value of information procedures for ranking and selection, but performs better in T&S.

1 - Community Waste Management Optimization
Colyn Dickson, Student, Cal Poly State University, Industrial and Manufacturing Engineering, 1 Grand Avenue, San Luis Obispo, Ca, 93407, United States of America, cmdickso@calpoly.edu, Tali Freed

A cost minimization model for residential and commercial waste removal is presented. The model considers dumpster capacity constraints as well as pooling capacity of adjacent sub-communities. A case study of a university's waste management is discussed in detail.

2 - E-Waste Recycling Optimization
Roopak Mitra, United States of America, Mitra rmitra@calpoly.edu, Liang Li, Andrea Schmidt, Tali Freed

We propose a model for regional optimization of e-waste recycling. The existing drop off system utilized in many communities is modified to include optimization of pickup locations and vehicle scheduling. The goals include higher recycling rates of various types of e-waste, and minimal costs to the region and its residents.

3 - Integer Programming Formulation for Course Timetabling using Partially Aggregated Student Data
Jesse Bukenberger, jbukenbe@gmail.com, Tali Freed

We propose an integer programming formulation for the course timetabling problem that maximizes student enrollment in their desired courses. The formulation takes partially aggregated student data and quickly generates an optimal timetable; specific student enrollments are then generated from the timetable. The method is tested with local schools.

4 - Small-scale Dynamic Job Shop Scheduling
Heidi Richardson, California Polytechnic State University, San Luis Obispo, CA, United States of America, herichar@calpoly.edu, Lauryl Nakagawa, Tali Freed

This paper presents a heuristic scheduling algorithm created for dynamic work environments with multiple types of inputs and resources to address scheduling conflicts and tardiness. Better resource utilization is shown to increase throughput and customer satisfaction.

5 - Optimal Search Pattern for Difficult to Find Targets
Blake Currie, California Polytechnic State University, San Luis Obispo, CA, United States of Americabcurrie@calpoly.edu, Jessica Burke, Tali Freed

This paper focuses on optimization of search patterns based on the orienteering problem with resource dependent rewards. Target location probabilities are based on environmental conditions and last known location. Variable search times are allowed with upper limit on total time. Node probabilities decay exponentially as the area is searched.

Chair: Issac Shams, University of Michigan-Ann Arbor, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, issacsh@umich.edu

1 - Phenotyping from Electronic Health Records using Tensor Factorization
Jimeng Sun, Associate Professor, School of Computational Science and Engineering, Georgia Tech, 266 Ferst Drive, Atlanta, GE, 30363, United States of America, jsun@cc.gatech.edu, Joydeep Ghosh, Joyce C. Ho

Limestone, a nonnegative tensor factorization method to derive phenotype candidates with no human supervision. We demonstrate the capability of Limestone on a cohort of 31k patient records. Our results show that using only 40 phenotypes, we can outperform the original 640 features to achieve AUC of 0.720. Moreover, in consultation with a medical expert, we confirmed 82% of the top 50 candidates are clinically meaningful.

2 - Does Healthcare Insurance Matter? Establishing Insurance Status as a Risk Factor for Trauma Mortality
Bruce Golden, Professor, University of Maryland - Robert H. Smith School of Business, University of Maryland - Robert H. Smith, College Park, MD, 20742, United States of America, BGolden@rhsmith.umd.edu, Hector Corrada Bravo, Shawn Mankad, Hisham Talukder

The identification of risk factors that affect the outcome of trauma patients has critical healthcare policy implications. We investigate the National Trauma Database, a collection of outcome records from over 100 trauma centers in the United States, to find that insurance status has a significant impact on survival outcomes when controlling for confounding variables. We utilize logistic regression and visualization techniques to identify potential explanations for these findings.

3 - Cost-effectiveness of HIT-facilitated Adoption of Collaborative Depression Care for Diabetes Patient
Shinyi Wu, Associate Professor, University of Southern California, 1150 S. Olive Avenue, Suite 1400, Los Angeles, CA, 90015, United States of America, shinyiwu@usc.edu, Haomiao Jin

Collaborative depression care is an evidence-based care model but providers find it difficult to implement among low-income minority diabetic patients. To support its adoption, an automated telephone assessment tethered with an enhanced disease management registry to task provider team was developed and tested in a three-group quasi-experimental trial with 1406 patients for 18 months. This study presents the propensity score adjusted regression results for cost-effectiveness of the intervention.

Sponsored Session

Chair: Warner North, President and Principal Scientist, NorthWorks, Inc., 1715 Taylor Street, San Francisco, CA, 94133, United States of America, northworks@mindspring.com

1 - Informing Decisions in a Democratic Society
Warner North, President and Principal Scientist, NorthWorks, Inc., 1715 Taylor Street, San Francisco, CA, 94133, United States of America, northworks@mindspring.com

My nearly 50 years of career experience, including many projects for U.S. and other government agencies plus participation in numerous reports of the National Research Council, endorse normative decision analysis fused with deliberative dialogue as a process that provides insight on critical information and value assessments in support of decision making. While decision analysis methodology fits the need, leadership and dialogue process improvements may enable more success in application.

2 - Improving Public Policy Decisions in California
Stephen Barrager, Publisher, Baker Street Publishing, San Francisco, CA, 94123, United States of America, steve@bakerstreetpublishing.com

California policy makers and implementors face three challenges: (1) moving large groups of people toward mutual learning; (2) Integrating the inputs of stakeholders, scientists, and experts; and (3) Overcoming the shortcomings of bureaucracies. This presentations reviews some of the key reasons for the success of the California Marine Life Protection Act Initiative. The charge of this initiative was to design a network of marine protected areas the length of California.

3 - EPA's Uses of Risk Assessment in Setting Ambient Air Quality Standards

Anne Smith, Senior Vice President, NERA Economic Consulting, 1255 23rd St NW, Ste 600, Washington, DC, 20008, United States of America, Anne.Smith@NERA.com

US air quality standards must be set at levels USEPA determines are protective of public health with a margin of safety. USEPA must make this judgment in face of uncertainties about critical relevant considerations such as levels for effects thresholds, often even lacking knowledge of physiological mechanisms that might cause health effects of concern. USEPA's risk analysis methods are described, and areas where principles of decision analysis could be more effectively applied are identified.

4 - DA and Analytics-Based Policy Program Design Enabling Balanced Growth and Job Creation for Nationals

Mazen Skaf, Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, CA, 94301, United States of America, mskaf@sdg.com

We present a DA-based approach to designing an active labor market policy program. Since its launch in May 2011, the program has spurred a significant increase in the rate of job creation for nationals in an economy that had a historical over-reliance on foreign labor. As of January 2014, within 32 months following the launch, more than 700,000 net new jobs for nationals have been created.

Chair: Yael Grushka-Cockayne, Darden School of Business, 100 Darden Blvd, Charlottesville, United States of America, GrushkaY@darden.virginia.edu

1 - Induced Dependence Coefficient for Heavy-tailed Distributions in DM

Jose Luis Guerrero-Cusumano, Associate Professor, Georgetown University, 435 Hariri Builing, Business School, 37 and O street, NW, Washington, DC, 20016, United States of America, guerrerj@georgetown.edu

The detection of changes in the dependence structure of a multivariate process is essential in Data Mining given the large number of variables and its interactions. The multivariate mutual information T(X) and induced dependence coefficient are used as tools for supervised and unsupervised learning in Data Mining to summarize changes in the dependence of the multivariate process under the multivariate t family (Cauchy) distribution. Detection mechanisms in the dependence structure are developed

2 - An Ensemble of Ensembles

Alan Briggs, Elder Research Inc., VA, United States of America alan.briggs@datamininglab.com

Data scientists are always looking for new problems to solve, going directly to the data in pursuit of knowledge and insight that hasn't always been available. Experience suggests that just as ensemble methods have increased performance of certain machine learning applications by blending multiple advanced analytic methodologies into a single approach, ensembling popular data science techniques with conventional metrics and heuristics can provide practical solutions to many difficult problems.

3 - Ensembling Overfit and Overconfident Forecasts

Yael Grushka-Cockayne, Darden School of Business, 100 Darden Blvd, Charlottesville, United States of America, GrushkaY@darden.virginia.edu, Casey Lichtendahl, Victor Richmond Jose

We study the effect of combining forecasts that are overfit to sample data. We introduce a model that relates base-rate neglect and overconfidence. We present theory that suggests a trimmed opinion pool will be effective in combining forecasts that are both overfit and overconfident. Using a popular machine learning algorithm that ensembles a large number of overfit regression models, we test this hypothesis empirically on several public data sets.

4 - Ensemble Methods in DoD Decision Analyses: Improving Accuracy through Combining Utility Models

Aaron Burciaga, Senior Manager, North America Inventory Analytics Lead, Accenture, 4305 Majestic Lane, Fairfax, VA, 22033, United States of America, adburciaga@gmail.com

No single method for developing Decision is perfect, however each can be useful, and even powerful when considered in aggregate. Ensemble methods in Decision Analysis provide aggregate strength, detail, and confidence in prescribed actions. We present how ensemble methods have been used to support strategic DoD initiatives, through a combination of State Trees, Decision Trees, Influence Diagrams, Dynamic Bayesian Networks, and the Analytic Hierarchy Process.

Business Location Analysis with MCDM

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Luiz Flavio Autran M. Gomes, Professor, Ibmec, Rua Professor Manuel Ferreira, 115,, Apt. 201, Gavea, Rio de Janeiro, RJ, 22451030, Brazil, autran@ibmecrj.br

1 - Retail Location Analysis: A Comparison between TODIM-FSE and the Choquet Integral

Luiz Flavio Autran M. Gomes, Professor, Ibmec, Rua Professor Manuel Ferreira, 115,, Apt. 201, Gavea, Rio de Janeiro, RJ, 22451030, Brazil, autran@ibmecrj.br, Maria Augusta S Machado, Renato Monte Araujo

This paper approaches the problem of locating a new store for a major retailer in the City of Rio de Janeiro, Brazil. A number of factors are considered by the company's decision makers and some of them are clearly interrelated. Therefore the problem has a multicriteria nature. It is solved by the TODIM-FSE method as well as by using the unipolar Choquet Integral. The two results are next compared and suggestions are provided for future studies.

2 - An Approximation Algorithm for the Bi-criteria p-median/p-dispersion Problem

Golbarg K. Tutunchi, PhD stdudent, North Carolina State University, 400 Daniels Hall College of Engineering, Industrial and Systems Engineering, Raleigh, NC, 27695-7906, United States of America, gkazemi@ncsu.edu, Yahya Fathi

We consider the p-median and the p-dispersion problems in the context of a bi-criteria location analysis. We discuss a mathematical programming approach to obtain a non-dominated solution with respect to these two objectives, and an e-approximation algorithm to obtain the corresponding efficient front. Through a computational experiment we demonstrate the effectiveness of this approach for relatively large instances of the problem.

INFORMS Data Mining Best Student Paper Award

Sponsor: Data Mining

Sponsored Session

Chair: Onur Seref, Assistant Professor, Virginia Tech, Pamplin 1007, Blacksburg, VA, 24061, United States of America, seref@vt.edu

1 - Saddle Points and Accelerated Perceptron Algorithms

Adams Wei Yu, Graduate Student, Carnegie Mellon University, GHC 5508, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, weiyu@cs.cmu.edu

We consider the problem of finding a linear classifier or providing a near-infeasibility certificate if there is none. We bring a new perspective to addressing these two problems simultaneously in a single efficient process, by investigating a related Bilinear Saddle Point Problem(BSPP). We show that such a approach provides either a linear classifier or an ϵ-infeasibility certificate and that Mirror Prox can be used to achieve the best known convergence rate.

2 - Career Development Paths in Online Labor Markets

Marios Kokkodis, PhD Student, New York University, Room 8-180,, 44 W 4th New York, New York, NY, 10012, United States of America, mkokkodi@stern.nyu.edu

The workers' value in an online labor market resides in a combination of both observable (e.g., list of skills) and latent characteristics (e.g., true expertise on these skills). In this work, I propose a framework that (1) estimates the level of expertise of a given worker for a given skill (2) quantifies the value of each skill given the worker's level of expertise and (3) recommends additional skills based on the current skill set of the worker.

3 - Image Defect Detection with Smooth-Sparse Decomposition

Hao Yan, PhD Student, Georgia Institute of Technology, 755 Ferst Dr, NW, Atlanta, GA, 30332, United States of America, yanhao@gatech.edu, Jianjun Shi, Kamran Paynabar

Defect detection in noisy images is important in modern manufacturing system. Most of the existing approaches perform denosing and detection separately, which affects detection accuracy. In this paper, we develop a novel one-step methodology through a regularized least square optimization model together with a fast algorithm implementation for defect detection in noisy images under a smooth background. The accuracy and computational speed is evaluated using simulation study and case study.

4 - Finding Short Peptide Substrates using Bayesian Active Learning
Jialei Wang, PhD Student, Cornell University, Frank HT Rhodes Hall, 292, Ithaca, NY, 14853, United States of America, jw865@cornell.edu, Pu Yang, Peter Frazier, Nathan Gianneschi, Michael Burkart, Michael Gilson, Lorillee Tallorin, Nicholas Kosa

We consider a Bayesian active learning problem arising in biochemistry, in which we wish to find peptides with properties that support a number of innovations in medicine, biochemistry, and materials science. Such peptides are difficult to find, and expensive to experimentally verify. We present a machine learning method for choosing which peptides to test to find such peptides as quickly as possible. We prove theoretical bounds on its solution quality and demonstrate performance in simulation.

Sunday, 4:30pm - 6:00pm

Mathematical Modeling and Operations Research in Military Decision Making I

Sponsor: Military Applications Society

Sponsored Session

Chair: William Fox, Professor, Naval Postgraduate School, Department of Defense Analysis, Monterey, CA, 93943, United States of America, wpfox@nps.edu

1 - Mathematical Modeling of Terrorists for Decision Making
William Fox, Professor, Naval Postgraduate School, Department of Defense Analysis, Monterey, CA, 93943, United States of America, wpfox@nps.edu, Tiffany Crosby

We present two models of terrorists. Model 1 is an OML human targeting model than ranks terrorists based upon criteria. We provide some insights and sensitivity analysis. Model 2 describes an attempt to use a software package, CrimeStat, to predict terrorist event activity.

2 - Using Operational Patterns to Influence Attacker Decisions on a Transportation Network
Daniel Stimpson, Operations Research / Systems Analyst, Joint Improvised Explosive Device Defeat Organization, 115 Hunton Drive, Fredericksburg, VA, 22405, United States of America, stimpsonde@yahoo.com, Rajesh Ganesan

We introduce a Reinforcement Learning (RL) model for determining convoy and route clearance schedules to minimize attack costs on a network subject to IED ambushes. We assume dependence between attack probabilities and observed traffic patterns. RL algorithms offer opportunities for meaningful improvements by optimizing individual movements across the planning horizon, accounting for downstream interaction. Our approach is grounded in Boyd's observe, orient, decide, and act (OODA) loop.

3 - Using a Simulation Model to Test Policies for Managing a Fleet of Naval Combat Helicopters
David Marlow, Defence Science and Technology Organisation, Joint and Operations Analysis Division, Australia, domarlow@nps.edu

We present a discrete-event simulation model of a fleet of naval combat helicopters. The model represents helicopters moving between being embarked on ships to ashore and between various types of scheduled and unscheduled maintenance over their life. The fleet must always provide eight embarked aircraft and meet annual embarked and ashore flying hour requirements. Here we test the impact of various policies for managing multiple squadrons on the ability to meet these requirements.

Entrepreneurial Innovation Process (Discussant Session)

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Sinan Erzurumlu, Associate Professor, Babson College, 231 Forest St, Babson Park, MA, 02457, United States of America, serzurumlu@babson.edu

1 - Returns to Bargaining Power in the Market Process
Moren Levesque, Professor, York University, 4700 Keele Street, Toronto, ON, M3J1P3, Canada, MLevesque@schulich.yorku.ca, Mohammad Keyhani

This study investigates the role of bargaining power in the market process as described by the Kirznerian school of Austrian market process theory. We study market dynamics using computer simulations of coalition formation in a cooperative game in which players form new coalitions by discovering the opportunities afforded by the characteristic function. Counter-intuitively, we find that when all players have entrepreneurial discovery capability, the returns to bargaining power are not monotonic.

2 - Sequential Innovation by Start-ups: Balancing Survival and Profitability
Sinan Erzurumlu, Associate Professor, Babson College, 231 Forest St, Babson Park, MA, 02457, United States of America, serzurumlu@babson.edu, Karthik Ramachandran, Sreekumar Bhaskaran

Start-up firms typically consider launching an immediately available first version of a product to generate funds for developing more advanced products. However, this release could have an adverse effect on the perception of the firm's future products. We characterize an optimal policy with cash thresholds to determine when the firm should launch the first version and whether it should continue development.

3 - What is Your Return on Time Invested?
Onesun Steve Yoo, Assistant Professor, University College London, Gower Street, London, United Kingdom, o.yoo@ucl.ac.uk, Charles Corbett, Guillaume Roels

For entrepreneurs, how they invest their time and money has immediate consequences as they are often the key resource of their business. We discuss frameworks for (i) discounting time and money and (ii) exchanging time and money, and introduce a two-by-two NPV-type framework linking current and future money and time. We use it to show that high-growth entrepreneurs should discount time less than money.

Hilton- Golden Gate 7

Innovating in the Mobile World using Analytics

Cluster: Business Model Innovation

Invited Session

Chair: Marcel Goic, Assistant Professor of Marketing, University of Chile, Republica 701, Santiago, Chile, magoic@gmail.com

1 - Analyzing Mobile Application Usage and Ad Response for Optimal Targeting
Liye Ma, Assistant Professor, University of Maryland, 3323 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, liyema@rhsmith.umd.edu, Baohong Sun

Research shows that 64% of mobile phone time is spent on applications, and mobile advertising is expected to quadruple in five years. We study three questions regarding these two activities: 1) how does mobile application usage vary across people and time? 2) how are mobile ad responses driven by time and context? 3) how should firms target mobile ads? We develop an integrated model of mobile application usage and ad response, and develop optimal targeting strategy by solving a DP problem.

2 - Firm Value of Product Innovation in the Service Ecosystem
Hyunwoo Park, Georgia Institute of Technology, 85 5th St NW, Atlanta, GA, 30308, United States of America, hwpark@gatech.edu, Rahul Basole

We examine the asymmetric impact of product innovation on the market value of manufacturers (e.g. device manufacturers) and service providers (e.g. mobile network operators) in the mobile service ecosystem. Our analysis is based on a comprehensive dataset comprising over 1,500 smartphones and considers the influence of product characteristics, the frequency and timing of product innovation, and the network structure of the service ecosystem. Theoretical and managerial implications are discussed.

3 - Real-time Decisions to Serve the Unbanked Poor in the Developing World: Examples from Mexico & India
Devendra Potnis, Assistant Professor, University of Tennessee at Knoxville, School of Information Sciences, Communications Bldg., Suite 451, Knoxville, TN, 37996, United States of America, dpotnis@utk.edu, Lakshmi Mohan

Formal financial service providers like banks and microfinance institutions deploy field agents with mobile devices for serving the 2.5 billion "unbanked" poor at their door step. We present the applications of Banco Azteca in Mexico and Equitas Microfinance in India for making real-time decisions using data sent by field agents on their mobile devices. The business value of these applications is lower financial risk and improved operational efficiency.

4 - Empirical Analysis of the Effectiveness of Mobile Channels
Marcel Goic, Assistant Professor of Marketing, University of Chile, Republica 701, Santiago, Chile, magoic@gmail.com, Jose Guajardo

The continuously growing use of mobile devices provides the opportunity to use this new channel to complement the value proposition that companies offer to their customer. However, the nature of costumer responses to these initiatives remains largely unexplored. We empirically investigate the drivers of effectiveness in managing a mobile transactional channel and how to use location-based information to interact with consumers.

Empirical Research in Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Suresh Muthulingam, Assistant Professor, Cornell University, 401P Sage Hall, Ithaca, NY, 14853, United States of America, sm875@cornell.edu

1 - The Effects of National Culture on the Leakage of Proprietary Digital Assets
Brett Massimino, Cornell University, School of Hotel Administration, Ithaca, NY, 14850, United States of America, massimino.3@fisher.osu.edu, John Gray

In this study, we relate the cultural characteristics of parties in a product development chain to the propensity that the product under development will be leaked to unauthorized distribution channels. In our empirical analysis, we utilize longitudinal data covering the development of video game products from the years 2000 through 2010, as well as data detailing the illegal distribution activities of a major black-market distribution channel.

2 - Spillover of Quality Knowledge at Suppliers: an Empirical Investigation
Suresh Muthulingam, Assistant Professor, Cornell University, 401P Sage Hall, Ithaca, NY, 14853, United States of America, sm875@cornell.edu, Anupam Agrawal

We investigate whether quality knowledge developed by a buyer at its suppliers spills over and benefits other firms. We find that quality knowledge spills over: (i) At suppliers with low levels of operational complexity, (ii) When it is not embedded in technology, and (iii) When it is related to the output activities of a supplier. Further, the spilled-over quality knowledge depreciates faster than knowledge developed by undertaking quality improvement initiatives directly with suppliers.

3 - Critical and Complex Technological Capability Development: Longitudinal Study of a Surgical Robot
Kingshuk Sinha, Professor, Mosaic Company Professor of Corporate Responsibility, Carlson School of Management, University of Minnesota, Minneapolis, MN, United States of America, ksinha@umn.edu, Shoubhik Sinha, Scott Bosch, Ujjal Mukherjee

We report the results of a longitudinal field study on the adoption and usage of a surgical robot. Specifically, we investigate doctors' learning, surgical team's learning and the impact of doctors' specialization and experience (general and specific) on capability development. The impact of doctor and team learning on the usage of the surgical robot is also analyzed. The empirical setting of the study is a large multi-specialty hospital.

Supplier Responsibility Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Li Chen, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, li.chen@duke.edu

1 - Designing Supply Networks for Relational Sourcing
Elena Belavina, Assistant Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, United States of America, belavina@uchicago.edu, Karan Girotra

Socially responsible sourcing has become a necessity for many global firms and a competitive advantage for others. Sourcing strategies based on social responsibility now increasingly employ long-term commitments (relational sourcing). This study examines the role that supply network configuration plays in the efficacy of relational sourcing in ensuring socially responsible behavior across the supply network (compliance).

2 - Time to Come Clean? Disclosure and Inspection Policies under Random Environmental Violations
Sang Kim, Yale School of Management, 165 Whitney Ave, New Haven, CT, 06511, United States of America, sang.kim@yale.edu

We examine the interplay between a regulator's inspections and a firm's noncompliance disclosure in the setting where environmental violations occur randomly, by developing a model that combines reliability theory and law enforcement economics. Our analysis shows that a threat of increased penalty does not always lessen the need for costly inspections. We also find that there are situations where pre-announced periodic inspections are preferred to unannounced random inspections.

3 - Supplier Evasion of a Buyer's Audit: Implications for Motivating Compliance with Labor and Environment
Terry Taylor, Associate Professor, U.C. Berkeley, Haas School of Business, 2220 Piedmont Ave., Berkeley, CA, 94720, United States of America, taylor@haas.berkeley.edu, Erica Plambeck

Many brands have recently been tarnished by publicity of suppliers' labor and environmental violations, and have responded by increasing their auditing efforts. Suppliers seek to pass audits not only through efforts to comply with standards, but also through efforts to deceive auditors. We characterize when auditing backfires by increasing deception effort and reducing a supplier's effort to comply with labor and environmental standards.

4 - Mitigate Supplier Responsibility Risk in Emerging Economies: An Ethical Sourcing Framework
Li Chen, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, li.chen@duke.edu, Hau Lee

Sourcing from emerging economies may yield direct cost savings, but this practice often entails greater supplier responsibility risk. In this paper, we discuss the effectiveness of various contracting and certification mechanisms that aim to mitigate such risk.

Hilton- Continental 3

Strategic Supply Risk Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Yimin Wang, Arizona State University, Department of Supply Chain Management, Tempe, 85287, United States of America, Yimin_Wang@asu.edu

1 - To Remarket Now or Save for Warranty Claims
Cerag Pince, Kuehne Logistics University, Grosser Grasbrook 17, Hamburg, 20457, Germany, Cerag.Pince@the-klu.org, Beril Toktay, Mark Ferguson

Consumer returns constitute a substantial fraction of sales in the consumer electronics industry and often cannot be re-sold as new due to litigation concerns. Therefore, identifying the best joint pricing and disposition strategy is a challenging but important decision for consumer electronics OEMs. This paper investigates how an OEM should price new and refurbished products while allocating consumer returns between remarketing and warranty coverage options over the product's short life cycle.

2 - Worker Poaching in a Supply Chain: Enemy from Within?
Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Achal Bassamboo, Evan Barlow

Luring workers away from other firms (or poaching) has become a universal practice. Poaching between firms usually hurts firm profits through higher wages and higher worker turnover. We explore worker poaching between firms linked in a supply chain. We show that the supply chain relationship reverses some common conclusions from the labor economics literature. Furthermore, we show how and under what conditions worker poaching can, in fact, improve supply chain performance.

3 - Unsold versus Unbought Commitment: Minimum Total Commitment Contracts with Nonzero Setup Costs
Geoffrey Chua, Nanyang Technological University, Singapore, 639798, Singapore, geoffchua@pmail.ntu.edu.sg, Frank Youhua Chen, Xing Liu, Quan Yuan

We study a minimum total commitment where the buyer commits to purchase a minimum quantity of a single product from the supplier over the contract horizon. We consider non-stationary demand and per-unit cost, discount factor, and nonzero setup cost. Since existing method cannot solve this problem, we develop a new method based on a state transformation technique using unsold commitment instead of unbought commitment as state variable. We prove for the first time the optimality of a modified (s,S) policy. We also discuss some extensions to show the generality of our method's effectiveness.

4 - United We Stand, Divided We Fall: Strategic Supplier Alliances under Default Risk

Xiao Huang, Assistant Professor, Concordia University, 1455 de Maisonneuve Blvd W, Montreal, QC, H3G1M8, Canada, xiaoh@jmsb.concordia.ca, Tamer Boyaci, Mehmet Gumus, Saibal Ray, Dan Zhang

We study coalition formation among suppliers in a one downstream firm-n upstream suppliers framework. Each supplier faces an exogenous default risk and is endowed with certain risk-mitigating resources that can be shared within an alliance. We characterize the Coalition-proof stable alliance structure and stakeholders' equilibrium investment strategy and establish under what conditions will suppliers form large coalitions and when will they opt for only a few partners.

Global Healthcare Operations

Cluster: Tutorials

Invited Session

Chair: Pinar Keskinocak, Georgia Institute of Technology, 755 Ferst Dr. NW, Atlanta, United States of America, pinar.keskinocak@isye.gatech.edu

Co-Chair: Julie Swann, Harold R. and Mary Anne Nash Associate Professor, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, jswann@isye.gatech.edu

1 - Research in Public Health for Efficient, Effective, and Equitable Outcomes

Pinar Keskinocak, Georgia Institute of Technology, 755 Ferst Dr. NW, Atlanta, United States of America, pinar.keskinocak@isye.gatech.edu, Julie Swann, Turgay Ayer

Public health focuses on preventing disease, prolonging life, and promoting health in a population. In this tutorial, we discuss examples of work in several areas of public health including Access and Equity, Disease Screening, Chronic Diseases and Infectious Diseases. In each of these areas, we give a brief overview of challenging issues and related literature, give a specific example of a research topic, and point to potential future directions for research. We describe several trends that could impact future public health research including aging populations and an increase in electronic records. The tutorial is intended to introduce OR/MS researchers to the many opportunities for having a positive impact on specific populations and the society overall, through OR/MS research related to public health.

Hilton- Continental 6

Tackling Readmissions: From Policy to Practice

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Jonathan Helm, Indiana University, 1309 E. 10th St, Bloomington, IN, United States of America, helmj@indiana.edu

1 - Missed Opportunities in Preventing Readmissions: Redesigning Post-discharge Checkup Policies

Michael Hu, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, hum@mit.edu, Mariel Lavieri, Jonathan Helm, Kedi Wu, Ted Skolarus, Xiang Liu

Readmissions affect hundreds of thousands of patients annually, negatively impacting patients and tremendously burdening the healthcare system. Post-discharge checkups can reduce readmissions, but the methods behind designing effective checkup policies are poorly understood. Up to 67% of readmitted patients are readmitted before their first scheduled checkup. We examine the structure of optimal policies and develop policies that mitigate at least 32% more readmissions than current practice.

2 - Should Hospitals Keep Their Patients Longer? The Role of Inpatient Care in Reducing Readmissions

Song-Hee Kim, Yale School of Management, sk3116@columbia.edu, Carri Chan, Ann Bartel

Under the Affordable Care Act, hospitals with higher than expected 30-day readmission are being financially penalized. Using retrospective data on the over 6.6 million Medicare patients treated between 2008 and 2011, we develop an understanding of the potential impact of an inpatient intervention (keeping patients in the hospital for an extra day) versus providing outpatient interventions.

3 - Hospital Readmission Reduction Program: An Economic and Operational Analysis

Itai Gurvich, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu, Dennis Zhang, Jan Van Mieghem, Eric Park, Robert Young, Mark Williams

The Hospital Readmission Reduction Program is a new government policy that penalizes hospitals with excess readmissions. The policy benchmarks hospitals against similar peers and inherently introduces a game theoretic element to hospital decisions. We take an economic and operational (patient flow) view to map hospitals' characteristics to their readmission reduction decisions and quantify the effectiveness of the policy. We apply our model to data from hospitals in California.

4 - Reducing Readmissions through Scheduling and Staffing a Follow-up Organization

Jonathan Helm, Indiana University, 1309 E. 10th St, Bloomington, IN, United States of America, helmj@indiana.edu, Shanshan Hu, Sean Yu

Readmissions are an increasingly major problem for US healthcare organizations because of new reimbursement structures, government penalties and more. The medical literature has shown that following up with patients can have a major impact. We investigate scheduling and staffing rules for follow-ups to improve the effectiveness of follow-ups in a systematic way based on reallocating current medical staff time or contracting with an independent follow-up organization.

Hilton- Continental 7

Crowdsourcing

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Michael Wagner, University of Washington, Seattle, United States of America, mrwagner@uw.edu

1 - Managing Innovation in a Crowd

Mohamed Mostagir, University of Michigan, Ross School of Business, Ann Arbor, United States of America, mosta@umich.edu, Daron Acemoglu, Asuman Ozdaglar

A central problem in crowdsourcing innovation is that the difficulties of innovation tasks as well as the skills of crowdsourced labor are not known in advance. How can we then best match tasks to workers when we know neither the difficulties of the tasks nor the skills of the workers? We give a pricing mechanism for tasks that provides an incentive for workers to reveal their skills and that implements the optimal matching.

2 - Crowdsourcing Critical Fractiles from Overconfident Forecasters

Casey Lichtendahl, University of Virginia, 100 Darden Blvd, Charlottesville, United States of America, LichtendahlC@darden.virginia.edu, Yael Grushka-Cockayne

We present a model of overconfident forecasters and show how to optimally aggregate their critical fractiles into a consensus critical fractile for the newsvendor problem. We also introduce an incentive-compatible mechanism for eliciting critical fractiles that are well-calibrated. This mechanism provides a reward as a function of the consensus critical fractile.

3 - Mechanisms Design for Crowdsourcing: The Optimal Budget-Feasible Mechanism for Large Markets

Afshin Nikzad, Stanford University, 37 Angell Court, Stanford, Ca, 94305, United States of America, afshin.nikzad@gmail.com, Gagan Goel, Nima Anari

We consider a mechanism design problem in the context of large-scale crowdsourcing markets such as Amazon's Mechanical Turk: There is a requester who wants to hire workers to accomplish some tasks. Each worker gives some utility to the requester; each worker also has a minimum cost (only known to himself) that he needs to be paid for getting hired. We design a (provably optimal) direct revelation mechanism that picks the right set of workers to hire in order to maximize the requester's utility.

Joint Session M&SOM Supply Chain/BOM: Pricing from the Practitioner's Perspective

Sponsor: Manufacturing & Service Operations & Behavioral Operations Management

Sponsored Session

Chair: Wedad Elmaghraby, Associate Professor, University of Maryland, wedad_elmaghraby@rhsmith.umd.edu

1 - Revenue-Maximizing Dynamic Tolling

Robert Phillips, Columbia University, rp2051@columbia.edu

Increasingly, new highway capacity is being built by private companies who have the authority to set tolls to maximize revenue. We present a dynamic toll-setting algorithm that seeks to maximize revenue based on current and anticipated traffic. We discuss the real-world challenges in implementing the approach considering technical limitations, issues of public acceptance, and regulatory consideration.

2 - Pricing Mediated by Humans: The Role of Sales Rep Discretion

Loren Williams, Chief Data Scientist, EY, 55 Ivan Allen Jr. Blvd, Suite 1000, Atlanta, GA, 30308, United States of America, loren.williams@ey.com

Many observers hold the belief that permitting front line B2B sales reps to have pricing discretion leads to over discounting, while at the same time many firms execute their pricing with such a policy. In this talk we examine reasons that we might expect sales reps to over discount, some survey results on the prevalence of the practice of granting pricing discretion and some reasons that might explain the patterns observed.

3 - The Emperor has no Clothes! Issues and Opportunities to Enhance the Human Agent Role in PRM

Vedat Akgun, Director, Operations Research, Revenue Analytics, 3100 Cumberland Blvd, Suite 1000, Atlanta, GA, 30339, United States of America, vakgun@revenueanalytics.com, Jon Higbie

At Revenue Analytics we have had a unique opportunity to observe many companies' current and future Pricing and Revenue Management processes. Based on our experience and research, we will share insights that challenge perceptions that persist in public domain research. We will also share some success stories on how companies have achieved extraordinary benefits by dealing directly with the role of the human agent in the process.

Sustainability Impacts of Operational Choices in Energy Generation and Storage

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Gil Souza, Associate Professor, Indiana University, Kelley School of Business, Bloomington, IN, 47405, United States of America, gsouza@indiana.edu

1 - Combining Operations Management and Engineering Models to Manage and Value Electricity Storage

Yangfang Zhou, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, 178899, Singapore, helenzhou@smu.edu.sg, Nicola Secomandi, Stephen Smith, Alan Scheller-Wolf, Jay Apt

The extant literature on the management and valuation of grid-level electricity storage facilities often ignores their physical characteristics and operating dynamics (such as energy-capacity degradation). We develop a stochastic optimization model and apply it to realistic data to study the importance of modeling these features when determining the storage operating policy and resulting valuation, focusing on three state-of-the-art grid-level electricity storage technologies.

2 - Operations and Investment of Energy Storage in the Presence of Transmission Losses

Owen Wu, Indiana University, owenwu@indiana.edu, Roman Kapuscinski, Santhosh Suresh

Due to transmission losses, the value of energy storage depends on the location of its investment. We consider the problem of sizing and siting storage facilities on a grid, to minimize investment and production costs. We model this problem as a trade-off between centralizing storage capacity, that increases aggregation, or localizing storage capacity, that brings it closer to the end consumer. We provide intuition on how changes in system parameters will affect this choice.

3 - Building and Replacing Battery Capacity for Energy Shifting

Shanshan Guo, Doctoral Student, Indiana University, Kelley School of Business, Bloomington, IN, 47405, United States of America, guoshan@indiana.edu, Gil Souza, Shanshan Hu

Batteries may be used for energy shifting in the power system: storing electricity when the power supply is abundant and cheap, and releasing electricity when the supply is tight and more expensive. The batteries' effective (storage) capacity decays over time, and its deterioration speed is determined by the depth of discharge, which decreases in the battery capacity. This paper determines the optimal battery size and replacement time, as a function of energy shifting demands.

4 - Capacity Investment in Renewable Technology with Uncertain Yield

Shanshan Hu, Assistant Professor, Indiana University, Kelley School of Business, 1309 E. 10th St,, Bloomington, IN, 47405, United States of America, hush@indiana.edu, Wenbin Wang, Mark Ferguson, Gil Souza

Motivated by the penetration of renewable technologies, particularly in the energy sector, we study a firm's one-time strategic capacity investment in a portfolio of technologies that are used to meet stochastic demand. The renewable intermittency is modeled through stochastic capacity yield. We derive closed-form solutions for the optimal investment. Actual case studies demonstrate the effects of yield uncertainty and its correlation with demand.

Stochastic Alternatives: SFA and StoNED

Cluster: Data Envelopment Analysis

Invited Session

Chair: Timo Kuosmanen, Aalto University, Finland, timo.kuosmanen@aalto.fi

1 - Modeling Joint Production under Noise: Axiomatic Nonparametric Approach

Timo Kuosmanen, Aalto University, Finland timo.kuosmanen@aalto.fi, Andrew Johnson, Chris Parmeter

Stochastic data generating process of joint production is introduced where all inputs and outputs correlate with inefficiency and noise. We show that directional distance functions (DDF) are identified by an appropriate specification of the direction vector. A consistent nonparametric estimator of DDF is developed, which satisfies the axioms of the production theory. DDF of Finnish electricity distribution firms is estimated.

2 - Intra-Firm Wage Bargaining, Hold-Up, and Over-Employment: A Test of the Stole-Zwiebel Model

Ronald Warren, Professor of Economics, University of Georgia, Department of Economics, Terry College of Business, Athens, GA, 30602, United States of America, warren@uga.edu, Yongseung Han, Arthur Snow

We test the Stole-Zwiebel model of intra-firm wage bargaining in the presence of the threat of employee hold-up, using panel data on savings banks in Korea. We find evidence of allocative inefficiency, in the form of over-employment of labor, and equality of the bargain-determined wage and the competitive wage, consistent with the key predictions of the model.

3 - A Multivariate Seminonparametric Bayesian Concave Regression Method to Estimate Stochastic Frontiers

Andrew Johnson, Texas A&M, 3131 TAMU, College Station, TX, United States of America, ajohnson@tamu.edu, Jose Luis Preciado Arreola

We estimate a production frontier using Multivariate Bayesian Convex Regression and several distributional assumptions for inefficiency combining Bayesian semi-parametric regression and parametric Bayesian inefficiency modeling. Only axiomatic restrictions are imposed on the production function. The concavity constraints are automatically satisfied by our regression method, while monotonicity is imposed through a rejection method. The method can be used in data sets with up to 3000 observations.

4 - Orthogonality Conditions for Identification of Joint Production Technologies Axiomatic

Chris Parmeter, University of Miami, 5250 University Drive, Miami, United States of America, cparmeter@bus.miami.edu

This paper sheds some new light on this issue from the perspective of the production theory. We introduce a stochastic data generating process of joint production where all inputs and outputs correlate with inefficiency and noise. We show that an appropriately specified direction vector can provide the orthogonality conditions required for identification of the directional distance functions.

Information, Risk Management, and Production Strategies

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Ying-Ju Chen, Berkeley- IEOR, 4121 Etcheverry Hall, Berkeley, United States of America, chen@ieor.berkeley.edu

1 - On the Supply Chain Finance Role of 3PL's Procurement Service

Gangshu Cai, Santa Clara University, OMIS Department, Santa Clara, CA, 95053, United States of America, gcai@scu.edu, Xiangfeng Chen, Jing-Sheng Song

Some third-party logistics (3PL) firms have taken the role of procurement for the retailers in addition to the traditional shipping service. Our analysis indicates that there exists a Pareto zone where all firms benefit from the procurement service compared with the traditional pure logistics service.

2 - Supply Diagnostic Incentives in New Product Launch

Mehmet Gumus, Associate Professor of Operations Management, McGill University, 1001 Sherbrooke Street West, Bronfman Building, Montreal, QC, H3A 1G5, Canada, mehmet.gumus@mcgill.ca, Mohammad Nikoofal

In launching new products, the newness of the production leads to unexpected reliability issues on supply side. The adverse effect of supply risk can be mitigated via test production. We explore how such a diagnostic technology investment may affect both incentive and information asymmetries across channel partners.

3 - A Bayesian Nonparametric Mixture Model for Logistics Disruption Risk Assessment

Yan Shang, PhD Candidate, Duke University, 845 Ivy Meadow Ln, Apt 3D, Durham, NC, 27707, United States of America, ys79@duke.edu, David Dunson, Jing-Sheng Song

We develop a Bayesian nonparametric (BNP) mixture model to estimate multi-stage logistics service delay distributions. These estimates allow us to separate recurrent and disruption risks, which helps to devise suitable hedging strategies. They can also be used to rank service supplier reliability, aiding supplier selection decisions. We apply this method to a one-year international air cargo dataset and use the results to make suggestions on airport cargo warehouse capacity planning.

4 - Nonlinear Pricing with Consumer Satiation

Hui Xiong, Huazhong University of Science and Technology, 1037 Luoyu Road, Wuhan, 430074, China, zsjxh@163.com, Ying-Ju Chen

In various scenarios, consumers may get satiated with the products, and the degree of satiation is directly associated with their prior experiences. We find that the ex ante quantity is first decreasing and then increasing in the satiation rate. Further, the two-stage information asymmetries may give rise to a rationale for the quantity upward distortion when the consumers' preferences are highly sensitive to the first-stage consumptions.

Customer Behavior and Call Center Management

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Philipp AfËche, Rotman School of Management; University of Toronto, 105 St.George Street, Toronto, Canada, Philipp.Afeche@Rotman.Utoronto.Ca

1 - Service Time Sensitivity to Load: Who is to ìBlameî?

Pnina Feldman, UC Berkeley, Haas School of Business, 2220 Piedmont Ave, Berkeley, CA, 94720, United States of America, feldman@haas.berkeley.edu, Galit Yom-Tov, Jun Li

The service operations literature typically assumes that firms control service times and that those are independent of the time customers spend waiting. Empirical evidence suggests otherwise. In fact, the time customers spend in line affects their expected service length. The reasons for that are many and involve agents and customers mechanisms for adaptations to load. Using call center data, we examine such correlations, and distinguish between customer and agent effects.

2 - Customer Learning in Call Centers

Seyed Emadi, Assistant Pofessor, Kenan-Flagler Business School, 300 Kenan Drive, Chapel Hill, NC, 27599, United States of America, Seyed_Emadi@kenan-flagler.unc.edu, Baris Ata, Jay Swaminathan

We investigate the impact of customers' repeat contacts on their abandonment behavior. We use a Bayesian learning framework to model customers' behavior and estimate their parameters from a call center data.

3 - Optimal Staffing under Endogenous Arrivals with Heterogeneous Customer Time-of-Service Preferences

Yang Li, Doctoral Student, Rotman School of Management, University of Toronto, 105 St. George Street, Toronto, ON, M5S3E6, Canada, Yang.Li10@rotman.utoronto.ca, Philipp AfËche

The service operations literature usually treats arrivals as exogenous processes. However, arrival processes may be endogenous in many settings. That is, customers may account for system congestion in choosing their time of service. We propose an equilibrium model that captures how rational customers with heterogeneous preferences decide their time-of-service. We also study the optimal staffing policies, taking into account customers' time-of-service choices.

4 - using Estimated Patience Levels to Optimally Schedule Customers

Ramandeep Randhawa, USC, Marshall School of Business, Los Angeles, CA, United States of America, ramandeep.randhawa@marshall.usc.edu, Achal Bassamboo

In M/M/N+G queueing systems, even though arriving customers appear identical, as they wait in the queue, an update can be formed on their willingness to wait. In this manner, as time progresses, customers become differentiated. We exploit this dimension of customer heterogeneity to construct scheduling policies that dynamically prioritize customers based on their time in the system in order to optimize any given system performance metric.

Choice Models in Revenue Management and Pricing IV

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Jeffrey McGill, Professor, Queen's University, Queen's School of Business, 143 Union Street, Kingston, ON, K7L3N6, Canada, jmcgill@business.queensu.ca

Co-Chair: Mikhail Nediak, Queen's University, Kingston, Ontario, Canada

1 - Pricing under the Nested Attraction Model

Tim Huh, Associate Professor, University of British Columbia, Sauder School of Business, Vancouver, BC, V6T 1Z2, Canada, tim.huh@sauder.ubc.ca, Hongmin Li

We develop a solution approach to the centralized pricing problem of a nested attraction model with a multi-stage tree structure. We identify conditions under which the optimal solution can be uniquely determined and characterize the optimal solution as a fixed-point of a single variable.

2 - Sequential Price Competition with Unknown Demand Functions

Yonatan Gur, Assistant Professor, Stanford University, 655 Knight Way, Stanford, CA, United States of America, ygur@stanford.edu, Omar Besbes

In most dynamic pricing problems demand depends on prices selected by competitors. This, in conjunction with the uncertainty about the underlying demand leads to dynamic interactions among competitors. We study such interactions and appropriate equilibrium notions.

3 - Probabilistic Choice Models for Aggregate Pricing in RM markets

Srini Krishnamoorthy, Visiting Assistant Professor - Management Science, A.B. Freeman School of Business, Tulane University, New Orleans, LA, 70118, United States of America, Srinivas.Krishnamoorthy@tulane.edu

Standard game theoretic methods fail to explain aggregate pricing decisions of travel capacity providers that often appear to be economically irrational. We use probabilistic choice models to obtain more realistic predictions of provider behavior in competitive revenue management markets.

4 - Revenue Management under a Markov Chain Based Choice Model

Jacob Feldman, Cornell University, Ithaca, NY, United States of America, jbf232@cornell.edu, Huseyin Topaloglu

We study both static and dynamic assortment problems under a Markov chain based choice model. We provide a novel LP formulation for the static assortment optimization problem whose geometry allows us to develop efficient solution approaches for the network revenue management problem.

Hilton- Franciscan D

Integrating Pricing and Supply Chain Planning

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Mike Freimer, VP Science & Research, PROS, 101 Montgomery Street, Suite 400, San Francisco, CA, 94104, United States of America, mfreimer@pros.com

1 - Coordinating Pricing and Production Decisions for Commodity-Based Manufacturers

Mike Freimer, VP Science & Research, PROS, 101 Montgomery Street, Suite 400, San Francisco, CA, 94104, United States of America, mfreimer@pros.com

Price volatility has become increasingly dramatic in agricultural and other commodity industries, causing significant pain for manufacturers who suffer the effects of volatility on both upstream procurement and downstream sales. We present an optimization framework that allows manufacturers to react more quickly to changes in the marketplace, and to make coordinated pricing, production, inventory and procurement decisions.

2 - Demand-Driven Production Optimization for Commodity-Based Manufacturers

Evan Davidson, Senior Scientist, PROS, 101 Montgomery Street, Suite 400, San Francisco, CA, 94104, United States of America, edavidson@pros.com

In this talk, we round out the description of an optimization framework for commodity-based process manufacturers. We focus on the supply side of the problem, describing how procurement, production, and inventory planning can be coordinated with allocation and pricing to maximize overall profitability. We discuss how the procurement optimization problem can be viewed as the mirror image of the pricing problem.

3 - Supply Chain Analysis of Contract Farming

A. Serdar Simsek, Instructor/Researcher, Cornell ORIE, 282 Rhodes Hall, Ithaca, NY, United States of America, as2899@cornell.edu, Awi Federgruen

Contract farming sustains the operations of vulnerable farmers while better positioning the manufacturers to manage their supply risks. In this setting, a manufacturer who owns several production plants – each with a random demand for the crop – selects the set of farmers that minimizes her expected procurement and distribution costs before the growing season. We present two solution methods to this problem. We applied our model to a company contracting with hundreds of small farmers in India.

4 - Structural Results for a Capacity Sharing Problem

David McCaffrey, Senior Scientist, PROS, 3100 Main Street, Houston, TX, 77002, United States of America, dmccaffrey@pros.com, Darius Walczak

We consider a capacity sharing problem for a single leg airline reservation process with two compartments, business and economy, in which business reservations are accepted only into business, but economy reservations are accepted into either economy or business. We define the dynamic programming equation for this problem and show that the 2-dimensional value function is discretely sub-modular and concave in both variables. We present examples and consider generalizations to more compartments.

■ SD20

Matching Markets

Cluster: Matching and Market Design (in honor of Al Roth)

Invited Session

Chair: Yash Kanoria, Columbia Business School, 404 Uris Hall, New York, NY, 10027, United States of America, ykanoria@columbia.edu

1 - Stable Matching in Large Economies

Fuhito Kojima, Stanford University, 579 Serra Mall, Stanford, CA, 943055007, United States of America, fkojima@stanford.edu

Complementarities of preferences have been known to jeopardize stability of two-sided matching markets, yet they are a pervasive feature in many matching markets. In large markets, we demonstrate that if each firm's choice changes continuously as the set of available workers changes, then there exists a stable matching even if firm preferences exhibit complementarity. Building on this result, we show that there exists an approximately stable matching in any large finite economy.

2 - The Prior-Independence Approach

Inbal Talgam-Cohen, PhD Candidate, Stanford University, 86 Hulme Ct, Apt 108, Stanford, CA, 94305, United States of America, italgam@stanford.edu, Tim Roughgarden

The matching literature has recently begun to consider priors on agents' utilities. One of the barriers to adopting this potentially very fruitful approach is that priors add significant informational assumptions to the model. We survey a successful alternative approach from mechanism design called prior independence, which alleviates such assumptions while still reaping most benefits. We discuss both sampling-based methods and methods based on ensuring sufficient competition in the market.

3 - The Structure of the Core in Assignment Markets

Yash Kanoria, Columbia Business School, 404 Uris Hall, New York, NY, 10027, United States of America, ykanoria@columbia.edu, Daniela Saban, Jay Sethuraman

Assignment markets (Shapley & Shubik 1971) involve matching with transfers, as in labor markets and housing markets. We consider a two-sided assignment market with agent types and stochastic structure similar to models used in empirical studies. Each agent has a randomly drawn "productivity" associated with each type on the other side. We characterize how the structure of the core, i.e., the set of stable outcomes, is determined by market characteristics.

Transportation and Routing under Uncertainty I

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Arthur Flajolet, MIT, Cambridge, MA, United States of America, flajolet@mit.edu

1 - Reliable Vehicle Routing Problems (RVRP) with Correlated Parameters

Carlos Felipe Ruiz, Universidad de los Andes, Cra 1 Este No 19A - 40, Bogota, DC, 0000, Colombia, cf.ruiz1135@uniandes.edu.co, Andres Sarmiento, Raha Akhavan Tabatab, Andrés L. Medaglia, Jorge Mendoza

Reliable vehicle routing problems consist of designing time-dependable transportation routes of minimal expected cost over a network where travel and service times are represented by random variables. In this work we consider the case in which the random variables describing travel times may be correlated. We propose a flexible methodology that comprises a state-of-the-art routing engine and is able to effectively handle any travel and service time distribution and pairwise correlations.

2 - Handling Travel Time Uncertainty in City Logistics

Utku Can Kunter, Research Assistant, Middle East Technical University, ‹niversiteler mah. ODTU Kampüsü, Endüstri Mühendisligi Bölümü Oda No:325, Ankara, 06800, Turkey, kunter@metu.edu.tr, Cem Iyigün, Haldun Süral

City logistics aims to design freight distribution networks on a large scale. In this study, we consider the travel time uncertainty in 1-tier city logistics systems. We propose approaches to analyze the effect of travel time stochasticity on the location decisions of city distribution centers. We provide computational results to compare the performances of the proposed approaches with those of deterministic methods.

3 - Dynamic Technician Routing with Experience-based Service Times

Xi Chen, University of Iowa, IA, United States of America, xi-chen-3@uiowa.edu, Barrett Thomas, Michael Hewitt

We study a dynamic technician routing problem with experience-based service times. We use well-established models from the psychology community to model how gains in experience impact service times. We assume that the volume and location of customer requests are uncertain. We model the problem as a Markov decision process with the objective of minimizing the expected total makespan over a finite horizon. We also propose a number of approximate dynamic programming schemes and present results.

4 - Robust Adaptive Routing under Uncertainty

Arthur Flajolet, United States of America, flajolet@mit.edu, Patrick Jaillet, Sebastien Blandin

We consider an adaptive stochastic shortest path problem with independent random arc costs. Our contributions are two-fold. First, we extend a pre-existing dynamic programming formulation to a large class of objective functions. Second, in an attempt to mitigate the impact of scarce information on the arc costs, we develop a robust counterpart that relies on lower-order statistics as opposed to entire arc cost probability distributions for the nominal problem.

Preparing for and Responding to Disaster with Tools of OR

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Martijn Mes, University of Twente, P.O. Box 217, Enschede, 7500 AE, Netherlands, m.r.k.mes@utwente.nl

1 - Empirical Study on People's Route Choice Behavior in Response to the Reopening of the I-35W Bridge

Sharon(Xuan) Di, University of Minnesota, 500 Pillsbury Dr. SE, Minneapolis, MN, 55455, United States of America, dixuan@umn.edu, Henry X. Liu, Shanjiang Zhu, David M. Levinson

Fewer people used the new I-35W Bridge after its reopening in 2008 in Minneapolis though it provided substantial time saving to commuters. The classical route choice model assumption that people always take the shortest path fails to capture the above anomalous phenomenon. This study proposes a boundedly rational route choice model to explain the observation and the parameter related to bounded rationality is estimated from a GPS study conducted before and after the reopening of the bridge.

2 - Objective Decision-Making Tools for Infrastructure Investments to Combat Impacts of Sea Level Rise

Ali Asadabadi, Graduate Research Assistant, University of Maryland, College Park, College Park, College Park, MD, 20742, United States of America, ali.asadabadi@gmail.com, Elise Miller-Hooks

Probabilistic projections of sea level rise and related intensified storm surges can affect coastal transportation infrastructure through temporary or permanent inundation. Mitigative and adaptive actions can be taken to combat these impacts. We will present optimization-based, decision-making techniques to aid in choosing among these options.

3 - Goal Programming Model for Integrated Relief Supply and Network Restoration-Hazus based Application

Kasin Ransikarbum, Clemson University, 103 Freeman Hall, Clemson, SC, 29634, United States of America, kransik@g.clemson.edu, Scott Mason

We present a goal programming model for integrated relief supply and network restoration operations. Our model provides fairness-based solutions for constrained capacity, budget, and resource problems. We analyze efficient frontiers between objectives and discuss compromise solutions when targets or goals are desired. Our results are illustrated with loss data in South Carolina generated from Hazus software to provide decision makers with candidate supply distribution and restoration plans.

4 - Integrated Tactical and Operational Planning of Police Helicopters

Martijn Mes, University of Twente, P.O. Box 217, Enschede, 7500 AE, Netherlands, m.r.k.mes@utwente.nl

We propose a tactical planning model to support various decisions regarding the use police helicopters, which include shift planning, standby time and the positioning of helicopters, while taking into operational decisions such as the starting times and optimal routes of surveillance flights. Decisions are based on historic data of high impact crimes. We also present a trade-off between maximizing the response time and an equitable distribution of helicopter capacity over the Netherlands.

Rich Vehicle Routing Problems II

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Han Zou, University of Southern California, Los Angeles, CA, 90089, United States of America, hanzou@usc.edu

1 - A Multi-start Biased Method for the Vehicle Routing Problem with Backhauls and Environmental Impact

Javier Faulin, Professor, Public University of Navarre, Dept Statistics and OR, Campus Arrosadia, Pamplona, NA, 31006, Spain, javier.faulin@unavarra.es, Adrian Serrano, Javier Belloso, Angel Juan, Alejandro Garcia del Valle

We solve the Vehicle Routing Problem with Backhauls (VRPB) using a multi-start approach based on an adaptation of the SR-GWCS-CS method introduced by Juan et. al (2011). Later, the environmental impact associated with CO2 emissions was calculated using the Ubeda et al. (2012) methodology. Some classical benchmark instances for the VRPB were selected in order to compare the efficiency of our approach. Promising solutions have been obtained from our method implementation.

2 - An Adaptive Large Neighborhood Search Heuristic for the PDP with Fixed Scheduled Lines Services

Veaceslav Ghilas, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612 AZ, Netherlands, v.ghilas@tue.nl, Emrah Demir, Tom Van Woensel

The investigated problem concerns scheduling a set of vehicles to serve the freight requests such that a part of the journey can be carried out on fixed scheduled lines transportation service. We propose an Adaptive Large Neighborhood Search heuristic algorithm to solve the problem. Extensive computational results provide a clear understanding of the benefits of using fixed scheduled services as part of the freight's journeys.

3 - A Large Neighborhood Search Approach for the Truck and Trailer Routing Problem

Wentao Zhang, University of Southern California, Los Angeles, CA, United States of America, wentao@usc.edu

In the truck and trailer routing problem (TTRP), a fleet of trucks and trailers is used to serve a set of customers, some of which are only accessible by trucks, while the others are also accessible by a truck coupled with a trailer. A large neighborhood search heuristic is developed to solve the problem. Operators are designed to take care of the special constraint of TTRP. Our competitive numerical results indicate the effectiveness of this relatively simple approach.

4 - An Intelligent Look-ahead Framework for the Dynamic Vehicle Routing Problem

Han Zou, University of Southern California, Los Angeles, CA, 90089, United States of America, hanzou@usc.edu, Maged Dessouky

The problem concerns routing a fleet of capacitated vehicles in real time to fulfill both advanced and dynamic orders from a set of known customers. We develop an intelligent look-ahead framework that makes predictions based on historical information, instantly accepts or rejects dynamic orders, and constructs partial vehicle routes. Our approach has the potential to outperform both a priori routing and total dynamic dispatching schemes when the uncertainty level is moderate.

Modeling of Emerging Sensor Technologies

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Pablo Durango-Cohen, Northwestern University, 2145 Asbury Avenue, Evanston, United States of America, pdc@northwestern.edu

1 - Analytics Approach to Support Health-monitoring and Management of Transportation Infrastructure

Pablo Durango-Cohen, Northwestern University, 2145 Asbury Avenue, Evanston, United States of America, pdc@northwestern.edu, Yikai Chen

Motivated by recent technological advances, we describe the development and validation of a statistical framework to support health-monitoring and management of transportation infrastructure. The framework consists of formulation of structural time-series models to explain, predict, and control for common-cause variation, and use of multivariate control charts to detect special-cause variation. We present several examples from an in-service bridge to validate the framework.

2 - Utilizing Mutiple Wireless Roadside Sensors At Intersections

David Kim, david.kim@orst.edu, Nadia Bathaee, SeJoon Park, Alireza Mohseni, David Porter

This research examines the estimation of vehicle time-distance trajectory through an intersection utilizing the data collection capabilities of multiple wireless roadside sensors that have been deployed along an intersection. Prior research with Bluetooth wireless roadside sensors show that signal strength data collected when data is obtained from a wireless device present in a vehicle can be used to estimate when the vehicle is close to passing a sensor. This capability is exploited through the development of portable Bluetooth wireless data collection units that communicate and synchronize time utilizing a Zigbee mesh network.

3 - Penetration Requirement of Mobile Sensing Data for Arterial Performance Measurement

Peng Hao, UC Riverside, Riverside, CA 92507, United States of America, haop@cert.ucr.edu, Xuegang (Jeff) Ban

This paper investigates the penetration requirement of mobile data to generate satisfactory performance measures for urban arterials. The results will help decision makers to assess the necessity and feasibility of mobile sensing at a given urban location or area.

4 - Real Time Freeway Traffic State Estimation and Prediction with a p-detector Based Approach in a Lagrangian Framework
Kerem Demirtas, Research Assistant, Arizona State University, Tempe, AZ, 85281, United States of America, kerem.demirtas@asu.edu, Zhuoyang Zhou, Pitu Mirchandani, Xuesong Zhou

Along with the recent technological developments, the availability of Lagrangian measurements become more widely used in real time traffic management applications. In this talk, we present a fast and novel approach to the freeway state estimation and prediction problem, that is based on a p-detector method in a Lagrangian sensing framework. Preliminary results show the accuracy of our proposed method.

Advances in Routing and Scheduling Problems

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Hai Wang, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, wanghaimit@gmail.com

1 - Dynamic Hierarchical Modeling of Vehicle Routing Problem in Urban Supply Chains
Tao Yao, tyy1@engr.psu.edu, Terry Friesz, Yiou Wang, Ke Han, Hongcheng Liu

This research proposes a substantial extension of dynamic vehicle routing problem (VRP) formulation to a dynamic Stackelberg game model that takes into account the congestion as a result of freight activities among the background passenger traffic in urban freight planning. The model incorporates the dynamic VRP with dynamic traffic assignment problems by explicitly capturing their interplay on a network. We find that the routing decisions that explicitly consider congestions yields a significantly lower cost than the dynamic VRP solutions.

2 - Dynamic Vehicle Routing and Pricing with Look Ahead for Taxi Fleet
Hamid R. Sabarshad, Ryerson University, Toronto, ON, hsabarsh@ryerson.ca, Joseph Y.J. Chow

We propose a dynamic dial a ride and pricing problem with non-myopic policies for last mile transit, one with time-dependent non-homogeneous Poisson process for customer demands. Two policies are considered: customer-vehicle allocation, and dynamic fare pricing. The policy proposes a new fare structure which accounts for extra travel distance by anticipating the value of having the vehicle at the new location. The proposed model is compared against an "allocation only" queueing approach from Hyytia et al. (2012).

3 - Scheduling and Routing Operation of a Last Mile Transportation System
Hai Wang, PhD Candidate, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, 02139, United States of America, wanghaimit@gmail.com

We describe a model that considers a last mile transportation system as a batch arrival, batch service, and multi-server queueing system. We present several methodologies to operate the system through near-optimal scheduling and routing decisions. Technically the model focus on "multi-server queue operation with flexible service combinations."

4 - Vehicle Routing with Flexible Delivery Locations
Daniel Gartner, Carnegie Mellon University, The H. John Heinz III College, Pittsburgh, PA, 15213, United States of America, dgartner@andrew.cmu.edu, Alexander Düge, Markus Frey, Rainer Kolisch

We present a new extension of the vehicle routing problem (VRP): The VRP with flexible delivery locations (VRPFDL). In the VRPFDL, a job not only corresponds to exactly one location but has to be performed at one out of a set of possible locations. In order to solve the VRPFDL we present a Dantzig-Wolfe formulation which is solved by means of branch-and-price. The column generation's subproblem is treated as an elementary shortest path problem with resource constraints (ESSPRC).

Location Optimization II

Sponsor: Location Analysis

Sponsored Session

Chair: Alan Murray, Professor, Drexel University, Center for Spatial Analytics and Geocomp, College of Computing and Informatics, Philadelphia, PA, 19104, United States of America, amurray@drexel.edu

1 - Exploiting Spatial Properties in Location Optimization
Alan Murray, Professor, Drexel University, Center for Spatial Analytics and Geocomp, College of Computing and Informatics, Philadelphia, PA, 19104, United States of America, amurray@drexel.edu

This paper details properties of space and spatial arrangement that can be relied upon to establish and solve a number of location models. Models are presented for which this is true, and application results are demonstrated.

2 - High Performance Computing to Optimize Spatial Coverage
Ran Wei, Oregon State University, 104 CEOAS Admin BLDG, Corvallis, OR, 97331, United States of America, rwei@coas.oregonstate.edu, Alan Murray

This paper addresses a continuous space problem focused on complete spatial coverage of continuously distributed demand. A new solution approach is developed through an iterative bounding scheme based on high performance computing techniques.

3 - Easy and Not so Easy Continuous Multifacility Location Problems
Justo Puerto, Universidad de Sevilla, Universidad de Sevilla, Sevilla, Spain, puerto@us.es, Victor Blanco

This talk presents a methodology for solving a class of continuous, multifacility location problems, in any dimension and l_p-norms: 1) by a new mixed integer second order cone programming formulation and 2) by a sequence of semidefinite programs that converges to the solution of the problem; each of these relaxed problems solvable in polynomial time. We apply dimensionality reductions of the problems by sparsity and symmetry to be able to solve larger problems.

4 - A Bi-objective Model for Designing Safe Walking Routes for School Children and its Applications
Ken-ichi Tanaka, Keio University, 3-14-1 Hiyoshi, Kohoku-ku, Yokohama, Japan, ken1tnk@ae.keio.ac.jp, Yuichiro Miyamoto, Ryuhei Miyashiro

We consider the problem of designing safe walking routes from school to homes for school children. Children are thought to be safer when walking together in groups rather than alone. We propose a bi-objective model in which both the total distance walked alone and the total distance traveled by children are minimized. We apply the problem to road networks and analyze Pareto optimal solutions. We also apply heuristic methods to solve real-size instances.

1 - AAS Dissertation Prize Finalists

Thomas Vossen, University of Colorado Boulder, Leeds School of Business, UCB0419, Boulder, CO, 80309, United States of America, Vossen@Colorado.edu

This session will feature finalists for the Aviation Applications dissertation prize. The Aviation Applications dissertation prize winner will be announced in the business meeting at INFORMS.

2 - The Airline Container Loading Problem with Pickup and Delivery

Virginie Lurkin, PhD Student, Université de Liège, Rue Louvrex 14, Liège, 4000, Belgium, vlurkin@ulg.ac.be, Michael Schyns

We look into the problem of optimizing the loading of a set of containers into cargo aircraft serving multiple airports. Due to the pickup and delivery operations, this problem is simultaneously a weight and balance problem and a sequencing problem. Our objective is to minimize fuel and handling operations costs. We resort to a mixed integer linear program. We show that our approach yields better solutions than traditional manual planning, which results in substantial cost savings.

3 - Wind Models and Stochastic Programming Algorithms for En Route Trajectory Prediction and Control

Clayton Tino, Resource Management Architect, Virtustream, Inc., 6 Concourse Pkwy NE #1930, Atlanta, GA, 30328, United States of America, clayton.tino@gmail.com

There is a need for a fuel-optimal required time of arrival (RTA) mode for aircraft flight management systems capable of enabling controlled time of arrival functionality in the presence of wind speed forecast uncertainty. A computationally tractable, two-stage stochastic algorithm utilizing a data-driven, location-specific wind forecast uncertainty model to generate forecast uncertainty scenarios is examined.

Hilton- Union Sq 9

New Directions in Understanding Buyer-Supplier Relations

Cluster: Strategy Science

Invited Session

Chair: Todd Zenger, Washington University, St. Louis, Missouri, United States of America, zenger@wustl.edu

1 - Discovering Value in Buyer-supplier Relationships

Olivier Chatain, HEC Paris, France, chatain@wharton.upenn.edu, Peter Zemsky

Relevant information about how much value can be created in a buyer-supplier relationship is often difficult to evaluate before exchange takes place. For instance, in professional services, the fit between buyers and suppliers can be hard to assess ex ante. We use a formal model to explore the implications of the lack of ex ante observability of bilateral value creation on the process of value discovery. We explore how the cost of resolving the uncertainty about value creation potential is magnified or minimized due to conflicts about the distribution of value.

2 - Contracts and Trust: Foundations and Emerging Directions

Laura Poppo, University of Kansas, lpoppo@ku.edu

Cooperative strategy has emerged as a paradigm for examining interfirm exchanges, with trust and contracts as focal concepts. After reviewing the significant work which has explored these facets, I will explore three under-researched and emerging areas: 1) different bases of trust; 2) asymmetric trust; and 3) the emergence of cooperation.

3 - The Fragility of Trust in Interorganizational Relationships

Bart S. Vanneste, University College London, United Kingdom, b.vanneste@ucl.ac.uk, Onesun Steve Yoo

We investigate under which conditions interorganizational trust is fragile (i.e., easily lost). We propose a generalized trust game, which has the well-known trust game as a special case. Using a formal model, we show that whether interorganizational trust is fragile depends on situation characteristics: value (creation vs. capture), risk (scope for failure vs. opportunism), task (difficulty vs. temptation), and fragility of trustworthiness (competence vs. benevolence).

4 - Creating and Capturing Value in Repeated Exchange Relations: Managing a Second Paradox of Embeddedness

Daniel Elfenbein, Washington University, elfenbein@wustl.edu, Todd Zenger

Prior studies reveal a strong relationship between repeated exchange and value in exchange relations, suggesting buyers may focus exchange to maximize relationship value. However, by distributing exchange, buyers may position themselves to capture more of the value created. We label this dilemma the second paradox of embeddedness, distinguishing it from Uzzi's (1997) paradox driven by technological uncertainty. Using data on the procurement activities of a large, diversified manufacturing company, we then test for supplier and buyer behavior consistent with this paradox.

5 - Buyer-supplier Relations: Exploring the Contractual Micro-foundations

Tomasz Obloj, HEC Paris, tobloj@gmail.com

The design and ensuing effectiveness of the buyer-supplier relationships interact in an important way with internal contractual structures and individual characteristics of organizational members. Yet, much remains to be understood about the micro-foundations of productive relationships. Unpacking these interactions, I study two sources of behavioral heterogeneity across and within firms: social comparison costs and transactional integrity of economic actors. I then discuss the broader implications of the behavioral micro-foundations for productive relationships.

Hilton- Union Sq 10

Supply Chain and Scheduling

Cluster: Scheduling and Project Management

Invited Session

Chair: Zhi-Long Chen, Professor, University of Maryland, R.H. Smith School of Business, College Park, MD, 20742, United States of America, ZChen@rhsmith.umd.edu

1 - Supply Chain Scheduling in Steel-making and Hot Rolling Operations

Lixin Tang, Chair Professor, Northeastern University, 3-11 Wenhua Road, Heping District, Shenyang, 110004, China, lixintang@mail.neu.edu.cn, Hongzhi Luo

We study a supply chain scheduling problem in steel-making and hot rolling operations. In steel making, orders with similar steel grades are grouped into charges, which are produced as a batch in oxygen converters. In hot rolling, slabs are chosen and produced in a serial of capacitated turns. We propose a column-generation-based algorithm for this problem with additional cuts. We test our algorithm on randomly generated data, and show the effectiveness of the proposed algorithm.

2 - Managing Engineering Design for Competitive Sourcing in Closed-Loop Supply Chains

Nagesh Murthy, Associate Professor, University of Oregon, Lundquist College of Business, Eugene, OR, 97403, United States of America, nmurthy@uoregon.edu, Tolga Aydinliyim

Using a game theoretical framework, we study the joint design and procurement decisions of a manufacturer who chooses between integral or modular design alternatives, and the pricing decisions made by its suppliers. The integral design requires more raw materials per pound of final product and prevents yield loss due to final joining. However, the modular design is simpler, resulting in a more competitive supplier base and allows the suppliers to rely less on reverse material flows.

3 - Integrated Production and Two-stage Delivery Scheduling

Feng Li, Northeastern University, Shenyang, China, fengli055@gmail.com, Zhi-Long Chen, Lixin Tang

We study several integrated production and two-stage delivery scheduling problems that arise in practical make-to-order settings in several industries. In these problems, make-to-order products are first processed in a plant, then delivered from the plant to a pool point, and finally delivered from the pool point to customer sites. We propose algorithms and analyze their performance theoretically and computationally.

■ SD31

Theory Development, Measurement and Testing in Service Science

Sponsor: Service Science

Sponsored Session

Chair: Aleda Roth, Professor, Clemson University, 100 Sirrine Hall, Clemson, SC, United States of America, aroth@clemson.edu

1 - Innovative Experimental Approaches for Behavioral Service Research

Liana Victorino, Assistant Professor, University of Victoria, Peter B. Gustavson School of Business, PO Box 1700 STN CSC, Victoria, BC, V8W 2Y2, Canada, lianav@uvic.ca, Mike Dixon, Rohit Verma

From observation to participation to co-production to co-creation, service operations require customer engagement. Therefore to investigate behavioral issues for service design, researchers must leverage innovative methodologies such as video experiments or illustrated written scenarios. We review examples and offer suggestions for newer applications of experimental approaches for service research.

2 - Success and Failure of Technology-based Innovations in Service Encounters

Min Kyung Lee, Student, Clemson University, 100 Sirrine Hall, Clemson, SC, 29634-1305, United States of America, minl@g.clemson.edu, Mike Dixon, Rohit Verma, Aleda Roth

Technology-based innovations are introduced to increase efficiency and enhance service delivery. However, not every technology is successful for service industry. We present customer usage and preference of technology-based innovations in the US restaurant industry to demonstrate the success or failure of technology-based innovations.

3 - Managerial and Employees' Perceptions of Improvisation in Service Settings: A Multigroup Analysis

Enrico Secchi, Assistant Professor, University of Victoria, Gustavson School of Business, PO Box 1700 STNCSC, Victoria, BC, V8W2Y2, Canada, esecchi@uvic.ca, Aleda Roth, Rohit Verma

This paper tests a model of antecedents and consequences of Service Improvisation Competence-the ability of service delivery employees to promptly deviate from established processes when needed-across samples of hotel managers and employees. We find a mismatch between service design choices and their realization in the service encounter.

4 - Efficiency Analysis of U.S. and Indian Banks: Theory and Evidence

Sriram Venkataraman, Assistant Professor, University of South Carolina, Department of Management Science, Moore School of Business, Columbia, SC, 29208, United States of America, sriram.venkataraman@moore.sc.edu, Aleda Roth, Paul Wilson

By integrating diffusion theory from marketing literature and path dependency theory from economics into service operations, we compare and contrast the efficiency of U.S. and Indian banks. We find that Indian banks have caught up to U.S. banks in terms of efficiency after the entry of foreign banks into India.

■ SD32

Hilton- Union Sq 12

Data Science in Online Retailing

Sponsor: Service Science

Sponsored Session

Chair: Zhiwei (Tony) Qin, Data Scientist, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, tqin@walmartlabs.com

1 - Mixtures of Multivariate Dynamic Linear Models for Demand Forecasting in the Long-Tail Environments

Shubankar Ray, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, SRay@walmartlabs.com, Abhay Jha

We model multivariate time series via dynamic regressions of cross-sectionally correlated sales (from similar products) on structural multivariate Gaussian processes. Bayesian machinery is used to continuously ensemble/learn infinitely many dynamic regressions with new incoming sales; and effectively predict future sales for a variety of retail product categories in long-tail environments.

2 - Product Clustering through Low-rank Matrix Factorization with Side Information

Arnau Puig, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, APuig@walmartlabs.com

We present new matrix factorization techniques that find a representation of products on a lower dimensional space which enhances their clustering into frequently purchased groups. The novelty of our approach resides in the combination of various sources of data to estimate the low dimensional latent factors: an incomplete matrix of customer orders data for each product, and a complete matrix of semantic features that contains item attributes obtained from our catalog.

3 - Real-Time and Scalable Anomaly Detection using Parallel Regression

Derek Farren, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, derek@walmartlabs.com

In this paper we propose Sherlock, a scalable real-time Anomaly Detector that has been tested in large production systems. This Anomaly Detector was developed in order to accurately detect anomalies in massive data streams that can not be monitored with traditional Anomaly Detection solutions because of to the big processing needs required by such streams. We show Sherlock's efficacy and speed by comparing it against other popular Anomaly Detection solutions.

4 - Trend Spotting through Word Clouds: The Effects of Online Product Reviews on Product Sales

Hsuanwei Chen, Assistant Professor, San Jose State University, One Washington Square, San Jose, CA, 95192, United States of America, hsuanwei.chen@sjsu.edu

I will investigate the effects of online product reviews on product sales, particularly from an information visualization perspective. I will conduct a trend spotting analysis on product reviews through word cloud visualizations. The word clouds are used to identify the opinions and sentiments expressed by consumers. I will then examine the relationship between the evolutions of word clouds and product popularity trends (e.g., product sales).

■ SD33

Hilton- Union Sq 13

Incentives and Organizational Issues In New Product Development

Cluster: New Product Development

Invited Session

Chair: Nicos Savva, London Business School, Regentís Park, London, NW1 4SA, United Kingdom, nsavva@london.edu

Co-Chair: Niyazi Taneri, SUTD, 20 Dover Drive, Singapore, Singapore, niyazitaneri@sutd.edu.sg

1 - Resource Allocation Decisions under Imperfect Evaluation and Organizational Dynamics

Nektarios Oraiopoulos, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, n.oraiopoulos@jbs.cam.ac.uk, Jochen Schlapp, Vincent Mak

Every product portfolio manager is challenged by the limited information that she has available when allocating resources across multiple products. Her task is further complicated when this information is obtained from self-interested managers who might have an incentive to be overly optimistic about their own products. Our work studies how balancing individual and shared incentives can mitigate such inefficiencies and improve the product selection process.

2 - How Communication and Incentives Transform a Strategic Plan into Action

Jeremy Hutchison-Krupat, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, KrupatJ@darden.virginia.edu

We study the incentive and communication decisions that senior leadership makes to transform a strategic plan into actions. We embed a game of strategic information transmission in a principal agent framework to study senior leadership's incentive and communication decisions. We provide a characterization of senior leadership's communication and we contrast the results that are driven by an initiative's characteristics as opposed to those that are driven by the structure of the organization.

3 - Too Successful to Innovate? Dynamic Entrepreneurial Reputation and Venture Capital

Noam Shamir, Tel Aviv University, Tel Aviv, Israel, nshamir@post.tau.ac.il, David Zvilichovsky

This research integrates entrepreneurial experience, success, reputation and venture financing into a dynamic model which explores the execution of innovative projects under asymmetric information. We are interested in exploring the tension between the desire of the entrepreneur to exploit the current project opportunity and her understanding that the success or failure in this current project also impacts her future reputation.

4 - Licensing Contracts: Control Rights and Options

Niyazi Taneri, SUTD, 20 Dover Drive, Singapore, Singapore, niyazitaneri@sutd.edu.sg, Bert De Reyck, Pascale Crama

We investigate the impact of control rights, options, payment terms and timing decisions on R&D collaborations. Our study reveals a counterintuitive result: the innovator may, under certain conditions, prefer to grant launch control rights or buy-out options to the marketer despite the fact that both terms restrict its downstream actions. Studying renegotiation and postponed contracting we demonstrate that contract timing can also have a significant influence on the outcome of collaborative R&D.

Hilton- Union Sq 14

Humanitarian Operations Management Applications

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Alfonso Pedraza-Martinez, Assistant Professor, Kelley School of Business, Indiana University, 1309 E 10th Street, Kelley School of Business, IU, Bloomington, In, 47405, United States of America, alpedraz@indiana.edu

1 - Post-Disaster Information Dissemination in Online Social Networks

Eunae Yoo, Arizona State University, PO Box 874706, Tempe, AZ, 85287, United States of America, eunae.yoo@asu.edu, Mahyar Eftekhar, Elliot Rabinovich

Humanitarian organizations utilize social media platforms to collect local and instantaneous data. While this helps resolve post-disaster informational needs, data may be inaccurate. We integrate Network Theory and Information Cascades Theory to explore how information disseminates in online social networks and what network structures affect correction time. Our study contributes by analyzing misinformation propagation and by shedding light on the reliability of social media data.

2 - Service Agreements in Vehicle Leasing Programs: Turning Perception Gaps into Opportunities

Nathan Kunz, Research Fellow, INSEAD, Bd de Constance, Fontainebleau, 77305, France, nathan.kunz@insead.edu, Luk Van Wassenhove

Fleet leasing models in the humanitarian sector have led to significant savings for relief organizations. However, the adoption of this model is inhibited by biased perception from field offices. Through a case study we demonstrate how service agreements and performance measurement can facilitate the acceptance of fleet leasing models and lead to higher efficiency. Our findings are also relevant to other areas in humanitarian logistics similarly affected by perception gaps.

3 - Funding-Strategy Competition in Humanitarian Operations

Arian Aflaki, Duke University, Durham, NC, United States of America, arian.aflaki@duke.edu, Alfonso Pedraza-Martinez

Humanitarian organizations (HOs) follow the general practice of earmarking their funds to specific programs. Extant literature has shown that this practice negatively affects operational performance. To understand HOs' behavior, we use an analytical model that captures the effect of earmarking on operational performance, fundraising effort, and donor preferences. We find that no-earmarking could be a dominant strategy under monopoly; however, competition forces HOs to ask for earmarked funds.

4 - Measuring Humanitarian Response Capacity

Jason Acimovic, The Pennsylvania State University, 462 Business Building, University Park, PA, 16802, United States of America, jaa26@smeal.psu.edu, Jarrod Goentzel

Humanitarian aid organizations may manage several supply depots around the world used to help respond to disasters. They must decide how much to store and how to distribute inventory. We develop a metric based on a stochastic linear program that measures the capacity to respond to a disaster, and the quality of the inventory distribution.

Decisions in a Nonprofit Supply Chain I

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Gemma Berenguer, Purdue University, 403 W. State St., West Lafayette, IN, 47906, United States of America, gemmabf@purdue.edu

1 - The Nonprofit Newsvendor's Procurement Problem

Gemma Berenguer, Purdue University, 403 W. State St., West Lafayette, IN, 47906, United States of America, gemmabf@purdue.edu, George Shanthikumar

The standard decision-making policies developed to efficiently run operations by for-profit organizations are not always efficient when run by nonprofit organizations. This talk focuses on the analysis of the newsvendor problem in a nonprofit context. Several scenarios are analyzed including the newsvendor problem that incorporates the external influence of the government through the use of subsidies.

2 - Dynamic Programming to Reduce Food Waste at Campus Dining Services

Esma Birisci, PhD Student, University Of Missouri, 217 W Broadway Apt C31, Columbia, United States of America, esmabirisci@mail.missouri.edu, Ronald McGarvey

In this study we propose a dynamic programming equation for minimizing food wastage in a stochastic inventory model at the University of Missouri. The aim is to reduce food wastage over multi-period horizon by taking into account uncertain demand. Mainly, focusing on how food production and ordering decision can reduce storage losses and over preparation loses. Because of uncertainty of demand, we use robust optimization to make decision on quantity of order for Campus Dining Services.

3 - Dynamic Facility Location and the Value of Inventory Mobility in Disaster Relief

Amber Richter, PhD Candidate, University of California, Berkeley, 4141 Etcheverry Hall, Berkeley, CA, 94720, United States of America, amberr@berkeley.edu, Zuo-Jun Max Shen

This research examines dynamic inventory relocation for responding to disasters over time. We model the problem using dynamic programming (DP) and find analytical and numerical results regarding optimal movement policies and the value of inventory mobility over traditional warehouse pre-positioning. We develop a heuristic which, on average, solves large instances of the problem within 0.5 percent of optimality in less than 1 percent of the time taken by an exact backward DP algorithm.

4 - Foreclosure Operations and Strategy Design for Community-based Organizations

Michael Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu, Senay Solak, David Turcotte, Jeffrey Keisler

The foreclosure crisis in the U.S. has resulted in immense economic and social losses for individuals and neighborhoods. The scale of the problem and the financial and technical limitations of not-for-profit responding organizations require novel methods for community stabilization and revitalization. We discuss neighborhood-based decision modeling responses that support housing acquisition and redevelopment as well as alternative land uses, depending on the likelihood of continued local decline.

Hilton- Union Sq 16

Wireless Mobility Modeling

Sponsor: Telecommunications

Sponsored Session

Chair: David Shallcross, Applied Communication Sciences, 150 Mount AIry Road, Basking Ridge, NJ, 07920, United States of America, dshallcross@appcomsci.com

1 - Hadal Zone Networks Modeling

Michael Bartolacci, Pennsylvania State Univesity, Berks, Reading, PA, 19610, United States of America, mbartolacc@aol.com

There has been recent interest in the exploration of the hadal zones of the world's oceans, the parts of the oceans that are below 6,000 meters deep. Recent interest in such explorations have brought to light the need for networks that can support the use of undersea technologies. Model such hybrid networks represents a challenge from several points of view: propagation of signals through the deep ocean, power conservation, heterogeneous hybrid nature of network devices, and other factors.

2 - Distributed Location of Wireless Mobile Relay Nodes
David Shallcross, Applied Communication Sciences, 150 Mount AIry Road, Basking Ridge, NJ, 07920, United States of America, dshallcross@appcomsci.com, Eric Van Den Berg

Client nodes distributed over an area may require relay nodes to enable communication. We consider mobile relay nodes, such as unmanned aerial vehicles, that may travel to position. We investigated variations of a simple distributed algorithm to minimize link lengths, and improve capacity. This is related to the Euclidean Steiner tree problem. We have both theoretical results and experimental results.

3 - Optimal Sensor Deployment to Increase the Security of the Maximal Breach Path
Necati Aras, Bogazici University, Bebek, Istanbul, Turkey, arasn@boun.edu.tr, Kuban Altinel, Ezgi Karabulut

We focus on an application of wireless sensor networks for border surveillance. It is a bilevel optimization problem involving two players. The defender is the leader of the Stackelberg game and wants to determine the best sensor locations in order to maximize the security in the area. The intruder, who is the follower, is capable of destroying some of the sensors to identify the maximal breach path. For the solution of the model we propose three heuristics based on Tabu search.

■ SD37

Social Intelligence: Learning, Aggregation and Applications

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Ankur Mani, Massachusetts Institute of Tech, 20 Ames Street #385, Cambridge, MA, 02139, United States of America, amani@MIT.EDU

1 - Homophily in Voter Networks
Peter Krafft, Massachusetts Institute of Tech, 20 Ames Street #385, Cambridge, MA, 02139, United States of America, pkrafft@mit.edu, Ankur Mani, Alex Pentland, Joshua Tenenbaum

In this work we study the effect of network homophily on voting outcomes in multicandidate elections. We observe that homophily among rational voters affects this type of election by shifting the distribution of votes away from center candidates, which may lead to non-central candidates winning more often.

2 - Point of View and Manipulation on Wikipedia
Sanmay Das, Associate Professor, Washington University in St. Louis, sanmay@seas.wustl.edu, Allen Lavoie, Malik Magdon-Ismail

We describe new machine learning techniques for automatic classification of points of view and detection of possible manipulation on Wikipedia, and show how these techniques can be used to study social processes. In particular, we discuss applications to understanding administrator promotion elections as well as the evolution of Wikipedia pages in terms of which points of view are represented.

3 - Airplanes Aloft as a Sensor Network for Wind Forecasting
Debadeepta Dey, United States of America, debadeep@cs.cmu.edu, Ashish Kapoor

We explore the feasibility of using commercial aircraft as sensors for observing weather phenomena at a continental scale. We focus on the problem of wind forecasting and explore the use of machine learning and inference methods to harness air and ground speeds reported by aircraft at different locations and altitudes. We validate the learned predictive model with a field study where we release an instrumented high-altitude balloon and compare the predicted trajectory with the sensed winds.

Healthcare Analytics

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Sinjini Mitra, Assistant Professor, California State University, Fullerton, ISDS Dept. SGMH-4113, 800 N State College Blvd, Fullerton, CA, 92831, United States of America, smitra@fullerton.edu

1 - Studying Consumer Behavior for Adopting Social and Mobile Media for Health Management via Analytics
Sinjini Mitra, Assistant Professor, California State University, Fullerton, ISDS Dept. SGMH-4113, 800 N State College Blvd, Fullerton, CA, 92831, United States of America, smitra@fullerton.edu, Rema Padman

Advances in technology and increased availability of large amounts of data in the recent decade has made it possible to use extensive analytical methods for effective decision-making, particularly in the healthcare industry. Based on a member survey of a large health plan, we identify factors (demographic, clinical and technological) that are significantly associated with member interest in adopting social and mobile media for obtaining health information from the health plan via analytics.

2 - On Learning and Visualizing Practice-based Clinical Pathways for Chronic Kidney Disease
Yiye Zhang, Carnegie Mellon University, 532 Tyrella Ave, Apt 56, Mountain View, CA, 94043, United States of America, yiyez@andrew.cmu.edu, Larry Wasserman, Rema Padman

This study analyzes the treatment data of chronic kidney disease (CKD) patients. We use hierarchical clustering based on longest common subsequence distance to discover patient subgroups, and represent each subgroup's clinical pathway as 2nd-order Markov chains to learn practice-based clinical pathways. Further, we model treatments as hidden states, and laboratory data as observations in the context of hidden Markov model, to decode the most likely sequence of treatments given laboratory data.

3 - Impact of Individual and Organizational Usage Experience on eVisit Service Efficiency
Changmi Jung, changmi@andrew.cmu.edu, Ateev Mehrotra, Rema Padman, Linda Argote

In this study, we aim to understand how the service efficiency is linked to individual and organizational usage experience. We address our questions by using physicians' evaluation time associated with eVisits in primary care practices affiliated with a major academic medical center. Results demonstrate that there is evidence of individual learning with moderating effect from physicians' system expertise, and complementing effect from organizational experiences on physician service efficiency.

4 - Evaluating m-Health Services for User Engagement and Health Promotion: A Randomized Field Experiment
Yi-chin Lin, Carnegie Mellon University, 4800 Forbes Ave HBH 3011, Pittsburgh, PA, 15213, United States of America, yichinl@andrew.cmu.edu, Vibhanshu Abhishek, Julie Downs, Rema Padman

Mobile technologies have the potential to engage patients and change their healthy behaviors, yet little evidence has been documented. Drawing on theoretical frameworks, this study proposes novel mobile-enabled interventions to improve healthy eating behaviors. The effects of interventions are examined via a randomized field experiment. Analysis of objective usage and subjective survey data provide strategic insights that can be generalized to other healthy behaviors.

Joint Session HAS/Analytics/CPMS: Practicing OR/OM in Healthcare Providers - A Panel

Sponsor: Health Applications, Analytics & CPMS, The Practice Section

Sponsored Session

Chair: Alexander Gutfraind, Research Assistant Professor, University of Illinois at Chicago, 1603 W. Taylor Street, MC 923, Chicago, IL, 60612, United States of America, agutfraind.research@gmail.com

1 - Panel on Implementation of Operations Research/Operations Management in Healthcare
Alexander Gutfraind, Research Assistant Professor, University of Illinois at Chicago, 1603 W. Taylor Street, MC 923, Chicago, IL, 60612, United States of America, agutfraind.research@gmail.com, Tarun Mohan Lal

Leading healthcare organizations like the Mayo Clinic, Geisinger Health System, and Cincinnati Children's Hospital have benefited from utilizing OR/OM and present approaches from idea generation to implementation. The panel will share examples that have benefited their organization, highlight tools and applied technologies, as well as present challenges and successes that can be translated for both academics and practitioners.

2 - Bridging the Gap between Theory & Application at Geisinger Health System
Christopher Strömblad, Senior Modeler - Operations Research, Geisinger Health System, 100 N. Academy Ave, Danville, PA, 17822, United States of America, chris.stromblad@gmail.com

This will be an integrated part of the above panel discussion with OR/OM practitioners in leading healthcare organizations.

3 - using Analytics to Improve Quality at Cincinnati Children's Hospital

Denise White, PhD, Director, QI Analytics, Cincinnati Children's Hospital, 3333 Burnet Avenue, Cincinnati, OH, United States of America, DeniseL.White@cchmc.org

Public Health Applications

Sponsor: Health Applications

Sponsored Session

Chair: Margaret Brandeau, Professor, Stanford University, MS&E Department, Stanford, CA, 94305, United States of America, brandeau@stanford.edu

1 - Cost-effectiveness of Cardiac Resynchronization Therapy Defibrillator in Mild Heart Failure

Allison Pitt, Stanford University, 475 Via Ortega, Stanford, CA, 94305, United States of America, alpitt@stanford.edu, Christopher Woo, Erika Strandberg, Jeremy Goldhaber-Fiebert, Mark Hlatky, Michelle Schmiegelow, Douglas K. Owens

Objective: We develop a decision analytic Markov model to estimate the cost-effectiveness of cardiac resynchronization therapy (CRT) in addition to an implantable cardioverter-defibrillator (ICD), compared with ICD alone, in patients with left ventricular systolic dysfunction, prolonged intraventricular conduction, and mild heart failure. Results: CRT plus ICD increased life expectancy and QALYs compared with ICD at a cost of $70,000 per QALY gained.

2 - Optimal Screening Strategies for Cervical Cancer

Esma Gel, Associate Professor, Arizona State University, 699 S Mill Ave, BYENG 318, Tempe, AZ, 85281, United States of America, Esma.Gel@asu.edu, Raha Akhavan Tabatab, Isabel Namen Leon

The recent use of the human papillomavirus DNA (HPV) test has motivated questions on how the test should be used in conjunction with traditional cervical cancer screening methods such as pap smear. We propose a POMDP model to suggest optimal policies for cervical cancer screening and prevention. For a case study, we use data from a practice in Colombia as well as specificity/sensitivity results from the medical literature to provide guidelines on optimal screening strategies for cervical cancer.

3 - Planning for HIV Screening, Testing and Care at the Veterans Health Administration

Sandeep Rath, PhD Student, UCLA Anderson, B513 Gold Hall, 110 Westwood Plaza, Los Angeles, CA, 90024, United States of America, sandeep.rath.2015@anderson.ucla.edu, Sarang Deo, Kumar Rajaram

CDC has recommended a routine screening policy for HIV. We modeled a QALY maximizing nonlinear mixed integer program incorporating system dynamics and disease progression and found that routine screening may not be always feasible. We applied this model to the Greater Los Angeles station of the Veterans Health Administration and used it to develop and evaluate managerially relevant policies within existent capacity and budgetary constraints to improve upon the current screening policy.

4 - Expansion of the National Salt Reduction Initiative: Requirements for Reducing Cardiovascular Disease

Sung Eun Choi, Stanford University, 475 Via Ortega, Stanford, CA, 94305, United States of America, sungeunc@stanford.edu, Sanjay Basu, Margaret Brandeau

A number of public health programs, including National Salt Reduction Initiative, are increasingly seeking to mitigate upstream causes of high cardiovascular disease mortality in the United States by reducing dietary sodium intake. Individuals have different degrees of benefit from sodium reduction, given their demographic characteristics, such as age, race, and income. A microsimulation model was developed to investigate these complexities affecting national efforts to reduce dietary sodium.

Decision Modeling for Disease Prevention Considering Imperfect Screening

Sponsor: Health Applications

Sponsored Session

Chair: Mahboubeh Madadi, PhD Candidate, University of Arkansas, 4117 Bell Engineering Center 1 Universit, Fayetteville, AR, 72701, United States of America, mmadadi@email.uark.edu

1 - A Simulation-based Cost-effectiveness Study on Age and Gender-specific CRC Screening Strategies

Nan Kong, Assistant Professor, Weldon School of Biomedical Engineering, Purdue University, West Lafayette, IN, 47907, United States of America, nkong@purdue.edu, Carolina Vivas Valencia, Robert Klein, Thomas Imperiale

Current colorectal cancer (CRC) screening guidelines do not tailor recommendations to patients of different risks. However, there is new evidence that polyps form earlier and progress faster in men. We extend the Vanderbilt-NC State CRC simulation model and update model parameters based on recent evidence. Model-based cost-effectiveness analyses are conducted for distinct age- and gender-specific subpopulations. Our results quantify the benefits of starting screening earlier in men than women.

2 - Considering Heterogeneity of Provider Implementation of Screening Policies in Simulation models

Irene Vidyanti, Los Angeles Department of Public Health, 3530 Wilshire Boulevard, Los Angeles, CA, 90010, United States of America, irenevidyanti@gmail.com, Shinyi Wu

Imperfect screening requires a targeted approach and cooperation from providers to implement evidence-based policies. Implementation at the provider level and provider's heterogeneity of implementation then becomes an important issue in accurately assessing cost-benefit of screening. We use the case of Diabetic Retinopathy screening to compare a simulation model that takes into account heterogeneity of provider implementation with one that does not to show differences in precision of estimates.

3 - Analyzing the Effects of Different Models of Screening Choice in Colorectal Cancer Outcomes

Maria Mayorga, Associate Professor, North Carolina State University, 111 Lampe Dr., Raleigh, NC, 27695, United States of America, memayorg@ncsu.edu, Rachel Townsley, David Cornejo, Kristen Hassmiller Lich

Modality and compliance choice decisions substantially affect the health outcomes in colorectal cancer screening programs. We have created a dynamic simulation model that evaluates the effects of individual choice of screening modality and compliance on health outcomes. We experiment with different frameworks for defining these choice decisions. We find that the embedded assumptions of these choice frameworks lead to different results.

4 - A Nonlinear Programming Model to Optimize Screening Policies Considering Patients' Adherence

Mahboubeh Madadi, PhD Candidate, University of Arkansas, 4117 Bell Engineering Center 1 Universit, Fayetteville, Ar, 72701, United States of America, mmadadi@email.uark.edu, Shengfan Zhang, Edward Pohl

Patients' imperfect adherence is one of the issues that physicians encounter when recommending their patients undergo screening tests such as mammography. In this study, a nonlinear optimization model is developed to extract a screening guideline that minimizes the risk of a disease getting clinical while taking into account uncertainty in patient adherence behavior. Some numerical examples with application to screening mammography tests are solved using a heuristic method.

Sponsored Session

Chair: Mehmet Erkan Ceyhan, Operations Research Manager, Lahey Hospital & Medical Center, 41 Mall Road, Burlingto n, United States of America

1 - Anesthesiologist and Nurse Anesthetist Assignment

Ayten Turkcan, Northeastern University, Mechanical and Industrial Engineering, Boston, MA, 02115, United States of America, a.turkcan@neu.edu, Mehmet Erkan Ceyhan, Sina Aghsaei

We worked with the Surgery Department at Lahey Hospital and Medical Center to develop an optimization based decision support tool to solve anesthesiologist and nurse anesthetist (CRNA) assignment problem. We proposed integer programming models that consider working hours, skill levels, surgery durations, and difficulty of surgeries to assign anesthesiologists and CRNAs to operating rooms on the day of the surgery with the objective of balancing workload.

2 - Simulation of Chemotherapy Patient Flow in an Oncology Clinic

Bohui Liang, Northeastern University, Mechanical and Industrial Engineering, Boston, MA, 02115, United States of America, liang.boh@husky.neu.edu, Ayten Turkcan, Mehmet Erkan Ceyhan

We worked with the Hematology and Oncology Clinic at Lahey Hospital and Medical Center to improve patient flow and appointment scheduling for chemotherapy patients. We developed a discrete event simulation model to evaluate the operational performance in the clinic and to identify initiatives for improvement in process flow, scheduling and staffing. We proposed a mathematical programming model to generate balanced appointment schedules for oncologist visit and chemotherapy treatment.

3 - Stochastic Appointment Sequencing and Scheduling with Heterogeneous Service Times and No-show Rates

Onur Arslan, Teaching Assistant, Northeastern University, 360 Huntington Avenue, Boston, MA, 02115, United States of America, arslan.o@husky.neu.edu, Ayten Turkcan

We solve appointment sequencing and scheduling problem in a primary care setting where multiple patients with heterogeneous service time distributions and no-show probabilities are considered. We propose a two-stage stochastic programming model that minimizes waiting time, idle time, and overtime cost. We present the properties of an optimal solution for special cases, and provide comparative results for different service time distributions, uncertainty levels, and cost coefficients.

Sparse Optimization: Theory and Applications

Sponsor: Computing Society

Sponsored Session

Chair: Dongdong Ge, Shanghai University of Finance and Economics, 777 Guoding Road, Shanghai, China, dongdong@gmail.com

1 - A Linear Time Algorithm for Bridge Regression Problem

Dongdong Ge, Shanghai University of Finance and Economics, 777 Guoding Road, Shanghai, China, dongdong@gmail.com

In this paper we consider a class of non-Lipschitz and non-convex minimization problems which generalize the L2-Lp minimization problem. We propose an iterative algorithm that decides the next iteration based on the local convexity/concavity/sparsity of its current position. We show that our algorithm finds a nearly KKT point within linear time iterations.

2 - New Analysis on Sparse Solutions to Random Standard Quadratic Optimization Problems and Extensions

Xin Chen, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave., Urbana, IL, 61801, United States of America, xinchen@illinois.edu, Jiming Peng

The standard quadratic optimization problem (StQP) refers to the problem of minimizing a quadratic form over the standard simplex. Such a problem arises from numerous applications and is known to be NP-hard. In this talk, we present an analysis for random StQPs combining probability inequalities derived from both the first-order and second-order optimality conditions to quantify the sparsity of optimal solutions, significantly improving our previous results.

3 - A Fast First Order Algorithm for Linear Constrained L2-Lp Problem

Rongchuan He, City University of Hong Kong, AC1-G7722, Tat Chee Ave 83, Kowloon, 852, Hong Kong - PRC, rongchuhe2@gmail.com

We propose a fast first order algorithm for solving linear constrained L2-Lp problem, which is shown to have the worst complexity O(\epsilon^-2) to reach an ϵ-KKT point. Further more, we use several techniques, such as lower bound cut, noise de-blurring and so on, to improve the speed of the algorithm and the quality of the solution. Numerical results on several applications demonstrate the efficiency of our algorithm.

4 - SOCP Formulation for Singly Constrained QCQP

Rujun Jiang, Student, CUHK, Department of Seem,CUHK,HK, Hong Kong, Hong Kong - PRC, rjjiang@se.cuhk.edu.hk, Duan Li

We investigate a general class of singly constrained QCQP. Applying simultaneous block diagonalization, we obtain a congruent canonical form for both symmetric matrices in the objective function and in the constraint. We derive necessary conditions for the solvability of QCQP. For all solvable QCQP problems, we can transform them into their corresponding SOCP formulation. Compared to the state-of-the-art in formulating QCQP as SDP, our SOCP formulation delivers a much faster solution algorithm.

Sponsored Session

Chair: Sunil Wattal, Temple Univ, 1810 N 13 Street, Philadelphia, PA, 19122, United States of America, swattal@temple.edu

1 - Anonymity and Information Revelation in Online Crowdfunding

Sunil Wattal, Temple Univ, 1810 N 13 Street, Philadelphia, PA, 19122, United States of America, swattal@temple.edu, Gordon Burtch, Anindya Ghose

Most online crowdfunding platforms maintain a public record of transactions while providing users with transaction-level information controls, which enable them to conceal their identity or contribution amount. In this study, we explore the impact of these information control mechanisms on crowdfunder behavior, acknowledging possible positive (e.g., comfort) and negative (e.g., privacy priming) impacts. We also discuss the implications of our findings for the design of online platforms.

2 - Through the Looking Glass: The Relationship between Real World and Virtual World Behavior

Michael Frutiger, PhD Candidate, GT Scheller College of Business, 800 West Peachtree Street, Atlanta, GA, 30308, United States of America, mike.frutiger@scheller.gatech.edu, Eric Overby, D. J. Wu

Online services increasingly support complex individual expression by providing rich environments that are substantially abstracted from real-world experiences. While real-world meaning is often inferred from user online behavior (and vice versa), there is a limited understanding of how these are related. Using a combination of survey and archival data, this study contributes to a foundational understanding of the relationship between an individual's real world and virtual world behavior.

3 - Impact of Platform Integration on Consumer Demand in Complementary Markets

Zhuoxin Allen Li, PhD Student, University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, 78703, United States of America, zhuoxin.li@phd.mccombs.utexas.edu, Ashish Agarwal

Platform owners often seek for complementary innovations from third-party providers (third-party contents), while at the same time providing their own applications to consumers (first-party contents). Using the Facebook platform as an example, we study the impact of Facebook's acquisition and tighter integration of Instagram on consumer demand for Instagram and other photo-sharing applications provided by third-party developers.

New Developments on MINLP and MIQCP

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Daniel Bienstock, Columbia University, 500 W. 120th Street, New York, NY, United States of America, dano@columbia.edu

1 - A Two-Variable Analysis of the Two-Trust-Region Subproblem

Boshi Yang, University of Iowa, Department of Mathematics, 14 MacLean Hall, Iowa City, IA, 52242, United States of America, boshi-yang@uiowa.edu, Samuel Burer

The two trust-region subproblem (TTRS) minimizes a general quadratic function over the intersection of two ellipsoids. For this problem, a general semidefinite-programming (SDP) relaxation admits a gap. In this paper, for the special case of TTRS with two variables, we fully characterize the remaining valid inequalities to close the gap. We also discuss computational issues and generalizations to the case of an arbitrary number of variables.

2 - Branch-and-Cut for Integer Programs with Complementarity Constraints

Ismael de Farias, Texas Tech, Department of Industrial Engineering, Lubbock, TX, United States of America, ismael.de-farias@ttu.edu

We give new inequalities valid for the complementarity-constrained optimization problem (CCOP), and in particular for CCOPs that are mixed-integer. We then present an extensive computational study where we discuss the effectiveness of different formulations for CCOP and the dramatic reduction in computational time, over some professional optimization solvers, that results from using the inequalities, particularly when the variables are constrained to be integers.

3 - Extended Formulations for Conic Quadratic Mixed Integer Programming

Juan Pablo Vielma, Assistant Professor, Massachusetts Institute of Technology, E62-561, 77 Massachusetts Ave, Cambridge, MA, 02142, United States of America, jvielma@mit.edu

An extended formulation for Mixed Integer Programming (MIP) is a formulation that uses a number of auxiliary variables in addition to the original or natural variables of a MIP. Extended formulations for linear MIP have been extensively used to construct small, but strong formulations for a wide range of problems. In this talk we consider the use of extended formulations in quadratic MIP and show how they can be used to improve the performance of branch-and-cut algorithms.

4 - Progress on Solving Quadratically Constrained Optimization Problems

Daniel Bienstock, Columbia University, 500 W. 120th Street, New York, NY, United States of America, dano@columbia.edu

We present results and survey older results on solving optimization problems subject to multiple quadratic constraints, starting with the classical CDT (Celis Dennis Tapia) problem (minimizing a general quadratic subject to two ellipsoidal constraints).

Chair: Siqian Shen, Assistant Professor, University of Michigan, 2793 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, siqian@umich.edu

1 - Stochastic Inventory Systems with Service Level Constraints: Structures and Approximations

Yuchen Jiang, University of Michigan, G815 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, ycjiang@umich.edu, Cong Shi, Siqian Shen

We study multiperiod stochastic inventory systems with probabilistic service level guarantees for restricting stockout probabilities. We prove that base-stock policies are optimal in the backlogging model and partially characterize optimal policies in the lost-sales model with positive lead time. We also propose an efficient approximation algorithm that admits a worst-case performance guarantee of 2 for the backlogging model and give an effective heuristic policy for the lost-sales model.

2 - A New Method for Solving Large-scale Multi-stage Stochastic Integer Programs

Osman Ozaltin, Assistant Professor, North Carolina State University, Industrial and Systems Engineering, Raleigh, United States of America, oyozalti@ncsu.edu, Burhaneddin Sandikci

Many large-scale multi-stage stochastic integer programs are among the most computationally challenging optimization problems. We propose a new solution method based on scenario decomposition, which is inherently parallelizable. Computational experiments demonstrate that the proposed method scales nicely with problem size and produces high quality solutions to practical instances within a reasonable time.

3 - Appointment Scheduling in Two-stage Stochastic Service Systems

Qingxia Kong, Assistant Professor, Universidad Adolfo Ibañez, Av. Diagonal Las Torres 2700, 531C, Penalolen, Santiago, Chile, q.kong@uai.cl, Chung-Piaw Teo, Zhichao Zheng

We study the design of healthcare appointment system when the patients need to go through two stages of service with stochastic duration. The problem is motivated by a case from en eye clinic where the patients have to take some tests (e.g., visual acuity test, dilation, etc.) before the consultation with the doctor. We use a network flow model to capture the dynamics of the system and develop a co-positive program to solve the appointment scheduling problem.

4 - Solution of Moment Robust Optimization using a New Cutting Surface Algorithm

Sanjay Mehrotra, Professor, Northwestern University, 2145 Sheridan Rd, Industrial Engineering & Mgmt. Sciences, Evanston, IL, 60208, United States of America, mehrotra@northwestern.edu

A central cutting surface method for semiinfinite convex problem, and its use to develop an algorithm for distributional robust optimization is presented. The uncertainty set consists of distributions with bounds on generalized moments of any arbitrary order. Results showing improvements over cutting plane approaches are presented. Computational experience and theoretical results on this moment robust optimization framework will also be presented.

Chair: Kai Huang, Dr., McMaster University, 1280 Main St. W, Hamilton, On, L8S 4L8, Canada, khuang@mcmaster.ca

1 - Total Power Optimization of Multiple Wind Turbines

Shengyuan Chen, Assistant Professor, York University, 4700 keele street, Toronto, Canada, chensy@mathstat.yorku.ca, Yousef Akhavan, Dong Liang

Though the optimal operating point of a single wind turbine is known, the optimal operation of multiple wind turbines of a wind farm is a less explored area. We model the problem as a PDE-constrained optimization.

2 - Inventory Management Based on Target-Oriented Robust Optimization

Yun Fong Lim, Associate Professor, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, yflim@smu.edu.sg, Chen Wang

We propose a target-oriented robust optimization approach to solve a multi-product, multi-period inventory management problem subject to ordering capacity constraints. By tuning a cost target, we can achieve a balance between expected cost and the associated cost variance. Our approach significantly outperforms traditional methods based on dynamic or stochastic programming if inaccurate demand distributions are used. We apply our approach to two case studies from different industries.

3 - Resource Planning under Uncertainty

Haitao Li, Associate Professor, College of Business Administration, 229 ESH, One University Blvd, St. Louis, MO, 63121-4400, United States of America, lihait@umsl.edu, Carlos Valencia, Cipriano Santos, Sergio Perez, Ivan Perez, Marcos Vargas

Service enterprises face various uncertainties of project win probability and attrition in their daily operations. We have extended our existing deterministic resource planning (RP) model, developed at HP, to a stochastic one for explicitly handling uncertainties. Various efficient algorithms are developed to solve large-size problems with up to thousands of resources and jobs. Comprehensive computational study has shown significant benefit of our methodology for real world applications.

Optimal Allocation of Scarce Infrastructure Capacity: Lessons from Different Network Industries

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Mort Webster, Associate Professor, Penn State, 123 Hosler Bldg, State College, PA, 16802, United States of America, mort@MIT.EDU

1 - Design of Capacity Pricing and Capacity Allocation Mechanisms in Shared Railway Systems

Maria Teresa Pena Alcaraz, Massachusetts Institute of Technology, 77 Massachusetts Avenue, E40-246, Cambridge, Ma, 02139, United States of America, maitepa@MIT.EDU, Joseph Sussman, Mort Webster, Andres Ramos Galan, Jose A. Gomez-Ibanez

The use of shared railway systems enables high utilization of rail infrastructure. High utilization translates into efficiency gains for railways where infrastructure is often expensive and scarce. However, shared use requires the design of capacity pricing and allocation mechanisms to coordinate the infrastructure manager and the train operators (which trains access the system, when and at what price). This research analyzes how the design of these mechanisms impacts the system performance

2 - Design of a Capacity Allocation Mechanism for Airport Congestion Mitigation

Alexandre Jacquillat, Massachusetts Institute of Technology, 77 Massachusetts Avenue, Building E40-246, Cambridge, MA, 02139, United States of America, alexjacq@mit.edu, Amedeo Odoni, Mort Webster

We design a mechanism for allocating airport capacity to competing airlines to mitigate congestion. We consider airlines' preferred flight schedules and airport capacity estimates. We develop a flight rescheduling approach to meet efficiency (minimizing scheduling changes), equity (balancing fairly changes across airlines) and reliability (reducing delays) objectives. It integrates an Integer Programming scheduling model, a Dynamic Programming operational model and a queuing model of congestion.

3 - Allocating and Planning Transmission in Competitive Power Markets

Jonathan Ho, Johns Hopkins University, 313 Ames Hall, Baltimore, MD, United States of America, jho19@jhu.edu, Ben Hobbs, Pearl Donohoo-Vallett, Francisco Munoz, Ozge Ozdemir

Electric transmission planning and allocation is radically changing due to restructuring, which has separated generation and transmission ownership, and the increasing importance of small-scale (distributed) generation and remote large-scale renewable power sources. Transmission planning must consider long-run uncertainties and the response of generation siting and operating decisions, implying a important role for stochastic, multi-level optimization. We provide computational examples.

4 - A Case for Virtualizing the Electric Utility in Cloud Data Centers

Bhuvan Urgaonkar, Associate Professor, Pennsylvania State University, 338D IST Building, State College, PA, 16802, United States of America, bhuvan@cse.psu.edu

Several shortcomings arise from the big gap that exists between the pricing interfaces exposed by electric utilities to clouds and by clouds to their tenants. To overcome these, we propose the idea of a virtual electric utility that cloud providers should expose to individual tenants. We discuss initial ideas for pricing design and cost-effective control in such environments.

Network Design with Hubs I

Cluster: Network Design

Invited Session

Chair: Hans-Jurgen Sebastian, Professor, RWTH Aachen University, Kackertstrafle 7B, Aachen, NR, D-52062, Germany, sebastian@or.rwth-aachen.de

1 - Modeling Hub Location and Network Design with Fixed and Variable Costs

James Campbell, campbell@umsl.edu, Ricardo Saraiva de Camargo, Gilberto de Miranda Jr., Morton O'Kelly

Many hub location models adopt restrictive assumptions on the topology, path lengths or cost structure. We present a new hub location and network design model with fixed and variable costs for all arcs that allows direct O-D arcs and incomplete hub networks. Results document a wide range of different types of optimal hub networks that emerge based on the relative cost pressures.

2 - Consolidation of Residual Volumes in a Parcel Service Provider's Long-haul Transportation Network

Martin Baumung, RWTH Aachen University, Kackertstr. 7, Aachen, 52072, Germany, baumung@or.rwth-aachen.de, Halil Ibrahim Guenduez

We consider the direct long-haul transportation network of a parcel service provider where transports are carried out using swap bodies. Our focus is on residual volumes, which are not enough to fill a swap body, and investigate how consolidation using hubs can lead to cost reduction through better capacity utilization. We developed a corresponding model minimizing total costs consisting of transportation costs for the swap bodies and costs for the additional sorting required in the hubs.

3 - Planning Tank Wash Activities for Dispatch Optimization in Bulk Transport Operations

Ted Gifford, Distinguished Member of Technical Staff, Schneider National Inc., 3101 Packerland Dr., Green Bay, WI, 54313, United States of America, giffordt@schneider.com

Over-the-road transportation of liquid bulk chemicals are significantly complicated by requirements to wash and prep tanker trailers between shipments. These washes occur at a limited number of facilities distributed across the service region. We consider these facilities as de facto hubs in a network and describe methods to provide minimum cost solutions for assigning tankers to wash facilities and optimal matching of drivers and tanker trailers to shipments.

Recent Advances in Numerical Aspects for Nonlinear Programming

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: Andreas Waechter, Associate Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, andreas.waechter@northwestern.edu

1 - JuMP: Nonlinear Modeling with Exact Hessians in Julia

Miles Lubin, MIT Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, mlubin@MIT.EDU, Iain Dunning, Joseph Huchette

We describe the recent advances for nonlinear programming in JuMP, a solver-independent easy-to-use open-source algebraic modeling language built on top of the Julia programming language. This includes a reimagined implementation of Automatic Differentiation (AD) techniques for computing exact sparse Hessian matrices which takes advantage of Julia's advanced technical features like just-in-time compilation and metaprogramming. We present performance comparisons with AMPL.

2 - A Derivative-free Method for Solving Nonlinear Problems with Deterministic Noise

Andreas Waechter, Associate Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, andreas.waechter@northwestern.edu, Irina Dolinskaya, Alvaro Maggiar

We present a derivative-free algorithm for problems with deterministic noise. In contrast to previously proposed methods, we do not assume a stochastic objective function whose value is determined as the expected value of a random variable. Instead, the algorithm optimized a modified objective function that is smoothed using a Gaussian kernel. The method is based on an approximation of the modified objective function that is based on random sampling.

3 - Experiments with Linear and Nonlinear Optimization using Quad Precision

Ding Ma, Stanford University, Dept of MS&E, Huang Engineering Center, Stanford, CA, 94305, United States of America, dingma@stanford.edu, Michael Saunders

For challenging numerical problems, Kahan has said that "default evaluation in Quad is the humane option". We describe experiments on multiscale linear and nonlinear optimization problems using a Quad implementation of MINOS.

Advances in Binary Quadratic Programming

Sponsor: Optimization/ Linear and Conic Optimization

Sponsored Session

Chair: Nathan Krislock, Northern Illinois University, Department of Mathematical Sciences, DeKalb, IL, 60115-2888, United States of America, krislock@math.niu.edu

1 - Quadratization of Pseudo-Boolean Functions

Endre Boros, Distinguished Professor, Rutgers University, 100 Rockafeller Road, Piscataway, NJ, 08854, United States of America, endre.boros@rutgers.edu, Martin Anthony, Yves Crama, Aritanan Gruber

Representing high degree binary optimization problems as equivalent quadratic optimization is an idea introduced originally by Rosenberg in 1975. Such a transformation allows the derivation of persistencies, leading to simplifications in the problem. The price we pay is the higher number of variables. In this research we provide new quadratization algorithms, and tight lower and upper bounds for the number of additional variables.

2 - Separating Hierarchical Cuts to Strengthen Semidefinite Relaxations of Max-Cut Problems

Elspeth Adams, Polytechnique Montreal, Montreal, Canada, elspeth.adams@polymtl.ca, Miguel Anjos, Franz Rendl, Angelika Wiegele

The max-cut problem can be closely approximated using the basic semidefinite relaxation. This relaxation can be further improved by adding valid inequalities. We propose projection polytopes as a new way to improve the relaxation. We further discuss the problem of identifying promising projection polytopes to add to the relaxation. Theoretical and computational results will be presented.

3 - Some Experiences with Solving Semidefinite Programming Relaxations in Computational Biology

Alexander Engau, Assistant Professor, University of Colorado Denver, 1250 14th Street, Denver, CO, 80202, United States of America, aengau@alumni.clemson.edu

We present two recent integer programming models in molecular biology and study practical reformulations to compute solutions to some of these problems. In extension of previously tested linearization techniques, we formulate a class of corresponding semidefinite relaxations and discuss practical rounding strategies to find good feasible approximate solutions. Our computational results highlight the possible advantages and remaining challenges of this approach especially on large-scale problems.

4 - BiqCrunch: A Semidefinite-based Solver for Binary Quadratic Problems

Nathan Krislock, Northern Illinois University, Department of Mathematical Sciences, DeKalb, IL, 60115-2888, United States of America, krislock@math.niu.edu, Jérome Malick, Frédéric Roupin

BiqCrunch is a branch-and-bound solver for finding exact solutions of any 0-1 quadratic problem, such as Max-Cut, Max-k-cluster, and Max-independent set. The bounds are based on a regularized semidefinite relaxation and are efficiently computable using eigenvalue decomposition and a quasi-Newton optimization method. The resulting semidefinite bounding procedure gives us a competitive branch-and-bound algorithm for solving many binary quadratic problems to optimality.

Hilton- Taylor A

Robust and Data-Driven Portfolio Optimization

Cluster: Optimization in Finance

Invited Session

Chair: Daniel Kuhn, EPFL, EPFL CDM MTEI RAO, Station 5, Lausanne, 1015, Switzerland, daniel.kuhn@epfl.ch

1 - Tracking-Error Models for Multiple Benchmarks: Theory and Empirical Performance

Zhichao Zheng, Assistant Professor, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, danielzheng@smu.edu.sg, Yunchao Xu, Karthik Natarajan, Chung-Piaw Teo

We propose a new multiple-benchmark tracking-error model for portfolio selection. We construct a strategy to track the highest return from a set of benchmarks, by minimizing a quadratic loss function. This portfolio strategy retains features of the linear combination rule, with weights determined by the probability that each benchmark portfolio attains the highest return among all the benchmark portfolios. We develop the theory and describe several applications of this new approach.

2 - Portfolio Optimization with Ambiguous Correlation and Stochastic Volatilities

Chi Seng Pun, The Chinese University of Hong Kong, Rm2202, PGH2, CUHK, Shatin, N.T., Hong Kong, Hong Kong - PRC, cspun@cuhk.edu.hk, Hoi Ying Wong, Jean-Pierre Fouque

In a continuous-time economy, we investigate the asset location problem among a risk-free asset and two risky assets with an ambiguous correlation between the two risky assets. We formulate the robust portfolio selection as the utility maximization problem over the worst-case scenario with respect the possible choice of correlation. We solve the problem under the Black-Scholes model using theory of G-Brownian motions. We then extend the problem to stochastic volatility models.

3 - Robustifying Convex Risk Measures for Linear Portfolios: A Non-Parametric Approach

David Wozabal, Technische Universitat München, Arcisstrafle 21, Munich, 80333, Germany, david.wozabal@tum.de

We introduce a framework for robustifying convex risk measures. The robustified risk measures are defined as the worst case portfolio risk over neighborhoods of a reference probability measure. It is shown that the optimization problem of finding the worst-case risk can be solved in closed form. The resulting robust risk measures are computationally tractable and a numerical study shows that in most cases they perform significantly better out-of-sample than their non-robust variants.

4 - Robust Growth-Optimal Portfolios

Daniel Kuhn, EPFL, EPFL CDM MTEI RAO, Station 5, Lausanne, 1015, Switzerland, daniel.kuhn@epfl.ch

The log-optimal portfolio is known to outperform any other portfolio in the long run if stock returns are i.i.d. and follow a known distribution. In this talk, we establish similar guarantees for finite investment horizons where the distribution of stock returns is ambiguous. By focusing on fixed-mix portfolios, we exploit temporal symmetries to formulate the emerging distributionally robust optimization problems as tractable conic programs whose sizes are independent of the investment horizon.

1 - Risk Analysis and Hedging of Parisian Options

Dong-Young Lim, Ph.D. Student, KAIST, 291 Daehak-ro, Yuseong-gu, Industrial and Systems Engineering,KAIST, Daejeon, Ch, 305-701, Korea, Republic of, ldy1848@kaist.ac.kr, Kyoung-Kuk Kim

A Parisian option is a variant of barrier options. We study its greeks via Laplace transform and conduct risk analysis, showing that theta is important to understand the behavior of a Parisian option and how it can make dynamic hedging fail. As an alternative, we propose a quasi-static hedging strategy by decomposing a Parisian option into other contingent claims which are statically hedged. Numerical comparisons of dynamic and static hedging are reported.

2 - Employee Stock Option Valuation with Job Termination Risk and Jumps in Stock Price

Haohua Wan, PhD Student, UIUC, Room 14 Transportation Bldg, 104 S. Mathews Ave, Urbana, IL, 61801, United States of America, hwan3@illinois.edu, Tim Leung

This paper studies an Employee stock options (ESOs) valuation framework that accounts for job termination risk and jumps in stock price under general Levy dynamics, which shows that the optimal exercise boundary and ESO cost can be determined by solving an inhomogeneous partial integro-dierential variational inequality (PIDVI).

3 - Equilibrium Asset Pricing with Rational and Irrational Investors

Jing Guo, Columbia University, 500 W 122nd Street, Apt. 1E, New York, NY, 10027, United States of America, jg3222@columbia.edu, Xuedong He

We study a multi-period asset pricing problem with rational investors having recursive utility preferences and irrational investors having additional CPT utility of gains and losses. In the logarithmic utility case, we derive the unique equilibrium analytically, propose a stock performance measure that determines the irrational investors' stock holding and show the market dominance of the rational investors in the long run. In the general case, we develop an algorithm to compute the equilibrium.

4 - Optimal Mean Reversion Trading with Transaction Cost and Stop-Loss Exit

Xin Li, Columbia University, 500 West 120th Street, New York, United States of America, xl2206@columbia.edu, Tim Leung

Motivated by the industry practice of pairs trading, we study an optimal double stopping problem to analyze the timing to start and subsequently liquidate the position subject to transaction costs and stop-loss constraint. We apply a probabilistic methodology and derive the optimal price intervals for entry and exit.

5 - Robust Investment Management with Uncertainty in Fund Manager Asset Allocation

Yang Dong, Senior Analyst, J.P. Morgan, 330 E. 46th street, Apt 2A, New York, NY, 10017, United States of America, woshidongyang@gmail.com, Aurelie Thiele

In this paper, we propose a robust framework that takes into account the uncertainty stemming from the fund managers' allocation in the context of portfolio management. We assume that only bounds on the fund managers' holdings are available. Numerical experiments suggest that our robust model provides better protection against risk than the nominal model when the fund managers' allocations are not known precisely.

Chair: Zelda Zabinsky, Professor, University of Washington, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, zelda@u.washington.edu

1 - Solving Global Optimization Problems Via Stochastic Inclusion Sets

Wolf Kohn, Professor and Chief Scientist, University of Washington, Industrial and Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, wolfk@u.washington.edu, Zelda Zabinsky, Yanfang Shen

We present a feedback controller based on mean field theory that operates on domains defined by rules that represent physical principles, requirements and sensory data. The controller learns and adapts to changing environmental conditions by building a model that is dynamically tuned using data. Our approach captures multiple objectives and uncertainties by propagating sets of points towards a set of non-dominated (Pareto) solutions using a dynamic set inclusion approach and turnpike theory.

2 - A Stochastic Meta-control Bang-bang Solver for a Large Binary Integer Program

Pengbo Zhang, Ph.D. Student, University of Washington, Industrial and Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, pbzhang@u.washington.edu, Wolf Kohn, Zelda Zabinsky

We develop a discrete stochastic meta-control algorithm that provides a good approximation to large-scale binary integer programs with low polynomial time complexity. The key idea is to balance the feasibility problem and optimizing the objective function. We define two coupled linear quadratic tracking problems, and iteratively solve them in sequence to improve the feasibility and optimality measures with respect to the original binary integer problem.

3 - A Fast Marching Algorithm with I-frames for Parameter Estimation in the Cloud for Demand Forecasting

Philip Placek, Ph.D. Student, University of Washington, Industrial and Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98195-2650, United States of America, pcplacek@gmail.com, Wolf Kohn, Zelda Zabinsky

We develop a methodology for solving parameter estimation problems in a cloud environment for demand forecasting. The classic approach is to solve a nonlinear least squares optimization problem. Our method divides the optimization into a two-step process, the I-frame optimization and the incremental optimization. The incremental optimization connects the I-frame solutions at discrete points in the state space to approximate the solution of the original problem.

Hilton - Green Room

Software Demonstrations

Cluster: Software Demonstrations

Invited Session

1 - Online Games to Teach Operations and Supply Chain Management

Sam Wood, Responsive Learning Technologies, wood@responsive.net

Learn about online competitive exercises that are used in Operations Management courses and Supply Chain Management courses to teach topics like capacity management, lead time management, inventory control, supply chain design and logistics. These games are typically used as graded assignments.

2 - Provalis Research - How to Analyze Big Text Data with Text Analytics Tools

Normand Peladeau, President & CEO, Provalis Research, 2997 Ave Cedar, Montreal, QC, H3Y 1Y8, Canada, npeladeau@provalisresearch.com

Provalis Research will showcase its integrated collection of text analytics software. QDA Miner is an easy-to-use qualitative and mixed methods software that meets the needs of researchers performing qualitative data analysis and would like to code more quickly and more consistently larger amounts of documents. It offers high level computer assistance for qualitative coding with innovative text search tools that help users speed up the coding process as well as advanced statistical and visualization tools. Users with even bigger text data can also take advantage of WordStat. This add-on module to QDA Miner can be used to analyze huge amounts of unstructured information, quickly extract themes, find trends over time, and automatically identify patterns and references to specific concepts using categorization dictionaries.

Scaling Limits of Stochastic Networks

Sponsor: Applied Probability Society

Sponsored Session

Chair: Kavita Ramanan, Professor, Brown University, 182 George St, Providence, RI, 02912, United States of America, kavita_ramanan@brown.edu

1 - A Decentralized Variant of a Limited Flexibility System

John Tsitsiklis, Massachusetts Institute of Technology, Cambridge, Ma, 02139, United States of America, jnt@mit.edu, Kuang Xu

We consider a multiserver system with a limited degree of flexibility, whereby a fraction p of the total available service rate resides at a flexible server that serves jobs from a longest queue. For large systems, The resulting delay is known to be very favorable. We show the same for a "push" policy that diverts jobs to the flexible server whenever a corresponding local queue exceeds a suitable threshold, and for a broad class of interarrival and service time distributions.

2 - Ticket Queue with Impatient Customers: Optimal Ticket-based Staffing Policies

Li Xiao, National University of Singapore, BIZ 2 Building,Basement B2-03, 1 Business Link, NUS Business School, singapore, Singapore, lixiao@nus.edu.sg, Hanqin Zhang, Susan Xu, David Yao

For ticket queues with impatient customers, we use Markov chain analysis and fractional programming to optimize the ticket-based staffing policy so as to minimize the combined delay, abandonment and operating costs. We also develop a random-walk/Brownian motion based approximation approach, and show its asymptotic optimality.

3 - Diffusion Limits for Shortest Remaining Processing Time Queues under Nonstandard Spatial Scaling

Amber Puha, Professor, California State University San Marcos, Department of Mathematics, 333 S. Twin Oaks Valley Road, San Marcos, CA, 92058, United States of America, apuha@csusm.edu

We develop a heavy traffic diffusion limit theorem under nonstandard spatial scaling for the queue length process in a GI/GI/1 shortest remaining processing time queue. For processing time distributions with unbounded support, standard diffusion scaling yields an identically zero limit. For a natural class of rapidly varying processing time distributions that includes Weibull distributions, we specify an alternative spatial scaling that produces a nonzero limit.

4 - Fluid Limits of a Randomized Load Balancing Model

Mohammadreza Aghajani, Brown University, Mohammadreza_Aghajani@brown.edu, Kavita Ramanan

We introduce a general framework for studying a class of randomized load balancing models in a system with a large number of servers that have generally distributed service times and use a first-come-first serve policy within each queue. Under fairly general conditions, we use an interacting measure-valued process representation to establish fluid limits in these models, and discuss the insights that the fluid limit provides into the performance of the system.

Case Competitions II

Sponsor: INFORM-ED

Sponsored Session

Chair: Palaniappa Krishnan, University of Delaware, Newark, DE, United States of America\, baba@udel.edu

1 - Case Competition

Palaniappa Krishnan, University of Delaware, Newark, DE , United States of America, baba@udel.edu

INFORMed's Annual Cased Competition is an opportunity fir INFORMS Members to showcase their efforts in the classroom. Cases are often later published.

2 - Case Study: using Regression to Improve Parole Board Decisions

Wendy Swenson-Roth, Associate Professor, Georgia State University, 6230 Forest Park Dr, Signal Mountain, TN, 37377, United States of America, wroth@gsu.edu

In this case, students are guided in the process of developing a regression model for a parole board to predict recidivism of inmates coming up for parole. The case is based off of an article from the Wall Street Journal, increasing the credibility of the assignment and with the additional goal of exposure to outside sources of business information. (A copy of the article is included at the end of the document for reference.) Students are exposed to steps of the entire decision making process instead of just focusing on tool usage. This allows for a broader discussion of the implementation of regression. Students may be intimidated when asked to collect their own data. Enhanced discussion of the process as part of this case helps better prepare students to address data collection issues in future assignments.

3 - Growing Pains Case

Mina Hadianniasar, PhD Student, University of Arkansas, Fayetteville, AR, United States of America, mhadiann@uark.edu, Ashlea Milburn

This is a case study of transportation and distribution services in undergraduate and graduate level transportation logistics or optimization courses. More specifically, this case is appropriate for use in any course that emphasizes on modeling, solving and interpreting the outputs of mixed integer programs by using various heuristics related to vehicle routing problem (VRP). This problem is faced by a real transportation company, where the company names and details have been changed to protect privacy. The major problem considered in this case study is estimating the annual freight transportation miles of Northeastern Home Goods (NHG) which is a retail chain offering contemporary home furnishings for bargain prices; if a single DC in Wilmington is used under the current service schedule. Designing a set of feasible and minimum-distance routes to serve all customers of NHG and determining the minimum number of drivers and vehicles required for this feasible set are some other aims of this case. This case study is designed to improve students' skills on modeling, finding set of feasible solutions using various heuristics and interpreting the outputs of mixed-integer programs. During this case study which is based on a real problem, students will learn how to model and analyze real data set and interpret the outputs and solutions, in order to make appropriate decisions leading to increasing their confidence and preparation for confronting and managing real-life problems. Moreover, this case study helps the students improve their skills to interpret results on a complex problem and understand that large unsolvable problems can be divided into smaller more manageable problems.

4 - Contracting for LTL Services at Hankey Industries

Matthew J. Drake, Duquesne University, Pittsburgh, PA, United States of America, drake987@duq.edu

Michael Barth, logistics manager at Hankey Industries, has received contract quotes from four less-than-truckload (LTL) carriers to supply its outbound transportation services for the next 18 months. Michael must analyze the quotes and determine which quote or combination of quotes to select to minimize the total monthly transportation costs. This case fills a void in the existing library of educational materials by focusing on the LTL industry, especially the intricacies of pricing for LTL services. Very few, if any, published cases give students the opportunity to perform contract analysis in the LTL industry. This is an important part of many transportation analyst positions in third-party logistics (3PL) providers, an industry that has recently lamented the lack of available talent graduating from university programs. The case is appropriate for any undergraduate or graduate course that includes coverage of transportation services. The first part of the case requires that students determine the cost to ship to each customer location using various contract options; students at any level should be able to complete this task. Once all of the costs are determined, the students must then develop and solve a binary integer program that determines the best combination of contracts to select; this part may only be appropriate for graduate and advanced undergraduate students.

5 - Material Handling Improvement in Warehouses by Parts Clustering

Mohammad Moshref-Javadi, Purdue University, 315 N. Grant St., Purdue University, West Lafayette, In, 47907, United States of America, moshref@purdue.edu, Mark Lehto

In this study, several methods and algorithms were used to form part families and determine the locations of parts in the layout. The applied clustering methods are based on statistical tools. These methods help researchers and practitioners to become familiar with new applications of statistical methods. In addition, this approach is a new method in order picking problem and hopefully can trigger more extensions and improvements of the techniques in facilities design problems. This case study also teaches students four different layout design algorithms and the best method among them to be applied. The results, algorithms, and techniques utilized in this case study can be helpful to both students and researchers to become familiar with new methods, as well as practitioners to optimize facilities for performance improvement.

Recent Advances in Experimental Designs

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Moein Saleh, Research Associate, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85281, United States of America, Moein.Saleh@asu.edu

1 - A Clustering-based Coordinate Exchange Algorithm for Finding G-optimal Experimental Designs

Moein Saleh, Research Associate, Arizona State University, 699 S. Mill Ave., Tempe, AZ, 85281, United States of America, Moein.Saleh@asu.edu

In experimental designs, the G optimality criterion minimizes the maximum prediction variance over the entire experimental design region. In this presentation, a hybrid of a clustering-based point exchange algorithm and a coordinate exchange algorithm is developed for obtaining G-optimal experimental designs for line

2 - Adding Realism to Choosing and Constructing Optimal Designed Experiments

Christine Anderson-Cook, Research Scientist, Los Alamos National Laboratory, PO Box 1663 MS F600, Los Alamos, NM, 87545, United States of America, c-and-cook@lanl.gov, Lu Lu

As computational power improves, statisticians can choose designs increasingly tailored to study experimental goals. Recent optimal designs allow more flexibility, but usually consider only one criterion. The Pareto Front approach adapts to different # of criteria, eliminates non-contenders based on user-specified criteria, and provides tools to select a design which best matches user needs. Examples illustrate choosing from a catalog of designs and constructing designs using a search algorithm.

3 - Projection Properties of Three-Level Fractional Factorial Designs under the Linear-Quadratic System

Arman Sabbaghi, Assistant Professor of Statistics, Purdue University, Department of Statistics, 150 N. University Street, West Lafayette, IN, 47907, United States of America, sabbaghi@purdue.edu

The linear-quadratic (LQ) system is important in applications because it yields partially aliased and interpretable interaction contrasts for quantitative factors. Projection properties of fractional factorial designs are evident from their indicator functions. By means of a new algebraic operation for calculation of indicator function coefficients, new insights and connections are obtained for different projection properties of three-level designs under the LQ system.

4 - Iterative Sparsity Search for Modeling Brand Correlation and Computer Experiments with Mixed Factors

Qiong Zhang, UW-Madison, 9406 West Brightway Circle, Madison, WI, 53705, United States of America, zhangqiong1985@gmail.com

We propose a statistical approach to estimating covariance structures of multiple brands with similar products in grocery stores. This approach models the sales performances of multiple brands in multiple markets using a multivariate spatial processes and develops an iterative sparsity search algorithm to estimate the model parameters. The effectiveness of the method is illustrated by examples from a consumer packaged goods database. Interestingly, the method is also applicable to computer experiments with quantitative factors and a large number of qualitative levels.

1 - Modeling Outcomes of Cancer Screening

Alex Tsodikov, Professor of Biostatistics, University of Michigan, 1415 Washington Heights, Ann Arbor, MI, 48109, United States of America, tsodikov@umich.edu

Analysis of cancer data in the presence of screening is challenging because the phenotype observed at diagnosis and survival thereafter vary with cancer screening even in the absence of treatment benefit. In order to develop a foundation for decision making in the dynamic situation, we provide a statistical modeling approach and synthesize prostate cancer data from a variety of sources.

2 - Integrating Biological and Statistical Models for Predicting Complications in Radiation Therapy

Jing Li, Associate Professor, Arizona State University, jing.li.8@asu.edu, Xiaonan Liu

Intensity-modulated radiation therapy is a modern technique for treatment of aggressive cancers. Biological models exist for linking complications with radiation dose. While these models offer great biological insight, they do not consider individual patient difference. We propose an integrated approach that combines biological mechanisms and patient-specific data, to achieve better prediction and potentially individualized treatment.

3 - Aggregation of Statistical Findings, Case Study: BMR Estimation Models, White Males 8-18 Years Old

Mohammad S. Jalali, Virginia Tech / MIT, 113 Harvard St, Apt 1, Cambridge, MA, 02139, United States of America, mj@vt.edu, Hazhir Rahmandad, Kamran Paynabar

In this study, we present a general method to aggregate empirical statistical findings from prior studies. We present our method with a case study in obesity research where the literature provides over 100 equations to estimate Basal Metabolic Rate (BMR) as a function of different attributes (age, height, etc). There is currently no method that combines these equations into a more reliable one. Using our method, we aggregate BMR estimation models for a subpopulation (white males 8-18 years old).

4 - Measurement Error Isolation in Longitudinal MRI Data Analysis

Chitta Ranjan, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, United States of America, nk.chitta.ranjan@gatech.edu

MRI is common in hospitals for diagnosis, disease staging etc. Typically a patient undergoes MRI scanning in long intervals due to its harmful effects on health. This results into un-replicated longitudinal data and, owing to complexity of the procedure, with inherent measurement error. If this error is high then any inference is difficult to make. In this work we aim to measure and isolate the measurement error from the modeling error for better inferences using Bayesian mixed effect modeling.

Interfaces Between Simulation and Optimization

Sponsor: Simulation

Sponsored Session

Chair: Tito Homem-de-Mello, Professor, Universidad Adolfo Ibañez, School of Business, Diagonal las Torres 2640, Santiago, Chile, tito.hmello@uai.cl

1 - Random Search vs Sample-average Approximation

Peter Glynn, Stanford University, Huang Engineering Center 357, Stanford, CA, 94305, United States of America, glynn@stanford.edu

We discuss and contrast random search algorithms with sample-average approximations (SAA). We show that the complexity of random search depends upon the problem instance in a fundamentally different way than does SAA, and note that random search can be implemented in such a way that its complexity is close to that obtained in the setting of deterministic function evaluations.

2 - Chance-constrained Problems and Rare Events: An Importance Sampling Approach

Tito Homem-de-Mello, Professor, Universidad Adolfo Ibañez, School of Business, Diagonal las Torres 2640, Santiago, Chile, tito.hmello@uai.cl, Javiera Barrera, Eduardo Moreno, Bernardo Pagnoncelli, Gianpiero Canessa

We study chance-constrained problems where the constraints involve the probability of a rare event. In this context, existing sampling-based algorithms require an impractical number of samples. Using a Sample Average Approximation approach combined with importance sampling techniques, we show how variance can be uniformly reduced so the problem can be solved with much fewer samples. We apply our methodology to a telecommunications problem and present numerical results to illustrate the ideas.

3 - Derivative-Free Optimization of Noisy Functions using a Trust Region Framework

Stephen Billups, Associate Professor, University of Colorado Denver, Dept of Math. and Stat. Sciences, CB 170, PO Box 173364, Denver, CO, 80217-3364, United States of America, Stephen.Billups@ucdenver.edu

Modern derivative-free trust region algorithms efficiently find local optima of functions where only function values (not derivatives) can be calculated. This makes them attractive for optimizing functions evaluated by computer simulations. However, noise or uncertainty, which is typically present in such function evaluations can pose significant problems for such algorithms. This talk describes a derivative-free trust region algorithm designed to robustly and efficiently handle such noise.

4 - Sequential Detection of Convexity from Noisy Function Evaluations

Nanjing Jian, PhD Student, Cornell University, School of ORIE, Rhodes Hall, Ithaca, NY, 14850, United States of America, nj227@cornell.edu, Susan Hunter, Shane Henderson

Given simulation estimates of function values at a finite set of points, we want to detect convexity or non-convexity of the true function on those points. We review a frequentist hypothesis test and introduce a sequential Bayesian test. The Bayesian test works for both independent sampling and CRN, and allows unknown variance, iteratively updating a posterior on the true function values. We approximate the probability that the function is convex based on the posterior using Monte Carlo.

Sustainable and Responsible Supply Chain Management

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Jose Cruz, Associate Professor, School of Business, University of Connecticut, Storrs, CT, United States of America, Jose.Cruz@business.uconn.edu

1 - Corporate Social Responsibility and Performance in the Supply Chain Network

Trisha Anderson, Texas Wesleyan University, Fort Worth, TX, United States of America, trdanderson@txwes.edu, Zugang Liu

We study the level of corporate social responsibility (CSR) and performance over a period of seven years (2003-2009) to compare the relationship between activities, across time, and with different size firms for various industries identified by the Standard Industrial Classification codes. We explain and validate a dynamic panel regression model that is used in the supply chain network model.

2 - The Impact of Customer Satisfaction Function on Sustainable Remanufacturing of Commercial Returns

Farhad Azadivar, Professor, University of Massachusetts Dartmouth, 285 Old Westport Road, North Dartmouth, MA, 02747, United States of America, fazadivar@umassd.edu, Ardavan Ardeshirilajimi

Commercial returns are products returned by customers within a relatively short period after purchase due to perceived deficiencies. The environmental costs of disposal and wasted material have made remanufacturing almost a necessity. Common assumption has so far been that all customers have the same perception of deficiency. In this report an alternative is presented by considering the role of a customer satisfaction function in targeting the product quality and remanufacturing policies.

3 - How Coopetition Have Effect on Green Product Development?

Maryam Hafezi, Wilfrid Laurier University, 1207-125 Lincoln Road, Waterloo, ON, N2J 2N9, Canada, hafe1390@mylaurier.ca, Xuan Zhao

In this research, we use game-theoretic approach to see how competition affects the price, quantity and quality of green products. By considering three innovation strategies – independent innovation, investment sharing, and innovation sharing strategy – we try to help manufacturers know how much to cooperate and how much to compete.

4 - Economic Sustainability of Closed Loop Supply Chains: A Holistic Decision and Policy Analysis

Jose Cruz, Associate Professor, School of Business, University of Connecticut, Storrs, CT, United States of America, Jose.Cruz@business.uconn.edu, Sudip Bhattacharjee

This paper develops an end-to-end model of a closed-loop supply chain (CLSC), and analyzes the economic viability of participants in this chain. We model the lifecycle of consumer electronics good and implement a system dynamic (SD) model to examine the complex interactions among different components. Our results highlight the product and marketing strategies that create profitable streams for all stakeholders in the chain for the closed-loop to be economically and environmentally sustainable.

Analytics in the Petrochemical/Petroleum Industry

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Margery Connor, Chevron, 6001 Bollinger Canyon Road, San Ramon, United States of America, mhco@chevron.com

1 - O&G Value of Information of Appraisal Well with Continuous Distributions

Brian Putt, OC Manager, Chevron, 6001 Bollinger Canyon, San Ramon, CA, 94588, United States of America, brianputt@chevron.com

Traditional Value of Information requires Bayesian conditional probability assessments that are used in a decision tree with discrete outcomes. New modeling techniques enable the VOI analysis to consider continuous distribution. This presentation will contrast various VOI analyses techniques using an oil and gas upstream example and will introduce SIPmath to facilitate the probabilistic arithmetic of the VOI distributions using Excel only.

2 - R&D Roadmap for Aviation Biofuels: New Use for Decision Analysis Methods

Elizabeth Connelly, Graduate Research Assistant, University of Virginia, 151 Engineers Way, Charlottesville, VA, 22904, United States of America, ec5vc@virginia.edu, Lisa Colosi, James Lambert, Andres Clarens

Replacing petroleum-based jet fuel with renewable jet fuel addresses concerns related to environmental sustainability, price volatility, long-term supply, and national security. Multi-criteria decision analysis integrated with scenario analysis can be used to develop an R&D roadmap for promoting an aviation biofuel industry. Stakeholder preferences and uncertainties from emergent conditions are considered to produce a robust prioritization of R&D initiatives applicable to diverse groups.

3 - Rational Decision Making Model for Risk Assessment of Offshore Drilling

Maryam Tabibzadeh, University of Southern California, 1157 W., 30th St., Los Angeles, CA, United States of America, m.tabibzadeh@gmail.com

This paper introduces a rational decision making model, using the signal detection theory as a foundation, for risk assessment of misinterpreting a negative pressure test (NPT), as the primary means to ascertain well integrity during offshore drilling. This model proposes a structured framework to the practitioners of oil and gas industry for the interpretation of conducted NPTs and the analysis of involved decision making biases. This framework can be used in analyzing all high-risk operations.

1 - Identifying the Impacts on the Social Enterprises Development in Cambodian Tourism Industry

Sungyong Choi, Assistant Professor, Yonsei University, 1 Yonseidae-gil, Wonju, 220-710, Korea, Republic of, sungyongchoi@gmail.com, Sonita Eng

This research focuses on the work of identifying the impacts on the Social Enterprises (SEs) development in Cambodian tourism industry. In this exploratory work, we verify the four key factors, which are legal framework, financing, ownership, and social capital. The study wishes to find out both positive and negative impacts that are influencing current state of these SEs by analyzing its strengths, weaknesses, opportunities and threats (SWOT).

2 - Supply Chain Success Factors and Performance: Trust, Involvement and Partnership Perspectives

Chang Won Lee, Professor, Hanyang University Business School, 222 Wangshimni-ro, Seoul, KR, 133-791, Korea, Republic of, leecw@hanyang.ac.kr, Sang Hyung Ahn

The study is to present the relationship between supply chain success factors and supply chain performance in terms of trust, involvement and partnership perspectives. The research model is developed and empirically tested by Korean manufacturers. The results shows significant implications of trust, involvement and partnership in exploring supply chain success factors affecting supply chain performances in Korea business settings.

3 - Price Competition or Uncertainty Reduction? An Investigation of Green Car Technology

Byung Cho Kim, Associate Professor, Korea University Business School, Hyundai Motor Hall, KUBS, Anam-dong, Seongbuk-gu, Seoul, 136-701, Korea, Republic of, bkim@korea.ac.kr, Hosun Rhim, Hongsuk Yang

This paper examines the strategic choice of the green vehicle manufacturers under competition, between price competition and uncertainty reduction. Grounded on a stylized model for platform and two-sided market, we find profit- and welfare-maximizing levels of prices and uncertainty reduction effort, and investigate how the scope of network externality and cost differential influence the manufacturer's and the social planner's strategic choices.

4 - A Study on Emergency Logistics Problem after Massive Natural Disaster

Sumin Han, Ph.D candidate, Seoul National University, 39-317, Dept. of Industrial Engineering,, Seoul National University, Shillim-don, seoul, 151-744, Korea, Republic of, hans8501@mailab.snu.ac.kr, Youngwoo Kim, Gyusun Hwang, Sangyun Choe, Jinwoo Park

The occurrences of massive disasters increase in the 2000s. To minimize the damages due to disasters, studies on emergency logistics have received a wide attention. It is a logistics problem with uncertain information. So in these studies, it is important to include measures from advanced ICT and optimization tools. We suggest a solution that evolves with the information content of the situation beginning from uncertainty. Finally a simulation study supports the validity of our approach.

5 - Use of Noncental Composite Designs for Sequential Assembly

JH Byun, Professor, Gteongsang National University, 501 Jinju-daero, Jijju, Gyeongnam, Jinju, 660-701, Korea, Republic of, jbyun@gnu.ac.kr

In this paper we propose a non-overlapping noncentral composite design (NNCD) that can be used effectively when the data analysis result of the first factorial design shows synergistic interaction effects. We present design matrices and experimental points for NNCDs with two and three factors, in which the first factorial design is assembled with the second factorial design sharing one design point. A simple method for estimating linear, interaction, and quadratic coefficients is also given.

6 - Sequential Capacity Allocation under Order Manipulation

Kun Soo Park, Assistant Professor, KAIST College of Business, 85 Hoegi-ro, Donegaemun,, Seoul, Korea, Republic of, kunsoo@business.kaist.ac.kr, Bosung Kim, Seyed Iravani

We consider an allocation of a supplier's capacity that is made sequentially. In particular, we analyze how the ordering strategy of manufacturers change if they are allowed to manipulate their orders from their actual needs.

7 - A Rectified LAD for Numerical Data

Cui Guo, Shantou University Business School, No.243, Daxue Road, Shantou, China, cguo@stu.edu.cn, Hong Seo Ryoo

LAD presents some limitations when analyzing numerical data, owing to a difference in structural properties of originally 0-1 data and binarized 0-1 data. This paper illustrates these limitations and develops a way to rectify the general LAD framework to more accurately analyze numerical data.

ENRE Awards Session

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Miguel Anjos, Professor and Canada Research Chair, Polytechnique Montreal, C.P. 6079, Succ. Centre-ville, Montreal, QC, Canada, miguel-f.anjos@polymtl.ca

1 - ENRE Young Researcher Prize 2014

To Be Announced

This award is given annually to one or more young researcher(s) for an outstanding paper on the application of OR/MS to an important problem in energy, natural resources and/or the environment. The Prize serves as an esteemed recognition of promising colleagues who are at the beginning of their academic or industrial career.

2 - ENRE Best Student Paper Award 2014

To Be Announced

This award is given annually to the best paper dealing with Energy, Environmental, or Natural Resource issues by a student author who is presenting at the INFORMS Annual Meeting.

3 - ENRE Best Publication Award 2014 in Natural Resources

To Be Announced

This award is given annually to the best refereed journal article in the area of Natural Resources published within the two calendar years prior to the year in which the award is given.

4 - ENRE Best Publication Award 2014 in Energy

To Be Announced

This award is given annually to the best refereed journal article in the area of Energy published within the two calendar years prior to the year in which the award is given.

5 - ENRE Best Publication Award 2014 in Environment and Sustainability

To Be Announced

This award is given annually to the best refereed journal article in the area of Environment and Sustainability published within the two calendar years prior to the year in which the award is given.

Chair: Chris Fry, Managing Director, Strategic Management Solutions, PO Box 5721, Redwood City, CA, 94065, United States of America, chris@strategicmgmtsolutions.com

1 - Inventory Allocation in an eCommerce Fulfillment Network

Jagtej Bewli, Group Product Manager, WalmartLabs, 850 Cherry Avenue, San Bruno, CA, 94066, United States of America, jbewli@walmartlabs.com, Mohan Akella

eCommerce Inventory allocation poses new and interesting challenges in the areas of OR and Machine learning. Unlike physical retail, demand in an ecommerce network can be fulfilled from any node, which changes the concept of "In Stock" and the "Demand' at a node. In this talk, we will discuss the challenges of this structure as well as enhancements to demand forecast and network flow models that are needed to optimize ecommerce fulfillment operations.

2 - Spare Parts Inventory Management for Google's Data Centers

John Khawam, Operations Strategy Lead, Google Inc., 1600 Amphitheatre Parkway, Mountain View, CA, 94043, United States of America, johnkhawam@google.com

Our goal is to forecast and set inventory levels for spare parts that serve Google's Data Centers throughout the world. Server uptime is critical to Google, and spare parts are often the last defense in preventing down machines.

3 - NASA's SACE Analytic Software Demonstrates Hybrid Artificial Intelligence – Operations Research Serving Critical Space Station Operations

John Chachere, Sargeant, NASA Ames Research Center, Mountain View, CA, United States of America, john.chachere@gmail.com

NASA's Solar Array Constraints Engine (SACE) demonstrates hybrid artificial intelligence – operations research analytics serving critical operations. The SACE software has helped the International Space Station (ISS) flight controllers safely and effectively operate ISS solar arrays. Flight controllers must position the arrays to collect adequate power for life and experiments on the station, yet avoid numerous hazards, including thruster firings, environmental contamination, communications interference, and extra-vehicular activities. Within minutes, violating these constraints could result in catastrophic failure of ISS (loss of $100B station, a global partnership, and astronaut heroes). Analytically, SACE linear programming prioritizes the diverse constraints while knowledge-engineered constraint propagation optimizes across time. SACE has provided the Mission Control Center with awareness of operational constraints that are in danger of being violated either at the current time or in the immediate future, and given them the ability to plan solar array activities for periods of weeks into the future.

Parc- Mission III

Simulation Methods for Risk Analysis and Finance

Sponsor: Simulation

Sponsored Session

Chair: Marvin Nakayama, Professor, New Jersey Institute of Technology, Computer Science Department, 218 Central Avenue, Newark, NJ, 07102, United States of America, marvin@njit.edu

1 - Simulation of Tempered Stable Levy Bridges and its Applications

Kyoung-Kuk Kim, Associate Professor, Korean Advanced Institute of Science and Technology, 291 Daehak-ro, Yuseong-gu, Industrial and Systems Engineering,KAIST, Daejeon, Ch, 305-701, Korea, Republic of, catenoid@kaist.ac.kr

We consider tempered stable Levy subordinators and develop a bridge sampling method, i.e. sample paths conditioned on the end points. An approximate conditional PDF is derived using the double saddle-point approximation. The acceptance-rejection algorithm is then proposed using the known gamma and inverse Gaussian bridges as its proposals depending on a stable index. The method is applied to financial options under subordinated Brownian motion models and finite variation CGMY processes.

2 - A Sequential Procedure for Estimating Steady-State Quantiles

James Wilson, North Carolina State University, Dept.of Industrial & Systems Engineering, 111 Lampe Drive, Daniels Hall, Raleigh, NC, 27695, United States of America, jwilson@ncsu.edu, Anup Mokashi, Christos Alexopoulos, Kai-Wen Tien, David Goldsman

We formulate a fully sequential procedure yielding improved point and confidence-interval (CI) estimators for a steady-state quantile that incorporate effective methods to eliminate initialization bias in the point estimator and to adjust the CI half-length for the effects of skewness and correlation in the underlying simulation-generated process. We summarize the results of an experimental performance evaluation of the procedure.

3 - Stratified Estimators for Quantiles

Raghu Pasupathy, Associate Professor, Purdue University, Dept. of Statistics, West Lafayette, United States of America, pasupath@vt.edu, Soumyadip Ghosh

We consider quantile estimation in the context of streaming data.We present a new estimator obtained by adaptively stratifying incoming data, with the strata becoming progressively finer around the desired quantile. We find that the resulting reduction in storage is often dramatic, with negligible deterioration in estimator convergence rate. The method, while demonstrated for quantile estimation, seems to be applicable more widely.

4 - Confidence Intervals for a Quantile When Applying Latin Hypercube Sampling

Marvin Nakayama, Professor, New Jersey Institute of Technology, Computer Science Department, 218 Central Avenue, Newark, NJ, 07102, United States of America, marvin@njit.edu, Hui Dong

We develop confidence intervals (CIs) for a quantile when applying replicated Latin hypercube sampling (LHS). LHS reduces variance by stratifying inputs on all dimensions simultaneously. We use batching and sectioning to build asymptotically valid CIs. Similar to batching, sectioning CIs replace the batching estimator with the overall estimator. We establish the validity of the sectioning CI by first proving that a LHS quantile estimator satisfies a Bahadur representation.

Innovations in Supply-Chain Operations

Sponsor: The Practice Track

Sponsored Session

Chair: Sam Eldersveld, Principle Research Scientist, Amazon, 333 Boren Ave. N., Seattle, WA, 98109, United States of America, sam.eldersveld@comcast.net

1 - Multimodel Inference as the Basis for Improved Supply-chain Planning

Sam Eldersveld, Principle Research Scientist, Amazon, 333 Boren Ave. N., Seattle, WA, 98109, United States of America, sam.eldersveld@comcast.net

Optimizing suppl-chain performance depends on good supply-chain planning: Future predictions of exogenous operational factors are crucial to meet this end. Multiple predictive models are available to help explain historical data and often no one model may be "perfect" over any time horizon. We present strategies for making better predictions from an a priori set of models based on information-theoretic and Bayesian criteria. The theory and application in supply chain settings will be presented.

2 - Large Scale Multi-item Order Optimization

Andrea Qualizza, Sr. Research Scientist, Amazon, Seattle, United States of America, qualizza@amazon.com

Near real-time multi-item order planning problems are computationally challenging since they entangle a number of nested NP-hard problems. In this talk we present an approach based on Generalized Networks that trades off some of the complexity of the nested problems and is able to get solutions in useful time for tens of millions of multi-orders simultaneously. Several business constraints, like for example load balancing across warehouses, are readily embedded in the model.

3 - Network Solutions and Shipment Optimization at Starbucks

Stephen Stoyan, Manager, Advanced Analytics, Starbucks Coffee Company, 2401 Utah Ave. S., Seattle, WA, 98134, United States of America, stoyan@mie.utoronto.ca

The supply chain network at Starbucks Coffee Company is facing new complexities on how products are shipped, stored, and distributed in the network. The advanced analytics team at Starbucks has developed a set of tools that optimizes the network, consolidates shipments, and tackles new challenges faced in the supply chain. We present the set algorithms that has already lead to millions of dollars in savings and growing.

4 - Hybrid Metaheuristics and Large Neighborhoods for the Clustered Vehicle Routing Problem

Thibaut Vidal, LIDS — Massachusetts Institute of Technology, 77 Massachusetts Avenue, Room 32-D566, Cambridge, MA, 02139, United States of America, vidalt@mit.edu, Anand Subramanian, Maria Battarra, Günes Erdogan

A vehicle routing problem with cluster constraints is studied, in which deliveries within a cluster must be serviced consecutively by the same vehicle. Postal services can include such features when considering zip code restrictions. Our newly-proposed hybrid metaheuristics generate very high quality solutions in about five minutes on a single CPU, for instances with up to 1200 service locations.

Predictive Analytics Models and Methods

Sponsor: Analytics

Sponsored Session

Chair: Michael N. Katehakis, mnk@rutgers.edu

1 - Adaptive Task Assignment Policies for Multi-channel Call Centers

Ger Koole, VU, De Boelelaan 1105, Amsterdam, Netherlands, ger.koole@vu.nl, Benjamin Legros, Oualid Jouini

In many situations scheduling policies depend on the parameters of the system. However, often we have at best unreliable estimates of these parameters. In this paper we propose a policy for task assignment in call centers that automatically adapts itself to changes in the parameters without estimating these parameters but by changing the policy on the basis of changes in the objective value.

2 - On Single Payout Multi-armed Bandits and the Secretary Problem

Wesley Cowan, Rutgers University, Dept. of Mathematics, Piscataway, NJ, United States of America, cwcowan@math.rutgers.edu, Michael N. Katehakis

In this talk we present several extensions to the theory of the multi -armed bandit problem that are made possible by a new model of single payout bandits. We discuss applications to biding in auctions and extensions of the secretary problem.

3 - Multi-agent Coordination in Team Search Problems under a Bayesian Framework

Peter Beling, Associate Professor, University of Virginia, 151 Engineer's Way, Charlottesville, VA, 22904, United States of America, pb3a@virginia.edu, Yijia Zhao, Stephan D. Patek

We consider a decentralized path-planning problem for team Bayesian search. Each agent must formulate and solve a decentralized planning problem to compute its future actions. This planning problem is formulated as a partially observed Markov decision problem whose objective function is evaluated based on the assumption that all agents will use the same mixed strategy policy. We propose three dynamic programming heuristics for this planning problem.

4 - Predicting Inventory Status from Sales Transactions Data

Garrett van Ryzin, Columbia University, 412 Uris Hall, Columbia University, New York, NY, 10027, gjv1@columbia.edu, Juan Chaneton, Margaret Pierson

We use Monte Carlo Markov Chain (MCMC) methods to develop predictions of inventory status using only sales transactions data. Our predictions are shown to be effective at identifying out-of-stock status on both simulated and field tests and perform well relative to more naîve predictors. Such predictions are useful in a variety of supply chain applications and for detecting phantom stock-outs.

Applications of Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Mazen Skaf, Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, CA, 94301, United States of America, mskaf@sdg.com

1 - Decision Quality: A Cultural Change Effort

James Driscoll, Director of Decision Quality, Intel Corporation, 2200 Mission College Blvd, Santa Clara, CA, United States of America, james.r.driscoll@intel.com

Discussion of the adoption of Decision Quality at a large, multi-national technology leader. History and evolution of the effort and what we've learned along the way. Emphasis will be on the cultural changes that are required to embed and derive value from DQ/applied decision theory. Note: this presentation will NOT cover details regarding applications of DQ to internal and/or non-public business strategies.

2 - Decision Analysis in Life and Business: Differences and Similarities

Larry Neal, Manager, Decision Analysis Consulting, Chevron, 6001 Bollinger Cyn. Rd., San Ramon, CA, 94583-2324, United States of America, larryneal@chevron.com

On the occasion of using decision analysis for a personal medical situation, the author compares and contrasts the experience with applying decision analysis professionally in the workplace. The author draws conclusions from the experience and offers suggestions for better serving the layperson in a difficult or ambiguous decision making situation.

3 - Process and System for Optimizing the Allocation of Energy Resources in an Energy-Rich State

Mazen Skaf, Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, CA, 94301, United States of America, mskaf@sdg.com

We present a DA-based process and system for optimizing the allocation of hydrocarbon resources and other energy resources across proposed uses taking into account: i) uncertainty in future supply and demand, ii) various economic, social, and environmental value measures, and iii) existing commitments. The methodology has been successfully applied over the past four years to support decision-making on resource allocation as well as to guide investments on the supply side.

4 - Reducing Risk and Improving Incentives to Entrepreneurs and Backers

Sam Bodily, John Tyler Professor, Darden School, UVA, 100 Darden Boulevard, Charlottesville, VA, 22903, United States of America, BodilyS@Darden.virginia.edu

Incentive-compatible mechanisms are identified, risk analysis models are developed, and insights are obtained about how backers' funding (e.g. equity capital, incentive gifts, insurance, revenue contracts, and derivative swaps) can provide proper incentives and reduce risk to the entrepreneur, at least cost to the backers. Attention is given to avoiding problems of moral hazard. Certainty equivalents for financing alternatives are derived.

Real Option Applications

Sponsor: Decision Analysis

Sponsored Session

Chair: Luiz Brandão, Associate Professor, PUC Rio, Rua Marques de Sao Vicente 225, Rio de Janeiro, RJ, 22450-900, Brazil, brandao@iag.puc-rio.br

1 - A Symmetrical Binomial Lattice Approach for Modeling Generic One Factor Markov Continuous Processes

Carlos Bastian-Pinto, Assistant Professor, IBMEC RJ, Rio de Janeiro, RJ, Brazil, carbastian@gmail.com

The mathematical complexity associated with real options derives from the need for a probabilistic solution for the optimal decision. Binomial lattices such as that of Cox et al are robust, precise and intuitively appealing for option valuation. We propose a Symmetrical Binomial Lattice equivalent to the Cox et al when modeling GBM, but which can be utilized for a wide variety of other stochastic processes that have the Markov property. We demonstrate its applicability with several examples.

2 - Switching Options in Nitrogen Fertilizer Plants

Luiz Ozorio, Assistant Professor, IBMEC RJ, Rio de Janeiro, RJ, Brazil, lmozorio@ibmecrj.br, Carlos Bastian-Pinto, Luiz Brandão, Rafael Branco

Fertilizers are extremely important to agricultural production due to the productivity improvements in cropping that it allows. This article uses the Real Options Theory to evaluate the switch-output option, ammonia or urea, in a nitrogen fertilizer plant. The Monte Carlo simulation was used to define the value of the option and it was assumed that the prices of natural gas (input), ammonia and urea follow MRM as stochastic process. The results show that the option of the investor is valuable.

3 - Stochastic Price Process Calibration Methods and Their Impact on Real Option Values and Strategies

Reidar Bratvold, Professor, University of Stavanger, Kjell Arholmsgate 41, Stavanger, 4036, Norway, reidar.bratvold@uis.no, Philip Thomas

Stochastic commodity price models play a central role when evaluating energy investment opportunities. Despite this, there has been little systematic evaluation of the effects of choosing different calibration methods and time horizons to determine state variables and parameters of such models. We present sensitivity analysis results of the impact the choice of calibration method and time horizon on real option values and strategies.

4 - Is the Rio – Sao Paulo High Speed Rail Project Feasible? A Real Options Analysis

Luiz Brandão, Associate Professor, PUC Rio, Rua Marques de São Vicente 225, Rio de Janeiro, RJ, 22450-900, Brazil, brandao@iag.puc-rio.br, Leandro Monteiro, Leonardo Lima

We analyze the 18 billion dollar Rio–Sao Paulo High Speed Railway project under the Real Options approach considering a PPP risk sharing scheme where the government offers demand insurance in the form of a minimum traffic guarantee (MTG). As MTGs can generate significant long term liabilities for the government, we propose liability caps and the use of CVaR to determine the optimal combination of MTG and cap level which maximizes the returns and minimizes the risk for the government.

Optimization and Modeling in Radiation Therapy Treatment Planning

Sponsor: Data Mining

Sponsored Session

Chair: Shouyi Wang, Assistant Professor, University of Texas at Arlington, 500 West First Street, 420H Woolf Hall, UT Arlington, Arlington, TX, 76019, United States of America, shouyiw@uta.edu

1 - A New Optimization Approach for Multi-objective Radiotherapy Treatment Planning

Wenhua Cao, Research Assistant Professor, University of Houston, E206 Engineering Building 2, Houston, TX, 77204, United States of America, wcao@central.uh.edu, Laleh Kardar, Gino Lim

Designing treatment plans for radiotherapy often involves combining multiple objectives into a single objective function by taking a linear combination of multiple objectives. However, it is challenging to set the proper weights for those objectives. Here we introduce a sub-gradient optimization algorithm to find objective weights which can capture clinically relevant trade-offs. We test the algorithm on real patient data to show that the optimized weights outperform the ones used in the clinic.

2 - A Novel Approach for Real-Time Prediction of Semi-periodic and Nonstationary Time Series

Kin Ming Kam, The University of Texas at Arlington, Arlington, TX, 76019, United States of America, kinming.kam@mavs.uta.edu, Shouyi Wang

To suppress side effects of radiotherapy, system latency of device is needed to be compensated in order to accurately trace the respiratory motion. A novel method is developed by using adaptive orthogonal polynomials to precisely model the respiratory motion. Effective pattern recognition is then done by using the coefficients of OPs. The method can also be applied on other kinds of semi-periodic time series. Comparison with the latest methods will be presented to show the advancement.

3 - A Critical Evaluation of Worst Case Optimization Methods for Robust Proton Therapy Planning

Rasmus Bokrantz, RaySearch Laboratories, Sveavagen 25, Stockholm, 111 34, Sweden, rasmus.bokrantz@raysearchlabs.com, Albin Fredriksson

We analyze three optimization formulations for robust proton therapy treatment planning. The formulations range from protecting against the worst case error to protecting against the worst case error for each patient geometry volume element considered independently. We discuss the formulations' advantages and disadvantages based on their performance on clinical cases.

4 - A Scenario-based Generalization of Margins in Radiation Therapy Treatment Plan Optimization

Albin Fredriksson, RaySearch Laboratories, Sveavagen 25, Stockholm, Sweden, albin.fredriksson@raysearchlabs.com, Rasmus Bokrantz

We propose an optimization formulation using multiple scenarios to handle the effects of errors in radiation therapy treatment planning. This formulation coincides with margin-based planning if the implicit assumptions made when the margins are delineated are valid, but also generalizes to more difficult situations where these assumptions do not hold.

Bilevel Optimization: Algorithms and Applications

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Pekka Malo, Assistant Professor, Aalto University School of Business, P.O. Box 11000, Helsinki, Finland, pekka.malo@aalto.fi

1 - A Bilevel Optimization Approach to Automated Parameter Tuning

Peng Xu, Aalto University School of Business, Runeberginkatu 22-24, Helsinki, 00100, Finland, peng.xu@aalto.fi

In this paper, we propose that the parameter tuning problem is inherently a bilevel programming problem. Based on this insight, we introduce an evolutionary bilevel algorithm for parameter tuning. A few commonly used optimization algorithms (Differential Evolution and Nelder-Mead) have been chosen as test cases, whose parameters are tuned on a number of standard test problems. The bilevel approach is found to quickly converge towards the region of efficient parameters.

2 - Multiobjective Bilevel Optimization under Decision Uncertainty

Pekka Malo, Assistant Professor, Aalto University School of Business, P.O. Box 11000, Helsinki, Finland, pekka.malo@aalto.fi, Kalyanmoy Deb, Pekka Korhonen, Jyrki Wallenius, Ankur Sinha

Bilevel optimization problems are characterized by a hierarchical leader-follower structure, where the leader desires to optimize her own strategy taking the response of the follower into account. Such problems are often encountered in strategic product design, homeland security applications, and economics. In this paper, we focus our attention on the development of a flexible evolutionary algorithm for solving multi-criterion bilevel problems with lower level (follower) decision uncertainty.

3 - Multi-objective Stackelberg Game between a Regulating Authority and a Mining Company

Oskar Ahlgren, Aalto University, Runebergingkatu 22-24, Helsinki, 00100, Finland, oskar.ahlgren@aalto.fi

I present a bilevel programming problem in the form of a Stackelberg game with multiple objectives at the upper level and a single objective at the lower level. The leader is the regulating authority, which tries to maximize the total tax revenue over multiple periods while trying to minimize the environmental damages. The follower is a mining company that is trying to maximize its total profit.

Sponsored Session

Chair: Cynthia Rudin, MIT Sloan School of Management, 100 Main Street, Cambridge, MA, 02139, United States of America, rudin@mit.edu

1 - Predicting Power Failures in Electrical Grids

Seyda Ertekin, MIT, 100 Main Street E62 Building, Cambridge, MA, 02139, United States of America, seyda@mit.edu, Cynthia Rudin, Tyler McCormick

We present a new statistical model for predicting discrete events continuously in time, called Reactive Point Processes (RPP's). RPP's are a natural fit for many domains where time-series data are available, and their development was motivated by the important problem of predicting serious events (fires, explosions, power failures) in the underground electrical grid of New York City (NYC). The RPP model can also provide a cost/benefit analysis of different proactive maintenance programs.

2 - Statistical Methods for Ambulance Fleet Management

Dawn Woodard, Assistant Professor, School of ORIE, Cornell University, 206 Rhodes Hall, Ithaca, NY, 14850, United States of America, woodard@cornell.edu, Shane Henderson, David Matteson, Bradford Westgate

We address a problem arising in the management of ambulance fleets: predicting the distribution of ambulance driving time on an arbitrary route in a road network. We use a computationally efficient procedure to train a statistical model using GPS data from ambulance trips; challenges include the large size of the network and the lack of trips in the data that follow the route of interest. We demonstrate the accuracy of our methods using data from Toronto Emergency Medical Services.

3 - A Simple Frequency based Rule Classification Algorithm

Chun-An Chou, SUNY Binghamton, 4400 Vestal Pkwy, Binghamton, NY, United States of America, cachou@binghamton.edu, Anas Hourani

Associative classification has been increasingly applied to personalized medicine. Conventional approaches generate a large number of rules for classification of diagnostic outcomes. However, a simple rule, instead of various rules, is more desirable while accurate classification remains. In this work, we propose a new simple rule classification algorithm. A simple rule for individual patients is generated based on the class frequency.

Advances in Military Healthcare Operations Research

Sponsor: Military Applications Society

Sponsored Session

Chair: Nathaniel Bastian, PhD Student & NSF Graduate Research Fellow, Pennsylvania State University, 355 Leonhard Building, University Park, 16802, United States of America, ndbastian@psu.edu

1 - Optimizing U.S. Army Medical Department Workforce Planning Decisions using Goal Programming

Nathaniel Bastian, PhD Student & NSF Graduate Research Fellow, Pennsylvania State University, 355 Leonhard Building, University Park, 16802, United States of America, ndbastian@psu.edu, Lawrence Fulton, Pat McMurry, Paul Griffin

The U.S. Army Medical Department manages its officers over 30 years, so determining the appropriate number of hires and promotions for each medical specialty is complex. We proffer mixed-integer linear weighted goal programming models to optimize workforce planning, using simulation to verify and validate the results. Our models allow for better transparency of personnel for senior decision-makers and human resource planners, while effectively projecting the required manpower structure.

2 - Fuzzy Resource Allocation in Health Systems

Tahir Ekin, Assistant Professor, Texas State University, 601 University Dr. McCoy 411, San Marcos, TX, 78666, United States of America, tahirekin@gmail.com, Paul Griffin, Ozan Kocadagli, Nathaniel Bastian, Lawrence Fulton

The efficient use of system resources in health systems is crucial due to increasing demand despite increasing costs. Large health systems generally have fixed inputs to be allocated to branches that have particular target output levels. We propose a fuzzy resource allocation optimization model and illustrate it using real-world data from an U.S. Army hospital network. We discuss the implications of using a fuzzy decision making model that can deal with various risk preferences.

3 - Dispatching and Locating Military Aeromedical Evacuation Assets with Security Escort Assets

Benjamin Grannan, Virginia Commonwealth University, 1015 Floyd Ave, Richmond, VA, 23225, United States of America, grannanbc@mymail.vcu.edu, Laura McLay

In military medical systems, some aeromedical evacuation assets are weaponized and capable of flying solo. Other evacuation assets must fly in tandem with a security escort asset. Unavailable assets translate into delay of medical treatment for casualties. This paper introduces a MIP model that examines the locating and dispatching decisions for two types of aeromedical evacuation assets and security escort assets. The objective is to minimize the service time of the most urgent casualties

4 - The Future of Small Navy Ship Sickbays and Army Aeromedical Evacuation Aircraft

Nolan Roggenkamp, Captain / Student, U.S. Army, 11005 Moran Road, Monterey, CA, 93940, United States of America, ndroggen@nps.edu, Temi Ayeni

The purpose of this study is to explore the current configuration of Sickbays on small Navy surface combatant ships and the Army's Aeromedical Evacuation Aircraft. We will conduct a current capability based analysis that qualitatively identifies the employment of medical technology, equipment, and consumables on these two respective platforms. The results will be used as a baseline to determine the most effective means of utilizing advanced medical technologies in the future.

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Sinan Erzurumlu, Associate Professor, Babson College, 231 Forest St, Babson Park, MA, 02457, United States of America, serzurumlu@babson.edu

1 - Governance Structure and Growth of High-Technology Startup

Jizhen Li, Associate Professor, Tsinghua University, School of Economics and Management, Room 541, Weilun Building, Beijing, 100084, China, lijizhen@gmail.com, Yueheng Wang, Can Huang

The governance structure of high-technology startups would influence their early-stage growth. In particular, whether the owner of technology is a majority shareholder or holds a high-level management position may affect the firm's performance. Our research finds that the high-technology startups with technologist-dominant governance structure grow slower than the capitalist-dominant ventures.

2 - Relationships under Stress: The Effects of Business Cycles on Industry-university Systems

Julio Pertuze, Assistant Professor, Pontificia Universidad Catolica de Chile, Av. Vicuña Mackenna 4860, Macul, Santiago, RM, 7660259, Chile, jpertuze@ing.puc.cl

While universities have been portrayed as "engines of growth," little attention has been given to their role in periods of economic downturn. This paper analyzes the coevolution of industry-university relationships in the forest products sector. We found that universities act as "knowledge buffers" for cyclical industries, helping firms to regain lost capabilities and allowing corporate technologies time to mature despite changes in firm strategy. Policy and managerial implications are discussed

3 - The Role of Network Structure in Entrepreneurial Action

Sunny S. Yang, Senior Lecturer, University of Essex, Essex Business School, Essex, United Kingdom, sunnyy@essex.ac.uk, Emma Y. Liu, Yanto Chandra

We study the spread of entrepreneurial actions in a dynamic, networked system where each individual embedded decides to act entrepreneurially in each period. We develop a graph-theoretic model and simulate it to characterize system behaviors by investigating the combined impact of network structures and other contextual factors including external shock. Our analysis suggests that the change in network structures significantly impacts the number of individuals taking entrepreneurial actions.

4 - Innovation and Risk in Product Development: Empirical Testing of 3D Printers on KickStarter.com

Chao-Yang Song, Post-Doctoral Research Fellow, Singapore University of Technology and Design, 20 Dover Dr, Singapore, 138682, Singapore, chaoyang_song@sutd.edu.sg, Kevin Otto, Jianxi Luo, Katja Holtta-Otto

A new method is explored to explain market adoption of new products from innovation and risk perspectives. Based on the Real-Win-Worth framework, 26 questionnaires are developed to assess the all 3D printer projects to date from KickStarter.com. Key innovation or risk indicators and their correlations that explain crowd-funding success are identified via a PLS regression analysis. The results provide implications to crowd-funding strategy and risk management of early-stage innovation projects.

5 - Product Innovation and Platform Strategy: Technological Evolution in the Smartphone Industry

Hyunwoo Park, Georgia Institute of Technology, 85 5th St NW, Atlanta, GA, 30308, United States of America, hwpark@gatech.edu, Rahul Basole

Our study is based on the technological evolution of smartphones including physical characteristics, performance characteristics, and features over the past decade. Our longitudinal analysis of a dataset consisting of 1,169 smartphones by 79 device manufacturers and 12 different platforms highlights the significant transformational changes that have occurred. We propose an index to measure innovativeness of a smartphone upon which we test hypotheses on product family and platform strategy.

Social Networks, Personal Information, and Open Innovation

Sponsor: eBusiness

Sponsored Session

Chair: Idris Adjerid, University of Notre Dame, 358 Mendoza College of Business, Notre Dame, United States of America, iadjerid@nd.edu

1 - LIKE Economy: An Empirical Estimation

Rajiv Garg, McCombs School of Business, University of Texas, Austin, TX, United States of America, RajivGarg@mccombs.utexas.edu

Monetization of social interactions and influence is one of the key challenges facing researchers and practitioners alike. Users are often given incentives to "like" products and vendors on social media sites under the assumption that likes are valuable, the crux of the matter lies in the question: How much is a "like" worth to a seller? We address this question by empirically estimating the economic value of Facebook LIKE.

2 - Visceral Targeting - using Personal Information for ÚHidden Persuasion

Sonam Samat, Carnegie Mellon University, 5530 Howe Street, Apt 2, Pittsburgh, PA, 15232, United States of America, sonamsamat@gmail.com, Alessandro Acquisti, Eyal Pe'er, Ralph Gross

Online behavioral advertising has helped marketers target products to individuals based on their personal information. Marketers are constantly looking for ways to collect more information about customers. We investigate whether morphing individuals' facial images, which are collected from their social network profiles, making them unrecognizable yet subconsciously familiar, and using the resulting face composite to solicit personal information, can influence disclosure behavior.

3 - Baring Out with Iron Hands: Can Disclosing Make Us Harsher?

Laura Brandimarte, Carnegie Mellon University, Hamburg Hall 2107E, 4800 Forbes Avenue, Pittsburgh, United States of America, lbrandim@andrew.cmu.edu, Alessandro Acquisti, Francesca Gino

Two studies investigate how the act of disclosing sensitive information affects individuals' judgments of others who made similar disclosures. Study 1 uses information from social networks and finds that participants who shared online information about their questionable behaviors judged others who did the same more harshly, as compared to participants who did not share such information. Study 2 uses an online experiment to test for the causal role of disclosure, and confirms the result.

4 - Innovative or Practical? An Empirical Study of Idea Selection in an Open Innovation Funnel

Ajit Sharma, Ross School of Business, 701 Tappan Street, Ann Arbor, United States of America, asharmaz@umich.edu, Yan Huang

The digitization of innovation is increasingly manifest in a wide variety of open innovation archetypes. Arguably, the critical skill in open innovation is selection rather than generation of ideas. We empirically investigate idea-screening choices at the stage gates of an open innovation funnel for a large private bank. We find support for a desire to be radical in the early stage gates which is superseded by concerns of feasibility and execution in later stages closer to implementation.

1 - Organization Structure, Sourcing Quality, and Spillover

Anupam Agrawal, UIUC, 363 Wohlers Hall, Champaign, Il, 61821-6255, United States of America, anupam@illinois.edu

We detail a very interesting real life experiment, wherein a firm had two different organization structures in its two plants, and these different structures enabled differential improvement in the quality of sourced components. We also study spillover between these two plants.

2 - Differential Risks of Innovation Failures: New Products vs. New Versions of Existing Products

Kingshuk Sinha, Professor, Mosaic Company Professor of Corporate Responsibility, Carlson School of Management, University of Minnesota, Minneapolis, MN, United States of America, ksinha@umn.edu, Ujjal Mukherjee

We investigate the underpinnings of two types of failures of technological innovation-in-use: (i) new products and (ii) new versions of existing products. The empirical context of the study is medical device recalls. We analyze two types of recalls: PMA and 510K. The results suggest differential risk of failure for a medical device firm across the two types of recalls. Implications of the study results are discussed.

3 - Competencies for Contingent Talent Supply Chain Intermediaries

Sriram Narayanan, Associate Professor, Michigan State University, N357 College of Business Building, 632 Bouge Street, East Lansing, Mi, 48824, United States of America, narayanan@broad.msu.edu, Hakan Yildiz, David Closs

Contingent talent supply chain management (CT-SCM) is a proactive approach to effectively meeting changing workforce needs of companies. Our research focuses on identifying key competencies of a managed service provider in orchestrating a CT-SCM. We use case based approach and substantiate our analysis with archival data where applicable.

4 - Firm and Regulator Timeliness in the Medical Device Product Recall Process

Rachna Shah, Associate Professor, UMN, United States of America, shahx024@umn.edu, George Ball

We investigate the attributes of medical device recalls that impact firm and regulator recall timeliness. Utilizing a unique dataset containing multiple time-stamps for ten years of medical device recalls, we find that more serious recalls lead to slower response times from both firms and regulators. Contrary to our expectations, we then discover that taking more time to open and close a recall may create more opportunities for learning and prevent future quality problems which lead to recalls.

Hilton- Continental 2

Session

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Alp Muharremoglu, Associate Professor, University of Texas at Dallas, Richardson, TX, United States of America, alp@utdallas.edu

1 - Optimality of (s,S) Policies in EOQ Models with General Cost Structures

Sandun Perera, PhD Candidate, Naveen Jindal School of Management, The University of Texas at Dallas, 800 West Campbell Rd., Richardson, TX, 75080, United States of America, sandun.perera@utdallas.edu, Ganesh Janakiraman, Shun-Chen Niu

The EOQ model is at the heart of supply chain optimization. We prove the existence of an optimal policy of the (s,S) type in the EOQ model under minimal assumptions on the ordering/procurement and holding/backorder costs. This result holds whenever an optimal solution exists for the problem of minimizing the long-run average cost within the class of (s,S) policies. Our proof is constructive and elementary, i.e., it is based on first principles that do not rely on advanced mathematical machinery.

2 - Optimal Storage Profile in a Semi-automated Order Fulfillment System

Rong Yuan, PhD Candidate, MIT, 235 Albany St, Cambridge, MA, 02139, United States of America, rongyuan@mit.edu, Stephen Graves

In this paper we examine the operation of a semi-automated fulfillment center, in which the storage pods do the traveling rather than the operators. The primary decision we consider is on what pod to store each unit of inventory. The objective is to minimize the expected number of pods required to satisfy a set of randomly-generated orders. We model this problem as a mixed-integer problem with non-linear objective function.

3 - Generalized Price-Only Contracts

Lifei Sheng, University of British Columbia, 2053 Main Mall, Vancouver, BC, Canada, Fay.Sheng@sauder.ubc.ca, Mahesh Nagarajan, Tim Huh

We consider a two-stage decentralized supply chain using a generalized price-only contract, wherein a supplier sequentially and dynamically offers a retailer n different wholesale prices. We show structural properties of how the profits of the supplier and the retailer change as n becomes large. Our analysis has some important implications for the role of strategic inventory and Coase's conjecture.

Information in Supply-Chains

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Noam Shamir, Tel Aviv University, Tel Aviv, Israel, nshamir@post.tau.ac.il

1 - Information Sharing in a Supply Chain with a Trade Association under a Wholesale Price Contract

Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Noam Shamir

Studying the incentives of a group of retailers, organized as a trade association, to exchange forecast information, we compare between two industry policies: exclusionary and non-exclusionary information sharing. Although non-exclusionary policy has been advocated to promote information sharing, we show the opposite can happen and explain the reason.

2 - Cartel Formation through Strategic Information Leakage in a Distribution Channel
Noam Shamir, Tel Aviv University, Tel Aviv, Israel, nshamir@post.tau.ac.il

A group of retailers attempt to establish a cartel. In order to reduce the risk of the cartel's exposure, the retailers coordinate their strategies by sharing information with their manufacturer. Although the manufacturer is not part of the cartel, he is willing to assist the retailers in such a scheme.

3 - Bargaining in Supply Chains with a Single Pivotal Agent
Dror Hermel, Ariel University, Ariel University, Ariel, Israel, drorhe@ariel.ac.il, Daniel Granot, Mahesh Nagarajan

We study a setting where a single pivotal player negotiates with several non-pivotal players. We provide a bargaining framework to derive allocations of profit, using Nash bargaining principles. We identify inherent outside options, and use these to generate an endogenous disagreement outcome. When the non-pivotal players are not allowed to communicate, our solution coincides with the Nash-Nash solution, and it coincides with the Shapley value, when the non-pivotal players can communicate.

4 - The Third Party Logistics Coordinator Mechanism for Transshipments in Decentralized Systems
Yale T. Herer, Technion - Israel Institute of Technology, Faculty of Industrial Engineering, Haifa, 32000, Israel, yale@technion.ac.il, Avinoam Tzimerman

We investigate a multi-retailer single period stochastic lotsizing problem. In our decentralized system the retailers are independent, doing what is in their own best interest. We add transshipments to this constellation by introducing a third party whom we call 3PLC, which stands for Third Party Logistics Coordinator. We develop a coordination mechanism involving 3PLC with without the retailers disclosing their private information (costs and demand parameters) to the other retailers.

From OR to OM: Observations on the Emergence of a Discipline

Cluster: Tutorials

Invited Session

Chair: John Buzacott, York University, Schulich School of Business, Toronto, ON, Canada, jbuzacott@schulich.yorku.ca

1 - From OR to OM: Observations on the Emergence of a Discipline
John Buzacott, York University, Schulich School of Business, Toronto, ON, Canada, jbuzacott@schulich.yorku.ca

This tutorial is based on the author's experience 50 years ago in applying OR in industry. It describes some of the problems and issues encountered, almost all of which were then new. There were no textbooks about how to use OR to understand production and inventory control. However, as awareness of the problems increased, approaches were developed using OR that industry found helpful. Eventually consultants, software developers and academics working with managers created a body of knowledge which was the basis of a new discipline, Operations Management.

■ MA08

Hilton- Continental 5

Applications of Little's Law

Cluster: Applications of Little's Law

Invited Session

Chair: John Little, MIT Sloan School, E62-534, 100 Main St., Cambridge, MA, 02142, United States of America, jlittle@mit.edu

1 - Generalized Little's Law-Asset Picking System to Model an Investment Portfolio: a Working Prototype
ML Ceprini, MIT Sloan School, E62-534; 100 Main St, Cambridge, MA, 02142, mceprini@mit.edu, John Little

Decision rules create an Asset Picking System (APS) structure that, combined with Little's Law (LL), Generalized Little's Law (GLL) and its corollaries, generates the GLL-APS model, a financial engineering tool bridging operations research and finance. The model selects type and number of shares for each investment. Changes can be accepted/rejected by the customer. GLL-APS customizes portfolios for clients. Now it is a working prototype, later, an assessed and calibrated model.

2 - Formula for Profit Increase Based on Little's Law
Michael George, 3605 Beverly Drive, Dallas, TX, 75205, mike@entropy2718.com, Dinesh Rajan

We derive a formula that will allow an executive to predict the profit increase created by an investment in Operations Management methods such as Lean and Six Sigma. The decomposition of Little's Law results in the Entropy and waste in a manufacturing process, which is then minimized. The accuracy of the resulting Formula for Profit Increase is confirmed by case studies. Shannon's Information Theory thus becomes a new approach to optimization in OM applications.

3 - Use of Little's Law For the Diagnosis and Realization of Hidden Profits and Undiscovered Risks
John F. Carrier, MIT, 247 Gray Street, Arlington, MA, 02476, United States of America, jfcarrie@mit.edu

We demonstrate how Little's Law may be used to detect and quantify the "hidden factories" within any system. We show its application to a large logistics project (deepwater O&G), and how it "cut through the Big Data problem" to find $20M/yr in savings. We also show how a mid-sized US manufacturer used its principles to survive the economic downturn of 2008-9, and how a start-up company used it to develop a system to serve its key customers while remaining loyal to its sustainability goals.

4 - Analysis of Biological Aging
John Little, MIT Sloan School, E62-534, 100 Main St., Cambridge, MA, 02142, United States of America, jlittle@mit.edu

Mitnitski, Song and Rockwood (2013) in an article on biological aging apply Little's Law in the following form: (the average number of biological deficits present in an individual) equals (the rate of environmental stresses) times (the average recovery time). Average deficits accumulate with age and average environmental stresses stay relatively constant. So Little's Law tells us that average recovery time increases with age. The usefulness of this simple formula is demonstrated with data.

Healthcare Operations

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Robert Batt, Asst. Professor, UW-Madison, 975 University Ave., Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu

1 - Planning Regional Hospital Bed Capacity to Ensure Appropriate Access to Inpatient Care
Thomas Best, Doctoral Candidate, The University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, tbest@chicagobooth.edu, Burhaneddin Sandikci, Donald Eisenstein, Varun Gupta

We consider a public board that oversees hospital bed capacities across a geographic region. The board aims to avoid excess bed capacities and also to reduce delays of inpatient admissions. To achieve its mission, the board sets bed capacity targets and evaluates proposed capacity changes against these targets. We develop a model to predict the delays from proposed bed capacities. We apply our model to regional inpatient data, and discuss its predictions and their implications for the board.

2 - using Matching to Examine Early Warning Systems for ICU Admissions
Wenqi Hu, Columbia University Business School, 3022 Broadway, Uris 4V, New York, NY, 10027, United States of America, whu17@gsb.columbia.edu, Jose Zubizarreta, Carri Chan

Unplanned transfers of patients from the ward to the Intensive Care Unit (ICU) occur due to rapid deterioration and can increase patients' mortality. This work is an empirical study of the potential benefits of preventive ICU admission based on a new warning system. In estimating the effect of endogenous admission decisions, we use a near-far matching method to improve the strength of the instrumental variable and find that preventative admission can potentially improve patient outcomes.

3 - SURGE: Smoothing Usage of Resources is Good for Emergencies
Alex Mills, Indiana University, Operations & Decision Technologies Dept, Kelley School of Business, Bloomington, IN, 47405, United States of America, millsaf@indiana.edu, Jonathan Helm, Yu Wang

Following a mass-casualty incident (MCI), a hospital faces a surge in demand. We study management tools to create surge capacity to meet this demand. We show that a hospital's best strategy to improve its surge response is not through immediate actions after the MCI, but through proactive long-term demand planning. In particular, discharging patients early sacrifices long-term recovery for short-term responsiveness, while workload smoothing improves the response in both short and long-term.

4 - The Disposition Decision: Handoffs and End-of-Shift Effects in an Emergency Department

Robert Batt, Asst. Professor, UW-Madison, 975 University Ave., Madison, WI, 53706, United States of America, rbatt@bus.wisc.edu, Diwas KC, Brian Patterson, Bradley Staats

We examine what factors impact the probability of a patient being handed-off to a new doctor at the end of a shift versus being dispositioned by the current doctor. We also look at the effect of hand-offs on operational variables such as length of stay and revisit rate.

■ MA10

Hilton- Continental 7

Stochastic Models for Service Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Vasiliki Kostami, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, vkostami@london.edu

1 - Design and Operations of Service Systems with Unknown Customer Types

Mihalis Markakis, Assistant Professor, Universitat Pompeu Fabra, Ramon Trias Fargas, 25-27, Barcelona, Spain, mihalis.markakis@upf.edu, Kostas Bimpikis

Motivated by call centers and healthcare facilities, we consider a queueing system with two customer types and two server pools, where only a probabilistic prior for the types of customers is known upon their arrival. For given staffing levels we determine the stability region of the system and propose a simple threshold scheduling policy that is maximally stable, evaluating its delay performance through simulations. Finally, we look into the problem of optimally staffing the system.

2 - Prioritization of Customers with Hidden Types in a Service System

Zhankun Sun, Statistics and Operations Research UNC at Chapel Hill Hanes Hall, CB, szk@unc.edu, Nilay Argon, Serhan Ziya

We consider a service system with a single server and two types of customers. Each customer incurs a linear holding cost that depends on its type. The server can choose to investigate and classify a customer, serve one of the already classified customers, or serve one of the unclassified customers without investigation. We provide a characterization for the server's optimal actions.

3 - Competition and the Operational Performance of Hospitals: The Role of the Hospitals' Objective

Dimitrios Andritsos, HEC Paris, 1 Rue de la Liberation, Jouy-en-Josas, France, andritsos@hec.fr, Sam Aflaki

We examine the effect of a hospital's objective (i.e., non profit vs. for profit) in hospital markets for elective care. Using queueing models and game-theoretic analysis we compare the equilibrium behavior of three market structures: i) no competition ii) competition between non-profit hospitals and iii) competition between non-profit and for-profit hospitals.

4 - Managing the Customer Mix and Crowding via Pricing and Capacity Allocation

Vasiliki Kostami, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, vkostami@london.edu, Dimitris Kostamis, Serhan Ziya

We study the pricing and capacity allocation problem of a service provider who serves two distinct customer classes with utilities that depend on how many customers are in the system as well as who these customers are. We study the system when the provider can price discriminate and when she is restricted by a single price. We extend our analysis to the case where class interaction is prevented by allocating capacity segments to the two customer classes.

Pricing and Contracts in Supply Chains

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Fernando Bernstein, Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, fernando.bernstein@duke.edu

1 - Sell Directly or Indirectly? Channel Structure and Dynamic Pricing with Strategic Customers

Sean Zhou, The Chinese University of Hong Kong, Shatin, N.T., Hong Kong, Hong Kong - PRC, zhoux@baf.cuhk.edu.hk, Jiye Xue, Qianbo Yin

We consider a dual-channel supply chain where a manufacturer sells a seasonal product to strategic consumers through both an independent retailer and its direct channel over a finite selling season. During each period, the manufacturer and the retailer sequentially set the wholesale and retail prices. We derive the unique sub-game perfect Nash equilibrium of this dynamic game and study how channel structure affects dynamic pricing strategies.

2 - Optimal Long-Term Supply Contracts with Asymmetric Demand Information

Ilan Lobel, Assistant Professor, NYU Stern School of Business, 44 W 4th St, New York, NY, 10012-1126, United States of America, ilobel@stern.nyu.edu, Wenqiang Xiao

We study the design of optimal dynamic long-term supply contracts between a manufacturer and a retailer. We show the simple structure of optimal long-term contracts both for the case of backlogging and the case of lost sales.

3 - Chasing Demand: Learning and Earning in a Changing Environment

Bora Keskin, The University of Chicago Booth School of Business, 5807 S. Woodlawn Avenue, Chicago, IL, 60637, United States of America, bora.keskin@chicagobooth.edu, Assaf Zeevi

We consider a price-setting firm facing an unknown demand model that can change over time. We show that the firm can achieve a substantially better revenue performance in demand environments that change in "bursts" than it would in a demand environment that changes "smoothly." We also extend our analysis to the case of rapidly changing demand settings, and obtain a range of results that quantify the net effect of the volatility in the demand environment on the revenue performance.

4 - A Simple Heuristic for Joint Inventory and Pricing Problems with Lead Time

Yang Li, California State University, Sacramento, CA, United States of America, yang.li@csus.edu, Fernando Bernstein, Kevin Shang

We study a joint inventory and pricing problem in a single-stage system with positive lead time. This problem is, in general, intractable due to its computational complexity. We develop a simple heuristic that resolves this issue. The heuristic first generates a pricing policy which depends on the initial inventory level. We then transform the joint problem into a standard inventory problem. This heuristic enables us to explore the impact of lead time on the joint decision.

Hilton- Continental 9

Pricing and Regulation Issues in Sustainable Operations

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Gal Raz, Associate Professor, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, razg@darden.virginia.edu

1 - Optimal Pricing for New and Remanufactured Products

James Abbey, Texas A&M University, 4217, College Station, TX, 77843, United States of America, jabbey@mays.tamu.edu, Joe Blackburn, Dan Guide

When considering remanufactured products, do consumers follow the typical principle of 'cheaper is better' or do other rules apply? Additionally, do consumer markets for remanufactured products demonstrate homogeneous, price-taking behavior? This research provides insights into these and other questions through triangulation of empirical investigations and tightly coupled economic modeling.

2 - The Economical and Environmental Impact of Take Back Legislations in presence of Secondary Markets

Shumail Mazahïr, PhD Candidate, HEC, Jouy en Josas, 78350, France, shumail.mazahir@hec.edu

We analyze the economical and environmental impact of various take back schemes in presence of secondary markets. We look at the cases (a) secondary market with remanufactured product (b) new and remanufactured products for both markets.We analyze the environmental and economical impacts on primary and secondary markets in presence of various combination of take back laws and provide conditions where one scheme can outperform the other.

3 - Economic and Environmental Assessment of Remanufacturing in a Competitive Setting

Gal Raz, Associate Professor, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, razg@darden.virginia.edu, Anton Ovchinnikov, Vered Blass

This paper provides data-driven assessment of economic and environmental aspects of remanufacturing under competition. We study a product-line competition where one firm is selling new products and the other new and refurbished products. We use analytical and behavioral models to examine the impact of remanufacturing on the firms' competition.

4 - Competing on Toxicity: The Impact of Supplier Prices & Reg on Mfgs Substance Replacement Strategies

Tim Kraft, Assistant Professor, University of Virginia, Darden School of Business, Charlottesville, VA, United States of America, KraftT@darden.virginia.edu, Gal Raz

We examine how competition impacts manufacturers' decisions to replace a substance of concern. We find that if manufacturers face a cost tradeoff between the substance's expected regulatory risk and the supplier price for the replacement substance, then a high-end manufacturer can use his brand to control the market. Conversely, opportunities may exist for manufacturers to collaborate to replace a substance, even when the shared cost to replace is greater than the sum of their individual costs.

■ MA14

Imperial B

Air Traffic Control: Safe and Sound?

Sponsor: Aviation Applications

Sponsored Session

Chair: David Chin, FAAFederal Aviation Administration, 800 Independence Avenue, SW, Washington, DC, 20591, United States of America, david.chin@faa.gov

1 - Computer Simulation Model to Study Current and Future Oceanic Operations

Antonio Trani, Virginia Tech, Blacksburg, VA, United States of America, vuela@vt.edu, Tao Li, Aswin Gunnam

This presentation describes the development of a North Atlantic Simulation Model (NATSAM III) to investigate the effects of changes to operational policies and strategies in oceanic airspace. We discuss the methodology, different components of the model, validation and a case study of the benefits of North Atlantic Data Link Mandates.

2 - Reducing Scheduled Block Times through Departure Sequencing

Mark Hansen, University of California, Berkeley, 114 McLaughlin Hall, Berkeley, CA, 94720, United States of America, mhansen@ce.berkeley.edu, Lu Hao

In previous work we have found a relationship between scheduled block times and the distribution of realized times, by phase of flight. Here, we consider how departure sequencing might be used to change the taxi-out time distribution and therefore reduce scheduled block times.

3 - World Airline Safety: Better than Ever?

Arnold Barnett, Professor, MIT, E62-568, MIT, Cambridge, MA, 02139, United States of America, abarnett@mit.edu

Moving beyond the (often ghastly) headlines about plane crashes and disappearances, we investigate statistically both the absolute mortality risks that air travelers face and cross-national disparities in risk levels. The answer to the titled question is: yes and no.

4 - Is There a Business Case for North Atlantic Data Link Mandate?

Aswin Gunnam, Research Analyst, GRA Incorporated, 1250 Maryland Avenue SW, Washington, DC, 20024, United States of America, aswin.ctr.gunnam@faa.gov, Arnold Barnett, Thea Graham

ICAO is has introduced GPS & satellite based Data Link technology over the North Atlantic oceanic airspace which would reduce the safety risks, but also would require huge investments. We present a cost-benefit analysis by estimating the risk levels with and without the Data Link and translating the resultant reduction in risk in NAT into economic consequences.

■ MA15

Hilton- Exec. Boardroom

Applications in Electricity Networks and Natural Disasters

Cluster: Data Envelopment Analysis

Invited Session

Chair: Jaap Bos, Maastricht University, Maastricht,The Netherlands, j.bos@maastrichtuniversity.nl

1 - Institutions and the Impact of Natural Disasters

Jaap Bos, j.bos@maastrichtuniversity.nl, Mark Sanders, Martien Lamers

We investigate the impact of natural disasters events using stochastic frontier analysis, separating efficient government responses to disasters from inefficient ones that have high human and economic costs. We find that the inefficiencies are not related to variables such as disaster intensity and regional geography, but instead have to turn to indicators of institutional quality and economic activity to explain them.

2 - StoNED Versus Two-stage DEA for Regulation of Electricity Networks

Mette Bjørndal, Norwegian School of Economics, NHH, Helleveien 30, Bergen, Norway, Mette.Bjorndal@nhh.no, Endre Bjørndal

We compare StoNED to the present method used by the Norwegian regulator. We see that the estimation of distributional parameters under StoNED has a strong effect on the best-practice frontier, while the average-practice frontier is more robust to noise in the data. The efficiency scores are calibrated by the regulator in order to ensure that companies with average efficiency earn the regulatory rate of return, and we discuss how this calibration can be related to the average-practice frontier.

3 - Compensating for Exogenous Cost Drivers in the Regulation of Electricity Networks

Endre Bjørndal, Norwegian School of Economics, NHH, Helleveien 30, Bergen, Norway, Endre.Bjorndal@nhh.no, Mette Bjørndal, Astrid Cullmann, Maria Nieswand

The present yardstick model used by the Norwegian regulator compensates, via two-stage DEA efficiency analysis, for a number of environmental factors. These factors are correlated with measured efficiency and company size. We compare conditional nonpararametric methods to current benchmarking model, and we discuss whether the choice of method affects the revenue caps of companies in a systematic manner.

4 - Stepwise DEA in Benchmarking of the Brazilian Distribution Electricity Companies

Ana Lúcia Lopes, Professor, Universidade Federal de Minas Gerais, Rua Rio de Janeiro, 2754 apto. 601, Belo Horizonte, MG, 30160042, Brazil, analopes.ufmg@gmail.com, Marcelo Azevedo, Sergio Fiuza

Data Envelopment Analysis(DEA) has been used by regulators to measure the efficient operational costs in transmission and distribution energy sector. This paper explores the Stepwise DEA methodology to identify variables that should be used in the evaluation of the Brazilian distribution energy companies. The results points out to the inclusion of number of transformers, rural and urban network as outputs in a model that uses OPEX as input and energy, consumers and network length as outputs.

Operations and Finance

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Arun Chockalingam, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, A.Chockalingam@tue.nl

1 - Managing Inventory for Entrepreneurial Firms with Trade Credit and Payment Defaults

Kevin Shang, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, kevin.shang@duke.edu, Wei Luo

This paper considers an entrepreneurial firm that periodically orders inventory to satisfy non-decreasing demand in a finite horizon. The firm provides trade credit to its customer while receiving it from its supplier. A default penalty cost is incurred for unfulfilled payments. We prove the optimal and near-optimal policies under different trade credit periods and assess the value of considering financial flows when making the inventory decision.

2 - The Financial Holding Cost of Inventory
Lei Xie, Associate professor, Shanghai University of Finance and Economics, Yangpu district, Guoding Road 777, Shanghai, China, xie.lei@mail.shufe.edu.cn, S. Alex Yang, Fehmi Tanrisever, Xiaoying Liang

We study a joint financing and inventory management model that characterizes firms' inventory policy under certain financial market imperfections and relate this model to the traditional inventory models.

3 - The Entrepreneurial Newsvendor: Managing Market Frictions through Process Investment
Fehmi Tanrisever, Bilkent University, Main Campus MA Building, Ankara, Turkey, tanrisever@bilkent.edu.tr, Sinan Erzurumlu, Nitin Joglekar, Moren Levesque

We show that the preemptive investment decision can be employed as an operational hedge to mitigate capital market frictions and create value by enhancing the firm's financing options and production volume. The fiscal value created by mitigating frictions is in addition to the traditional benefits of process investment. We derive conditions when such a preemptive investment is the optimal for the entrepreneur in the presence of capital market frictions.

4 - Short-term Financing with Reverse Factoring
Arun Chockalingam, Assistant Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, A.Chockalingam@tue.nl, Matthew Reindorp, Fehmi Tanrisever

According to pecking order theory, firms resort to external sources to finance their operations when internal funds are limited. Firms may obtain short-term loans directly from banks or they may receive loans in the form of reverse factoring through the aid of other supply chain partners. We examine the trade-off between dynamically switching between traditional bank loans and reverse factoring as the risk-free rate of interest and customer demand fluctuate over time.

Empirical Research in Service Operations

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Jose Guajardo, University of California Berkeley, 545 Student Services Bldg #1900, Berkeley, CA, United States of America, jguajardo@haas.berkeley.edu

1 - Impact of Delay Announcements in Call Centers: An Empirical Approach
Seyed Emadi, Assistant Pofessor, Kenan-Flagler Business School, 300 Kenan Drive, Chapel Hill, NC, 27599, United States of America, Seyed_Emadi@kenan-flagler.unc.edu, Baris Ata, Che-Lin Su, Zeynep Aksin

We undertake an empirical study of the impact of delay announcements on callers' abandonment behavior and the performance of a call center with two priority classes. We develop a methodological framework to find the new system equilibrium and analyze the impact on the system performance when there is a change in the call center operations, e.g. a new delay announcement rule or a new service discipline is introduced.

2 - Profitability Implications of Selling the Right Set of Information
Chris Parker, Penn State University, Business building, State College, PA, 16802, United States of America, chris.parker@psu.edu, Kamalini Ramdas, Nicos Savva

Farmers in India can receive daily price information via a text message subscription service in their choice of up to three markets out of a large selection of markets. We model the farmers' decision process and use structural estimation to understand these dynamics. We use counterfactual analysis to determine the impact of different managerial decisions on service penetration and profitability as well as farmer profitability.

3 - The Impact of Team Presence on Worker Productivity
Tom Tan, Cox Business School, Southern Methodist University, 6212 Bishop Blvd, Dallas, United States of America, ttan@mail.cox.smu.edu, Serguei Netessine

We examine how the presence of other coworkers affects individual workers' performance. Our study offers an approach for capturing the experience in a fluid team and highlights the need to understand the external impact of heterogeneous skills on other coworkers. In addition, our findings provide insights into how team composition can optimize worker productivity to achieve higher sales.

4 - Disentangling Production Smoothing from the Bullwhip Effect
Robert Bray, Assistant Professor, Kellogg School of Management, 830 Hinman Ave., 2S, Evanston, IL, 60202, United States of America, robertlbray@gmail.com, Haim Mendelson

Historically, production smoothing and the bullwhip effect have shared a common measure: the difference between production variability and demand variability. This metric confounds the two effects, however, suggesting that firms that exhibit the bullwhip effect cannot smooth production. We develop new production smoothing measures that are robust to the bullwhip effect. We derive these measures from a structural econometric production scheduling model, based on demand signal processing.

Choice Models in Revenue Management and Pricing V

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Huseyin Topaloglu, Cornell University, 223 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, ht88@cornell.edu

1 - A Market Discovery Algorithm to Estimate a General Class of Non-parametric Choice Models
Gustavo Vulcano, New York University, 44 West Fourth St, Suite 8-76, New York, NY, 10012, United States of America, gvulcano@stern.nyu.edu, Garrett van Ryzin

We develop a column generation algorithm to estimate rank-based customer preferences for a set of substitutable products using only sales transactions and product availability data. The problem we address is how to jointly estimate the arrival rate of consumers and the pmf of the rank-based choice model under a maximum likelihood criterion. Numerical experiments confirm the potential of our proposal.

2 - A Dynamic Model of Shopping and Consumption
John Semple, SMU, Cox School, Dallas, United States of America, jsemple@mail.cox.smu.edu, Edward Fox, Laura Norman

We combine standard random utility theory with dynamic programming to determine how one should consume a set of products in order to maximize the utility of the entire set. Both the optimal policy and the optimal expected value function are closed-form and intuitively appealing. Our model can be used to design the optimal set of any size for a particular consumer based solely on their marginal preferences for products in a larger assortment.

3 - Solving Large-Scale Network Revenue Problems: An Aggregation Perspective
Thomas Vossen, University of Colorado Boulder, Leeds School of Business, UCB0419, Boulder, CO, 80309, United States of America, Vossen@Colorado.edu

Using compact approximate linear programs (ALPs) resulting from functional approximations to the network revenue management problem as a starting point, we propose aggregation schemes to solve the resulting problems. Computational results illustrate the potential of our approach.

4 - Revenue Upper Bound under Mixture of Logits
Huseyin Topaloglu, Cornell University, 223 Rhodes Hall, Cornell University, Ithaca, NY, 14853, United States of America, ht88@cornell.edu, Jacob Feldman

We consider assortment optimization problems when customers choose according to a mixture of multinomial logit models. The problem of finding the revenue-maximizing assortment is NP-hard. We develop an efficient approach to obtain good upper bounds on the optimal expected revenue.

1 - Risk-aversion and Contracting in Managed Print Services

Jie Ning, Case Western Reserve University, 11119 Bellflower Rd, Cleveland, Oh, 44106, United States of America, jxn174@case.edu, John Handley, Volodymyr Babich, Jussi Keppo

Managed print service is an IT infrastructural service that provides comprehensive management over institutional customers' printer fleets. We develop a model on the service provider's optimal contracts under asymmetric information. Applying our model to a proprietary data set from Xerox, we estimate the structural parameters and report that the service provider is better modeled to be risk-averse rather than risk-neutral. We show that this result is robust to different model specifications.

2 - Newsvendor Mergers

Xin Wang, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, xinwang1@andrew.cmu.edu, Soo-Haeng Cho

We examine the effects of a merger between two price-setting newsvendors on the firms' prices, inventories and expected profits in an oligopolistic market. Existing literature studies mergers under deterministic demand, and predicts that cost savings always cause prices to drop. However, we find that under uncertain demand, cost savings from inventory pooling always cause prices to rise, and that marginal cost reduction induces firms to lower their prices only when it is substantial.

3 - Dynamic Pricing with Reference Price Effects under Heterogeneous Customer Arrivals

Zizhuo Wang, University of Minnesota, 111 Church St SE, Minneapolis, United States of America, zwang@umn.edu

We consider a seller facing heterogeneous arriving customers with reference price effect. We illustrate a new form of price discrimination opportunity, where the seller's optimal pricing strategy is cyclic even when customers are loss-neutral and have identical demand functions. This result differs from those in prior studies where the optimal price paths are shown to be asymptotically constant and is unique due to the interaction between heterogeneous arrivals and reference price effects.

4 - Less for More: Product Line Design under Social Influence

Jiahua Wu, Jiahua.Wu09@Rotman.Utoronto.Ca, Ming Hu

We consider a monopolistic firm selling multiple substitutable products to a stream of sequential arrivals whose purchase decisions can be influenced by earlier purchases. The products are horizontally differentiated on a Hotelling circle. We show that social influence increases product substitutability. In anticipation of this, the firm would reduce product variety in its product line.

Pricing & Revenue Management Convergence

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Hai Chu, Director, Decision Science, Walt Disney Parks & Resorts, 1375 E Buena Vista Dr., Lake Buena Vista FL 32836, United States of America, Hai.D.Chu@disney.com

Co- Chair: Cara Dienes,Walt Disney Parks & Resorts U.S., P.O. Box 10000, Lake Buena Vista FL 32830-9600, United States of America, Cara.J.Dienes@disney.com

1 - Optimization Challenges with a Customer Choice Model

Matt Maxwell, SAS Institute Inc., 500 SAS Campus Dr, Cary NC 27513, United States of America, Matt.Maxwell@sas.com

Traditional revenue management techniques centered on an independent demand model (IDM) where each demand is only interested in a single product. Recent market changes have weakened the legitimacy of the IDM model and prompted increased interest in customer choice models (CCM) where potential customers select from all available products based upon their preferences. We highlight some challenges that arise when using a CCM as compared to an IDM in revenue optimization.

2 - The Evolution of Revenue Management Systems

Frederick Zahrn, Walt Disney Parks & Resorts U.S., P.O. Box 10000, Lake Buena Vista FL 32830-9600, United States of America, Frederick.C.Zahrn@disney.com, Cara Dienes

Revenue Management (RM) systems in the travel industry have focused on availability control rather than dynamic pricing functionality, and they have tended to pay limited attention to customer choice behavior such as buy-down. This presentation explores a framework for understanding current and future RM systems that incorporate choice models or dynamic pricing functionality. While we focus on resort hotel applications, the framework is intended to be relevant beyond this context.

3 - Upgrades and Upsells: Hilton vs Hert

Guillermo Gallego, The Liu Family Professor, Columbia University, New York NY 10027, United States of America, gmg2@columbia.edu

We consider a revenue management problem with two popular upsell models that resemble the practice by Hilton and Hertz. Under the Hilton model, customers may be offered a conditional discount for an upgrade at booking. Under the Hertz model, customers may be offered an upgrade at a discounted price if profitable to Hertz. We compare the profitability of these models and against other variants.

4 - Lower Bounds on the Effectiveness of Dynamic Pricing under Limited Learning

Wang Chi Cheung, Graduate Student, Massachusetts Institute of Technology, 77 Massachusetts Ave, E40-149, Cambridge MA 02139, United States of America, wangchi@mit.edu, David Simchi-Levi

Motivated by flash-sales in the online retail environment, we consider an online dynamic pricing problem with limited price experimentation, when the underlying demand curve is unknown. We provide a tight lower bound on the seller's regret, which matches the regret upper bound by Simchi-Levi et al. (2013). Through the analysis, we identify the structure of an optimal pricing strategy, and illustrate a learning-earning trade-off by quantifying the loss in revenue under insufficient learning.

1 - Approximate Dynamic Programming for Last Mile Problem with Stochastic Demand

Shih-Fen Cheng, sfcheng@smu.edu.sg, Lucas Agussurja, Hoong Chuin Lau

We look at the problem of arranging rides for stochastically arriving passengers from a hub to their final destinations with limited number of vehicles. We propose a two-level approach: at the upper level, the strategic decision of assignment and dispatch in each period is made, and it is formulated as a MDP. The value function of this MDP is evaluated at the lower level by running Monte Carlo simulation. The effectiveness of our approach is demonstrated using a real-world dataset.

2 - Reliable Facility Location Design under Service Disruption, En-Route Congestion and In-Facility Waiting

Weijun Xie, Georgia Institute of Technology, Atlanta, GA, United States of America, xieweijun06@gmail.com, Na Cui, Yanfeng Ouyang, Yun Bai, Shi An, Mingliu Chen

The quality of service systems highly depends on the accessibility, efficiency and reliability of service facilities. This paper presents a scenario-based stochastic program that integrates service disruption uncertainty, en-route traffic congestion and in-facility delay into a reliable service facility location problem. Numerical bounds and a tractable MINLP approximation model are derived and solved by a customized solution approach based on Lagrangian relaxation and conic quadratic program.

3 - Algebraic Approaches for the Stochastic Shortest Path Problem in General Networks

Katherine Hastings, West Liberty University, 208 University Drive, CUB 165, West Liberty, WV, 26074, United States of America, katherine.hastings@westliberty.edu, Douglas Shier

We present an algebraic approach for computing the distribution of the length of a shortest s-t path in general (possibly cyclic) networks, in which arc lengths are modeled with probability distributions. Fixed-point iteration techniques along with concepts from min-plus algebra are used to develop algorithms for the exact distribution as well as lower bounding distributions. We also obtain bounds on the expected length of a shortest path. Results are presented for example networks.

4 - Dynamic Snow Plow Fleet Management under Uncertain Demand and Service Disruption

Leila Hajibabai, University of Illinois at Urbana–Champaign, Urbana, IL, United States of America, hajibab1@illinois.edu, Yanfeng Ouyang

A set of models and methodologies are developed for dynamic snow plow fleet management in a demand-responsive decision-making process (e.g., under service disruptions or uncertain maintenance demand). The numerical results show that the proposed algorithm can solve the problem effectively.

Chair: Nilay Noyan, Associate Professor, Sabanci University, Istanbul, 34956, Turkey, nnoyan@sabanciuniv.edu

1 - Modeling Public-Private Inventory Management Partnership Policies for Regional Catastrophic Planning

Unsal Ozdogru, Clinical Assistant Professor, University of Illinois at Chicago, 601 South Morgan Street , MC 294, Chicago, IL, 60607, United States of America, uozdogru@uic.edu, Matthew Liotine

Preparedness for disasters such as hurricanes, etc. has been a challenging task to plan for, but is critical to reducing losses in human life, improving economic welfare and limiting environmental damage. We developed analytical models to evaluate tradeoffs between various public and private sourcing arrangements to make necessary items such as water available in the affected regions in order to reduce the impact of disasters. Recommendations are made regarding the efficacy of the policies.

2 - Strategic Planning for Disabled and Elderly Populations in Natural Disasters

Jacqueline Griffin, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA, 02115, United States of America, ja.griffin@neu.edu, Rana Azghandi

New York City received criticism for how it served the disabled in its response to Superstorm Sandy. In order to address disaster response for the mobility challenged, we develop a MIP model to aid in the evacuation of these individuals accounting for real-time location information, availability of limited resources, and time constraints. The evacuation planning problem is complicated by the heterogeneous nature of evacuee's needs, shelter-in-place options, and reusable transportation resources.

3 - G-network Models for Relief Centers at Disaster Sites

Merve Ozen, PhD Student, University of Wisconsin Madison, 1513 University Avenue, Madison, Wi, 53706, United States of America, mozen@wisc.edu, Ananth Krishnamurthy

We use a generalized queuing network (G-network) to model relief centers that distribute aid to victims at a disaster site. We analyze the effects of batch routing and crowd congestion on sojourn times in the network and explore impacts of stock-outs and staffing decisions.

4 - Stochastic Optimization Models for Designing Last Mile Relief Networks

Nilay Noyan, Associate Professor, Sabanci University, Istanbul, 34956, Turkey, nnoyan@sabanciuniv.edu, Burcu Balcik, Semih Atakan

We introduce a last mile relief network design problem under demand- and network-related uncertainties. We focus on providing accessible and equitable services to beneficiaries, and develop two-stage stochastic programming models. We implement an exact branch-and-cut algorithm based on Benders decomposition, and conduct numerical analysis to evaluate the proposed alternative models. We discuss the practical implications of our results on a case study based on the 2011 Turkey earthquake.

Sponsored Session

Chair: Maria Elbek, Aarhus University, Fuglesangs Allee 4, Aarhus V, 8210, Denmark, meandersen@econ.au.dk

1 - Effective Truckload Dispatch Decision Method with Incomplete Advance Load Information

Hossein Zolfagharinia, PhD Candidate, Wilfrid Laurier University, 75 University Avenue west, Waterloo, ON, Canada, hzolfagharinia@wlu.ca, Michael Haughton

One source of improved profitability for truckload freight carriers is advanced knowledge of detailed client demand. We quantify the profit improvement by using mixed integer programming (MIP) to model dynamic truckload transportation operations. The MIP model, along with an effective approach to handle incomplete knowledge are the study's major contributions.

2 - Robust Optimization of Truckload Relay Networks under Demand Uncertainty

Zahra Mokhtari, Graduate Research Assistant, Oregon State University, 204 Rogers Hall, Corvallis, OR, 97321, United States of America, mokhtarz@onid.oregonstate.edu, Hector A. Vergara

This study addresses the problem of strategic relay network design for truckload transportation under demand uncertainty. We try to find suitable robust solutions under any possible realization of demand instead of optimizing the relay network design using most likely values. Budgeted uncertainty is applied in defining the demand uncertainty set. Thus, a trade-off between conservatism and optimality determines the quality of the solutions. A robust optimization formulation is presented along with results obtained for several problem instances of this problem.

3 - Shipment Consolidation with Generalized Arrival Processes and Non-linear Customer Disutility Functions

Qishu Cai, University of Waterloo, Waterloo, ON, Canada qcai@uwaterloo.ca, Qi-Ming He, James Bookbinder

We model the process of combining multiple small orders into a larger load, for shipment together to gain economies of scale. Markovian arrival processes of orders with different quantities and priorities, and disutility functions that increase in a customer-order's waiting time, are considered. An optimal dispatch policy is found.

4 - A Stochastic Solution Approach for Multi-period Collection of Recyclable Materials in a Multi-compartment Vehicle

Maria Elbek, Aarhus University, Fuglesangs Allé 4, Aarhus V, 8210, Denmark, meandersen@econ.au.dk, Teodor Gabriel Crainic, Walter Rei

We consider an approach for scheduling the multi-period collection of recyclable materials. To establish a high service level for the citizens, cubes for collection may not be overfilled. Inspired by theory on the Inventory Routing Problem (IRP), we present a two-stage stochastic model and solution method for scheduling the collection in order to minimize the cost.

Active Traffic Control Strategies for Real-Time Management

Sponsor: TSL/Intelligent Transportation Systems (ITS)

Sponsored Session

Chair: Ketan Savla, Assistant Professor, University of Southern California, 3620 South Vermont Avenue KAP 254A, Los Angeles, CA, 90089, United States of America, ksavla@usc.edu

1 - A Processor Sharing Perspective on Horizontal Traffic Queues

Ketan Savla, Assistant Professor, University of Southern California, 3620 South Vermont Avenue KAP 254A, Los Angeles, CA 90089, United States of America, ksavla@usc.edu, Mohammad Motie

Motivated by emerging ITS technologies, we consider a horizontal traffic queue, where vehicles arrive on a road with finite length according to a spatio-temporal Poisson process, and depart after traveling to a common destination at the end of the road. Vehicle speed is dynamically determined by relative distance with respect to neighbors, and a constant speed limit. We make connection with processor sharing queues to derive fluid limit of proposed system, and use it to study maximum throughput.

2 - Information-based Network Traffic Control using Hybrid Route Guidance Strategy under Vehicle-to-vehicle Communications
Yong Hoon Kim, Purdue University, West Lafayette, IN, United States of America, kim523@purdue.edu, Srinivas Peeta

We address information-based network control using a hybrid route guidance strategy under vehicle-to-vehicle (V2V) communications. It seeks to improve guidance quality by balancing the ability of the centralized layer to generate a predictive guidance with the ability of the decentralized V2V layer to respond rapidly to random incidents. Numerical experiments are illustrated to demonstrate the efficiency of the proposed approach.

3 - Data-driven Linear Decision Rule Approach for Distributionally Robust real-time Signal Control
Tao Yao, Penn State University College of Engineering Electronic and Computer Services, University Park, PA, United States of America, tyy1@engr.psu.edu, H. Liu, K. Han, Terry Friesz

We propose a two-stage linear-decision-rule approach for optimizing traffic signal based on both historical and real-time information. In the offline stage a distributionally robust optimization problem is solved based on historical data whiling accounting for daily variations (uncertainties). The online stage employs a practical linear decision rule that provides the best traffic signal response to real-time data. This methodology is implemented in a realistic network setting.

4 - A Three Level Location-inventory Problem with Correlated Demand
Mehrdad Shahabi, West Virginia University, Morgantown, West Virginia, United States of America, mshahabi@mix.wvu.edu, Avinash Unnikrishnan, Stephen Boyles

A model for three level location-inventory problem correlated demand has been presented. A solution approach based on a customized outer approximation strategy is applied and the algorithmic benefits of such framework are discussed. The results from numerical experiments show that the proposed solution procedure clearly outperforms state-of-the-art commercial solvers.

5 - Dynamic Pricing and Learning in Network Equilibrium Models
Tarun Rambha, tarun.1988@gmail.com, Stephen Boyles

Route choice dynamics of boundedly rational travelers in traffic networks seldom converge to equilibria. Under general assumptions of the learning behavior of travelers, we propose a Markov decision process framework that dynamically prices the network to maximize the probability of reaching a particular equilibrium or system optimal state.

Infrastructure Investment and Management

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Harry van der Weijde, Vrije Universiteit Amsterdam, Department of Spatial Economics, De Boelelaan 1105, Amsterdam, 1081HV, Netherlands, h.vanderweijde@gmail.com

1 - Regulating the Formation of Transport Networks when Capacity Investment is Discrete
Harry van der Weijde, Vrije Universiteit Amsterdam, Department of Spatial Economics, De Boelelaan 1105, Amsterdam, 1081HV, Netherlands, h.vanderweijde@gmail.com, V. A. C van den Berg, E. T. Verhoef

We examine the effects of different policies that regulate the formation of transport networks by private operators. To do so, we construct a small network in which it is possible to build congestible links with discrete capacities between each pair of nodes. We examine several multi-stage games in which one or more operators choose which links to construct and operate. We find that capacity subsidisation and price regulation are not always sufficient to achieve the first-best welfare maximum. We also discuss when second-best network regulation is better than price regulation.

2 - Analytical Model for Evaluating the Long-Term Benefits of Internal Curing
Yuntao Guo, Purdue University, West Lafayette, IN, United States of America, guo187@purdue.edu, Jason Weiss, Srinivas Peeta, Xiaozheng He

This study seeks to quantify the long-term benefits of internally cured concrete mixtures in terms of cost reduction, sustainability, and congestion mitigation. A nonlinear programming model is developed to maximize the long-term benefits of internal curing by identifying the optimal infrastructure renewal plan. The model can help planners in designing effective and sustainable repair mechanisms in high traffic areas to reduce the impacts of the associated traffic disruptions.

3 - Pavement Rehabilitation Planning using a Mechanistic-empirical Approach
Yun Bai, University of Illinois at Urbana-Champaign, Urbana, IL, United States of America, yunbai1@illinois.edu, Yanfeng Ouyang, Jaime Alberto Hernandez-Urrea, Osman Erman Gungor, Imad L. Al-Qadi

This research develops an optimization framework for design and rehabilitation of a single pavement integrating Mechanistic-Empirical roughness transfer models. A mixed integer nonlinear program and a dynamic programming subroutine are developed to determine the optimal rehabilitation timing and asphalt concrete design thickness addressing the trade-off between agency and user costs.

4 - Utilization Optimization of Tolled Freeways
Shokoufeh Mirzaei, California State Polytechnic University,pomona, Industrial and Manufacturing Engineering, 3801 W Temple Ave, Pomona, CA, 91768, United States of America, smirzaei@csupomona.edu, Gabriela Abanto, Santiago Galvis Correa, Alberto Rosa, Sesar Salasar

In this paper a set of parameters that has a significant impact on the traffic intensity of tolled freeway lanes are identified. The impacts of significant parameters are then quantified and their optimal values are obtained so that the utilization level of tolled lanes is maximized while the system constraints (e.g. minimum speed) are met. Finally, a set of he control actions are defined to maintain the traffic flow as optimum as possible.

Chair: Mihiro Sasaki, Professor, Nanzan University, 27 Seirei, Seto, Japan, mihiro@nanzan-u.ac.jp

1 - A Business Model on the EV Support Infrastructure Focusing on the Number of Stations and Charge Fee
Yudai Honma, Assistant Professor, The University of Tokyo, Komaba 4-6-1, Meguro-ku, Tokyo, 153-8505, Japan, yudai@iis.u-tokyo.ac.jp

Electric vehicles (EV) have attracted an increasing amount of attention. However, the continuous cruising distance of an EV is limited to around 160 km, which is insufficient for everyday use. To promote the diffusion of EV, EV support infrastructure such as EV station is essential and it must become profitable. In this research, we propose a business model on the EV support infrastructure with respect to the number of EV stations and charging fee.

2 - Solving Large-scale Multi-target Tracking Problem to Identify Massive People Flow in Urban Area
Shunji Umetani, Dr., Osaka University, 2-1 Yamadaoka, Suita, Osaka, Japan, umetani@ist.osaka-u.ac.jp, Akira Kumano, Takashi Hasuike, Yuma Konishi

Analysis of spatiotemporal people flow in urban area has become increasingly important in many applications including marketing and public services. Although we can partially monitor people flow by tracking various devices such as mobile phones and IC tickets, it is quite incomplete because some privacy and integration issues still remain. To identify massive people flow from fragmentary observed data, we solve multi-target tracking problem by integer linear programming approach.

3 - Special Considerations in Transit Route Optimization
Richard Church, Professor, University of California, Santa Barbara, 1832 Ellison Hall, Santa Barbara, CA, 93106-4060, United States of America, rick.church@ucsb.edu, Timothy Niblett

There are several fundamental models that have been used as the basis for transit route optimization including the shortest covering path model and the maximal covering shortest path model. We show that special issues arise in the use of these two models which may actually prevent optimal routes from being identified.

4 - A Scheduling Problem for Locating EV Battery Charging Stations
Mihiro Sasaki, Professor, Nanzan University, 27 Seirei, Seto, Japan, mihiro@nanzan-u.ac.jp, Kazuya Matsui, Ken-ichi Tanaka

In this paper, we consider a scheduling problem of locating EV battery charging stations where the location of all stations is given. Due to budgetary limitation, it might be generally difficult to locate all stations at a time. In such a case, the stations would be located in order according to a pre-determined schedule. We show how the schedule difference give an impact on user convenience, and propose heuristics to find good schedules.

Airline Network Planning and Schedule Development

Sponsor: Aviation Applications

Sponsored Session

Chair: Ahmed Abdelghany, Associate Professor, Embry-Riddle Aeronautical University, 600 S. Clyde Morris Blvd., Daytona Beach, FL, United States of America, abdel776@erau.edu

1 - Airline Schedule Optimization Model with Efficient Aircraft and Crew Rotations

Ahmed Abdelghany, Associate Professor, Embry-Riddle Aeronautical University, 600 S. Clyde Morris Blvd., Daytona Beach, FL, United States of America, abdel776@erau.edu, Khaled Abdelghany

This research contributes to the clean-sheet flight scheduling problem by presenting a modeling framework that incorporates aircraft and crew rotations in flight scheduling models. Given the desired service frequency in the different city pairs, the framework generates an operational flight timetable that maximizes the airline's revenue, while generating efficient rotations for aircraft and crew. We present the application of the framework using a real-world data of a major US airline.

2 - An Approach to Analyze Consumer Welfare Impacts of U.S. Airline Mergers

Laurie Garrow, Georgia Institute of Technology, School of Civil Engineering, Atlanta, GA, 30332, United States of America, laurie.garrow@ce.gatech.edu, Matthew Higgins, Jeff Newman

The U.S. airline industry has experienced significant consolidation. Economists often use a BLP approach to quantify consumer welfare impacts associated with mergers. Within aviation, the full potential of the BLP approach has yet to be realized, due to limited publicly-available fare information. We discuss a dataset we are using to overcome this limitation, outline our research approach, and discuss and potential benefits for airline itinerary choice modeling applications.

3 - Bank Structure Model

Gizem Keysan, Manager, United Airlines, 233 S Wacker Dr, Chicago, IL, 60606, United States of America, gizem.keysan@united.com

Banks are periods where most flights arrive/depart around the same time. They create more connection possibilities while providing efficiency with opportunities to swap aircraft. In order to build the best bank structure, it is crucial to consider several factors such as valuable connections, manpower availability and gating feasibility. We present an optimization model that recommends bank start and end times to maximize connection revenue while adhering to the operational constraints.

4 - Considering Uncertain Capacity Changes in Airline Revenue Management

Daniel Kadatz, Freie Universität Berlin, Garystr. 21, Raum 201, Berlin, 14195, Germany, daniel.kadatz@fu-berlin.de, Catherine Cleophas, Christina Büsing

We demonstrate a model integrating non-optimal mandatory capacity changes in airline revenue management. Such changes frequently occur in the booking horizon in practice, but theoretical approaches almost entirely neglect them so far. We outline a new approach incorporating uncertain capacity changes, present a set of designs for simulation experiments as well as first numerical results.

Joint Session Wagner/CPMS: Daniel H. Wagner Prize for Excellence in Operations Research Practice

Cluster: Daniel H. Wagner Prize for Excellence in Operations Research Practice & CPMS, The Practice Section

Invited Session

Chair: C. Allen Butler, President, Daniel H. Wagner, Associates, Inc., Hampton, VA, United States of America, Allen.Butler@va.wagner.com

1 - Daniel H. Wagner Prize

C. Allen Butler, President, Daniel H. Wagner, Associates, Inc., Hampton, VA, United States of America, Allen.Butler@va.wagner.com

The competition for the 2014 Daniel H. Wagner Prize for Excellence in Operations Research Practice resulted in six finalists, who submitted papers to the judging committee and who will present their results in three sessions. In this keynote, the winner of the competition will be announced and the authors will give a reprise of the winning presentation.

2 - Project Portfolio Planning at Intel Corporation

Siddhartha Sampath, Intel Corporation, Decision Engineering Group, 5000 W. Chandler Blvd., Chandler, AZ, 85226, United States of America, siddhartha.sampath@intel.com, Karl Kempf

We address the problem of deciding between project funding opportunities under budget constraints. Projects interactions make selection difficult but senior managers have business intuitions that inform the decisions. We use modeling, simulation and optimization methods to find the best project portfolios including tools for decision makers to apply their insights in making the final selection. Interplay of analytics and intuition produces better solutions faster than was previously achieved.

3 - Airline Crew Augmentation, Decades of Improvements from Sabre

Shahram Shahinpour, Senior of Operations Research, Sabre Holdings, Inc, 3150 Sabre Dr., Southlake, TX, 76092, United States of America, Shahram.Shahinpour@sabre.com, Tina Shaw, Yogesh Dashora

The airline crew pairing problem is to generate optimized legal anonymous pairings that cover the flight complement requirements. The exact crew composition needed on a flight often varies depending on of the pairings that cover it. Different from the conventional approaches, Sabre Long Haul Pairing Optimizer models this dependency explicitly and uses sophisticated Branch and Price techniques. We use real airline examples to show our solution brings considerable savings to the airline industry.

Stochastic Scheduling and Supply Chains

Cluster: Scheduling and Project Management

Invited Session

Chair: Xiaoqiang Cai, Professor, The Chinese University of Hong Kong, Dept of Systems Engineering, Shatin, NT, Hong Kong, Hong Kong - PRC, xqcai@se.cuhk.edu.hk

1 - Production Planning and Pricing Policy in a Make-to-stock System Subject to Machine Breakdowns

Houcai Shen, Professor, Nanjin University, 22 Hankou Road, Nanjing, Jiangsu, Nanjing, China, hcshen@nju.edu.cn, Ting Wu, Xiutian Shi

We consider a make-to-stock system served by an unreliable machine that produces one type of product. The system manager must determine the production level and selling price at each decision point. We first show that the optimal production and pricing policy is a threshold control. We then establish the structural relationships among the three threshold parameters. Finally we provide some numerical examples to illustrate the analytical results and gain additional insights.

2 - Production Costs, High Worth Players, and Tails in Subcontracting

George Vairaktarakis, Professor, Case Western Reserve University, 10900 Euclid Ave, 323 PBL, Cleveland, Oh, 44106, United States of America, gxv5@case.edu, Vernon Hsu, Ke Fu

We consider multiple manufacturers subcontracting part of their workload at a third-party (3P) production facility with the rest of the work processed in-house. Production costs are customer-specific, both at their own facility as well as at 3P. We explore production plans and cooperative strategies that incentivize optimal behavior.

3 - Carbon Emission Reduction in the Presence of Production Mix Selection

Xiaolin Xu, Professor, Nanjing University, Nanjing, China, xuxl@nju.edu.cn, Jian chen, yongbo xiao, Xiaoqiang Cai

This paper investigates the question of how should the government impose a suitable incentive to induce firms to emit carbons to the level that optimizes the social welfare. We consider a producer that manufactures a product either by an old or new technology, or by a mix of the two technologies. Two carbon emission reduction policies, i.e., taxing on the high-carbon products and subsiding on the low-carbon products, are studied on the side of the government.

4 - Risk Sharing by Delay-in-Supply for a Dual-Channel Supply Chain

Weili Xue, Southeast University, School of Economics and Management, Nanjing, China, wlxue1981@gmail.com, Chen Zhiyuan, Xiaogan Jiang

We study a dual-channel supply chain where the supplier can delay his supply to the retailer. The supplier can satisfy his realized demand of the direct channel by the retailer's order. We find that delay-in-supply can be used to sharing the supplier's demand risk, and benefits the retailer at the same time, to improve the whole supply chain. We also study the delay-in-supply affects' on selling prices and the wholesale price, show the effect of demand variability on the obtained results.

1 - Primary Task Utilization and Secondary Task Compliance: A Behavioral Investigation

Brett Massimino, Cornell University, School of Hotel Administration, Ithaca, NY, 14850, United States of America, massimino.3@fisher.osu.edu, John Gray, James Hill

We use a laboratory experiment to examine human performance behaviors in a multitasking environment. We examine how the level of utilization on a primary, individual-oriented task and noncompliance penalties for a secondary, organization-oriented task interact in affecting one's propensity to perform the secondary task. We frame our study in the realm of non-IS workers complying with Information Security processes, yet offer implications for many other manufacturing and service settings.

2 - Incorporating Customer Feedback in Service Operations with Text Analytics

Shawn Mankad, Assistant Professor, University of Maryland, 4316 Van Munching Hall, College Park, MD, 20742, United States of America, smankad@rhsmith.umd.edu, Rohit Verma, Spring Han, Nagesh Gavirneni

There is a large literature showing that online reviews have a direct impact on decision making and product sales. Yet, most extant works utilize only the numerical "star" rating or at most the valence of the review text for modelling. In this work, we apply modern text analytics to a corpus of reviews for hotels in a major city from a leading review website to identify key areas of service operations that depend on hotel type and quality.

3 - The Influence of Surprise and Anticipation on Peak and End Effects in Service Operations

Mike Dixon, Assistant Professor, Naval Postgraduate School, 555 Dyer Road, IN-234, Monterey, 93943, United States of America, mjdixon@nps.edu, Rohit Verma, Liana Victorino

In many service designs there is a high point — a peak portion that often defines the entire experience. We investigate how anticipation and surprise influences these peak segments. We test the influence of anticipation and surprise of peaks and their placements using an online survey-based experiment.

4 - Service Design, Customer Reviews and Preferences: Insights from Hospitality Industry

Rohit Verma, Singapore Tourism Board Distinguished Professor, Cornell University, School of Hotel Administration, 338 Statler Hall, Ithaca, NY, 14850, United States of America, rv54@cornell.edu, Rachna Shah, Kanika Thakran

This paper presents the results of customer preferences and reviews for service design features in the hospitality industry.

Sponsored Session

Chair: Changrui Ren, IBM Research - China, Building 19, Zhongguancun Software Park, Beijing, China, rencr@cn.ibm.com

1 - Process Monitoring and Automation to Enable Service Delivery Excellence

Sai Zeng, Research Scientist, IBM T. J. Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, saizeng@us.ibm.com, Miao He, Changrui Ren

Process Automation is critical to reduce the need for human work in the production of goods and services to make the processes uniform and efficient. In this talk, we present an evidence based analytical approach to identify top opportunities for process automation, and provide objective assessment of benefit to enable process leaders to take informed decisions. A case study in Finance and Administration Process Delivery Services is used to illustrate the core idea of our analytical approach.

2 - Practice in Data-Driven Target Marketing Activities in O2O Commerce

Bing Shao, Staff Researcher, IBM, Building 19, Zhongguancun Software Park, 8 Dongbeiwang West Road, Haidian Distric, Beijing, China, shaobing@cn.ibm.com, Changrui Ren, Miao He, Jinfeng Li, Hao Ji

The essence of online-to-offline (O2O) commerce is closed loop processing of transactions from online consumer decision making through payment to local service. We present a piece of practice to transform big data into actionable insights and guidance using decision analysis and optimization, which may help the O2O merchants optimize its marketing strategy including providing real time, relevant, and personalized product or service promotions, obtaining the early customers.

Incentives for Innovation/Innovative Projects

Cluster: New Product Development

Invited Session

Chair: Morvarid Rahmani, Assistant Professor, Georgia Tech, 800 West Peachtree Street, N.W., Atlanta, GA, 30308, United States of America, Morvarid.Rahmani@scheller.gatech.edu

Co-Chair: Karthik Ramachandran, Associate Professor, Georgia Institute of Technology, Scheller College of Business, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, Karthik.Ramachandran@scheller.gatech.edu

1 - Incentive Alignment and Coordination of Project-Based Supply Chains with Schedule Based Contracts

Shi Chen, Assistant Professor, University of Washington, Foster School of Business, Foster School of Business, ISOM Department, Box 353226, Seattle, WA, 98195, United States of America, shichen@uw.edu, Hau Lee

Consider a project-based supply chain which involves multiple activities each requiring a concentrated use of certain key materials. We derive the optimal material delivery schedule and payment scheme so that a delivery-schedule-based contract coordinates the channel. We show that the manufacturer's profit is not affected by the average supply lead time but is affected by the variance of the lead time. We also show that delivery reliability is the most important factor for channel coordination.

2 - Selling a New Product to Uncertain Customers with Learning Externality

Yufei Huang, PhD Student, University College London, Gower Street, London, United Kingdom, yufei.huang.10@ucl.ac.uk, Onesun Steve Yoo, Bilal Gokpinar

We study a seller's optimal pricing strategy and capacity decision when selling a new/innovative product to risk-averse customers who are uncertain about their valuations. Customers may deliberately delay their purchase for more information from other customers to reduce their valuation uncertainty. We then analyse the effect of learning externality on the market equilibrium, the seller's pricing strategy and capacity decision.

3 - Economics of Co-design: The Role of Product Lines

Sreekumar Bhaskaran, Associate Professor, Southern Methodist University, 6212 Bishop Blvd., Dallas, TX, 75275, United States of America, sbhaskar@mail.cox.smu.edu, Amit Basu

Inputs from final customers can be very helpful in creating effective customized products, but this "co-design" process requires customers who participate in it to commit significant time and effort. In this paper, we illustrate the role of product lines to engage the customer in the design process.

Sponsored Session

Chair: Donna C Llewellyn, Associate Vice Provost for Learning Excellence, Georgia Tech, CETL Clough 457, 266 4th St. NW, Atlanta, GA, 30332-0383, United States of America, donna.llewellyn@cetl.gatech.edu

1 - The U.S. STEM Undergraduate Model: Applying System Dynamics to Undergraduate STEM Student Persistence

Debbie Hughes, Director of Higher Education & Workforce, The Business-Higher Education Forum, 2025 M St NW Suite 800, Washington DC, 20036, United States of America, debbie.hughes@bhef.com

BHEF's U.S. STEM Undergraduate Model, a first-of-its-kind system dynamics model focused on undergraduate STEM education, contextualizes President Obama's call for 1M additional STEM graduates, and provides an evidence-based approach to the high-impact practices needed to change STEM student persistence at scale. Through its National Higher Education and Workforce Initiative BHEF embeds the Model findings into strategic regional workforce projects in emerging high-skill high-demand fields.

2 - Modeling the Knowledge Economy: Exploring Productivity, Inequality, and Creative Destruction

Dan Sturtevant, CEO, Silverthread, Inc., 12 Lill Ave, Newton, MA, 02465, United States of America, dan@silverthreadinc.com, Merrilea Mayo, Jeanne Contardo

We present the "Aligned Workforce Model," a computer simulation used to explore the misalignment between education production and workforce needs. This agent- and network-based model contains simulated people, firms, and a representation of the ever-changing constellation of human knowledge. Using this model, we can explore the impact of policy choices on unemployment, skills across the workforce, economic productivity, inequality, and the strength of the middle class.

3 - Modeling Market-Based Reforms in Education

Spiro Maroulis, Assistant Professor, Arizona State University, School of Public Affairs, 411 N. Central Ave, Phoenix, AZ, 85004, United States of America, Spiro.Maroulis@asu.edu

In this talk, I will discuss applying the ideas and tools of complexity science to educational policy and management problems. In particular, I will present a computational, agent-based model that captures the dynamic processes involved in moving from a non-market to choice-based system. I will also present an example of applying network analysis to better understand competition within school districts.

4 - Analyzing K-12 Education System Interventions

Pratik Mital, PhD Candidate, Georgia Institute of Technology, North Ave NW, Atlanta, GA, 30332, United States of America, pratik_mital@gatech.edu, Roxanne Moore, Donna C Llewellyn

Schools and school districts are complex, dynamic systems affected by numerous factors. In this work, a framework is developed that can be used to analyze interventions in the K-12 education system in US. Techniques like agent-based modeling and social network analysis are used that allow the user to analyze the barriers and enablers to school change and reform. The framework is applied to model and analyze various case studies of school interventions.

Sponsored Session

Chair: Chaitra Gopalappa, Assistant Professor, University of Massachusetts, 160 Governors Drive, Amherst, United States of America, chaitrag@umass.edu

1 - Understanding the Crisis in Somali IDPs

James Cochran, University of Alabama, Culverhouse College of Commerce and Bus, 347 Alston Hall, Tuscaloosa, AL, 35487, United States of America, jcochran@cba.ua.edu, Alaa Zeid

1.5 million Somalis have been internally displaced; many live in overcrowded settlements with limited access to water, sanitation, food, and shelter. Not surprisingly, mortality rates for children under 5 and women in these settlements are alarmingly high. We describe our WHO–supported efforts to collect data in these settlements and apply negative binomial regression to determine the conditions most strongly associated with these high mortality rates and provide guidance for relief efforts.

2 - Estimation of Global Impacts and Costs of Cancer Screening

Chaitra Gopalappa, Assistant Professor, University of Massachusetts, 160 Governors Drive, Amherst, United States of America, chaitrag@umass.edu, Carel Pretorius, Jeremy Lauer, Melanie Bertram, Rachel Sanders

Estimates of health impacts and costs of screening for different types of cancers can guide development of public health policies on screening strategies. We present our ongoing work with WHO in developing simulation models of national populations for estimation of impacts and costs of alternate screening strategies and Markov models for estimation of onset and progression rates for simulating the natural history of cancer.

3 - Modeling the Complex Interaction between Comorbidities: Breast Cancer and Diabetes

Julie Ivy, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, United States of America, jsivy@ncsu.edu, Jennifer Mason, Shadi Hassani Goodarzi, Kendall McKenzie, Nisha Nataraj, Maria Mayorga, Jeremy Tejada

In 2010, over 200,000 women were diagnosed with invasive breast cancer, and 12.6 million women were affected by diabetes in the US, according to the Centers for Disease Control and Prevention. While we know much about these prevalent diseases individually, little has been studied about the interaction between them. Here, we build a modeling framework that explores this complex relationship so as to assess the prognosis for women who are diagnosed with diabetes given their breast cancer risk.

4 - Potential Impact of H7N9 Influenza Virus Pandemic Outbreak in the U.S.

Walter Silva Sotillo, PhD Student, University of South Florida, 4202 E. Fowler Ave, Tampa, FL, 33620, United States of America, silvasotillo@mail.usf.edu, Tapas Das

Until April 8, 2014, WHO reported 409 confirmed cases (with fatality around 30%) of H7N9 virus in China. Current concerns are that H7N9 might become human-to-human transmittable and spread internationally. We use data from recent reports and a simulation model to predict the potential impact of H7N9 pandemic in the U.S.

Chair: Bernard Fortz, Professor, Université Libre de Bruxelles, GOM CP212, Bld du Triomphe, Brussels, 1050, Belgium, bernard.fortz@ulb.ac.be

Co-Chair: Dimitri Papadimitriou, Pr.Eng.Research, Bell Labs, Copernicuslaan 50, Antwerp, 2018, Belgium, dimitri.papadimitriou@alcatel-lucent.com

1 - Robust Optimization Approaches to Virtual Network Embedding

Martin Tieves, RWTH Aachen University, Lehrstuhl II für Mathematik, Wüllnerstrafle 5b, Aachen, 52056, Germany, tieves@math2.rwth-aachen.de, Arie Koster, Stefano Coniglio

Network virtualization is a key technology of modern telecommunications, allowing to decouple management aspects of the physical network from service provisioning. We consider the virtual network embedding problem (VNE) of selecting which virtual networks to embed onto the physical network to maximize profits. We present and investigate extensions of Mixed Integer Programming formulations for VNE handling data uncertainty by adopting both the Hose and the Gamma Robustness uncertainty models.

2 - Virtual Network Embedding with Network Design Elements: Reservation of Physical Resources

Stefano Coniglio, RWTH Aachen University, Lehrstuhl II für Mathematik, Wüllnerstrafle 5b, Aachen, 52056, Germany, stefano.coniglio@gmail.com, Martin Tieves, Arie Koster

Virtualization techniques allow for the coexistence of many virtual networks jointly sharing the resources of an underlying physical network. Unlike previous work, we focus on the service provider's point of view of deciding not only which virtual network requests to accept, but also which quantity of resources to reserve from the physical network owner so to maximize the revenue. We present Mixed-Integer Linear Programming formulations for the problem and investigate them computationally.

3 - Models for Traffic Engineering in Ethernet Networks Implementing the Multiple Spanning Tree Protocol

Bernard Fortz, Professor, Université Libre de Bruxelles, GOM CP212, Bld du Triomphe, Brussels, 1050, Belgium, bernard.fortz@ulb.ac.be, Luis Gouveia, Martim Moniz

The Multiple Spanning Tree Protocol (MTSP) maintains a set of spanning trees that are used for routing the demands in the network. Each spanning tree is allocated to a pre-defined set of demands. We present MIP models for the problem of optimally designing a network implementing MTSP, such that link utilization is minimized and propose a binary-search algorithm that efficiently produces near-optimal solutions for the problem.

4 - The Two-Level Diameter Constrained Spanning Tree Problem

Luis Gouveia, Professor, Univ of Lisbon, Centro de Investigacao Operacional, Bloco C6 - Piso 4- Campo Grande, Lisbon, 1749-016, Portugal, legouveia@fc.ul.pt, Ivana Ljubic, Markus Leitner

In this work, we introduce the Two-Level Diameter Constrained Spanning Tree Problem (2-DMSTP). We first observe that any feasible solution to the 2-DMSTP can be viewed as a DMST that contains a diameter constrained Steiner tree. This observation allows us to prove graph theoretical properties related to the centers of each tree which are then exploited to develop mixed integer programming formulations, valid inequalities, and symmetry breaking constraints.

Predictive Analytics for Social Media

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Hyun-Woo Kim, PhD Candidate / Graduate Teaching Fellow, Pennsylvania State University, 324 IST Building, University Park, PA, 16802, United States of America, hxk263@ist.psu.edu

1 - Predictive Analytics for Presidential Elections

Hyun-Woo Kim, PhD Candidate / Graduate Teaching Fellow, Pennsylvania State University, 324 IST Building, University Park, PA, 16802, United States of America, hxk263@ist.psu.edu

There are a great amount of non-random signals and opinionated conversations related to presidential election campaigns coming out of social media. This work will demonstrate that understanding social dynamics associated with user affects, influence and information diffusion would help voters, political parties, election candidates and public administrations accurately capture the common understanding of the general public.

2 - 8-K Filings, Twitter Activities and Stock Market Reactions

Tawei Wang, University of Hawaii at Manoa, 2404 Maile Way, BUSAD E602C, Honolulu, HI, 96822, United States of America, twwang@hawaii.edu, Asheq Rahman, Roger Debreceny

This paper investigates Twitter activities around 8-K filing dates and the association between such activities and stock market reactions to 8-K filings. Using a sample of S&P 1500 companies' 8-K filings in 2012, we show the number of tweets, impression, sentiment, and influential tweeters directly affect the stock market reactions.

3 - Geolocation of Twitter Users through NLP, Machine Learning and Social Networking Algorithms

Ryan McKeown, Booz Allen Hamilton, 9800 Gable Ridge Terrace, Rockville, MD, 20850, United States of America, mckeown_ryan@bah.com, Curie Chang, Ryan Corbett

There are many problems that would benefit from Twitter data if geolocation was available. Less than two percent of Twitter users have geolocation enabled. We have developed an approach that combines NLP, machine learning and social networking algorithms to automatically detect a user's residence location at state level.

4 - CRM in Social Media: Predicting Increases in Facebook Usage Frequency

Michel Ballings, Professor, University of Tennessee, Knoxville, Knoxville, United States of America, Michel.Ballings@Gmail.com, Dirk Van den Poel

The purpose of this study is to (1) assess the feasibility of predicting increases in Facebook usage frequency, (2) evaluate which algorithms perform best, (3) and determine which predictors are most important. The results indicate that it is feasible to create models with high predictive performance. The top performing algorithm was Stochastic AdaBoost with a cross-validated AUC of 0.66 and accuracy of 0.74. This study is the first to assess the prediction of usage frequency in a social network

5 - Evaluating Social Media Data Appropriateness for Travel Demand Analysis: A Time Geography Approach

Mohsen Parsafard, Mississippi State University, 319 N Jackson St, Apt 2A, Starkville, MS, 39759, United States of America, mp1273@msstate.edu, Guangqing Chi, Xiaopeng Li

Social media data (e.g., twitter) hold a large amount of geo-tagged records of individuals that can be potentially used to reconstruct their activity trajectories. Based on time geography, this study proposes a set of measures that specify a continuous temporal-spatial bound of an individual's possible activity range with a discrete set of sampled time-location tags of this individual. We apply these measures to show the suitability of the tested twitter data for individual activity studies.

Exploring Strategies for Innovation and Learning

Cluster: Strategy Science

Invited Session

Chair: Hart Posen, Associate Professor, University of Wisconsin-Madison, 975 University Avenue, Madison, WI, 53706, United States of America, hposen@bus.wisc.edu

1 - Technological Change and Incumbent Search in Music and Movies

Mary Benner, University of Minnesota, 3-365 Carlson School of MGMT, 321-19th Avenue South, Minneapolis, MN, 55455, United States of America, mbenner@umn.edu, Joel Waldfogel

Digital technology has spurred important changes in the music and movie industries, challenging the advantages of incumbents and creating innovative ways to conduct industry activities. Using extensive data on music and movie product releases, we examine how the search strategies of incumbents changed in the wake of the technological changes. We explore their approaches for discovering and selecting new talent and products, and the outcomes of these strategies.

2 - Does Strategic Management Need Neurosciences?

Stefano Brusoni, ETH Zurich, Weinbergstrasse 56/58, Zurich, 8092, Switzerland, sbrusoni@ethz.ch, Maurizio Zollo, Daniella Laureiro-Martinez, Vinod Venkatraman, Stefano Cappa

Neuroscientific methods enable management scholars to observe constructs nowadays central to strategy, e.g. cognition, ambidexterity. Yet, these methods (e.g. fMRI) are not 'general purpose technologies': They are good at solving specific classes of problems, but not all problems. We identify these classes of problems, with specific focus on three areas: attention control, routine emergence, and emotions. We discuss the ethical issues and the managerial implications.

3 - The Roles of the Giant Cluster in Knowledge Diffusion and Recombination

Jeho Lee, Associate Professor, Seoul National University, 599 Gwanangno, Gwanak-gu, Seoul, 151-916, Korea, Republic of, jeho0405@gmail.com, Jaeyong Song, Sungyong Chang

We examine the roles of a giant cluster in fostering knowledge diffusion and recombination. Our numerical analysis shows that the giant cluster acts as a knowledge integrator by facilitating knowledge diffusion between previously unconnected clusters. But, not all giant clusters are equally effective in fostering knowledge recombination. We find that only giant clusters with a modest fraction of bridges with no hubs are conducive to enhancing knowledge recombination.

4 - Performance Responses To Competition Across Skill-Levels In Rank Order Tournaments

Karim Lakhani, Harvard Business School, k@hbs.edu, Kevin Boudreau, Michael Menietti

Tournaments are widely used in the economy to organize production & innovation. We study individual contestant-level data on 2796 contestants in 774 software design contests. We find that performance response to added contestants varies non-monotonically across contestants of different abilities; most respond negatively to competition; highest-skilled contestants respond positively. In counterfactual simulations, we interpret a number of tournament design policies.

Hospital-based Challenges

Sponsor: Health Applications

Sponsored Session

Chair: Vedat Verter, Professor, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, vedat.verter@mcgill.ca

1 - Integrated Surgical Bed Management

Mohammad Mehdi Ghotboddini, McGill University, 1001 Sherbrooke St, Montreal, QC, Canada, mehdi_ghotboddini@yahoo.com, Vedat Verter, Lawrence Rosenberg, Valerie Vandal

In collaboration with Montreal Jewish General Hospital Surgical Unit, we systematically approach surgical block scheduling problem to achieve cost containment by controlling over surgical case cancellation due to downstream bed shortage. We develop a stochastic model and apply a modified sample average approximation method to solve it.

2 - Operating Room Simulation Model Helps Hospitals Quantify their Challenges

Michael Carter, Professor, University of Toronto, Mech & Ind Engineering, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, mike.carter@utoronto.ca, Carolyn Busby, Daphne Sniekers

Over the past six years, we have developed a generic perioperative simulation model that has so far been implemented in eight Ontario hospitals. Initially, we developed the model to help OR planners optimize the surgical schedule and case mix. However, we discovered that the very act of validating the model provided hospitals with quantitative evidence highlighting flaws in their practices and exactly how to correct them. We will discuss several examples.

3 - Patient Flow Smoothing

Hamidreza Eslami, Canada, hamidreza.eslami@mail.mcgill.ca, Vedat Verter

Observing the current flow of colorectal surgery patients at Montreal General Hospital (MGH) reveals a significant gap between reality and the care pathway designed collectively by the care providers. This study addresses this issue in three phases, care process analysis, simulation, and mathematical modeling.

4 - Design of Financial Incentives for Avoiding Unnecessary C-Sections

Beste Kucukyazici, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, beste.kucukyazici@mcgill.ca, Cheng Zhu

Rates of C-section, which exposes potential harms on mothers and newborns as well as heavy economic burden, have been increasing constantly and this growth raises some concerns for the policy makers. This research focuses on optimizing the financial incentives, i.e. choosing best payment scheme and optimizing how to reimburse obstetricians under this scheme, in order to reduce the C-section rates without sacrificing birth quality while alleviating economic burden for overall health care system.

Monitoring and Prevention of Hospital Acquired Infections

Sponsor: Health Applications

Sponsored Session

Chair: Eduardo Perez, Assistant Professor, Texas State University, 601 University Drive Ingram School of En, San Marcos, TX, 78666, United States of America, eduardopr@txstate.edu

1 - Agent-Based Mediation Modeling of a Controlled Trial to Reduce MDRO Transmission

Sean Barnes, Assistant Professor, University of Maryland, 4352 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, sbarnes@rhsmith.umd.edu, Anthony Harris, Lisa Pineles, Daniel Morgan

In 2012-2013, the University of Maryland led a 20-site randomized controlled trial to assess the benefits of universal gloves and gowns to reduce the transmission of multidrug-resistant organisms (MDROs) in acute-care hospitals. We develop an agent-based model to estimate the reduction in MDRO transmission directly due to this intervention.

2 - Further Empirical Evidence for Hand-Hygiene as a Habitual Citizenship Behavior

Reidar Hagtvedt, Assistant Professor, University of Alberta, 2-43 Business Building, Edmonton, Al, T6G2C7, Canada, hagtvedt@ualberta.ca, Sarah Forgie, Ken Schultz

Hand-hygiene is a habitual behavior often neglected, occasionally leading to nosocomial infections, which can be devastating to patients. Health-care workers typically claim to understand the importance of hand-hygiene, yet compliance is routinely low. We propose a theory for the phenomenon of hand-hygiene, based on an expansion of the Theory of Planned Behavior, and test it using observations gathered over four years at a major teaching hospital, as well as surveys.

3 - Reducing Surgical Site Infections

Eva Lee, Professor & Director, Georgia Institute of Technology, Ctr for OR in Medicine & Healthcare, Atlanta, GA, 30332, United States of America, eva.lee@gatech.edu

This project is joint with Grady Memorial Hospital. Surgical-site infections (SSI) are a national problem, occurring in an estimated 2.8% of all procedures (for some, it is up to 30%). It causes complication, prolong length and stay and unnecessary burden on patients, hospitals and 3-party payers. We describe our recent successes in reducing SSI for coronary artery bypass graft through systems modeling and process optimization.

4 - Analyzing CAUTI Prevention Strategies: A Discrete-Event Simulation Study

Eduardo Perez, Assistant Professor, Texas State University, 601 University Drive Ingram School of En, San Marcos, TX, 78666, United States of America, eduardopr@txstate.edu, Berkcan Uyan

Healthcare associated infections are a significant problem for the U.S. healthcare industry, with 1.8 million patients affected each year. Catheter-associated urinary tract infections (CAUTIs) are the second most common type of HAI. Beyond the obvious patient care implications, Medicare has discontinued paying hospitals for care related to CAUTIs. In this work we utilize systems modeling and simulation methods to reduce the incidence of CAUTIs at a real hospital located in central Texas.

Chair: Diana Negoescu, University of Minnesota, Minneapolis, MN, United States of America, dianegoescu@gmail.com

1 - Approximation Methods for Determining Optimal Allocations in Response Adaptive Clinical Trials

Vishal Ahuja, University of Chicago, Chicago, IL, 60615, United States of America, vahuja@chicagobooth.edu, John Birge, Chris Ryan

Response-adaptive clinical trials, where patient assignment to treatments evolves dynamically, offer potential for efficiency gains over traditional designs, and typically modeled as Bayesian adaptive MDP. A consequence of this setup is the increase in problem size, often exponentially, with trial size & complexity. We propose grid-based approximation as a way to reduce the problem dimensionality and the associated computationally burden, thus widening the scope of implementing adaptive designs.

2 - Active Postmarketing Drug Surveillance for Multiple Adverse Events

Joel Goh, Stanford, Palo Alto, CA, United States of America joelgoh@stanford.edu, Margrét Bjarnadóttir, Mohsen Bayati, Stefanos Zenios

Existing methods for drug surveillance do not capture multiple adverse events and their interactions. We propose a new method to do this based on a queueing network. We apply asymptotic analysis to design a sequential hypothesis test that assesses the effect of a drug on multiple adverse events, by continuously monitoring the times of drug treatment and adverse event occurrences in a patient population. We validate our method on (a) simulated data and (b) actual health insurance claims data.

3 - Dynamic Kidney Exchange: The Effect of Batching and Pooling Across Programs

Vahideh Manshadi, Yale University, New Haven, United States of America, manshadi@mit.edu, Itai Ashlagi, Maximilien Burq, Patrick Jaillet

In kidney exchange, incompatible patient-donor pairs arrive over time; they usually register at one of the exchange programs, and wait to be matched. Because of the abundance of hard-to-match patients, the average waiting time is currently long. Using theoretical analysis and computational experiments, we show that the waiting time can be reduced using certain batching policies, or matching schemes that incentivize programs to share their easy-to-match pairs with other programs.

4 - Dynamic Learning of Patient Response Types

Diana Negoescu, University of Minnesota, Minneapolis, MN, United States of America, dianegoescu@gmail.com, Kostas Bimpikis, Dan Iancu, Margaret Brandeau

We optimize treatment policies for a class of chronic diseases where measurements of treatment effectiveness are noisy and where negative health events occur with frequencies that depend on patient response type. We find analytic expressions for adaptive treatment policies and illustrate the performance of such a policy in a case study on multiple sclerosis.

Chair: Matthew Saltzman, Associate Professor, Clemson University, Dept. of Mathematical Sciences, Martin Hall, Box 340975, Clemson, SC, 29634-0975, United States of America, mjs@clemson.edu

1 - Dual-guided Pivot Rules for Linear Programming

Jaques Desrosiers, Professor, HEC Montréal & GERAD, 3000, Ch Cote-Sainte-Catherine, Montréal, Qc, H3T2A7, Canada, jacques.desrosiers@gerad.ca, Jean Bertrand Gauthier, Marco Luebbecke

We describe a generic algorithm for LPs guided by dual feasibility considerations. The resolution process moves according to a direction and a step size. The core component is obtained via the smallest reduced cost upon dividing the dual variables in two subsets: one fixed, the other optimized. The Primal Simplex, the Minimum Mean Cycle-Canceling for network problems, and the Improved Primal Simplex are special cases. We show how to identify directions yielding non-degenerate pivots.

2 - Decomposition Algorithms for Mean-CVaR Multistage Stochastic Linear Programs

Hamed Rahimian, PhD Student, The Ohio State University, 1971 Neil Ave., Columbus, OH, 43210, United States of America, rahimian.1@osu.edu, Güzin Bayraksan, Weini Zhang

We study a risk-averse approach in the multistage stochastic linear programming, where a convex combination of the expected cost and its associated conditional value-at-risk represents the objective function. Due to the coherency of the CVaR, five decomposition schemes are considered in the general framework of Nested L-shaped method to solve the model. We present the computational performance of the single-cut and multi-cut versions of the algorithms for a multistage water allocation problem.

3 - Computational Experience with the MAS Algorithm for Derivative-free Optimization

Hua Zheng, Carnegie Mellon University, Department of Chemical Engineering, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, huazheng@andrew.cmu.edu, Luis Miguel Rios, Nick Sahinidis

The derivative-free optimization algorithm Model-and-Search (MAS) is a local optimization algorithm designed to improve the objective of the best known point by using models fitted by information from nearby evaluated points. The algorithm relies on global optimization of algebraic models to guide the search and identify improving points. The main purpose of this paper is to present extensive computational experience with this algorithm and comparisons with existing implementations.

1 - Playing God: Role of Intermediary in Matching Markets

Rajiv Mukherjee, Assistant Professor, Southern Methodist University, 6212 Bishop Blvd., Dallas, TX, 75275, United States of America, rmukherjee@mail.smu.edu, Amit Basu, Sreekumar Bhaskaran

We examine the role of an intermediary in matching markets like marriage and labor. In this context, an online intermediary's optimal positioning and pricing strategy is developed. The role of competition and social norms is also considered.

2 - Selecting Tasks in Crowdsourcing Platforms

Jiahui Mo, Assistant Professor, Nanyang Technological University, jiahui.mo@utdallas.edu, Sumit Sarkar, Syam Menon

Crowdsourcing platforms are increasing in popularity, and consequently the number of tasks posted by seekers is also increasing – this makes it difficult for solvers to evaluate all the tasks before making a participation decision. We develop a system that provides recommendations to solvers when they log on to the platform.

3 - Firm's Strategic use of Recommendation System
James Zhang, UC Irvine, Paul Merage School of Business, Irvine, United States of America, zhez1@uci.edu, Vidyanand Choudhary

We examine the impact of the use of recommender systems by an online retailer on his profit and consumers' surplus. The retailer employs both recommender system and search engine to help consumers search for products. We develop an analytical model to examine the firm's strategy when products offer heterogeneous margins to the retailer.

4 - Community Involvement in Online Crowdsourcing Communities
Indika Dissanayake, Doctoral Student, University of Texas at Arlington, Box 19437, 701 S West Street, Arlington, TX, 76019, United States of America, indika.dissanayake@mavs.uta.edu, Jingguo Wang, Jie Zhang

Recent advances in information technology bring significant changes to the nature of social interactions and information exchange. Physical face-to-face communications are slowly replaced by online virtual communities. Motivated by this phenomenon, this research investigates how the voluntary community involvement impact peer-recognition and performance in virtual crowdsourcing communities.

Behavioral Research on Inventory and Pricing

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Elena Katok, Ashbel Smith Professor, University of Texas at Dallas, 800 W. Campbell Drive, Dallas, TX, 75080, United States of America, ekatok@utdallas.edu

1 - Learning with Censored Information: An Application to Inventory Management
Kyle Hyndman, University of Texas at Dallas, 800 W Campbell Rd (SM31), Richardson, TX, 75080, United States of America, tdp062000@utdallas.edu, Canan Ulu, Dorothee Honhon

We conduct an experiment in which a retailer must learn about the unknown demand of two related products. Customers may substitute in case of a stock-out. Subjects over-estimate demand of the low-demand product and underestimate demand of the high-demand product.

2 - Decision Making Under Service Level Contracts
Tobias Stangl, University of Cologne, Albertus-Magnus-Platz, Koeln, 50923, Germany, tobias.stangl@uni-koeln.de, Gary Bolton, Ulrich Thonemann

Service level contracts are common in practice. By measuring service levels and enforcing penalty payments service level contracts can feature a sharpened expected profit function which makes the economic consequences of deviations from the normative benchmark more severe. In a set of laboratory experiments we show that service level contracts can significantly reduce the pull-to-center effect and ensure high supply chain efficiency.

3 - Pure Reciprocity under Alternative Procurement Mechanisms
Jason Shachat, Professor, Durham University, Millhill Ln., Durham, DH1 3LB, United Kingdom, jason.shachat@gmail.com

Almost all procurement contracts fail to specify standards for all possible supplier performance dimensions, making moral hazard a ubiquitous presence in supply chain relationships. We argue that gift exchange and reciprocity is an alternative force that supports this phenomenon. We test for this presence and relative strength of this gift exchange hypothesis in a stylized procurement setting under alternative auction mechanisms.

4 - Markdown or Everyday-Low-Price? The Role of Behavioral Motives
Karen Zheng, Massachusestts Institute of Technology, Sloan School of Management, Cambridge, MA, 02142, United States of America, yanchong@mit.edu, Özalp Özer

We study a seller's optimal pricing (markdown vs. everyday-low-price) and inventory strategies when consumers are affected by two salient behavioral motives: anticipated regret and misperception of product availability. We determine and quantify the operational and profit implications of these motives. We contrast the roles of consumers' strategic (pecuniary) versus behavioral (non-pecuniary) motives in affecting purchase, pricing, and inventory decisions.

Convexification Techniques in MIP & MINLP

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Jean-Philippe P Richard, University of Florida, 303 Weil Hall P.O. Box 116595, Gainesville, FL, 32611, United States of America, richard@ise.ufl.edu

1 - Disjunctive Cuts for the Second-Order Cone and its Cross-Sections
Sercan Yildiz, Carnegie Mellon University, Pittsburgh, PA, United States of America, syildiz@andrew.cmu.edu, Fatma Kilinc-Karzan, Gerard Cornuejols

Several recent papers have attempted to extend the disjunctive cut framework from mixed-integer linear to mixed-integer conic programs. In this work we study sets obtained via a two-term disjunction on the second-order cone or its cross-sections. We develop a methodology to derive a family of convex valid inequalities for such sets. We also show that a single inequality is sufficient to describe the convex hull of the disjunction and can be represented in second-order conic form in many cases.

2 - Supermodular Inequalities for Bounded Products of Continuous and 0/1 Variables
Akshay Gupte, Assistant Professor, Clemson University, Martin O-321, Dept. of Math Sciences, Clemson, SC, United States of America, agupte@clemson.edu, Shabbir Ahmed, Santanu Dey

We study the convex hull of the lower-level set of a function defined by the product of a single bounded continuous variable x and a nonnegative monotone submodular function that is zero-valued at some points. This set arises in mixed integer bilinear programs, hyperbolic functions etc. We exploit the supermodular structure in this set and use disjunctive programming to obtain extended formulations. When the upper bound on x is "large enough", the convex hull is described explicitly. The valid inequalities are strengthened under specific generalizations of the level set.

3 - On Cutting Planes for Cardinality Constrained Optimization Problems (CCOP)
Jinhak Kim, Purdue University, 403 W. State Street, Room 532, West Lafayette, IN, 47906, United States of America, kim598@purdue.edu, Jean-Philippe P Richard, Mohit Tawarmalani

We separate the optimal point of an LP relaxation of CCOP from the intersection of a cardinality constraint with a relaxation of the optimal tableau. The separation problem is recast as a network optimization problem on a network formed using the coefficients of the tableau constraints. Our procedure generalizes the equate-and-relax procedure recently developed for complementarity problems.

4 - On Sublinear Inequalities for Mixed-integer Conic Programs
Dan Steffy, Oakland University, Dept. of Mathematics and Statistics, 2200 N. Squirrel Road., Rochester, MI, 48309, United States of America, steffy@oakland.edu, Fatma Kilinc-Karzan

First, without making any assumptions, we show that sublinear inequalities, together with the conic constraint, are sufficient to describe the closed convex hull of the feasible region for MICPs. Second, we show that for Lorentz cone, the description of sublinear inequalities can be significantly simplified.

Chair: Yuping Huang, Ph.D Candidate, University of Central Florida, 12800 Pegasus Dr. RM 320, Orlando, FL, 32816, United States of America, yuping.huang@knights.ucf.edu

1 - Power Generation Expansion Planning: Benders Decomposition with Efficient Cut Calculation
Timo Lohmann, Colorado School of Mines, Division of Economics and Business, Golden, CO, United States of America, tlohmann@mines.edu, Steffen Rebennack

We present a long-term power generation expansion planning model with short-term demand response, i.e., load depends on the electricity market price, in its general form, and introduce a Benders Decomposition approach in GAMS' .net environment to solve the large scale (convex) MINLP. We discuss special cases of the model which allow us to efficiently calculate the Benders optimality cuts. Solving linearized NLP subproblems becomes obsolete which leads to a highly efficient algorithm.

2 - Capacity Expansion of Distributed Generation using Bilevel Mixed Integer Program

Jasper Quach, University of South Florida, 4202 E Fowler Ave, Tampa, Fl, 33620, United States of America, jasper@mail.usf.edu, Bo Zeng

We consider using bilevel mixed integer program to study capacity expansion problem of distributed generation within an electricity market environment. Numerical study on a typical distributed system will be presented, along with detailed discussions and management insights.

3 - A Multistage and Multiscale Stochastic Programming Approach to Electricity Infrastructure Investment

Zhouchun Huang, University of Central Florida, 4000 Central Florida Blvd., University of Central Florida, Orlando, FL, 32816, United States of America, zhouchun.huang@knights.ucf.edu, Qipeng Zheng

To study the infrastructure needs of an electricity grid, we propose a stochastic programming model that integrates long-term investment planning and short-term unit commitment models, both of which are multistage decision problems in nature but have different time scales. The infrastructure expansions are planned several years ahead and the time scales for unit commitment decisions are in hours to meet real-time demand. A nested column generation approach is adopted for solving the problem.

4 - Stochastic Multistage Expansion Planning for an Integrated Energy System

Yuping Huang, Ph.D Candidate, University of Central Florida, 12800 Pegasus Dr. RM 320, Orlando, FL, 32816, United States of America, yuping.huang@knights.ucf.edu

A stochastic multistage expansion planning model is proposed for the integrated natural gas and power generation system. Under uncertainties from energy supply and NG price, the objective is to minimize the expected gas-electricity investment and O&M costs with risk aversion. This model is solved by a modified Benders' decomposition.

Decomposition Algorithms for Stochastic (Integer) Programs

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Merve Bodur, PhD Student, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, mbodur@wisc.edu

1 - Dual Decomposition Algorithms for Solving Chance-Constrained Binary Programs

Yan Deng, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, yandeng@umich.edu, Jon Lee, Siqian Shen

Based on the standard mixed-integer programming reformulation of a chance-constrained binary program, we assign multipliers to constraints that involve variables across scenarios and formulate a Lagrangian relaxation that is decomposable into scenario subproblems. The subproblems are mutually independent and free of big-M constants. The algorithm follows an objective bounding process, and exploits inequalities particularly strong for 0-1 polytopes to shrink feasible regions and improve bounds.

2 - Decomposition Algorithms for Two-Stage Chance-Constrained Programs

Xiao Liu, Ohio State University, 1971 Neil Ave., Columbus, OH, 43210, United States of America, liu.2738@osu.edu, Simge Kucukyavuz, James Luedtke

We study a class of chance-constrained two-stage stochastic optimization problems where second-stage feasible recourse decisions incur additional cost. We propose a new model where recovery decisions are made for the infeasible scenarios to obtain feasible solutions to a relaxed second-stage problem. We develop decomposition algorithms with specialized optimality and feasibility cuts to solve this class of problems. Computational results indicate that our algorithms are highly effective.

3 - Spatial Detection to Minimize Abandonment Rate

David Morton, Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, mortondp@gmail.com, Fang Lu, John Hasenbein

We consider a spatial detection problem in which we seek to protect an offshore oil drilling platform in the Arctic Ocean from sea ice (ice floes) by locating docking stations and allocating autonomous underwater vehicles to those docking stations. We formulate and approximate a multi-stage stochastic integer program for this purpose. The model differs from a typical stochastic facility location model in that service times depend on how long a customer (ice floe) waits for service.

4 - Strengthened Benders Cuts for Stochastic Integer Programs with Continuous Recourse

Merve Bodur, PhD Student, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, mbodur@wisc.edu, Sanjeeb Dash, Oktay Gunluk, James Luedtke

With stochastic integer programming as the motivating application, we investigate techniques to use integrality information to obtain improved cuts within a Benders decomposition algorithm. We analyze the use of split cuts in the extended and projected spaces. We demonstrate that although the two approaches yield equivalent relaxations when considering a single split disjunction, applying multiple splits in the extended space generally yields significantly stronger relaxations.

Network Analysis Methods and Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Sergiy Butenko, Texas A&M University, 4037 ETB, TAMU-3131, College Station, TX, 77843, United States of America, butenko@tamu.edu

1 - On S-plex and S-defective Clique Numbers of a Graph

Oleg Shirokikh, Frontline Systems Inc., 1575 Delucchi Ln, Suite 112, Reno, NV, United States of America, oleg@solver.com, Austin Buchanan, Vladimir Boginski, Sergiy Butenko

We consider degree-based clique relaxations – s-plex and s-defective clique – which have appeared in social network analysis and bioinformatics. We investigate theoretical properties, provide analytical and computational bounds for the related optimization problems. We provide exact solutions for both problems and show polynomial solvability for special graphs. We propose new scale reduction techniques and attempt to find optimal solutions for both problems on extremely large sparse networks.

2 - Large Cohesive Subgroups with High Clustering Coefficient

Zeynep Ertem, Texas A&M, 3131 University Dr, College Station, 77840, United States of America, zeynep84@tamu.edu, Sergiy Butenko

Cohesive subgroups often correspond to significant community structures. Clique finding methods can detect such groups, however, such groups usually have missing edges (i.e., not perfectly connected). We propose a clustering coefficient based relaxation, called α-cluster, which calculates a subgraph whose nodes satisfy at least α level of clustering coefficient. We introduce a clustering algorithm based on α-cluster.

3 - On Lifted Facet-defining Inequalities for Connected Subgraph Polytope

Yiming Wang, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, kkelvin@neo.tamu.edu, Austin Buchanan

We study the facet-defining inequalities for connected subgraph polytope. We mainly focused on the inequalities via lifting. We develop an algorithm to generate facet-defining inequalities in linear time if the graph is a forest and show in general graphs generating such an inequality is NP-hard. We also find a class of inequalities that are valid and discuss when these inequalities can be facet-defining.

4 - Applying a Hybrid Metaheuristic to the Routing on Multicast Problem

Carlos Oliveira, F-Squared Inc, Princeton, NJ, United States of America, oliveira@ufl.edu

Multicast routing systems are used to simultaneously transfer data to multiple destinations. We consider the delay constrained multicast routing problem (DCMRP), which is of great interest for telecommunication engineers. We propose a hybrid metaheuristic approach for the DCMRP, where a GRASP is used along with VNS algorithm. Experiments show that the proposed technique provides superior solution quality, while it is also efficient in terms of the use of computational resources.

Network Design with Hubs II

Cluster: Network Design

Invited Session

Chair: Hans-Jurgen Sebastian, Professor, RWTH Aachen University, Kackertstrafle 7B, Aachen, NR, D-52062, Germany, sebastian@or.rwth-aachen.de

1 - Solution Approaches for the Dynamic Hub Location Problem

Astrid Dettenbach, RWTH Aachen University, Aachen, Germany, hoerhammer@or.rwth-aachen.de

We consider a dynamic hub location problem with single allocation and multiple capacity levels. We contribute by developing a model that incorporates changes in cost and demand structure over time. Which locations serve as hubs, the capacity of these hubs and the allocation of non-hub locations to hub locations are the key decision variables in each period. We develop and evaluate heuristics to solve large problems.

2 - Continuous Facility Location with Backbone Network Costs

John Gunnar Carlsson, University of Minnesota, Minneapolis, MN, United States of America, jgc@isye.umn.edu

We consider a continuous facility location problem in which our objective is to minimize the weighted sum of three costs: fixed costs from installing the facilities, backbone network costs incurred from connecting the facilities to each other, and coverage costs incurred from providing services from the facilities to the service region. We derive two optimal facility configurations: one of these is the well-studied honeycomb heuristic, while the other is an Archimedean spiral.

3 - The Design of Capacitated Intermodal Hub Networks with Different Vehicle Types

Sibel Alumur, Assistant Professor, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, sibel.alumur@uwaterloo.ca, Elif Zeynep Serper

We propose a mixed-integer programming formulation of this hub network design problem. The aim of the model is to minimize total costs while determining the location of hubs, the allocation of non-hub nodes to hubs, which hub links to establish, and how many vehicles to operate on each hub link to route the demand between given origin-destination pairs. We propose a local search heuristic and present computational analysis on the CAB and Turkish network data sets.

Chair: Naiyuan Chiang, Argonne National Laboratory, 9700 S Cass Ave, Bldg 240, Lemont, IL, 60439, United States of America, nychiang@mcs.anl.gov

1 - A Multi-scale Optimization Approach to Dynamic Optimal Power Flow Problems

Fu Lin, Argonne National Laboratory, 9700 South Cass Avenue, Argonne, IL, 60439, United States of America, fulin@mcs.anl.gov, Sven Leyffer, Todd Munson

We study dynamic optimal power flow problems with temporal constraints. These constraints couple variables over different time periods, and they arise in modeling dynamical aspects of power generation and storage. We develop a multi-scale approach that exploits the multi-period structure. Our column-generation-based algorithm solves a sequence of problems from coarsest to finest time scales. This approach strikes a balance between solution quality and computational complexity in large problems.

2 - Advanced Vehicle Routing Based on Powertrain Type, Battery State of Charge and Traffic Conditions

Orkun Karabasoglu, Assistant Professor in ECE, SYSU-CMU, Joint Institute of Engineering, 5000 Forbes Ave, pittsburgh, PA, 15213, United States of America, karabasoglu@cmu.edu, Zhiqian Qiao

Most navigation systems use data from satellites to provide drivers with the shortest-distance, least-time or highway-preferred paths. We propose a novel navigation strategy where vehicle powertrain type, battery state of charge and traffic conditions are used in addition to the traditional parameters. It is found that optimal paths might change significantly for different vehicle types and different initial battery state of charge.

3 - Development of Control-Oriented Models for Model Predictive Control in Buildings

OíNeill Zheng, University of Alabama, Dept. of Mechanical Engineering, Box870276, Tuscaloosa, AL, 35487, United States of America, zoneill@eng.ua.edu

Model Predictive Control (MPC) has gained attention in recent years for application to building controls because of significant potential for energy savings. MPC utilizes dynamic models and input forecasts to estimate future energy usage and employs optimization to determine control inputs that minimize an integrated cost function or a specified prediction horizon. This talk will present the development of control-oriented models in buildings.

4 - Scalable Strategies for Large-scale Structured Nonlinear Optimization

Naiyuan Chiang, Argonne National Laboratory, 9700 S Cass Ave, Bldg.240, Lemont, IL, 60439, United States of America, sorakid507@gmail.com, Victor Zavala

A robust and efficient solver is alway a challenge for large-scale stochastic NLP problems. We discuss the details of our implementation PIPS-NLP, a parallel nonlinear interior-point solver. PIPS-NLP is designed to exploit different types of the problem structure. It adopts a filter-based line search method and applies a curvature test instead of the inertia test. We present the global convergence analysis and also some numerical results based on CUTEr test problems and real energy applications.

Sponsored Session

Chair: Katya Scheinberg, Lehigh University, 200 West Packer ave,, Bethelehem, PA, 18015, United States of America, katyas@lehigh.edu

1 - Distributed Coordinate Descent Method for Learning with Big Data

Martin Takac, Lehigh University, 27 Memorial Drive West, Bethlehem, United States of America, martin.taki@gmail.com, Peter Richtarik

We initially partition the coordinates (features) and assign each partition to a different node of a cluster. At every iteration, each node picks a random subset of the coordinates from those it owns, independently from the other computers, and in parallel computes and applies updates to the selected coordinates based on a simple closed-form formula. We give bounds on the number of iterations sufficient to approximately solve the problem with high probability.

2 - Stochastic Approximation Schemes for Stochastic Optimization with Imperfect Information

Uday Shanbhag, Pennsylvania State University, 310 Leonhard Building, University Park, PA, 16803, United States of America, udaybag@engr.psu.edu, Hao Jiang

We consider the solution of a stochastic convex optimization problem complicated by a parametric misspecification. We assume that this misspecification may be resolved by the solution of a suitable defined convex learning problem. To resolve the absence of convergent efficient schemes, we present a coupled stochastic approximation scheme (with rate estimates) which simultaneously solves the computational and the learning problems.

3 - A Dynamic Penalty Parameter Updating Strategy for Matrix-free SQO Methods

Hao Wang, Lehigh University, H.S. Mohler Laboratory, 200 West Packer Avenue, bethlehem, pa, 18015, United States of America, haw309@lehigh.edu, James V. Burke, Frank E. Curtis, Jiashan Wang

A penalty parameter updating strategy is proposed within a penalty-SQO algorithm for solving nonlinear optimization problems. Our strategy dynamically updates the penalty parameter during the solution process for each subproblem, producing a search direction that simultaneously predicts progress towards feasibility and optimality. We prove that our strategy yields reasonable (not excessively small) values of the penalty parameter and illustrate the behavior of our strategy via numerical test.

4 - Non-linear Label Ranking for Large-scale Prediction of Long-Term User Interests

Mihajlo Grbovic, Yahoo Labs, 701 First Avenue, Sunnyvale, CA, 94089, United States of America, mihajlo@yahoo-inc.com, Vladan Radosavljevic, Nemanja Djuric, Narayan Bhamidipati

We consider the problem of personalization of online services from the viewpoint of ad targeting. We propose to address this problem as a task of ranking the ad categories depending on a user's preference, and introduce a novel label ranking approach capable of efficiently learning non-linear, highly accurate models in large-scale settings. Experiments on real-world advertising data set with more than 3.2 million users show that the proposed algorithm outperforms the existing solutions.

Invited Session

Chair: John Birge, Jerry W. and Carol Lee Levin Professor of Operations Management, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu

1 - Comparing Front-end Load and Balance Fees in Individual Account Pension Systems

Luis Chavez-Bedoya, Research Professor, Esan Graduate School of Business, Alonso de Molina 1652, Surco, Lima, Peru, l.chavezbedoya@gmail.com

We study the effect of risk aversion and density of contribution on the comparison of proportional charges on flow (contributions) and balance (assets) during the accumulation phase of a defined contribution pension under the system of individual accounts. Theoretical results are shown when the comparison is done through expected utility of terminal wealth, expected terminal wealth and the inverse of its coefficient of variation.

2 - Expected Utility Maximization in Large-scale Portfolio Optimization

Gerd Infanger, Department of Management Science and Engineering, Stanford University, Stanford, CA, 94305, infanger@stanford.edu

We discuss a new approach of expected utility maximization for large-scale portfolio optimization when asset returns are represented via a factor model (fundamental, economic and/or statistical). We show how to obtain equilibrium returns and discuss active management based on factor exposures. Expected utility maximization is more general than mean-variance optimization and can better consider fat tails in asset return distributions. Numerical results are discussed.

3 - Heuristic Algorithms for Financial Model Calibration

Amber Zhang, IBM, 185 Spadina Ave, Toronto, Canada, Amber.Zhang@ca.ibm.com, Asif Lakhany, Helmut Mausser

Estimating the parameters of a financial model is an important part of any pricing framework. Calibration tries to find the parameter values that minimize the discrepancy between model and market prices. Heuristic search methods, which can escape from local minima, are an effective alternative to commonly-used gradient-based methods. We develop heuristic algorithms to calibrate the parameters of a two factor Hull-White interest rate model.

Co-Chair: Xuedong He, Assistant Professor, Columbia University, 316 Mudd, 500 W. 120th street, New York, NY, 10027, United States of America, xh2140@columbia.edu

1 - Optimal Stopping Problems in Diffusion-type Models with Running Maxima and Drawdowns

Neofytos Rodosthenous, Lecturer Financial Mathematics, Queen Mary, University of London, Mile End Rd, London, E1 4NS, United Kingdom, N.Rodosthenous@qmul.ac.uk, Pavel Gapeev

We study optimal stopping problems related to the pricing of perpetual American options. We consider a risky asset with dividend and volatility rates depending on its maximum and maximum drawdown processes. We obtain closed-form solutions to the equivalent free-boundary problems for the value functions in the state space of the resulting 3-dimensional Markov process. The 2-dimensional optimal stopping boundary functions are characterized by 1st-order nonlinear ordinary differential equations.

2 - A Super-solution Based Iterative Approach for Stochastic Dynamic Programming

Nan Chen, The Chinese University of Hong Kong, 609 William Mong Engineering Building, Hong Kong, Hong Kong - PRC, wyu@se.cuhk.edu.hk, Nan Chen

We use the information relaxation technique to develop a value-and-policy iterative method to solve stochastic control problems. In each iteration, an upper bound for the true value function and a suboptimal policy with its corresponding value (a lower bound) are obtained so that we can use the gap between the bounds to measure the quality of the policy. Our iterative approach also points to a systematic way to improve heuristic policies widely used in large-scaled control problems.

3 - Realization Utility with Adaptive Reference Points

Linan Yang, Columbia University, United States of America, ly2220@columbia.edu

We consider a dynamic stock liquidation problem in which an investor decides when to sell a stock to maximize her realization utility with reference points adaptive to prior gains and losses. We study both theoretically and numerically the trading strategies and asset pricing implications of three types of investors: those who don't realize the reference point adaptation, those who realize but fail to adjust their strategies for the adaptation, and those who are able to do the adjustment.

4 - Optimal Multiple Stopping with Negative Discount Rate and Random Refraction Times under Levy Models

Hongzhong Zhang, Assistant Professor, Columbia University, 1255 Amsterdam Ave, New York, NY, 10027, United States of America, hz2244@columbia.edu, Tim Leung, Kazutoshi Yamazaki

We study an optimal multiple stopping problem driven by Levy processes. Our model allows for a negative effective discount rate, which arises in a number of financial applications such as stock loans and real options. Moreover, successive exercise opportunities are separated by i.i.d. random refraction times. Under a wide class of Levy models, we rigorously show that the optimal strategy to exercise successive call options is uniquely characterized by a sequence of up-crossing times.

Sponsored Session

Chair: Ruth Misener, Royal Academy of Engineering Research Fellow, Imperial College London, South Kensington Campus, London, United Kingdom, r.misener@imperial.ac.uk

1 - Undercover: A Primal MINLP Heuristic Exploring a Largest Sub-MIP

Timo Berthold, Fair Isaac Europe Ltd, Takustr. 7, Berlin, 10551, Germany, timoberthold@fico.com, Ambros Gleixner

We present Undercover, a primal heuristic for nonconvex MINLP that explores a linear sub-MIP of a given MINLP. Therefore, we identify a smallest set of variables to fix, a so-called cover, such that each constraint is linearized. It turns out that many instances allow for small covers. Although general in nature, we show that the heuristic is most successful on MIQCPs.

2 - A Second Order Multilevel Algorithm for Nonconvex Optimization

Chin Pang Ho, Imperial College London, South Kensington Campus, London, SW7 2AZ, United Kingdom, c.ho12@imperial.ac.uk

Using classical methods, it does not seem possible to overcome the well known curse of dimensionality in nonconvex optimization. However, high-dimensional systems often behave as if governed by a model with only few degrees of freedom. In this talk we discuss how to make systematic use of low dimensional models to speed up the computations in second order optimisation algorithms such as Newton method. We discuss the convergence rate and its application to problem of exploring energy landscapes.

3 - A New Relaxation Technique for Nonconvex Stochastic Programs with Continuous Random Variables

Joseph Scott, Assistant Professor, Clemson University, 206 S. Palmetto Blvd, 207B Earle Hall, Clemson, SC, 29634, United States of America, jks9@clemson.edu

We consider the global solution of nonconvex stochastic optimization problems with expected-value objectives, continuous and compactly supported random variables, and no recourse decisions. This problem is common in engineering design applications including power generation from renewable resources. We present a method for computing underestimating programs that are convex, rigorously account for sampling error, and are convergent, enabling the use of branch-and-bound optimization algorithms.

Co-Chair: Costis Maglaras, Columbia Business School, New York, NY, United States of America, cm479@columbia.edu

1 - Dynamic Matching Markets with an Application in Residential Real Estate

Hua Zheng, Columbia Business School, 3022 Broadway, Uris 4S, New York, NY, 10027, United States of America, hzheng14@gsb.columbia.edu, Ciamac Moallemi, Costis Maglaras

We study a dynamic microstructure model of a dynamic market where buyers and sellers arrive stochastically over time, and are heterogeneous with respect to their product characteristics and preferences and their idiosyncratic financial information. We analyze its dynamics, market depth, and buyer/seller bidding strategies. The motivating application stems from residential real estate.

2 - Optimal Allocation without Money: An Engineering Approach

Itai Ashlagi, MIT, 100 Main st., Cambridge, MA, United States of America, iashlagi@mit.edu, Peng Shi

We study the allocation of heterogeneous services to agents without monetary transfers under incomplete information. The social planner's goal is to maximize a possibly complex public objective. We take an "engineering" approach, in which we solve a large market approximation, and convert the solution into a feasible finite market mechanism that still yields good results. We apply this framework to real data from Boston to design a mechanism that assigns students to public schools.

3 - Managing Congestion in Dynamic Matching Markets

Nick Arnosti, Stanford University, Stanford, CA, United States of America, narnosti@stanford.edu, Yash Kanoria, Ramesh Johari

It is often costly for agents in matching markets to determine whether potential partners are interested in forming a match. This creates friction in the marketplace, lowering welfare for all participants. We use a dynamic model to quantitatively study this effect. We demonstrate that by reducing visibility, the market operator may benefit both sides of the market. Somewhat counter-intuitively, benefits of showing fewer sellers to each buyer are greatest when there is a shortage of sellers.

Diffusion Models for Queues

Sponsor: Applied Probability Society

Sponsored Session

Chair: Shuangchi He, National University of Singapore, 1 Engineering Drive 2, Singapore, 117576, Singapore, heshuangchi@nus.edu.sg

Co-Chair: Jim Dai, Cornell University, 226 Rhodes Hall, Cornell University, 136 Hoy Road, Ithaca, NY, 14853, United States of America, jd694@cornell.edu

1 - Further Reflections on Reflected Brownian Motion in the Octant

John Hasenbein, University of Texas at Austin, Grad Program in OR/IE, Austin, United States of America, jhas@mail.utexas.edu, Ziyu Liang

This work is an extension of earlier work on optimal paths in large deviations for rotationally symmetric RBM in the octant. In particular, for the Harrison-Reiman case, we show that only gradual paths can be optimal. Furthermore, we show that, unlike the general case, spiral optimal paths are not optimal in this case. This conforms with the intuition that approximations of single-class queueing networks are more well-behaved than those for multiclass networks.

2 - SRBM, Geometric Views, and Optimal Paths

Jim Dai, Cornell University, 226 Rhodes Hall, Cornell University, 136 Hoy Road, Ithaca, NY, 14853, United States of America, jd694@cornell.edu, Masakiyo Miyazawa

For a multidimensional semimartingale reflecting Brownian motion (SRBM), I will first describe a geometric condition for the existence of product-form stationary distribution (Dai, Miyazawa and Wu 2014). I will then discuss a connection between this condition and the "entrance velocity" of the optimal path for the associated variational problem. Examples and conjectures will be presented.

3 - Hazard Rate Scaling for the G/M/1+G Processor Sharing Queue

Josh Reed, New York University, 44 W 4th St, New York, NY, 10012, United States of America, jreed@stern.nyu.edu, Guodong Pang, Bert Zwart

We study the G/M/1+G processor sharing queue. In our first result, under the assumption of Poisson arrivals and exponential abandonment distributions, we provide a partial differential equation satisfied by the Laplace transform of the sojourn time distribution of an infinitely patient customer arriving to the system and requesting service. In our second set of results, we obtain diffusion approximations to several performance measures of the system.

4 - A Diffusion Model for Efficiency-Driven Queues

Shuangchi He, National University of Singapore, 1 Engineering Drive 2, Singapore, 117576, Singapore, heshuangchi@nus.edu.sg

We propose a one-dimensional diffusion model for GI/GI/n+GI queues in an overloaded regime. Using this model, we obtain performance formulas, including the distributions of the steady-state queue length and virtual waiting time, for service level estimation in efficiency-driven call centers. The proposed diffusion model and performance formulas are justified by limit theorems. We prove the convergence of queue length and virtual waiting time processes when they are scaled in both space and time.

QSR Best Student Paper Competition

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Hui Yang, Assistant Professor, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, huiyang@usf.edu

1 - Reliability of Systems with Spatially Distributed Units

Dingguo Hua, Graduate Student, Rutgers University, Department of Industrial and Systems Eng, Rutgers University, Piscataway, NJ, 08854, United States of America, hua.dingguo@gmail.com, Elsayed Elsayed

The reliability of systems with spatially distributed units has emerged as an important topic in aerospace and military industries. In this paper, we investigate spatially distributed k-out-of-n pairs:G balanced systems with different requirements. Reliability and other metrics such as time to a specified failure are estimated.

2 - Optimal Supersaturated Design via Lasso

Dadi Xing, Purdue University, 210 Airport Rd, Apt 4, West Lafayette, IN, 47906, United States of America, dxing@purdue.edu, Michael Yu Zhu, Hong Wan

In the supersaturated design(SSD)study, most existing criteria for constructing optimal SSD are motivated and further justified from the estimation perspective. We will propose a number of optimality criteria for the construction of SSD from the perspective of penalized variable selection methods. The properties of these criteria will be discussed. A computing algorithm will be used to construct such optimal SSD, examples of simulation and an application of the algorithm will also be presented.

3 - Heterogeneous Time-to-event Data Modeling and Inference with an Unknown Number of Sub-populations

Mingyang Li, University of Arizona, 1127 James E. Rogers Way, Tucson, AZ, 85721, United States of America, mingyangli@email.arizona.edu

A Bayesian non-parametric model is proposed to model heterogeneous time-to-event data by assuming an unknown number of sub-populations and quantifying influence of covariates. An inference algorithm is further proposed to achieve joint model estimation and selection and to deal with non-conjugate priors.

4 - Non-crossing Quantile Regression Processes Based on Monotone B-splines

Yuan Yuan, Student, University of Wisconsin-Madison, 1513 University Ave, room 3255, Madison, WI, 53706, United States of America, yyuan4@wisc.edu, Nan Chen, Shiyu Zhou

In this paper, we solve the well-known problem, i.e. crossing of multiple quantile curves, by developing a model based on monotone B-splines. We have also developed a procedure to adaptively select variables and reduce model complexity. Numerical studies illustrate its effectiveness well. The proposed model is also applied to study how wind characteristics affects the wind power generation.

Reliability Analysis and Fault Management for Complex Engineering Systems

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Qingyu Yang, Assistant Professor, Wayne State University, 4815 fourth street, Detroit, United States of America, qyang@wayne.edu

1 - Maintenance Policies for Complex Systems with Stochastic and Economic Dependent Components

Linkan Bin, Assistant Professor, Mississippi State University, lb1425@msstate.edu, Nagi Gabraeel

Methods that study the maintenance of complex systems focus on policies based on independent components. We develop a dynamic maintenance policy that accounts for both economic dependence due to shared set-up costs and stochastic dependence resulting from the interactions among the degradation processes by grouping maintenance activities. We show in the numerical studies that the total maintenance cost of the system is significantly reduced by incorporating both types of component dependence.

2 - Optimal Maintenance and Parts Reordering for a One-unit System with a Deteriorating Spare Part

Hongwei Luo, Research Assistant, University of Arizona, 1127 E. James E. Rogers Way Room 111, P.O. Box 210020, Tucson, AZ, 85721, United States of America, harveyluo@email.arizona.edu, Haitao Liao

In this research, we consider an operating system with one-unit operating component and a deteriorating on-site spare part. The goal of this study is to derive the long-run average cost during the maintenance cycle by introducing related costs and also determine the optimal spare part replacement and reordering policy to minimize the cost. Numerical examples are provided to illustrate the use of the model in practice.

3 - Reliability Assessment during a Product's Early Design Stage using Bayesian Networks

Petek Yontay, Arizona State University, 699 S Mill Ave, Tempe, AZ, 85281, United States of America, pyontay@mainex1.asu.edu, Luis Mejia, Rong Pan

In this research, we propose a Bayesian Network model for reliability prediction of a new product at its conceptual design stage. We focus on the concept of integrating functional analysis with the product failure information derived from multiple sources such as historical data from parent products and expert opinions. We will demonstrate our methodology with an industrial example.

4 - A Physical-Statistical Model of Overload Retardation in Crack Propagation under Cyclic Loading

Wujun Si, Wayne State University, 4815 fourth street, Detroit, MI, 48202, United States of America, wujun.si@wayne.edu, Qingyu Yang

Reliability analysis for units subjected to cyclic stress loading has been intensively studied under the assumption that the loading stress is ideally periodic. In reality, however, many factors such as overloads during cyclic loading will have a remarkable effect on unit life prediction. In this paper, a physical-statistical model is proposed to capture the overload retardation effect in crack propagation. An experiment is designed and conducted to verify the developed model.

Sponsored Session

Chair: Jie Xu, Assistant Professor, George Mason University, 4400 University Dr., MS 4A6, Fairfax, VA, 22030, United States of America, jxu13@gmu.edu

1 - Multi-objective Particle Swarm Optimization

Loo Hay Lee, Associate Professor, National University of Singapore, 10 Kent Ridge Crescent, Singapore, Singapore, iseleelh@nus.edu.sg, Ek Peng Chew, Haobin Li

Particle Swarm Optimization (PSO) is a popular search method for single objective problem. In this talk, we will demonstrate how the PSO can be extended to tackle the multi-objective problems. Through the numerical runs, we will show the promising performance of this algorithm. We will also discuss how the approach can be extended for stochastic problem.

2 - Stochastically Constrained Simulation Optimization on Integer Lattices

Raghu Pasupathy, Associate Professor, Purdue University, Dept. of Statistics, West Lafayette, United States of America, pasupath@vt.edu, Kalyani Nagaraj

We present theoretical and implementation details of a random-restarts solver for solving constrained simulation optimization problems on integer lattices. Our theory and implementation is particularly sensitive to the difficult context where the stochastic constraints are binding. We will discuss choice of constraint relaxation, relationship between restarts and sample size, and consistency/efficiency.

3 - Gradient-based Adaptive Stochastic Search for Simulation Optimization over Continuous Space

Enlu Zhou, Georgia Institute of technology, 755 Ferst Drive, NW, Atlanta, GA, 30319, United States of America, enlu.zhou@isye.gatech.edu, Shalabh Bhatnagar

We extend the idea of model-based algorithms for deterministic optimization to simulation optimization over continuous space. Our idea starts with reformulating the original simulation optimization problem into another optimization problem over the parameter space of the sampling distribution, and thus we can use a direct gradient search on the parameter space to update the sampling distribution. To improve the computational efficiency, we further develop a two-timescale updating scheme.

4 - Developing an Agent-based Model for Cardiovascular Health
Yan Li, Purdue University, West Lafayette, IN, 47907, United States of America, li528@purdue.edu, Jose Pagan, Mark Lawley, Nan Kong

Cardiovascular disease (CVD) is the leading cause of death in the U.S. We develop an agent-based model to capture individual health progression and social influencing on health behaviors, as well as study emergent CVD-related population health outcomes (e.g., diabetes, MI, stroke, death). The numerical results demonstrate predictive validity of the model and show how it can be used in practice by assessing the impact of various hypothetical lifestyle interventions on CVD-related outcomes.

Applications of OR in Bioenergy

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Sandra D. Eksioglu, Associate Professor, Department of Industrial Engineering, Clemson University, 134 Freeman Hall, Clemson, SC, 29634, United States of America, seksiog@clemson.edu

1 - Designing a Reliable and Dynamic Intermodal Hub and Spoke Supply Chain for Biomass
Mohammad Marufuzzaman, Mississippi State University, Industrial & Systems Engineering, PO Box 9542, Starkville, MS, 39762, United States of America, maruf237@gmail.com, Sandra D. Eksioglu

The objective of this paper is to design cost-efficient and reliable supply chain networks for biomass delivery to biofuel plants. We propose a dynamic, mixed integer nonlinear programming model that is solved using a Benders based rolling horizon algorithm. Numerical experiments show that the proposed algorithm can solve large scale problem instances to a near optimal solution in a reasonable time.

2 - A Hub-and-Spoke Supply Chain Design with Multi-objective Analysis for Cellulosic Biofuel
Md Roni, Computational Energy Analyst, Idaho National Laboratory, PO BOX 1625, Idaho Falls, Id, 83401, United States of America, mohammad.roni@inl.gov, Jacob Jacobson, Hadi Karimi, Kara Cafferty

We propose a multi-objective, hub-and-spoke model to design the supply chain for biofuels. The multi-objective optimization model captures the trade-offs that exist between costs, environmental and social impacts of delivering biofuels. The multi-objective, mixed-integer, linear programming model is solved using an augmented ?-constraint method. In order to perform the multi-objective analysis, we develop a case study using data from the Midwest region of the USA.

3 - Models for Analyzing the Impact of Production Tax Credit on Renewable Electricity Production
Sandra D. Eksioglu, Associate Professor, Department of Industrial Engineering, Clemson University, 134 Freeman Hall, Clemson, SC, 29634, United States of America, seksiog@clemson.edu

This work is focused on using biomass for co-firing in coal-fired power plants. We develop models to capture the impact of the production tax credit (PTC) on renewable electricity production. The existing PTC is a flat tax credit that is not affected by the amount of renewable electricity produced, plant capacity, etc. We develop a case study and use numerical analysis to compare renewable electricity production through the existing PTC scheme and all-units, and incremental discount schemes.

4 - Stochastic Biomass Logistics Network Design under Price-based Supply
Gokhan Memisoglu, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, gmemis@tamu.edu, Halit Uster

We present a two-stage stochastic program to construct biomass logistics networks under price dependent biomass supply at farms and yield uncertainty. An efficient solution approach based on Sample Average Approximation (SAA) and an analysis of the relationship between price and the network structure decisions are presented.

1 - Optimal Treatment Strategies for Invasive Species Control under Dispersal Uncertainty
Eyyüb Kibis, Research Assistant, Wichita State University, 1845 Fairmount St., Wichita, KS, 67260, United States of America, eyyubyunus@gmail.com, Esra Büyüktahtakin

In this study, we present a mixed integer linear programming method for invasive species control. The study integrates the biological characteristics of invasive species into a complex spatially explicit model which stimulates the stochastic seed dispersal behavior of an invasive weed in Kansas.

2 - A Stochastic Dynamic Programming Model of Large Wildfire Management
Matthew Thompson, Research Forester, Rocky Mountain Research Station, US Forest Service, Missoula, MT, 59802, United States of America, mpthompson02@fs.fed.us

Previous research has shown that the dynamics of large wildfire incidents can be represented as a Markov chain, capturing the effects of environmental variation and partial control on incident management decisions through time. Here that work is expanded to consider a stochastic dynamic programming formulation to help fire managers determine the optimal organizational capacity as a function of current incident complexity, suppression cost, and density of at-risk resources and assets.

4 - Some Thoughts on Human Resources Analytics
Hila Chalutz, Tel Aviv Afeka College of Engineering, Tel Aviv, Israel, Hilab@afeka.ac.il, Gonen Singer

The paper examines predictive capabilities of service organizations in regards to client success measures based on human resources data. The precision framework of human factors is of paramount importance when predicting client success. The paper provides evidence that predicting client's human resources variables play a vital role on service success in the long run. This approach may assist practitioners to invest the appropriate resources throughout the service delivery process. The paper also provides evidence that service organizations can be selective in regards to their clients based on predetermined criteria.

3 - Natural Hazard Management for Post-Wildfire Debris Flows
Vitaliy Krasko, Colorado School of Mines, Division of Economics and Business, Golden, CO, United States of America, vkrasko@mines.edu, Paul Santi, Kevin McCoy, Timo Lohmann, Steffen Rebennack, Daniel Kaffine

The focus of this talk is a natural-social science optimization model that provides guidance for allocating mitigation funds towards reducing the economic impacts of post-wildfire debris flows. The model minimizes expected damages by optimally allocating funds into mitigation treatments across individual drainage basins that decrease the probability of an event and/or reduce the volume conditional on occurrence. Several case studies are presented.

4 - An Agent-based Modeling of a Multimodal Near-field Tsunami Evacuation: Decision-Making and Life Safe
Haizhong Wang, Assistant Professor, Oregon State University, 101 Kearney Hall, Corvallis, OR, 97331, United States of America, Haizhong.Wang@oregonstate.edu, Dan Cox, Lori Cramer

The goal of this research is to investigate the impacts of different evacuee decision-making time on the estimation of casualties in a multi-modal tsunami evacuation. We are using NetLogo to simulate the evacuee decision-making process in a near-field tsunami evacuation scenario. The simulation results would provide the coastal community an effective evacuation decision making guidelines for a tsunami event, minimizing the loss of life in the limited warning time.

5 - Estimating the Burn Probability of the Forest Reserve of Bogota, Colombia
Ridley S. Morales, Universidad de los Andes, Cra 1 Este No 19A - 40, Bogota, DC, 0000, Colombia, rs.morales64@uniandes.edu.co, Gilberto Morales, Carlos Felipe Valencia, Raha Akhavan Tabatab

Forest fires are time evolving disasters that consume environmental and financial resources, endangering the rescue units that try to mitigate them. In this study, we use simulation integrated with Geographic Information Systems (GIS) to map the burn probability of the forest reserve of Bogot·. This study is conducted in collaboration with Bogota's Fire Department, with the goal of providing a tool for long-term planning in fire prevention activities.

Auctions for Procurement

Cluster: Auctions

Invited Session

Chair: Sasa Pekec, Duke University, Durham, NC, United States of America, pekec@duke.edu

1 - Budget Constrained Procurement

Giuseppe Lopomo, giuseppe.lopomo@duke.edu, Alexandre Belloni, Roberto Steri, Leslie Marx

We characterize optimal mechanisms for a financially constrained buyer facing multiple suppliers with privately known costs. We first establish the optimality of a simple direct mechanism, using basic duality, within the class of all mechanisms with a dominant strategy equilibrium. We then provide a dynamic implementation, and calibrate the parameters of our model to data and show numerically that our mechanism outperforms auctions formats currently used by the Brazilian government and the FCC.

2 - Split-Award Procurement Auctions – Can Bayesian Equilibrium Strategies Predict Bidding Behavior?

Martin Bichler, mar.bichler@gmail.com, Kemal Guler, Stefan Mayer

We analyze to which extent Bayes Nash equilibrium predictions can explain human bidding behavior in sealed-bid split-award auctions with ex ante split decisions. There was no significant difference to the risk-neutral Bayes Nash equilibrium bid function in computerized experiments in the lab where bid functions are reused, however, there was underbidding in human subject experiments. The experiments suggest that strategic complexity does not serve as an explanation for underbidding.

3 - Split Award Auctions: Insights from Theory and Experiments

Damian Beil, Associate Professor, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI, 48109, United States of America, dbeil@umich.edu, Aadhaar Chaturvedi, Elena Katok

We consider two (sealed and open) split-award auction formats where the buyer announces the award splits before the auction. We show revenue equivalence between the two formats and find that for non-regular cost distributions more multi-sourcing might actually reduce the buyer's overall expected payment. Lab experiments indicate that revenue equivalence fails, and the buyer's expected payment in a sealed-bid auction may decrease with more multi-sourcing even with regular distributions.

Study of Reliability and Security in Power Systems

Sponsor: Energy, Natural Res & the Environment/ Energy

Sponsored Session

Chair: Bo Zeng, Assistant Professor, University of South Florida, 4202 E Fowler Ave, Tampa, FL, 33620, United States of America, Bzeng@usf.edu

1 - Demand Response Portfolio Management via Robust Optimization

Andy Sun, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

We consider the demand response (DR) portfolio management problem faced by demand response service providers, where the portfolios are composed of a large number of commercial and industrial organizations. We construct new mixed-integer optimization models to describe the specific dynamics of such DR resources. Then we propose a robust optimization model with a new type of uncertainty sets to model the realization uncertainty of DR. We will discuss solution methods and preliminary test results.

2 - The Value of a Spare Transformer Inventory to an Electric Power Grid's Security against Attack

Wood Kevin, Professor, Naval Postgraduate School, Operations Research Dept., Glasgow Hall, Monterey, CA, 93943, United States of America, kwood@nps.edu, Javier Salmeron

We develop an attacker-defender model for an electric power grid in which certain high-voltage transformers (HVTs) damaged by an attacker can be replaced quickly with inventoried spares. The model can help guide a utility company's inventory strategy for HVTs. Global Benders decomposition solves the model, which includes a mixed-integer subproblem that extends a DC power flow model. A new enumerative solution of the master problem shows great promise for improving efficiency.

3 - Detect Unobservable Attacks with Phasor Measurement Units

Feng Pan, Los Alamos National Laboratory, M.S. C933, Los Alamos, NM, 87545, United States of America, fpan@lanl.gov, Annarita Giani, Russell Bent, Kameshwar Pooll

There've been increasing concerns about cyber-attack to power grids, partly due to the reliance on remote sensing. We first discuss unobservable attacks and introduce a bilevel program to model such attacks. Under sparse attacks, we show that enumerating upper-level extreme point is sufficient to get an optimal solution and is more efficient than KKT based approaches. We then introduce a model for placing phasor measurement units to detect unobservable attacks and present our empirical studies.

4 - Investment of Wind Power with Dynamic Topology in a Market Environment

Yifan Wang, University of South Florida/Northeastern University, China, 3707 Jefferson Commons DR., apt 202, Tampa, FL, 33613, United States of America, yifanw@mail.usf.edu, Bo Zeng, Shixin Liu

We consider wind plant installation within an existing grid operated within an electricity market. A bi-level model is formulated with the consideration of intentional transmission line switching off. A novel algorithm is implemented to solve the problem in an efficient way.

1 - Incentives for Early Adoption of Carbon Capture Technology

Stephen Comello, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, 94305, United States of America, scomello@stanford.edu, Stefan Reichelstein

We analyze a policy proposal for regulating future electricity power plants in the U.S. The cornerstone of this regulation is an emission standard of 80 kg CO2/MWh, beginning in 2027 for all plants that come into operation after 2017. Initial compliance costs are high, yet learning effects reduce this cost by 2027, provided all plants adopt carbon capture in the intervening years. We identify a set of tax credits that provide the required incentive to comply with the standard before the mandate.

2 - Cost- and Price Dynamics of Solar PV Modules

Anshuman Sahoo, PhD Candidate, Stanford University, 473 Via Ortega, Stanford, CA, 94305, United States of America, asahoo@stanford.edu, Stefan Reichelstein

Recent solar module price declines have exceeded those predicted by an 80% learning curve that has characterized prices. We develop a dynamic model of a competitive module industry; the equilibrium price, which we call the economically sustainable price (ESP), equals the long-run marginal cost. Comparing ESPs to selling prices, we find that the dramatic price reductions were due to excess capacity. We extrapolate a trajectory of future costs to which equilibrium prices should converge over time.

3 - A Decision Support Tool for Assessing the Installation Logistics of an Offshore Wind Farm

Euan Barlow, Department of Management Science, University of Strathclyde, Glasgow, United Kingdom, euan.barlow@strath.ac.uk, Diclehan Tezcaner Ozturk, Evangelos Boulougouris, Kerem Akartunali, Sandy Day, Matthew Revie

This study describes a simulation tool designed to support decision makers during the planning and bidding phase of an offshore wind farm (OWF) installation. Duration and costs of an installation scenario subject to uncertain weather conditions are modelled, and different installation scenarios compared. A case study of an OWF installation explores the impact of key logistical decisions, such as installation fleet composition and vessel scheduling. Recommendations on good practice are proposed.

4 - Diffusion Networks of Residential Solar Panels

Sebasti·n Souyris, Ph.D. Candidate, The University of Texas at Austin, 1652 W 6th St Apt P, Austin, TX, 78703, United States of America, sebastian.souyris@utexas.edu, Varun Rai

We investigate the diffusion of residential solar panels in Texas using a novel point process approach. We collect a unique data set at disaggregate household level that allows us to understand how the demographic and economic characteristics influence the adoption decision. We project the dynamics of the market; thereby, giving insights about where the developers should focus their customer acquisition efforts and what type of policies are more efficient to incentivize the adoption.

Design and Control of Energy Systems

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Jay Rosenberger, Associate Professor, University of Texas Arlington, P.O. Box 19017, Arlington, TX, 76019, United States of America, jrosenbe@uta.edu

1 - Sustainable Design of Plug-in Hybrid Electric Vehicle Charging Stations Considering Service Level

Amirhossein Khosrojerdi, University of Oklahoma, 1021 East Brooks St Apt F, Norman, Ok, 73071, United States of America, akhosrojerdi@ou.edu, Janet Allen, Farrokh Mistree, Alexander Rodriguez

We propose a method for considering trade-offs among economic, social and environmental aspects of sustainability when designing a plug in hybrid electric vehicle (PHEV) charging station. Our approach is based on simulations of charging demand of PHEV users and then projecting the charging service level using Multi-Variant Adaptive Regression Splines (MARS) for different design alternatives. We also discuss the impact of various charging scenarios on promoting PHEV adoption.

2 - Hybrid SVM for Market Price Forecasting for the Adaptive Design of PHEV Charging Stations

Piampoom Sarikprueck, The University of Texas at Arlington, 1020 W.Abram St.,, Apt.146, Arlington, TX, 76013, United States of America, piampoom.sarikprueck@mavs.uta.edu, Wei-Jen Lee, Asama Kulvanitchaiyanunt, Victoria Chen, Jay Rosenberger

PHEV charging stations utilized with renewable energy sources and storage device can participate to a deregulated market. The accurate predictions of availability and/or prices of energy sources are essential to minimize the forecast uncertainty for optimal dynamic control. For electric price prediction, hybrid SVM with data clustering techniques is proposed to particularly improve spike price estimation. Future research will analyze forecasting results by Martingale Model Forecast Evolution.

3 - Two-Stage Approach for Controlling a System of Plug-In Hybrid Electric Vehicle Charging Stations

Jay Rosenberger, Associate Professor, University of Texas Arlington, P.O. Box 19017, Arlington, TX, 76019, United States of America, jrosenbe@uta.edu, Wei-Jen Lee, Asama Kulvanitchaiyanunt, Victoria Chen, Piampoom Sarikprueck

This research uses a Design and Analysis of Computer Experiment (DACE) approach to build a metamodel representing the expected value function of a second-stage dynamic control problem in a two-stage framework for plug-in hybrid electric vehicle (PHEV) charging stations. The control problem is formulated and initially solved by the mean value problem using linear programming. The metamodel is developed based on an experimental design over possible solutions from the first stage design problem.

4 - Designing a System of PHEV Electric Charging Stations Considering Market Penetration

Janet Allen, University of Oklahoma, University of Oklahoma, Norman, Ok, 73071, United States of America, janet.allen@ou.edu, Farrokh Mistree, Amirhossein Khosrojerdi

A method is proposed for designing a system of plug-in hybrid electric vehicle charging stations. The rate of the PHEV penetration is projected using a Bass diffusion model, and a simulation model is developed to determine PHEV charging service level of the system for various design scenarios. Finally, a mixed-integer mathematical model is developed to consider the control stage and to design both charging stations (node level decision) and a network of charging stations (network level decision)

Simulation and Optimization I

Contributed Session

Chair: Ingmar Vierhaus, Zuse Institute Berlni, Takustrafle 7, Berlin, 14195, Germany, vierhaus@zib.de

1 - Design and Management of Mobility-on-Demand Systems (MoD) under Uncertainty

Yinghan Deng, National University of Singapore, Blk E1 07-17, 1 Engineering Drive 2, Singapore, Singapore, yinghandeng@nus.edu.sg, Michel Cardin, Amedeo Odoni

This is a first effort to demonstrate the complex interactions between strategic and operational decisions in MoD systems, and provide an effective approach to addressing them. An agent-based simulation model was developed to evaluate the performance of a generic MoD system. A simulation-based optimization approach is then applied to determine the strategy for deploying the system's resources in a way that minimizes both set-up cost and the operating cost associated with load rebalancing.

2 - A Prediction Interval Estimator for the Original Response when using Box-Cox Transformations

Michael Walker, The University of Alabama, 305 Alston Hall, 361 Stadium Dr., Tuscaloosa, AL, United States of America, mlwalker3@crimson.ua.edu, Marcus Perry

Motivated by electron microscopy experiments, we develop an approximate prediction interval on the original response variable Y, where a normal-theory linear model is fit using a transformation on Y from the Box-Cox family. In simulation we assess the performance of our estimators for the mean and variance of Y as well as our proposed interval. We then apply our method to two experimental data sets, one with a standard design, and the other with a split-plot error structure.

3 - Patient and Impatient Pedestrians in a Spatial Game for Egress Congestion

Harri Ehtamo, Professor, AALTO University, Otakaari 1, Espoo, Finland, harri.ehtamo@aalto.fi, Simo Heliövaara

In this study, we present a spatial game theoretic model for pedestrian behavior in situations of exit congestion. The behavioral game model is coupled with a popular social-force egress simulation model. The simulation results to optimize the pedestrian motion are discussed.

4 - Re-Engineering Tree Ensemble Algorithms to Capture Individual-Level Effects for Agent-Based Models

Michael Egner, Senior Vice President, Ipsos, 10567 Jefferson Blvd., Culver City, CA, 90232, United States of America, megner@gmail.com

Tree ensembles are powerful and well-known machine learning classification methods. In this research, we re-engineer these ensembles to split on the magnitude of bivariate or multivariate relationships, in order to transform the trees from classifiers into estimators of individual-level model impacts (e.g., an individual-level estimate of the effect of price on purchase). A real-world business case study applying this method to an agent-based market forecasting model will be discussed.

5 - Layers of Experiments with Adaptive Combined Design

Sungil Kim, Samsung SDS, 512, Samseongro, Gangnamgu, Seoul, Korea, Seoul, Korea, Republic of, sungil.kim@outlook.com

In the field of nanofabrication, where engineers often work with resource-limited experimental budgets, it is essential to involve methodology regarding the selection of experimental regions over batches of experiments. This article proposes such a methodology for sequential design of experiments for batches of experimental runs, termed Layers of Experiments with Adaptive Combined Design (LoE/ACD).

1 - Text Analytics - Today and Tomorrow

Edward Jones, Exec. Vice President, Texas A&M Statistical Services, LP, 4285 Hollowstone Dr., College Station, TX, 77845, United States of America, Edward.Jones@TAMStatServices.com

Applications of text analytics increase daily as analysts develop and explore new techniques for analyzing unstructured data. Integrating text analytics with traditional structured data analysis is an area of increasing interest and opportunity. Analysts are now able to explore not only what people say, but also what they think and feel using text analytics. This paper describes these techniques and presents examples of their use in quality assurance, marketing and politics.

2 - High Performance Statistical Procedures

Mike Speed, Analytical Consultant, SAS Institute, 9312 Lake Forest Ct, S, College Station, TX, 77845, United States of America, mike.speed@sas.com

The SAS high-performance analytics infrastructure forms the backbone of your ongoing analytic endeavors – no matter how big your big data demands get, nor how complex your analysis needs become. While, these procedures are great when you have big data and the infrastructure to do the analyses, these procedures are still very important for those who have a typical desktop and/or laptop. This talk will explore those features.

3 - Predictive Analytics for Structured Data using SAS and JMP

Simon Sheather, Texas A&M University, Department of Statistics, College Station, TX, 99843, United States of America, sheather@stat.tamu.edu

We shall focus on the challenges and issues associated with applying regression methods to big data problems in business. In particular, we will consider the pros and cons of subset selection versus shrinkage methods approach (including lasso and elastic net) to model selection. We will also discuss the use of multiple adaptive regression splines (MARS). Real examples to be discussed include average airline ticket prices and fan interest in NFL games.

Joint Session Analytics/CPMS: Predictive Analytics Applicatons

Sponsor: Analytics & CPMS, The Practice Section

Sponsored Session

Chair: Hila Chalutz Ben-Gal, Dr., Afeka College of Engineering, Industrial Engineering, Tel Aviv, Israel, hilab@afeka.ac.il

1 - Predicting Future Trends by Social Excitement Patterns

Irad Ben-Gal, Professor, Tel Aviv University, Faculty of Engineering, Tel Aviv, Israel, bengal@tau.ac.il, Roi Libman, Hila Chalutz Ben-Gal, Alon Sela

The spread of new ideas has much in common with the spread of viral infections. We will present two works that have used these "Social Hypes Finger Print" in order to predict new hypes. The first work is the "Hot Trends Detector". It predicted the growth of new trends with a success of 80%. The second is the Tweet Advice project that confronted the complex prediction of "hot" stock by analyzing tweets sentiment in combination with the Social Hypes Finger Print.

2 - Project Management Analytics

Hila Chalutz Ben-Gal, Dr., Afeka College of Engineering, Industrial Engineering, Tel Aviv, Israel, hilab@afeka.ac.il

We propose a method to monitor and analyze large-scale projects in order to reduce the uncertainty regarding the project completion time. We show that there are optimal control/observation points for the above purpose. Examples will be given.

3 - Multiclass Classification Based on Random Subspaces, Bagging and Bayesian Inference

Marcelo Bacher, PhD Student, Tel Aviv University, Tel Aviv University, Ramat Aviv, Israel, Tel Aviv, Israel, mgbacher@post.tau.ac.il, Hila Chalutz Ben-Gal

We propose a classification method combining Random Subspace with Bagging and Bayesian inference. We investigated our method on multiclass data containing categorical, numerical and missing values. Moreover, we assume data clusters might overlap, the independence among its features can be violated and the assumption that the data is Gaussian-like distributed does not necessarily hold. Preliminary results show that the proposed method has good potential to cope with the above-mentioned scenarios.

4 - Some Thoughts on Human Resources Analytics

Hila Chalutz,Tel Aviv Afeka College of Engineering, Tel Aviv, Israel, Hilab@afeka.ac.il, Gonen Singer

The paper examines predictive capabilities of service organizations in regards to client success measures based on human resources data. The precision framework of human factors is of paramount importance when predicting client success. The paper provides evidence that predicting client's human resources variables play a vital role on service success in the long run. This approach may assist practitioners to invest the appropriate resources throughout the service delivery process. The paper also provides evidence that service organizations can be selective in regards to their clients based on predetermined criteria.

Sponsored Session

Chair: Kuo-Hao Chang, Dep. of Industrial Engineering and Engineering Management, National Tsing Hua University, Taiwan - ROC, chang@mx.nthu.edu.tw

1 - The Ship Routing and Freight Assignment Problem for Daily Frequency Operation of Liner Shipping

Dung-Ying Lin, National Cheng Kung University, 1 University Road, Transportation Management, Tainan City, Ch, 70101, Taiwan - ROC, dylin@mail.ncku.edu.tw

To cope with excess capacity and improve service quality, liner carriers have recently adopted a new operational model known as daily frequency. In this new model, carriers provide daily pickup and delivery service to customers at major ports along the Pacific Rim. We investigate the problem for daily frequency operation of liner shipping and find that Shanghai, Hong Kong and Singapore are ports that are ideal for carriers in establishing daily frequency operations along the Pacific Rim.

2 - Computing the Waiting Time in a Security Check System

Hsing Luh, Professor, Dep. of Mathematical Sciences, National Chengchi University, Taiwan - ROC, orlab63@gmail.com

The objective of this presentation is to introduce a queueing model to assist the Transportation Security Office understand how to design and manage the security wait environment with customers' satisfaction, for example the normal wait time is no more than 30 minutes. To meet the security conditions in practice, such as checks in various security stages, we use a queueing model with service time of semi-Coxian distributions. The semi-Coxian distribution in fact complicates the computation but reflects relatively better estimation than a traditional model. Thus, it is useful both to maintain the security level and to release the tense in the security check points in airports, or international borders.

3 - On Scheduling Recovery Teams for Reaching Shelters in Minimum Time in Disaster Management

I-Lin Wang, Professor, Department of Industrial and Information Management, National Cheng Kung University, Tainan 70101, Taiwan - ROC, ilinwang@mail.ncku.edu.tw

How to rescue people from dangerous regions affected by a disaster in minimum time is usually a top-priority task in humanitarian logistics. We consider a network restoration problem where the time and resources for restoring broken roads (arcs) have been estimated. We aim to schedule the recovery teams of different capabilities to restore roads such that all shelters (nodes) can be reached with minimum time. Efficient algorithms for special cases of our problem will be analyzed and discussed.

4 - Optimal Power Storage Strategy of Hybrid Renewable Energy Systems in Uncertain Environments

Kuo-Hao Chang, Dep. of Industrial Engineering and Engineering Management, National Tsing Hua University, Taiwan - ROC, chang@mx.nthu.edu.tw, Grace Lin

In this paper, we consider the optimal power storage strategy of Hybrid Renewable Energy Systems (HRES) in uncertain environments. The goal is to achieve minimum expected total cost over a finite time horizon, while satisfying the power demand of each area. We propose a simulation model to characterize the operation of HRES and develop a metamodel-based solution method to solve the problem. An extensive computational study shows that the solution method can solve the proposed model of realistic size efficiently, facilitating the decision process in practice.

Evaluating Forecasts

Sponsor: Decision Analysis

Sponsored Session

Chair: Victor Richmond Jose, Georgetown University, McDonough School of Business, 544 Hariri Building, Washington, DC, 20057, United States of America, vrj2@georgetown.edu

1 - Evaluating Forecasts Reported at Different Points in Time

Edgar Merkle, University of Missouri, 28A McAlester Hall, Columbia, MO, 65211, United States of America, merklee@missouri.edu, Barbara Mellers, Philip Tetlock, Mark Steyvers

We consider situations where forecasts associated with the same question are reported at different times. Question difficulty often decreases over time, so forecasts made earlier in time should receive a better score than equivalent forecasts made later in time. To address these issues, we tailor models from item response theory to handle probabilistic forecasts and to estimate change in question difficulty over time. We apply the models to geopolitical forecasts from a recent tournament.

2 - Scoring Rules for Sequences of Probabilistic Forecasts

Eva Regnier, Associate Professor, Naval Postgraduate School, 699 Dyer Road, Monterey, CA, 93943, United States of America, eregnier@nps.edu

There are more and more forecasting systems that generate a sequence of probability forecasts for the same event, such as sporting, political, and weather events. Based on a non-improvability axiom, we propose properties of a "good" forecasting system and offer scoring functions for evaluating the performance of a forecasting system and a sample of probability sequences.

3 - On Proper Scoring Rules and Cumulative Prospect Theory

Arthur Carvalho, University of Waterloo, 200 University Avenue West, School of Computer Science, Waterloo, On, N2L 3G1, Canada, a3carval@uwaterloo.ca, Stanko Dimitrov, Kate Larson

We discuss how to adapt proper scoring rules to cumulative prospect theory, and why comonotonicity is a sufficient condition for proper scoring rules to be indeed proper under cumulative prospect theory. We also show how to construct a comonotonic proper scoring rule from any proper scoring rule. Finally, we propose a new approach that uses non-deterministic payments based on proper scoring rules to elicit an agent's true belief when his value function and weighting functions are unknown.

4 - Percentage Error, Relative Error, and the Combination of Forecasts

Victor Richmond Jose, Georgetown University, McDonough School of Business, 544 Hariri Building, Washington, DC, 20057, United States of America, vrj2@georgetown.edu

We present properties of two families of scale-free forecast accuracy measures, which generalize the percentage and relative error measures, and discuss how these families provide incentives toward either over- or under-reporting of forecasts. We illustrate these properties in a forecast combination setting.

Data Analytics & Optimization with its Applications

Sponsor: Data Mining

Sponsored Session

Chair: Chun-An Chou, SUNY Binghamton, 4400 Vestal Pkwy, Binghamton, NY, United States of America, cachou@binghamton.edu

Co-Chair: Fatma Gumus, PhD Student, SUNY Binghamton, 4400 Vestal Pkwy, Binghamton, NY, United States of America, fgumus1@binghamton.edu

1 - Modeling Recovery Curves with Application to Prostatectomy

Fulton Wang, MIT, 5 Cambridge Center, Office 792, Cambridge, MA, 02139, United States of America, fultonw@mit.edu, Cynthia Rudin, John Gore, Tyler McCormick

We propose a Bayesian model that predicts recovery curves based on information available before the disruptive event. A recovery curve of interest is the quantified sexual function of prostate cancer patients after prostatectomy surgery. We illustrate the utility of our model as a pre-treatment medical decision aid, producing predictions that are both interpretable and accurate, and uncover covariate relationships that agree with and supplement past prostatectomy studies

2 - Spatiotemporal Analytics of Heart Diseases

Chen Kan, Graduate Student, University of South Florida, Tampa, FL, United States of America, chenkan@mail.usf.edu, Hui Yang

Cardiovascular diseases are the leading cause of death in the world. This paper presents a novel spatiotemporal warping approach to quantify the dissimilarity of disease-altered cardiac electrical activity. Furthermore, we optimize the embedding of each functional recording as a node in a high-dimensional complex network. This, in turn, significantly improves the recognition of disease patterns and advances the smart management of heart health.

3 - Network Optimization Formulation for Multi-voxel Pattern Analysis of Brain Functional Connectivity

Fatma Gumus, PhD Student, SUNY Binghamton, 4400 Vestal Pkwy, Binghamton, NY, United States of America, fgumus1@binghamton.edu, Chun-An Chou

We propose a network optimization method for multi-voxel pattern analysis of brain functional connectivity. The overall objective is to determine informative brain voxels that are functionally similar to each other. The selected voxels for benchmark fMRI datasets are tested with several machine learning techniques, and the experimental results shows comparable classification accuracy compared to previous approaches.

Multi-Criteria Analysis for Supply Chain and Logistics

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Hugo Yoshizaki., Associate Professor, University of Sao Paulo, Av. Professor Almeida Prado, Trav. 2, 128, Cidade Universitaria, Sao Paulo, SP, 05508-900, Brazil, hugo@usp.br

1 - Facilitated Modelling for Logistic Decisions: A Case Study on Ethanol Distribution in S.Paulo/Brazil

Claudio Barbieri da Cunha, Associate Professor, University of Sao Paulo, Department of Transportation Engineering, Escola Politecnica, Sao Paulo, SP, 05508-900, Brazil, cbcunha@usp.br, Rachel Silva

Decision-making techniques usually focus on the alternative comparison, rather than studying the values and preferences of the decision-makers. This research aims to demonstrate how individual stakeholders' criteria can be extracted and incorporated using the "Facilitated modeling mode" in order to consider the greenhouse gas emissions from different transport modes in view of the environmental prerequisites for ethanol exports.

2 - Multi-attribute Value Theory Applied to Last-mile Delivery of Disaster Relief Items

Luĺsa Cavalcanti, Researcher, University of Sao Paulo, Logistic Systems Program - POLI/USP, Cidade Universitaria, Sao Paulo, SP, 05508-900, Brazil, luba0587@gmail.com, Andre Mendes

After a disaster strikes, decisions regarding cargo transportation have a high impact on the vulnerable victims waiting for help. The multiplicity of objectives, especially when demand outsources capacity, suggests the applicability of the Multi-Attribute Value Theory (MAVT) approach. In this research, the method was applied to a Logistics Cluster training scenario, and the results encourage using MAVT as a tool for humanitarian decision makers.

3 - Multi-criteria in Location Decisions for Pre-positioning Relief Supplies in Brazil

Irineu Brito Jr, Professor, Fatec Jessen Vidal SJ dos Campos, Rua Helena Davi Neme, 94 ap 41, Sao Jose dos Campos, SP, 12245310, Brazil, ibritojr@yahoo.com.br, Adriana Leiras, Hugo Yoshizaki.

This paper proposes a methodology to define locations for pre-positioning disaster relief supplies through a two-stage stochastic optimization model with multi-criteria decision analysis considerations. An application in Brazil illustrates the effectiveness of the proposed approach. Results show that stochastic models promote more reliable outcomes than deterministic ones; and multi-criteria methods help in the modeling process by considering variables often treated exogenously to the problem.

Statistical Approaches for Medical Engineering

Sponsor: Data Mining

Sponsored Session

Chair: Daehan Won, ph.d. student, University of Washington, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98105, United States of America, wondae@uw.edu

1 - Feature Selection and Classification of Visual Evoked Responses in Idiopathic Generalized Epilepsy

Daehan Won, PhD Student, University of Washington, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98105, United States of America, wondae@uw.edu, Jeffrey Tsai, Cao (Danica) Xiao, W. Art Chaovalitwongse

Our goal of this study is to determine whether steady-state visual evoked potentials (SSVEPs) can facilitate diagnosis of Epilepsy. SSVEPS were recorded using a 128-channel EEG to a foveal Gabor pattern whose contrast was modulated. By stepwise incrementing the contrast, we obtained a contrast versus response function (CRF) yielding parameters that characterized the shape of the CRF. Features selections are applied to determine channel importance for classifying individuals.

2 - An Integrated Feature Ranking and Selection Framework for ADHD Diagnosis

Cao (Danica) Xiao, PhD Student, University of Washington, Seattle, 3900 Northeast Stevens Way, Mechanical Engineering Building, room G6, Seattle, WA, 98195, United States of America, danicaxiao@gmail.com, W. Art Chaovalitwongse, Jesse Bledsoe, Margaret Semrud-Clikema, Thomas Grabowski, Sonya Mehta

We propose an Integrated Feature Ranking and Selection Framework that utilizes normalized brain cortical thickness extracted from MRI data to help diagnose ADHD in an early age with objective measures and promising accuracy.

3 - using Physiological Signals to Assess Mental Workload on Human-Computer Interaction Tasks

Shouyi Wang, Assistant Professor, University of Texas at Arlington, 500 West First Street, 420H Woolf Hall, UT Arlington, Arlington, TX, 76019, United States of America, shouyiw@uta.edu

Degraded state of cognitive functioning due to high cognitive workload can lead to errors and overall suboptimal performance. In this work, we made a comprehensive signal features analysis and classification study to investigate the feasibility of wireless physiological signals for mental workload assessment in real-life. Our study shows the affordable wireless acquisition systems may have a great potential to facilitate the development of Brain-Computer-Interfaces (BCI) technologies.

4 - An Algorithm for Non-convex Structural Regularization

Minh Pham, ptuanminh@gmail.com, Xiaodong Lin, Andrzej Ruszczynski

Structural L1 penalties have many applications in machine learning, biology, cancer research, medical imaging...The non-convex counterpart of L1 penalties such as SCAD and MCP are shown to have less bias than L1 penalties. A few algorithms have been proposed to solve the case when the structural matrix is identity. We propose an algorithm based on alternating linearization for the general structural matrix.

5 - A Center-based Community Detection Method

Dohyun Kim, Myongji University, Dept. of Industrial & Management Eng., 116 Myongji-ro, Cheoin-gu, Yongin, Gyeonggi-do, 449-728, Korea, Republic of, norman.kim@gmail.com, June Young Lee, Sejung Ahn

Community detection problem is one of the main topics in network analysis. One of the most popular method is the modularity maximization, which optimizes the strength of the communities. However, the modularity maximization often fails to detect communities smaller than some scale. To avoid the problem, the proposed approach finds centers considering the node density and distance and then explores center-based communities. We demonstrate the proposed method on real-world networks.

Analytics for New Efficiencies: Quality and Lifecycle Management in the DoD

Sponsor: Military Applications Society

Sponsored Session

Chair: Aaron Burciaga, Senior Manager, North America Inventory Analytics Lead, Accenture, 4305 Majestic Lane, Fairfax, VA, 22033, United States of America, adburciaga@gmail.com

1 - Product Segmentation and Lifecycle Methodologies for Target Service Levels

Rodrigo Hernandez, Analyst, Accenture, 1841 W. Evergreen, Apt 1R, Chicago, IL, 60622, United States of America, rodrigo.hernandez@accenture.com

Service Levels are critical components for managing inventory levels and expected rewards, namely revenue in business or readiness in the DoD and National Security. Our methodology weighs product lifecycle, value, demand and variability in order to maximize reward. Security issues share similar volatility with retail products, as characterized by conflict intensity and phase of operations. We demonstrate advanced algorithms that handle volatile demand in order to right-size inventories.

2 - A Quality Assessment Approach to Army Unit Readiness

Natalie Scala, Assistant Professor, Towson University, Dept. of e-Business and Technology Manag, 8000 York Road, Towson, MD, 21252, United States of America, nscala@towson.edu, Paul Goethals

This research examines the current U.S. Army readiness reporting method and proposes a system based on desirability functions from quality theory. We present case studies contrasting current and proposed systems and function weight guidelines. Under this methodology, readiness assessment becomes dynamic, increases in accuracy, and transforms to a holistic metric.

3 - Rethinking Military Applications of Modern Principles in Data Strategy across Military Organizations

Harpreet Toor, Big Data and Cloud Strategist, Booz Allen Hamilton, 360 H St. NE, Apt. #431, Washington, DC, 20002, United States of America, toor_harpreet@bah.com

Military applications of data strategies, specifically analysis capabilities that result from deploying "big data" methodologies for data management, are too often linearly focused on intelligence and logistics functions and not on application across the enterprise. This paper will explore how the application of modern principles in data strategy across military organizations to create an analysis-first approach to decision-making will result in better execution of military strategy.

Best Dissertation Award Finalists – Technology, Innovation Management and Entrepreneurship Section

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Sinan Erzurumlu, Associate Professor, Babson College, 231 Forest St, Babson Park, MA, 02457, United States of America, serzurumlu@babson.edu

1 - Organizational Ambidexterity and Networks in Successful Technology Commercialization

Andrew Earle, Assistant Professor, University of New Hampshire, Paul College of Business and Economics, 10 Garrison Ave., Durham, NH, 03824, United States of America, Andrew.Earle@unh.edu

This dissertation relieves tension between organizational ambidexterity and network perspectives by developing a contingent model of exploration and exploitation. I hypothesize firms benefit by configuring their inter-organizational networks to gather novel information when discovering new technologies but gather redundant information when bringing these to market. I test these hypotheses with panel data on firms active in commercializing technologies in the field of green chemistry.

2 - Identity and Institutional Change in a Mature Field: The Re-Emergence of the Swiss Watch Industry

Ryan Raffaelli, Assistant Professor of Business Administration, Harvard Business School, Morgan Hall, Boston, MA, 02163, United States of America, rraffaelli@hbs.edu

I examine the decline and re-emergence of the Swiss mechanical watch industry from 1970-2008, exploring how, when, and why market demand for legacy technologies resurrect and reshape a field. I focus on mechanisms of identity and institutional change, and how leaders reframe values associated with a legacy technology. I demonstrate how the reclamation of identity can reposition an industry, and how incumbent firms re-define their identity after a technology threatens their market position.

3 - Synchronizing Exploration and Exploitation: Knowledge Creation Challenges in Innovation

Jennifer Bailey, Babson College, Technology and Operations Management, Babson Park, MA, United States of America, jbailey@babson.edu

This research considers the challenges of simultaneously pursuing exploration and exploitation within an innovation project. An important theme across all three papers is the path-dependent nature of the knowledge creation process. Collectively, they consider issues related to the dynamic generation and resolution of uncertainty during the innovation process, managing short-term versus long-term performance tradeoffs, learning from innovation experience and knowledge-sharing under competition.

4 - Understanding Breakthrough Emergence through Missed Opportunities

Sen Chai, Harvard University, 1050 Mass Ave, Cambridge, MA, 02138, United States of America, chais@nber.org

Who misses breakthroughs? Why are some scientists more successful than others? I take a counterfactual perspective and explore the mechanism by which breakthroughs fail in the form of misses and delays. Instead of sampling on rare successes, I conceptualize breakthroughs as marked by multiple failures before eventual success. My findings suggest that the seminal discovery was missed several times due to difficulties in solving a particular problem and identifying breakthrough opportunities.

Chair: Rajiv Garg, McCombs School of Business, University of Texas, Austin, TX, United States of America, Rajiv.Garg@mccombs.utexas.edu

1 - The Effect of Store Transportation Costs on Customers' Multichannel Purchase Behavior

Amit Mehra, Professor, Indian School of Business, AC 6124, Gachibowli, Hyderbad, AP, 500032, India, amit_mehra@isb.edu, Anuj Kumar, Subodha Kumar

We examine the causal effect of changing customers' store access costs on their store and online purchase behavior. We use new store opening data for a large fashion retailers in the US and employ propensity score matching estimates to show that when store openings reduce customers' store transportation costs, it results in increase in their store and online purchases. But when store openings do not reduce customers' store transportation costs, their purchase behavior remains unchanged.

2 - The Spillover Effects of Health IT Investments on Regional Health Care Costs

Hilal Atasoy, Assistant Professor, Temple University, 455 Alter Hall, Philadelphia, PA, 19102, United States of America, hilal.atasoy@temple.edu, Pei-yu Chen, Kartik Ganju

Health IT investments are presumed to decrease health care costs, however the empirical evidence is mixed. Effects of health IT can go beyond hospitals due to patient mobility and information sharing. We find that, although EMR adoption increases the costs for the adopting hospitals, it has significant spillover effects by reducing the health care costs of the other hospitals in the same region. Higher software integration among adopting hospitals further strengthens the spillover effects.

3 - Impact of Location on Knowledge Sharing within Enterprise

Yingda Lu, Assistant Professor, Rensselaer Polytechnic Institute, 110 8th street, Troy, NY, 12180, United States of America, luy6@rpi.edu, Baohong Sun, Sunder Kekre

In this study, we propose a Hierarchical Bayes model to capture how employees from different markets have different contribution patterns on social media platform. We find that employees from emerging markets are mainly active whenever they have questions to answer, and immediately drop out of the community when all their questions are answered. On the other hand, employees from developed markets are more consistent over time on their contribution level on the platform.

4 - Knowledge Transfer and Depreciation in Online Medical Consultation: Study of eVisit Operation

Changmi Jung, changmi@andrew.cmu.edu, Linda Argote, Rema Padman, Ateev Mehrotra

Online medical consultation (eVisit), a digital innovation in healthcare, raises concerns among healthcare organizations due to challenges in incorporating the new service, we need to understand how the operational efficiency is linked to organizational experience in the care delivery environment and the effect of knowledge transfer among intra-practice offices. However, knowledge accumulated through experience may depreciate as the task of assigning and triaging eVisits is knowledge intensive.

5 - Jack of All, Master of Some: The Interaction Effect of Knowledge Breadth and Depth on Innovation

Elina Hwang, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, 15215, United States of America, elinah@cmu.edu, Param Singh, Linda Argote

To be innovative, individuals should possess both broad and deep knowledge. Although the value of knowledge breadth has been recognized, the role of deep knowledge in innovation has been overlooked. Our findings suggest that knowledge breadth feeds into novelty, but its effect on usefulness and innovativeness of ideas is contingent on the presence of deep knowledge. Consequently, breakthrough ideas were more likely to be spawned by innovators who possess both diverse and deep knowledge.

Information, Incentives and Behavioral Decision Making in Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Guangwen Kong, Assistant Professor, University of Minnesota, 111Church Street SE, Minneapolis, MN, 55455, United States of America, gkong@umn.edu

1 - How do Delay Announcements Shape Customer Behavior? An Empirical Study

Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Qiuping Yu, Achal Bassamboo

We explore the impact of delay announcements by studying the data from a medium sized call center, where customers are provided with anticipated delay. Our key insights show that delay announcements not only impact customers' beliefs about the system, but also directly impact customers' per unit waiting cost. Specifically, customers' per unit waiting cost decreases with the offered waiting times associated with the announcements.

2 - All You Need is Trust? An Examination of Interorganizational Supply Chain Projects

Gökçe Sargut, Assistant Professor, College of Business and Public Adm., Governors State University, 1 University Parkway, University Park, IL, 60484, United States of America, gsargut@govst.edu, Andreas Brinkhoff, Özalp Özer

We examine the effects of relationship-level (trust and asymmetric dependence) and project-level factors (between-firm communication and within-firm commitment) on the success of inter-firm supply chain projects (e.g. VMI, 3PL, and EDI implementation). In order to further probe our surprising findings, we introduce a categorical scheme that differentiates supply chain projects based on decision rights configuration. We discuss how firms can effectively manage supply chain projects and alliances.

3 - The Impact of Competition for Common Customer Base on Agent's Compensation Plan

Elnaz Jalilipour Alishah, PhD Student, University of Washington, Michael G. Foster School of Business, ISOM Department, Seattle, WA, 98195, United States of America, jalilipo@uw.edu, Hamed Mamani, Yong-Pin Zhou

We study effect of agent's competition for common customer base on incentive efficiency of compensation packages. We model an environment where customers make the final decision based on perceived service quality, while incurring disutility from waiting. We show that some well-known contracts in the literature are unable to coordinate. Therefore we suggest contracts and operational tools to coordinate and analyze their flexibility and implication for practical implementation.

4 - Farmers' Information Management in Developing Countries – A Highly Asymmetric Information Structure

Chen-Nan Liao, Department of Industrial Engineering and Operations Research, 4141 Etcheverry Hall, University of California Berkeley, Berkeley, CA, 94720, United States of America, chennanliao@gmail.com, Ying-Ju Chen

In developing countries, information is usually transmitted through local networks, and, thus, farmers may have very different information channels. We establish a general framework that accommodates highly asymmetric information structures to study farmers' information management and utilization problems. We find the unique Bayesian Nash equilibrium, show that asymmetric information structures can lead to various novel results, and conduct a comprehensive study in the weak signal limit.

Chair: Aleda Roth, Professor, Clemson University, 100 Sirrine Hall, Clemson, SC, United States of America, aroth@clemson.edu

1 - The Impact of Supply Chains on Firm-Level Productivity

Juan Serpa, Ph.D Candidate, University of British Columbia, 2053 Main Mall, Henry Angus 391, Vancouver, BC, V6T1Z4, Canada, juan.serpa@sauder.ubc.ca, Harish Krishnan

By collecting data on supply chain relationships, we explore the channels through which productivity can spill over across firms. We consider two key types of channels: endogenous and exogenous. The endogenous channel measures the extent to which a firm's productivity is influenced by the productivity of its supply chain partners; the exogenous channels measure how productivity is influenced by the partners' characteristics (e.g. inventory turnover, financial leverage).

2 - The Decision to Recall: A Behavioral Experiment in the Medical Device Industry

George Ball, University of Minnesota, 321 19th Ave, Minneapolis, MN, United States of America, ball0197@umn.edu, Rachna Shah

We present results of a behavioral experiment investigating biases in the product recall decision making process in the medical device industry. Using industry expert subjects, this experiment identifies opportunities for firms to improve the objectivity of the product recall decision.

3 - Recall Strategies and Supply Chain Capabilities: Time to Recall in the FDA-Regulated Food Industry

Aleda Roth, Professor, Clemson University, 100 Sirrine Hall, Clemson, SC, United States of America, aroth@clemson.edu, Tracy Johnson-Hall, Manpreet Hora

We examine the effects of recall strategies and supply chain capabilities on time to recall. Using survival analysis on data related to food recalls of FDA-regulated products from 2004-2010, we demonstrate the importance of supply chain capabilities in shortening time to recall, and discuss implications for firms and policy-makers.

Chair: Zhixi Wan, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 S Six Street, Champaign, 61820, United States of America, wanzhixi@illinois.edu

1 - Impact of Downstream Competition for an Innovative Supplier in a Supply Chain

Hyoduk Shin, University of California-San Diego, 9500 Gilman Drive, La Jolla, CA, United States of America, hshin@rady.ucsd.edu, Jingqi Wang

We study a supply chain with a supplier who invests in innovation, which increases the value of products, and downstream manufacturers who sell to users. Analyzing a bargaining model, we find that the supplier's optimal innovation level is higher under downstream competition than under downstream monopoly if innovation cost is relatively high, and lower if it is relatively low. Interestingly, we find that under certain conditions, the downstream competition negatively impacts the supplier.

2 - Coordinate Semi-Centralized Production Network through Fix Cost Sharing under Incomplete Information

Fang Liu, Nanyang Technological University, 50 Nanyang Drive, Singapore, Singapore, Liu_Fang@ntu.edu.sg, Jing-Sheng Song

A typical semi-centralized network comprises the headquarters (HQ), a home plant (H), and a foreign branch (B). H supplies a key component to B with guaranteed service. B incurs a high fix cost, which causes high expediting costs at H. We propose to have H share a portion of B's fix cost and find: 1) HQ-initiated contract can lead to the first-best solution, but H may be worse off. 2) H-initiated contract under full information and 3) asymmetric information can lead to near optimal performance.

3 - using Procurement Service Providers in Supplier Screening

Zhixi Wan, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 S Six Street, Champaign, 61820, United States of America, wanzhixi@illinois.edu, Sripad Devalkar

We consider a buyer who hires a procurement service provider to conduct preliminary screening and recommend suppliers from a supplier pool for final screening. We study the contract design problem and characterize the optimal number of suppliers the buyer should ask the provider to recommend.

4 - Bundle Payments vs. Fee-for-Service: Impact of Payment Scheme on Performance

Shima Nassiri, University of Washington, Foster School of Business, Seattle, WA, United States of America, shiman@uw.edu, Hamed Mamani, Elodie Adida

Healthcare payments in the US have been based on a fee-for-service scheme, which provides incentives for high volume of care. The new healthcare legislation tests Bundle Payments that remove such incentives. We consider a population of patients that wish to undergo treatment. Treatments may result in failure, where unforeseen complications can occur. We analyze effects of different payment schemes on the extent of patient selection, treatment intensity, payer costs, and the total social welfare.

Clearing the Jungle of Stochastic Optimization

Cluster: Tutorials

Invited Session

Chair: Warren Powell, Professor, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08544, United States of America, powell@princeton.edu

1 - Clearing the Jungle of Stochastic Optimization

Warren Powell, Professor, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08544, United States of America, powell@princeton.edu

Stochastic optimization is a highly fragmented field, reflecting the diversity of applications and computational challenges. We bring the competing approaches for sequential decision problems under a common umbrella. We first suggest a five-element modeling framework which replaces the challenge of finding decisions to one of finding policies. We then describe four fundamental classes of policies that integrate stochastic programming, dynamic programming with other communities.

■ MB08

Hilton- Continental 5

Celebrating the Contributions of George Dantzig: Applications and Software

Cluster: Celebrating George B. Dantzig's 100th Birthday and His Influence on MS/OR

Invited Session

Chair: Mukund Thapa, Stanford Business Software, Inc, CA, United States of America, Mukund.Thapa@sbsinc.net

1 - Applications of Stochastic Optimal Power Flow

Robert Entriken, Principal Technical Leader, EPRI, 3420 Hillview Avenue, Palo Alto, CA, 94304, United States of America, rentrike@epri.com, Taiyou Yong

Stochastic optimal power flow techniques have been used in formulating a reserve determination problem to address the issue of the increasing penetration of intermittent generation in the U.S. electric power system. Two immediate applications, market reserve validation and post-contingency rapid redispatch, are described to illustrate value that can be derived from using the reserve determination model. Utility system operations and planning personnel can use these applications to mitigate system uncertainty and improve system reliability.

2 - The Origins of a Practical Simplex Method

Robert Fourer, President, AMPL Optimization Inc, 2521 Asbury Ave, Evanston, IL, 60201, United States of America, 4er@ampl.com

Although the modern simplex method is traced to George Dantzig's "Programming of Interdependent Activities" of 1949, the algorithm described there has never been practical. It was rather Dantzig's later work with William Orchard-Hays at RAND that provided a template for a simplex method that could be implemented on early computers and steadily refined thereafter. This talk describes how the "revised" simplex method has made today's powerful linear (and integer) programming solvers possible.

3 - On Probabilistic Bounds in Two-stage Stochastic Programming

Gerd Infanger, Department of Management Science and Engineering, Stanford University, Stanford, CA, 94305, infanger@stanford.edu

George B. Dantzig, a great pioneer of stochastic programming, suggested very early on that sampling could be used to approximate expected values of second-stage cost and gradients. By now, sampling-based approximations have emerged as powerful techniques for solving practical stochastic problems. Based on joint work and recent results, this presentation will review confidence bounds on the optimal objective of two-stage stochastic programs.

4 - On Applied Mathematics

Richard Van Slyke, Department of Computer Science, NYU Polytechnic School of Engineering, Brooklyn, NY, 11201, rvslyke@poly.edu

This talk will cover what I learned from George Dantzig, during the years that he was at the RAND Corporation, U.C. Berkeley, and Stanford. As a result of our interactions I imagined myself an "applied mathematician". George was certainly a superb model, but intimidating to follow. I will illustrate some of the approaches I ultimately followed. To specify an applied mathematician one needs to specify the applications and the mathematics. I will emphasize applications to telecommunications and finance. The mathematical methods include a variety of optimization techniques.

Empirical Studies on Hospital Operations

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Stefan Scholtes, University of Cambridge, UK, ss248@cam.ac.uk

Co-Chair: Nicos Savva, London Business School, Regentís Park, London, NW1 4SA, United Kingdom, nsavva@london.edu

1 - Do Mandatory Overtime Laws Improve Quality? Staffing and Operational Flexibility in Nursing Homes

Susan Lu, Assistant Professor, Purdue University, Krannert School of Business, West Lafayette, IN, 47907, United States of America, lu428@purdue.edu, Lauren Lu

During the 2000s, a number of states passed laws that restrict the use of mandatory overtime and cap the maximum work hours for nurses. Using U.S. nursing homes data from 2004 to 2012, we find that the passage of mandatory overtime laws reduces the overall quality in nursing homes.

2 - An Empirical Analysis on the Effect of Nursing Team Characteristics on Patient Outcomes

Stefan Scholtes, Judge Business School, University of Cambridge, Cambridge, CB2 1AG, United Kingdom, s.scholtes@jbs.cam.ac.uk, Sandra Suelz

We match a sample of 40,025 patients across 19 wards of a major hospital over a 5-year period with nursing shift data to assess the impact of nursing team characteristics, specifically team familiarity and diversity, on patient outcomes.

3 - Managing Variety in Professional Service Firms: A Study of Service Platforms in Hospitals

Sandra Suelz, Faculty of Management, Economics and Social Science, University of Cologne, Albertus-Magnus-Platz, Cologne, 50923, Germany, suelz@wiso.uni-koeln.de, Stefan Scholtes, Ludwig Kuntz

This paper presents an empirical study of the quality implications of service platforms in the hospital industry. We show that for related services, platform-based delivery is associated with higher quality; that the beneficial effect of departmental focus on quality is reduced if the service is part of a service platform; and that quality deteriorates if merged service bundles are relatively unrelated. We outline the implications with a counterfactual departmental redesigns based on our sample.

■ MB10

Hilton- Continental 7

Learning in Queues

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Costis Maglaras, cm479@columbia.edu

1 - Observation-Based Abandonment in Queues

John Yao, Columbia University, New York, NY, United States of America, jyao14@gsb.columbia.edu, Costis Maglaras, Assaf Zeevi

We present a queueing model in which customers use their experience in line to infer system parameters, estimate waiting times, and make strategic abandonment decisions. The key feature is that customers do not know the service capacity when they join the queue, and instead observe their progress through the line - their queue position and estimated speed – to decide whether to abandon. We show how the large-scale system dynamics under our model differs from traditional abandonment models.

2 - A Model of Rational Retrials in Queues

Shiliang Cui, Georgetown University, McDOnough School of Business, Washingrton, DC, 20057, United States of America, shiliang.cui@georgetown.edu, Senthil Veeraraghavan, Xuanming Su

Consumers suffer disutility in waiting for a service. When they can self-organize the timing of their service visits, they may avoid long queues and choose to retry later. We study an observable queue in which consumers make rational join, balk and costly "retry" decisions upon their arrival. Retrial attempts could be costly due to factors such as transportation costs, retrial hassle and visit fees. We characterize the equilibrium under such retrial behavior, and study its welfare effects.

3 - First Ranked First to Serve: A Tournament Approach to Call Centers

Konstantinos Stouras, PhD Candidate, INSEAD, Bd. de Constance, Fontainebleau, 77305, France, Konstantinos.STOURAS@insead.edu, Serguei Netessine, Karan Girotra

We develop a stylized model of a virtual call center that pays its agents on-demand, by committing to a (relative) performance ranking prioritization scheme. We characterize the optimal design of such a "service contest" under different objectives of the firm, as well as different models of agents' performance. We show that using less information, or deploying coarser priority classes, can paradoxically create higher incentives for agents to most efficiently deliver service to its customers.

4 - How to Charge and Prioritize Time-sensitive Customers with Heterogeneous Demand Rates

Ricky Roet-Green, Postdoctoral Fellow, Rotman School of Management, University of Toronto, 105 St.George Street, Toronto, On, Canada, rgricky@gmail.com, Philipp AfËche, Opher Baron, Joseph Milner

Providers often face time-sensitive customers that differ in their demand rates. However, the pricing literature for queues typically assumes unit demand for all customers. We study a revenue-maximizing provider that designs a price/lead-time menu for customers with heterogeneous demand rates and private information on their preferences. We show under what conditions it is optimal to prioritize customers based on their demand rates and transaction values, even if all are equally time-sensitive.

■ MB11

Hilton- Continental 8

Empirical Research in Supply Chain Management

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Vishal Gaur, Cornell University, Johnson School, Ithaca, NY, United States of America, vg77@cornell.edu

1 - Inventories and the Bullwhip: A Chicken and Egg Situation

Maximilliano Udenio, Doctoral Student, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, M.Udenio@tue.nl, Vishal Gaur, Jan C. Fransoo

We explore the role of inventories in the bullwhip effect. Through an empirical study of firm-level data, we investigate whether inventory-related decisions exacerbate or smoothen the distortions commonly associated with the bullwhip effect.

2 - The Impact of Supplier Inventory Service Level on Retailer Demand

Nathan Craig, Ohio State University, 2100 Neil Avenue, Columbus, OH, 43210, United States of America, craig.186@osu.edu, Ananth Raman, Nicole DeHoratius

While the effects of inventory service level changes have been studied empirically at the end consumer level, relatively little is known about the interaction between a retailer and a supplier. Using data from an apparel supplier, we show increases in service level to be associated with substantial increases in retailer orders. Retailers that order frequently exhibit a larger reaction to service level changes, an outcome consistent with retailers learning about and reacting to such changes.

3 - Driving Open Innovation in Supply Networks

Marcus Bellamy, Georgia Institute of Technology, 800 West Peachtree NW, Atlanta, GA, 30308, United States of America, marcus.bellamy@scheller.gatech.edu, Soumen Ghosh, Manpreet Hora

We investigate how firms can benefit from open innovation in supply networks. This is particularly interesting since supply networks are primarily created to drive operational efficiency in the supply process, but can also be leveraged to drive open innovation. Using secondary empirical supply chain data on customer and supplier relationships, we show that certain structural characteristics and relationship strength can drive open innovation and impact firm performance.

■ MB12

Hilton- Continental 9

Environmental Sustainability in Service Operations

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Nagesh Gavirneni, Cornell University, Johnson Graduate School of Management, Ithaca, NY, 14853, United States of America

1 - Servicizing and Other Models for Reduced Consumption: A Literature Review and Call for Research

Sandra Rothenberg, Professor, Rochester Institute of Technology, 108 Lomb memorial drive, Rochester, Ny, 14623, United States of America, srothenberg@saunders.rit.edu, Anne Sherman, Jonathan Eppolito

In this paper, we first review the role of services in reduced consumption, and discuss the means by which a company can make more by selling less. We then take a broad look at the business models that move the economy toward lower levels of consumption. Our review suggests that there is a critical gap in our understanding of more collaborative consumption models. Implications for scholars, business and policy makers are discussed.

2 - Sustainability Practices in Convention Centers

Spring Han, Assistant Professor, Faculty of Management, Higher School of Economics, Moscow, Russia, hjh56@cornell.edu, Rohit Verma

The environmental impacts of meetings, incentives, conventions, and exhibitions (MICE) industry are as far reaching as its economic reach. Research on sustainability in the MICE sector, however, is scarce. This study explores the most prevalent practices that the industry employs in European countries and the US and, relative importance of sustainability to convention consumers.

3 - Positively Deviant: A Behavior Science Approach to Promoting Sustainability

Emily Leeming, University of Nevada Reno, Psychology Department MS/296, Reno, NV, 89557, United States of America, emilyleeming@yahoo.com, Daniel Reimer, Chelsea Wilhite

The concept of deviance often possesses negative connotations. However when societies face pervasive problems, deviant responses can be seen as valuable. Sustainability provides examples of positive deviance. This paper will provide case examples of behavior change within sustainability and human services. Contemporary behavior science is presented to discuss principles in these positively deviant successes. An in-depth evaluation of a Lake Tahoe resort's sustainability program is highlighted.

4 - An Investigation into the Association between Sustainability and Patient Satisfaction in US Hospitals

Tanya Boone, Associate Professor, College of William and Mary, 705 College Terrace, Williamsburg, VA, 23185, United States of America, Tonya.Boone@mason.wm.edu

Hospitals have significant environmental and social impacts yet lag in adoption of sustainability. This paper examines the association between successful sustainability programs and patient satisfaction in US hospitals. We match a set of hospitals that have demonstrated improvement in environmental performance with a set of comparable hospitals that have not. We find significant differences for some measures with sustainable hospitals viewed more favorably by patients.

Airport/Airline Operations Management

Sponsor: Aviation Applications

Sponsored Session

Chair: Farbod Farhadi, University of Massachusetts Amherst, 121 Presidents Drive 230, Amherst, MA, 01003, United States of America, ffarhadi@som.umass.edu

1 - An Effective Branch-and-Price Algorithm for Runway Scheduling Problems

Mohammad Reihaneh, University of Massachusetts Amherst, Isenberg School of Management, 121 Presidents Drive 230, Amherst, MA, 01002, United States of America, mreihaneh@som.umass.edu, Ahmed Ghoniem, Farbod Farhadi

This paper presents a branch-and-price algorithm for multiple-runway aircraft sequencing problems. The subproblem of column generation is solved as an elementary shortest path problem with resource constraints using an enhanced dynamic programming procedure. This approach greatly improves the tractability of the problem when compared with solving a classical 0-1 MIP model over a set of computationally challenging instances.

2 - Mergers and Service: Investigating the Merger-customer Service Relationship in the Airline industry

Amirhossein Alamdar Yazdi, Isenberg School of Management, 24 Rolling Green Dr., Amherst, MA, 01002, United States of America, aalamdaryazd@som.umass.edu, Adams Steven

We analyze the effect of the recent airline mergers on customer service and satisfaction both at carrier and route levels. Both service and satisfaction levels affect performance and it is therefore surprising why mergers are understudied from service level perspective. Our study extends the existing merger literature by incorporating service level into capacity and pricing effects of the consequent concentration of service providers.

3 - A Model for Airline Operations Recovery

Peng Duan, Lead Operations Research Analyst, Sabre Holdings, Inc, 1008 Zhongshan Road #1008, Shanghai, China, peng.duan@sabre.com, Xiaodong Luo, Shahram Shahinpour

Over the course of airline operations, disruptions can be caused by different factors which could lead to the cancellation and/or delay of flights. We presents a model that developed by Sabre Airline Solutions which will identify the disruptions and create options to help the operations controller to recover disruptions and bring operations back to normal. The model considers a variety of recovery options and takes into account of the impact to crew operation and passenger connections.

4 - On the Impact of Jet-fuel Price on the Size of Airlines

Soheil Sibdari, UMass Dartmouth, 248 Old Westport Rd, Dartmouth, MA, 02135, United States of America, ssibdari@umassd.edu, Iman Mohammadian

We address an interesting phenomenon in the US domestic airline market during 2003-2013 that despite higher load factors and inflated airfares most airlines were experiencing profit losses. We explore the operations of seven US major airlines and observe that this profit instability can be partly due to the fuel cost fluctuations in that period.

Hilton- Exec. Boardroom

Efficiency Analysis Applications

Cluster: Data Envelopment Analysis

Invited Session

Chair: Nataliya Plesha, University of Connecticut, Storrs, CT, 06269, United States of America, nataliya.plesha@uconn.edu

1 - Capial Misallocation and Firm Innovation: A Structural Analysis
Lihong Yang, Assistant Professor, Renmin University of China, School of Business, Zhongguancun 59 Street, Beijing, 100872, China, lihong.yang@ruc.edu.cn

In this paper we examine micro-level channels of how capital misallocation can affect a firm's innovation activities. In particular, we investigate theoretically and empirically how the misallocation of capital assets across firms inhibits a firm's incentive for product innovation and process innovation. Theoretical predictions are tested using unique firm level data which provides direct measures for innovation and firm-specific capital misallocation.

2 - Total Factor Productivity Growth in the U.S. Agricultural Sector: Interstate Analysis
Nataliya Plesha, University of Connecticut, Storrs, CT, 06269, United States of America, nataliya.plesha@uconn.edu, Subhash Ray

Growing concern toward global environmental and public health problems, the burden placed by agricultural activities on environmental quality have encouraged scientists to use models of productivity analysis to assess joint production of "goods" and "bads". We use directional distance function to measure TFP growth accounting for use of by-product assumption.

3 - Measuring Environmentally Sensitive Efficiency and Productivity Growth in the Urban Water Sector
Jayanath Ananda, Senior Lecturer, La Trobe University, School of Economics, Albury-Wodonga Campus, Wodonga Vi 3690, Australia, j.ananda@latrobe.edu.au, Benjamin Hampf

Using the global Malmquist-Luenberger index approach, this paper analyses the efficiency and productivity growth trends in the Australian urban water sector whilst incorporating an undesirable output – greenhouse gas emissions. Results indicate that the productivity growth of the sector has declined when greenhouse gas emissions are included. The findings call for a greater understanding of energy intensity of various water supply options and sewerage operations.

Hilton- Franciscan A

Managing Financial Flows in Supply Chain

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Lingxiu Dong, Associate Professor, Olin Business School, Washington University in St. Louis, One Brookings Drive, St. Louis, MO, 63130, United States of America, dong@wustl.edu

1 - Franchise Contracting with Dynamic Franchisee Response, Debt Financing, and Bankruptcy Risk
Volodymyr Babich, Georgetown University, McDonough School of Business, Washington D.C., United States of America, vob2@georgetown.edu, Chris Tang

In a sequential moves game the franchisor chooses values of franchise fee and a royalty rate, the franchisee solves an optimal stopping problem, deciding when to sign the contract and open a store, and banks offer competitive loan rates (accounting for bankruptcy risk). We explain the existence of royalty rates in contracts due to dynamics in the model, recommend that the franchisor assumes greater share of store operating costs, and quantify ramifications of ignoring financing considerations.

2 - The Strategic Role of Business Insurance in Managing Supply Chain Risk
Harish Krishnan, University of British Columbia, Sauder School of Business, Vancouver, BC, V6T 1Z2, Canada, krishnan@sauder.ubc.ca, Juan Serpa

Supply chain risk management involves coordinating the unobservable efforts of multiple firms. This can be done through contracts, which transfer risk to firms best positioned to mitigate it. Firms can also manage risk by purchasing insurance. Unlike contractual incentives, which allocate risk within a supply chain, insurance externalizes this risk and decreases effort incentives. We show, however, that firms may strategically use insurance to prevent excessive free riding in a supply chain.

3 - Softening Competition through Trade Credit
S. Alex Yang, Assistant Professor, London Business School, Regent's Park, London, NW1 4SA, United Kingdom, sayang@london.edu, Heikki Peura

We analyze the role trade credit plays in softening horizontal competition and show this role of trade credit induces higher capacity investment, benefiting customers and improving social welfare.

4 - Push, Pull, and Trade Credit Contracts in Competitive Markets
Xiaomeng Guo, Phd Candidate, Washington University in St. L, 605 Leland Ave, Apt 605, Saint Louis, MO, 63130, United States of America, xiaomeng.guo@wustl.edu, Lingxiu Dong, Danko Turcic

Supply chain contracts vary by the inventory responsibility imposed on supply chain members and the timing of payment. We consider three basic wholesale price contracts that are different from each other in one or both of the dimensions, push, pull, and trade credit. The research focuses on understanding the implications of product offerings and downstream retail competition for the equilibrium contract offering in the supply chain.

Queuing Models for Service Management

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Laurens Debo, Associate Professor, University of Chicago, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, laurens.debo@chicagobooth.edu

1 - Characterizing the Steady State Distribution of a Call Center with Forward-Looking Callers
Xiaoshan Peng, PhD Student, Booth School of Business, University of Chicago, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, x-peng@chicagobooth.edu, Baris Ata, Peter Glynn

We analyze a queue system with endogenous abandonment. The customers waiting in the queue in the call center decide either leave the system or keep waiting in the queue dynamically. On the other hand, the system evolution and thus the waiting time distribution are determined by customers' dynamic decisions. We characterize the equilibrium of the system.

2 - Optimal Pricing in Tandem Queueing Systems with Finite Buffers
Hayriye Ayhan, Professor, Georgia Institute of Technology, School of ISyE, Atlanta, GA, 30332, United States of America, hayhan@isye.gatech.edu, Sigrun Andradottir, Xinchang Wang

We study pricing in a two-station tandem queue with finite buffers. Our goal is to determine the pricing policies that maximize the long-run average profit. We show that the optimal dynamic policy exhibits a monotone structure in which the quoted prices have greater dependency on the queue length at station 1 than at station 2. We also show that the optimal static pricing policy performs as well as the optimal dynamic policy when the buffer size before station 1 becomes large.

3 - An Analytical Throughput Approximation for Closed Fork/Join Networks
Erkut Sonmez, Assistant Professor, Boston College, Carroll School of Management, 140 Commonwealth Ave, Chestnut Hill, MA, 02467, United States of America, erkut.sonmez@bc.edu, Alan Scheller-Wolf, Nicola Secomandi

Fork/Join stations are used to model synchronization between entities, and fork/join queueing networks are natural models for a variety of service, communication and manufacturing systems. In this paper, we present a new and simple analytical approximation to estimate the throughput of a closed queueing network that features a single fork/join station receiving inputs from general subnetworks.

4 - Optimization of Industrial-Scale Assemble-to-Order Systems
Alan Scheller-Wolf, Professor, Carnegie Mellon University, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, awolf@andrew.cmu.edu, Willem van Jaarsveld

We provide insights and algorithms for inventory control in industrial-sized Assemble-to-Order systems. Our initial focus is first-come first-serve (FCFS) allocation of components to products. By developing a novel stochastic programming formulation, we compute solutions that are within one percent of the lower bound for realistically sized systems. We then answer the following questions: How do common heuristics used in practice compare to our performance, and how costly is the FCFS assumption?

RM & Pricing Topics

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Wei Wang, Scientist, PROS Inc, 3100 Main St, #900, Houston, TX, 77002, United States of America, weiwang@pros.com

1 - Integrating Price Optimization Modeling with Marketing Initiatives

Yanqi Xu, Director of Applied Technology, Princess Cruises, 24305 Town Center Road, Valencia, CA, 91355, United States of America, yanqi6@yahoo.com

The session will focus on: 1. an algorithm that we used in the accurate estimation of price elasticity, and 2. a model that integrates price optimization with other key marketing objectives. We will present an example to illustrate an approach that jointly optimizes both company strategic objectives and short term profits. We will also discuss the influence of big data technology on the analytics applications in the travel industry.

2 - Channel and Competitor Based Pricing and Distribution Optimization for Rental Car Industry

Mohit Mahajan, Senior Manager, Science and Research, PROS, 3100 Main St, Suite 900, Houston, TX, 77002, United States of America, mmahajan@pros.com, Ezgi Eren, Nikhil Kumar

Pricing and distribution optimization solution for car rental industry jointly optimizes pricing and yielding decisions, and fleet movement recommendations. It incorporates demand forecast relative to competitor prices and differentiates pricing across booking channels and through booking horizon. The number of decision variables and constraints considered in the optimization problem leads to computational challenges which are addressed by decomposing the problem into three step optimization.

3 - Demand Learning in Dynamic Auctions

Fatemeh Saberian, University of Washington, Industrial & Systems Engineering, University of Washington, Box 352650, Seattle, WA, 98105, United States of America, negar.saberian@gmail.com, Archis Ghate

We will present a Bayesian framework for learning bidder demand in dynamic auctions while minimizing the minimum bids. We will first present a complete structural analysis of the clairvoyant model and then discuss computational procedures to approximately solve the optimal learning problem.

4 - Revenue vs. Load Factor in Dynamic Revenue Management

Darius Walczak, Principal Research Scientist, PROS Inc., Science and Research, 3100 Main Street, Houston, TX, United States of America, dwalczak@pros.com, Wei Wang

Revenue and load factor are two basic metrics in revenue management. The trade-off between these metrics can be effectively analyzed by means of an efficient frontier. We explore practical ways to generate it in a dynamic, single-resource context including optimization with a mixed objective as well as using heuristics.

■ MB19

Demand Response Pricing in Data Centers and Grids

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Parijat Dube, IBM, 1101 Kitchawan Road, Yorktown Heights, NY, 10598, United States of America, pdube@us.ibm.com

1 - Market Design for Data Center Demand Response

Zhenhua Liu, California Institute of Technology, Pasadena, United States of America, zhenhua@caltech.edu, Adam Wierman, Steven Low

Energy and sustainability have become one of the most critical issues of our generation. Demand response is considered crucial for the renewable energy incorporation. In this talk, we focus on a particularly promising industry for demand response: data centers. We use simulations to show that data centers can provide as much flexibility as large-scale storage if given the proper incentives. Then we discuss the challenges and our recent progress in the market design to improve social welfare.

2 - Equilibrium Analysis of the LMP Mechanism for Economic Dispatch

Rahul Jain, Associate Professor, University of Southern California, Electrical Engineering Department, Los Angeles, CA, 90089, United States of America, rahul.jain@usc.edu, Wenyuan Tang

Locational marginal pricing (LMP) is widely employed for pricing in the wholesale electricity market. Although it's known that the LMP mechanism is vulnerable to market manipulation, there is little systematic analysis. We show via counterexamples a Nash equilibrium may not exist in the LMP mechanism. And when it exists, the price of anarchy may be arbitrarily large. We then provide two sufficient conditions under either of which an efficient Nash equilibria exists.

3 - Transactive Energy Management (TEM) with Economic Value-based Signals

Mark Yao, Research Scientist, IBM Research, 1101 Kitchawan Rd, Ossining, NY, 10598, United States of America, markyao@us.ibm.com

TEM is a method of managing electricity system locally and globally. At its core an electricity system managed by TEM uses economic value-based signals as the primary control signal in a network of Transactive Control Nodes on the grid. Such economic value-based signals are computed by the TCNs along the electricity supply path based on local objectives and constraint. In response to these economic signals are feedback signals based on current and forecasted electrical loads.

4 - Optimal Battery Pricing under Undetermined Demand Response Programs

Yanyi He, Postdoctoral Researcher, NEC Lab America, 10080 North Wolfe Road, SW3-Suite 305, Cupertino, CA, 95014, United States of America, heyanyi@nec-labs.com, Ratnesh Sharma

The Goal of the study is to find the optimal battery selling pricing based on the benefits of participating on various demand response programs. The expected multi-objective benefits of representative customers are calculated under different load scenarios and demand response programs. The aggregated demand-price curve along with the cost curve is used to derive for the optimal battery prices under different market structures.

1 - The Split Delivery Min-Max Multi-Depot Vehicle Routing Problem with Minimum Delivery Amounts

Xingyin Wang, University of Maryland, Mathematics department, University of Maryland, College Park, MD, 20742, United States of America, wang_xingyin@yahoo.com, Bruce Golden, Edward Wasil

The split delivery min-max multi-depot vehicle routing problem with minimum delivery amounts is a variant of the standard multi-depot VRP. The objective is to minimize the total time of the most costly route taking into account the travel times and the customer service times. The service time of a customer can be split among the vehicles, provided that each visit serves a minimum fraction of the total service required. We develop a heuristic that produces high-quality results.

2 - The Split Delivery Vehicle Routing Problem
Gizem Ozbaygin, Ph.D. Candidate, Bilkent University, Industrial Engineering Department, Ankara, Turkey, ozbaygin@bilkent.edu.tr, Hande Yaman Paternotte, Oya Karasan, Barbaros Tansel

The split delivery VRP is a relaxation of the capacitated VRP where multiple vehicles can visit and serve the demand of a customer. We try to solve this problem with a formulation using two indexed flow variables. This formulation may have solutions where several vehicles exchange loads at some customers. We cut-off such solutions using a) cutting planes, b) extending the formulation locally with vehicle indexed variables, and c) node splitting. We report some preliminary computational results.

3 - Online and Open Vehicle Routing Problem with Split Delivery
Ibrahim Capar, Graduate Research Assistant, ISM Dept. 300 Alston Hall, 361 Stadium Drive, Tuscaloosa, Al, 35487-0226, United States of America, icapar@cba.ua.edu, Burcu Keskin

We consider an online, nomadic vehicle routing problem with split deliveries. This type of problem is common for shippers that use common carriers with TL, LTL, or container services. We develop an integer programming based online optimization model to minimize long run total transportation cost.

Chair: Yingyan Lou, Assistant Professor, Arizona State University, P.O. Box 873005, Tempe, AZ, 85287-3005, United States of America, yingyan.lou@asu.edu

1 - Pre-disaster Investment Decisions for Strengthening the Chinese Railway System to Earthquakes
Liu Hong, Huazhong University of Science and Technology, 1037#, Luoyu Road, Wuhan, 430074, China, liu.hong@hust.edu.cn, Xiaozheng He, Srinivas Peeta, Yongze Yan, Min Ouyang

We propose an analytical model for a pre-disaster investment problem that seeks to select and prioritize links in China Railway Network (CRN) to strengthen under a limited budget with the objective of minimizing the post-earthquake loss of the CRN, which is represented in terms of the functionality deterioration of railway system service. A heuristic is used to solve the problem. Numerical experiments using real-world data illustrate the tractability and effectiveness of the proposed method.

2 - Designing Service Coverage and Measuring Accessibility and Serviceability
EunSu Lee, Associate Research Fellow, Upper Great Plains Transportation Institute, 1616 12th Ave. N #210E, Fargo, ND, 58102, United States of America, eunsu.lee@ndsu.edu

This study proposes a novel approach to analyze potential accessibility to ambulance services by combining the demand-covered-ratio and potential serviceability with the ambulance-covering-ratio.

3 - A Bilevel Model and GPU Computing Solution Strategy for Evacuation Route Planning
David Prentiss, University of Maryland, 1173 Glenn Martin Hall, College Park, MD, 20742, United States of America, dprentiss@gmail.com, Elise Miller-Hooks

We propose a bilevel evacuation and shelter design problem with a space-based risk exposure objective that minimizes the maximum risk exposure of evacuees under stochastic, heterogeneous hazard scenarios. A solution strategy is developed that exploits a fast, low-memory, equilibrium-finding algorithm as well as parallel implementation on graphics processing units.

1 - Real-time Recovery in Berth Allocation with Stochastic Arrival and Handling Times
Nitish Umang, École Polytechnique Fédérale de Lausanne, Switzerland, nitish.umang@epfl.ch

In this research we study the berth allocation problem (BAP) in real time as disruptions occur. In practice, the actual arrival times and handling times of the vessels deviate from their expected or estimated values, which can disrupt the original berthing plan and potentially make it infeasible. We consider a given baseline berthing schedule, and solve the BAP on a rolling planning horizon with the objective to minimize the total realized costs of the updated berthing schedule as the actual arrival and handling time data is revealed in real time. The uncertainty in the data is modeled by making appropriate assumptions about the probability distributions of the uncertain parameters based on past data. We present an optimization based recovery algorithm based on set partitioning method and a smart greedy algorithm to reassign the vessels in the events of disruption. A simulation study is carried out to assess the solution performance and efficiency of the proposed algorithms, in which the baseline schedule is chosen as the solution of the deterministic berth allocation problem without accounting for any uncertainty. Our research problem derives from the real world issues faced by the SAQR port, Ras Al Khaimah, UAE, where the berthing plans are regularly disrupted owing to a high degree of uncertainty in information. Results indicate that the proposed algorithms can significantly reduce the total realized costs of the berthing schedule as compared to the ongoing practice of reassigning vessels at the port.

2 - A Constructive Heuristic for Stochastic Time-dependent Service Network Design
Stein W. Wallace, Professor of Operational Research, Norwegian School of Economics, Department of Business and Management Sc, Norwegian School of Economics, Bergen, NO-5045, Norway, Stein.Wallace@nhh.no, Teodor Gabriel Crainic, Xin Wang

This research looks at a stochastic, time-dependent, capacitated, multi-commodity service network design problem in which periodic, cyclic schedules are built. We find and illustrate the underlying structures of stochastic solutions by studying the optimal solutions to the stochastic network design problem and comparing them with deterministic counterparts. To achieve this, the following issues are addressed: Why does the solution select one particular route rather than others? What drives the solution to add/drop a service? Structural properties that characterize the stochastic solutions are found when addressing these issues and are then used to develop a constructive heuristic.

3 - Influence of Spillback Effect on the Dynamic Shortest Path Problem with Network Disruptions
Nico Dellaert, Associate Professor, Eindhoven University of Technology, Den Dolech 2, Eindhoven, 5612AZ, Netherlands, n.p.dellaert@tue.nl, Derya Sever, Tom Van Woensel

Due to the limited capacity of roads, we observe that when a particular road is disrupted because of accident or traffic jam, the traffic queue propagates backwards. We consider this so-called spillback effect in a dynamic shortest path problem, with network disruptions following a stochastic process. We model this problem as a Markov Decision Process, and consider several options to come to good solutions, using only a fraction of the available knowledge on the traffic situation.

Chair: Nan Jiang, University of Texas, Austin TX, United States of America, jiang@utexas.edu

1 - Modeling Mixed Equilibrium Behaviors in Transportation Networks with Link Flow Constraints
Xia Yang, University of Texas, Austin, TX, United States of America yangxiacsu.shiny@gmail.com, Xuegang (Jeff) Ban

We model mixed equilibrium behaviors with user equilibrium (UE), system optimum (SO) and Cournot-Nash (CN) players as a generalized Nash equilibrium problem (GNEP). Link flow constraints are considered and numerical results are presented to illustrate the model.

2 - Parallel Implementation of Agent-based and Kinematic Wave Model-based Dynamic Traffic Simulation
Jeff Taylor, The University of Utah, Salt Lake City, UT, United States of America, jeff.d.taylor@utah.edu, Xuesong Zhou

This talk will present a computationally efficient implementation of a simplified kinematic wave model based dynamic network simulator. To enable flexible parallel computing on a multi-core shared memory architecture, we discuss how to (1) how to embed an event-based simulation logic; (2) how to decompose simulation steps to reduce communications overheads in parallel execution; (3) how to automate the partition and map computation tasks. The algorithms are implemented in an open-source dynamic traffic assignment package.

3 - A Simulation-based Optimization Algorithm for Dynamic Transportation Problems

Carolina Osorio, MIT, Cambridge, MA, United States of America osorioc@mit.edu, Linsen Chong

This work proposes a simulation-based optimization algorithm for continuous generally constrained dynamic urban transportation problems with stochastic simulation-based objective functions. The algorithm combines ideas from metamodel simulation-based optimization, transient queueing theory, traffic flow theory and stochastic microscopic traffic simulation. We benchmark and evaluate the performance of the algorithm with a large-scale traffic signal control problem.

4 - System Optimal Dynamic Traffic Assignment with Schedule Delay on Two-terminal Networks

Hong Zheng, Purdue University, West Lafayette, IN, United States of America, zheng225@purdue.edu, Srinivas Peeta

We analyze system optimal dynamic traffic assignment with schedule delay on a single-origin single-destination network. We show the problem is equivalent to the earliest arrival latest departure flow. A numerical example is illustrated.

New Methods for Leveraging Open Data in Public Transit Analysis and Modeling

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Nicholas Lownes, University of Connecticut, 261 Glenbrook Rd, U-3037, Storrs, CT, 06269, United States of America, nlownes@engr.uconn.edu

1 - Clustering in Metric Space for Transit Route Stop Set Identification

Kelly Bertolaccini, Graduate Assistant, University of Connecticut, 260 Glenbrook Rd, Storrs, CT, 06269, United States of America, klb06003@engr.uconn.edu, Nicholas Lownes

Identifying sets of stops to group into routes is an important component of transit network design. This research presents a clustering model formulated in a metric space defined by the ratio of the LEHD trajectories between stop pairs to the shortest path distance between them with the objective of maximizing the metric space covered by the stop sets.

2 - A Bus Dispatching Policy to Minimize Headway Variance

Simon Berrebi, Georgia Tech, 790 Atlantic Drive, Atlanta, GA, 30332-0355, United States of America, sberrebi3@gatech.edu, Kari Watkins

On high frequency bus routes, passenger-waiting time increases with headway variance. In this research, the bus-dispatching problem was addressed as a continuous-time stochastic decision process, with time-dependent transition probabilities. A policy to minimize headway variance was derived analytically by backward induction and compared to methods used in practice through simulation. The policy yielded lower passenger waiting time and was more resilient to perturbation.

3 - Incorporating Travel Time Reliability in Schedule-based Transit Assignment

Alireza Khani, Postdoctoral Fellow, University of Texas at Austin, 1616 Guadalupe St, Suite 4.202, Austin, TX, 78701, United States of America, akhani@utexas.edu, Tyler Beduhn, Mark Hickman

A hyperpath model is proposed for modeling the effect of service reliability on user behavior in a schedule-based transit network. The reliability of the transit service is modeled through stochastic arrival and departure times at the stops, and a logit route choice model is proposed to assign passengers to the reliable paths.

4 - Schedule-based Transit Assignment with Capacities and Priority: A Multicommodity Flow Application

Mark Hickman, University of Queensland, St Lucia, 4072, Queensland, Australia, m.hickman1@uq.edu.au, Alireza Khani

We consider the problem of a user equilibrium in a schedule-based transit assignment. When fixed capacity constraints and boarding priority are applied, the assignment can be modelled as a multicommodity flow problem with side constraints. We show how this might be solved using a combination of dual prices and column generation. We implement this solution procedure in an agent-based passenger assignment and simulation for a network of a mid-sized city.

1 - Solving Location Problems by a Trajectory Approach

Zvi Drezner, California State University, 800 N. State College, Fullerton, CA, 92834, United States of America, zdrezner@fullerton.edu, Tammy Drezner

We solve location problems by following a trajectory from a solution point to a related problem to the desired solution location.

2 - Geospatial Analysis on Somali Piracy

Daisuke Watanabe, Tokyo University of Marine, Tokyo, Japan daisuke@kaiyodai.ac.jp, Shigeki Toriumi

Recently, piracy attacks occurred off the coast of Somalia and threaten the ships and vessels navigating on the sea lane between Asia and Europe. The purpose of this study is to determine geographical characteristics of the areas where Somali piracy has occurred. To achieve this purpose, we plotted the piracy incidents from 2005 to 2013 on a map and analysis using spatial analysis method including kernel density method and optimal location model.

3 - A Simple Framework for Parallel Multi-Objective Optimization using Java

F. Antonio Medrano, UC Santa Barbara, 1832 Ellison Hall, Santa Barbara, CA, 93106, United States of America, medrano@geog.ucsb.edu, Richard Church

Solving multi-objective combinatorial optimization (MOCO) problems can quickly become intractable when applied to big data. Top MIP solvers have built-in parallelism, but specialized algorithms are typically coded serially. Java provides a new concurrency API that allows for simple conversion of a serial method to parallel that is well suited to approaches for finding the supported Pareto set of a MOCO problem. These methods are discussed, along with extensions for finding unsupported solutions.

4 - Comparing Anti-Covering Location Problem New Heuristic Solutions and Times to Optimal Ones

Matthew Niblett, University of California, Santa Barbara, 1832 Ellison Hall, UC Santa Barbara, Santa Barbara, CA, 93106-4060, United States of America, mniblett@geog.ucsb.edu, Richard Church

The Anti-Covering Location Problem (ACLP) involves maximizing the number of facilities located within a region such that each is separated by a minimum separation standard. For small problems optimal solutions are obtained quickly, while larger problems require much more time. A new heuristic solution approach, Marching Army, has been developed. The heuristic solution performance is compared to optimal ones.

1 - Multivariate Deterioration Model using Railway Track Geometric Data

Zhiguo Li, IBM T J Watson Research Center, 1101 Kitchawan Road, Route 134, Yorktown Heights, 10598, United States of America, zhiguo.li.wisc@gmail.com, Qing He

Track geometric data play an important role in ensuring a safe, reliable and comfortable railway service. For optimization of track maintenance and renewal works, the track geometry deterioration model can be developed to represent a geometric parameter's behavior and predict its future trend. While the previous studies focused on the models for single parameters, we develop a multivariate model for multiple measurements. Its effectiveness is validated by using real track irregularity data.

2 - Risk Analysis of Petroleum Crude Oil Transportation by Rail
Xiang Liu, Assistant Professor, Rutgers, The State University of New Jersey, CoRE 606, 96 Frelinghuysen Road, Piscataway, NJ, 08854-8018, United States of America, xiang.liu@rutgers.edu, Christopher PL Barkan, Mohd Rapik Saat

Managing the risk of rail transport of petroleum crude oil receives growing national attention. In this research, a model is developed to estimate the probability of large, multiple-tank-car release indents accounting for a variety of track and train characteristics. The model is used to evaluate the safety effectiveness of various tank car designs.

3 - Rail Network Simulation System for Mining Industry
Alexey Sorokin, Senior Systems Engineer, Optym, LLC, 2153 SE Hawthorne Road, Gainesville, Fl, 32641, United States of America, alexey.sorokin@optym.com, Krishna Jha, Amit Agarwal, Ravindra Ahuja

We developed a simulation system designed to realistically simulate rail operations of mining companies and to perform a variety of what-if case studies regarding capital expansion and operational changes. This is a sophisticated discrete-event simulation system with many interdependent decision modules designed to handle all important aspects of rail operations. The system helps in effective capital expansion plans for a rail network in terms of throughput and maintenance operations.

4 - Identification of Asymmetric Wheel Profile Wear and Its Benefit Analysis
Qing He, University at Buffalo (SUNY), 225 Ketter Hall, Buffalo, NY, 14260, United States of America, qinghe@buffalo.edu, Zhiguo Li

Compared to normal wheel profile wear, asymmetric wheel profile wear accelerates the degradation process and cause much more consequential damages to the wheels, rails, turnouts and bogie components. This study develops a statistical method to identical the asymmetric wheel profile wear for a wheel set based on wayside detector data. Further, we conduct benefit analysis to classify the railcars with asymmetric wheel profile wear based on maintenance records.

Air Cargo and Aviation Operational Performance

Sponsor: Aviation Applications

Sponsored Session

Chair: Bo Zou, University of Illinois at Chicago, 2073 Engineering Research Facility, 842 West Taylor Street, Chicago, IL, 60607, United States of America, bzou@uic.edu

1 - Identifying Arrival and Departure Demand Metrics for an Empirical Runway Capacity Model
Amy Kim, Assistant Professor, University of Alberta, 3-007 NREF, Civ & Env Eng., University of Alberta, Edmonton, AB, T6G2W2, Canada, amy.kim@ualberta.ca, Yi Liu

Precisely identifying the number of flights that wish to both arrive to and depart at an airport is required to effectively assess its runway capacity. We extract this information by combining several existing and readily available data sources. We develop an empirical runway capacity model, and assess how data regarding arrival and departure demands should be represented in this model. The developed methodology was applied to case studies of several major commercial airports in the U.S.

2 - Optimization of Arrival Patterns for Time-dependent Queueing Models
Raik Stolletz, Professor, University of Mannheim, Schloss, Mannheim, 68131, Germany, stolletz@bwl.uni-mannheim.de, Axel Franz

We consider a time-dependent queueing system of truck handling operations at an air cargo terminal. Our optimization approach is based on the stationary backlog-carryover approach. The time-dependent arrival rates serve as decision variables, i.e., changes in the original demand pattern are allowed and intentional. The objective of this non-linear optimization model is to minimize total expected waiting times while limiting the change in the arrival pattern.

3 - Modeling Delay Propagation: A Joint Analytical-Statistical Approach
Bo Zou, University of Illinois at Chicago, 2073 Engineering Research Facility, 842 West Taylor Street, Chicago, IL, 60607, United States of America, bzou@uic.edu, Nabin Kafle

An analytical tool is developed to compute propagated flight delay in the US. The results are used to empirically model the impact on delay propagation of various influencing factors. Spatial and temporal analysis and assessment of the propagated delay are performed which is useful for airline scheduling and airport planning and performance benchmarking purposes. In particular, the delay multipliers are quantified for major carriers and airports in the system.

4 - The Air Cargo Scheduling Problem
Yavuz Durdak, Phd. Student, Middle East Technical University Operations Research Department, ODT Universiteler Caddesi, Dumlupinar Bulvari No:1, Ankara, 06800, Turkey, yavuz.durdak@metu.edu.tr, Haldun Süral, Sinan Gürel

In this study, we consider the Air Cargo Scheduling Problem based on real life application. The aim is to move cargo and passengers that have different priorities and delivery time windows, from a number of origin airports to destinations by a transportation system. The system has predefined routes and a heterogeneous fleet of aircraft. The problem is formulated as a heterogeneous vehicle, multicommodity, pick-up, and delivery network flow problem with a large set of system specific constraints.

Joint Session Wagner/CPMS: Daniel H. Wagner Prize for Excellence in Operations Research Practice

Cluster: Daniel H. Wagner Prize for Excellence in Operations Research Practice & CPMS, The Practice Section

Invited Session

Chair: C. Allen Butler, President, Daniel H. Wagner, Associates, Inc., Hampton, VA, United States of America, Allen.Butler@va.wagner.com

1 - Daniel H. Wagner Prize
C. Allen Butler, President, Daniel H. Wagner, Associates, Inc., Hampton, VA, United States of America, Allen.Butler@va.wagner.com

The competition for the 2014 Daniel H. Wagner Prize for Excellence in Operations Research Practice resulted in six finalists, who submitted papers to the judging committee and who will present their results in three sessions. In this keynote, the winner of the competition will be announced and the authors will give a reprise of the winning presentation.

2 - Vaccine Prioritization for Effective Pandemic Response
Eva Lee, Professor & Director, Georgia Institute of Technology, Ctr for OR in Medicine & Healthcare, Atlanta, GA, 30332, United States of America, eva.lee@gatech.edu

When vaccine availability is limited, prioritized vaccination is considered the best strategy to contain a (flu) pandemic. We derive a mathematical decision framework to track the effectiveness of prioritized vaccination through the course of a pandemic. Our approach couples a disease propagation model with both a vaccine queuing model and optimization engine to determine the optimal prioritized coverage in a mixed vaccination strategy. This approach demonstrably minimizes infection and mortality. This work is joint with the Centers for Disease Control and Prevention.

3 - Identifying Risks and Mitigating Disruptions in the Automotive Supply Chain
Don Zhang, Technical Expert, Research & Advanced Engineering, Ford Motor Company, Dearborn MI, United States of America, xzhang35@ford.com, Yao Ge, Oleg Gusikhin, Michael Sanders, Keith Combs, William Schmidt, David Simchi-Levi, Yehua Wei, Peter Y. Zhang

Firms are exposed to a variety of low probability / high impact risks which may disrupt their operations and supply chains. These risks are difficult to predict and quantify, and therefore difficult to manage. As a result, managers may deploy countermeasures sub-optimally, leaving their firms exposed to some risks while wasting resources to mitigate other risks that would not cause significant damage. In a three-year research engagement with Ford Motor Company, we address this practical need by developing a novel risk exposure model that assesses the impact of a disruption originating anywhere in the firm's supply chain. Our approach defers the need to estimate the probability associated with any specific disruption risk until after the company learns how the realization of such a disruption will impair its operations. As a result, the company can make more informed decisions about where to focus its limited risk management resources. We demonstrate how Ford has applied this model to identify previously unrecognized risk exposures, evaluate pre-disruption risk mitigation actions, and develop optimal post-disruption contingency plans, including circumstances in which the duration of the disruption is unknown.

Scheduling in Practice

Cluster: Scheduling and Project Management

Invited Session

Chair: Emrah Cimren, Sr. Analytics Lead, Nike, One Bowerman Drive, Beaverton, OR, 97005, United States of America, Emrah.Cimren@nike.com

1 - University of California Increases Procurement Efficiency with Optimal eCommerce Scheduling

Andrew Clark, Director, Strategic Sourcing, UCSF, 1855 Folsom St, San Francisco, Ca, 94141, United States of America, andrew.clark@ucsf.edu, Susan Cholette, Ozgur Ozluk

This paper documents the creation of a scheduling tool to find an optimal schedule for loading suppliers into the eCommerce systems at UC San Francisco and UC Berkeley. Automating supplier enablement decisions for these two campuses alone has led to a clear work plan with a clear understanding of the potential benefit; $15 Million over the next 5 years. Further, we formulated the model to permit expansion to all 10 UC campuses and explored various operational models.

2 - An Integration of Fatigue Risk Management into Crew Scheduling

Gulsah Hancerliogullari, Assistant Professor, Istanbul Bilgi University, Eski Silahtaraga Elektrik Santrali Kazim, Karabekir Cad. No: 2/13 34060 Eyüp, Istanbul, 34060, Turkey, gulsah.hancerli@bilgi.edu.tr, Emrah Koksalmis

The feasibility of a Crew Scheduling Problem (CSP) depends on many rules and regulations imposed by government, international organizations, labor unions and airline companies themselves. In this study, we compare the Fatigue Risk Management Systems (FRMS) enforced by civil aviation authorities such as Federal Aviation Authority (FAA), Directorate General of Civil Aviation (Turkey), and develop a mathematical model, in which these rules and regulations are included as constraints.

3 - Integrated Scheduling of Jobs and Maintenance Activities

Dirk Briskorn, University of Wuppertal, Rainer-Gruenter-Str. 21, Wuppertal, Germany, briskorn@wiwi.uni-wuppertal.de

We consider a problem to integratedly schedule jobs and maintenance activities. Maintenance levels of machines are lowered by jobs and must be increased by maintenance activities once in a while. We analyze approximability and provide heuristics with excellent avergage case performance.

Stochastic Methods in Cloud Computing Services

Sponsor: Service Science

Sponsored Session

Chair: Cathy Xia, Associate Professor, Ohio State University, Columbus, OH, United States of America, xia.52@osu.edu

1 - Cloud Provider Selection – An Expedia View

Ilyas Iyoob, Director, Advanced Analytics, Gravitant, 11940 Jollyville Rd, Ste 325-N, Austin, TX, 78759, United States of America, iyoob@utexas.edu, Aaron Yan

Wouldn't it be nice if we could pick and choose cloud providers like we do flights on Expedia? Consumers today are faced with a very large number of options, and a big part of the confusion is knowing which provider, offering, and location combination to pick for each of their IT environments such that their requirements are best satisfied. Using consumer requirements data from our cloud brokerage business, we model this as a vendor selection problem in the Cloud IT Supply Chain.

2 - Stochastic Optimal Control for Dynamic Resource Allocation in the Clouds

Mark Squillante, IBM T.J. Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, mss@us.ibm.com, Xuefeng Gao, Yingdong Lu, Mayank Sharma, Joost Bosman

We consider a general class of dynamic resource allocation problems that arises in many cloud environments, with the goal of dynamically allocating capacity for every resource type to serve uncertain/variable demand and maximize expected net-benefit over a given time horizon. We derive the optimal control policy and efficient algorithms for governing adjustments to resource allocation capacities over time. Numerical experiments investigate various issues of theoretical and practical interest.

3 - Performance Modeling and Approximations for Heterogeneous Servers

Natarajan Gautam, Associate Professor, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, gautam@tamu.edu

We consider multiple parallel heterogeneous servers which are typical in cloud computing services. The servers use processor sharing for cloud computing jobs. In addition, the server speeds change over time. Exact analysis of such a system is typically intractable. However, it is crucial that the servers provide probabilistic performance guarantees. To that end, we develop a few approximations based on fluid queues, large deviations and matrix analytic methods.

4 - Resource Provisioning for Cloud Computing Services via Poisson Approximation

Yue Tan, PhD Candidate, The Ohio State University, 1971 Neil Ave, Columbus, OH, 43210, United States of America, tan.268@osu.edu, Yingdong Lu, Cathy Xia

This talk presents a stochastic modeling approach to guide the resource-provisioning task for future service clouds with large-scale demands. By replacing commonly used normal approximation with Poisson approximation, then based on Stein-Chen methods, we show that the asymptotic provisioning methodology provides better provisioning solutions.

1 - Truthful Mechanisms for Resource Allocation and Pricing in Clouds

Mahyar Movahed Nejad, Wayne State University, 4815 Fourth St., Rm. 2033, Detroit, MI, 48202, United States of America, mahyar@wayne.edu, Daniel Grosu, Lena Mashayekhy

Cloud computing systems provide a large pool of virtualized and dynamically scalable resources as Infrastructure as a Service (IaaS), and offer them to users in the form of virtual machine (VM) instances. We design truthful greedy and optimal mechanisms for the problem of VM provisioning, allocation, and pricing. We prove that our proposed mechanisms are truthful, that is, the users do not have incentives to manipulate the system.

2 - A Unified, Operational View of Service, Service Systems, and Service Science

Steven Alter, Professor of Information Systems, University of San Francisco, alter@usfca.edu

To be taken seriously, service science should use concepts and frameworks that are easy to apply to real situations. I propose: 1) a broadly applicable definition of service 2) a conceptual model linking the definition to work systems that produce services 3) a related conceptual model linking work system resources to value for customers 4) use of those conceptual models to create operational meanings of co-production, value co-creation, value proposition, user experience, and other concepts

3 - Service Systems Engineering: A Field for Future Information Systems Research

Tilo Boehmann, Professor, University of Hamburg, Department of Informatics, Vogt-Koelln-Str. 30, Hamburg, 22527, Germany, Tilo.Boehmann@uni-hamburg.de, Jan Marco Leimeister, Kathrin Möslein

Service systems are complex socio-technical systems that enable value co-creation. Service systems engineering (SSE) calls to advance evidence-based design knowledge for such systems with regard to the architecture, the interactions, and the resource base of service systems, helping value creation to become better adapted to the context of need.Information systems research is ideally positioned to contribute through (action) design research or the piloting of IT-enabled innovation.

4 - Growing the Service Brand

Ming-Hui Huang, Professor, National Taiwan University, 1, Sec. 4, Roosevelt Rd., Taipei, 10617, Taiwan - ROC, huangmh@ntu.edu.tw, Chekitan Dev

Given the unique characteristics of service, it is important to have a better understanding about service branding. Analyzing a proprietary panel data set with a two-step system GMM panel model we observe the growth and decline of the service brand, identify core-value and value-added drivers for growing the service brand, and uncover the best service-driver combinations. Our findings provide important theoretical and managerial implications for growing the service brand.

New Research Topics on Innovation

Cluster: New Product Development

Invited Session

Chair: Manuel Sosa, Associate Professor of Technology and Operations Management, INSEAD, 1 Ayer Rajah Ave., Singapore, Singapore, manuel.sosa@insead.edu

1 - The Evolution of Product Form: Identifying and Analyzing Styles in Design Patents

Tian Chan, PhD, INSEAD, 1 Ayer Rajah Avenue, Singapore, Singapore, TianHeong.CHAN@insead.edu, Jurgen Mihm, Manuel Sosa

We introduce an approach to identify styles (categories of product designs similar in form) among 400,000 US design patents. We combine state-of-the-art clustering techniques with experimental validation to create, for the first time, a dataset of styles. Building on this platform, we find that i) the level of turbulence (unpredictability of changes) in product form follows a U-shaped pattern to the level of turbulence in product function, and ii) product form turbulence is increasing over time.

2 - Search Behavior in Innovation Communities and Contests

Karim Lakhani, Harvard Business School, k@hbs.edu, Kevin Boudreau

Crowds can be organized in the forms of communities and contests. Both of these approaches have within them different assumptions about incentives, intellectual property and the underlying innovative search process. We compare and contrast the assumptions and provide field experimental data to show the salience of the differences.

3 - Creativity in Contests

Sanjiv Erat, UCSD, Gilman Dr, La Jolla, CA, United States of America, sanjiv_erat@isb.edu

We investigate through an experiment whether contest incentives improve creativity. Our main finding is that while incentives can help improve creativity, the type of incentives matter. Specifically, while rewarding creativity through piece-rate enhances creativity, competition incentives are ineffective.

Chair: Christopher Zobel, Professor, Virginia Tech, Dept. of Business Information Technology, 1007 Pamplin Hall, Blacksburg, VA, 24061-0235, United States of America, czobel@vt.edu

1 - Volunteer Assignment Policies Following a Large-scale Disaster

Emmett Lodree, University of Alabama, 361 Stadium Drive, Tuscaloosa, AL, United States of America, ejlodree@cba.ua.edu, Lauren Davis

After a disaster event, volunteers sporadically emerge to perform relief tasks at various sites within the affected area. This paper investigates optimal policies for assigning volunteers to relief sites such that the expected work remaining at the end of a finite planning horizon is minimized. We introduce a nested Markov decision problem to address this situation, and discuss various solution approaches.

2 - Shortest Path Problem with Arc Failure Scenarios

Preethi Issac, University Of Iowa, S243 John Pappajohn Bus Bldg, Iowa City, 52242, United States of America, preethi-issac@uiowa.edu, Ann M. Campbell

We consider a shortest path problem from source to destination over a set of arc failure scenarios. Our aim is to create a primary path and a set of alternative paths that provide the driver an option when an impassable road is encountered after a disaster. We provide an integer programming model and an exact algorithm that can be used to solve instances derived from real road networks.

3 - Improving Disaster Relief Supply Pre-positioning in the Rocky Mountain Region

Andrew Arnette, Assistant Professor, University of Wyoming, aarnette@uwyo.edu, Christopher Zobel

This research is being conducted with the American Red Cross in Colorado and Wyoming to examine the effectiveness of pre-positioning decisions for relief supplies to help improve the accessibility and location of distribution centers and shelters, as well as the scheduling and delivery of materials needed in the relief efforts. Combining GIS functionality and mathematical modeling with real-world data, the effort seeks to develop a model to make future disaster response efforts more effective.

4 - Managing Bottlenecks in Port and Overland Transport Networks for Food Aid

Mallory Soldner, PhD Candidate, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, msoldner@gatech.edu, Ozlem Ergun, Jarrod Goentzel, Julie Swann

Delays in transportation in humanitarian supply chains prevent life-saving aid from reaching beneficiaries when needed. These delays are often driven by reliability issues (e.g., at congested ports) and can change greatly depending on the quantities arriving. We describe a queuing model with breakdowns to model delays, and include our congestion-based delay characterization into a convex cost network flow model that determines optimal routing when several port and corridor options are available.

Decisions in a Nonprofit Supply Chain II

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Gemma Berenguer, Purdue University, 403 W. State St., West Lafayette, IN, 47906, United States of America, gemmabf@purdue.edu

1 - A Framework to Support Direct-Marketing Strategies in Non-Profit Fundraising

Elizabeth Durango-Cohen, Associate Professor of, Illinois Institute of Technology, 565 W. Adams Street, Chicago, IL, United States of America, durango-cohen@iit.edu, Pablo Durango-Cohen

In this talk, we present an integrated framework to support nonprofit fundraising. The proposed models enable fundraisers to exploit the wealth of data now available to nonprofit organizations, and support the implementation of policies that discriminate based on both observed and unobserved characteristics that contribute to systemic differences between individuals.

2 - Resources for Results: Optimal Endowment Allocation for a Resource-constrained Early-stage NPO

Pryiank Arora, PhD Student, Georgia Institute of Technology, 800 W Peachtree St NW, Atlanta, GA, 30308, United States of America, Priyank.Arora@scheller.gatech.edu, Milind Sohoni, Sripad Devalkar

We study a novel `results-based' approach, to raise donations for projects, by an early-stage, resource-constrained, non-profit organization (NPO) that implements projects for public benefit. The NPO uses its endowment to implement initial phases, securitizes results as certificates, and invites donors to purchase them. We characterize the optimal endowment required to maximize benefit and compare it with `traditional' fund-raising approaches.

3 - Market Practices and Costs for Food Commodities in Darfur

Jarrod Goentzel, Massachusetts Institute of Technology, 77 Massachusetts Ave, Cambridge, MA, United States of America, goentzel@mit.edu, Tim Russell, Yasmin Abdel Gadir

Humanitarian organizations that increasingly complement aid distribution with cash or vouchers need to assess the supply of commodities in local markets. In 2013, the authors led a supply assessment of food commodities in markets across the Darfur region of Sudan. This paper uses the results of 145 trader surveys, 16 transporter surveys, and four focus groups to characterize practices and costs for sourcing, transporting, and managing key commodities in these markets.

4 - Supply Chains and Food Vouchers in Darfur

Michael Veatch, Gordon College, 255 Grapevine Rd, Wenham, MA, 01923, United States of America, Mike.Veatch@gordon.edu, Austin Drukker, Jarrod Goentzel

The U.N. World Food Program has tested food vouchers in the Darfur region of Sudan as an alternative to food aid. Because of high transport costs and other constraints, it is not clear that the market can meet the demand for food. We develop a simple food availability model, using optimization rather than market equilibrium, to support voucher planning.

Reliable Sensor Cover and Network Design

Sponsor: Telecommunications

Sponsored Session

Chair: Richard Li-Yang Chen, Principal Member of Technical Staff, Sandia National Laboratories, 7011 East Ave, Livermore, CA, 94550, United States of America, rlchen@sandia.gov

1 - Algorithms for a Robust Sensor Cover and Communication Problem

Andrew Romich, Sandia National Laboratories, 7011 East Avenue, MS 9154, Livermore, CA, United States of America, aromich@sandia.gov, George Lan, J. Cole Smith

We consider sensor placement to cover a set of targets in a region, in a manner that allows sensors to communicate with one another. Communication effectiveness for each sensor pair is determined by a concave function of distance between the sensors. Also, final sensor placement is stochastic, as caused by drifting. We maximize a communication effectiveness metric, and require all targets to be covered by some sensor, where sensor drift occurs according to a robust (worst-case) mechanism.

2 - Directed Edge-Failure Resilient Network Design

Deon Burchett, PhD Student, University of Florida, Weil Hall, Gainesville, Fl, 32611, United States of America, deonlb@hotmail.com, Cynthia Phillips, Richard Li-Yang Chen

We consider the directed edge-failure resilient network design problem (DRNDP). This problem entails the design of a directed multi-commodity flow network that is capable of fulfilling a specified percentage of demands in the event that any Γ arcs are destroyed, where Γ is a constant parameter. We provide a formulation of DRNDP and solve it in a branch-and-cut framework. We present computational results.

3 - LP Relaxations and a Branch-and-Cut Approach for the Resilient PMU Placement Problem

Robert Carr, Senior Member of Technical Staff, Sandia National Laboratories, 6350 Eubank #1517, Albuquerque, NM, 87111, United States of America, rdcarr@sandia.gov, Joseph Ruthruff, Richard Li-Yang Chen

Having a Phasor Measurement Unit (PMU) at a node of an electrical network helps detect a local electrical malfunction. The PMU placement problem seeks to place the minimum number of PMUs so as to detect all local malfunctions. In the resilient version, some small constant number of PMUs might fail. We give small non-trivial LP relaxations and describe a branch-and-cut approach to this problem.

4 - Reliable Network Design by Graph Algorithms and Integer Programming Approaches

Neng Fan, University of Arizona, Systems and Industrial Engineering, Tucson, AZ, United States of America, nfan@email.arizona.edu

In this talk, we use graph algorithms and integer programming approaches to solve reliable network design problems. The application cases include power grid design, water system planning, etc.

Joint Session AI/QSR: Multidisciplinary Information Fusion for System Informatics

Sponsor: Artificial Intelligence & Quality, Statistics and Reliability

Sponsored Session

Chair: Changqing Cheng, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ccheng@tamu.edu

Co-Chair: Hui Wang, Florida State University, 2525 Pottsdamer St., Tallahassee, FL, 32310, United States of America, hwang10@fsu.edu

1 - Surface Quality Monitoring in Ultra-precision Machining with Physical and Data-driven Model

Changqing Cheng, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ccheng@tamu.edu, Satish Bukkapatnam

We investigated a delayed differential equation model to identify chatter-free process parameters in ultra-precision machining, based on which we developed a data-driven approach for real-time surface roughness monitoring with features extracted from in situ sensor signals. By combining physical and statistical models, we achieved R^2 over 0.8 for surface roughness estimation in a real-time sense.

2 - Local Calibration of Parameters in Poly (Vinyl Alcohol)-treated Buckypaper Fabrication

Arash Pourhabib, Assistant Professor, Oklahoma State University, 322 Engineering North, Stillwater, OK, 74078, United States of America, arash.pourhabib@okstate.edu, Yu Ding, Jianhua Huang, Chuck Zhang, Kan Wang

We propose a framework for the the local calibration of parameters when a simulation model is used to approximate a physical process. The proposed framework acknowledges the dependency of parameters on input variables. We present the model in terms of a regularized optimization and solve it using a representer theorem. We apply the method to calibrate a finite element (FE) simulation for predicting Young's moduli of PVA-treated CNT buckypaper.

3 - A Transfer Learning Approach to Surface Variation Modeling and Cost-effective Monitoring

Chenhui Shao, University of Michigan, Ann Arbor, 2350 Hayward St., Ann Arbor, MI, 48109, United States of America, chshao@umich.edu, S. Jack Hu, Judy Jin, Hui Wang

This talk presents a method for modeling and monitoring surface variations by exploiting similarities among manufacturing processes. A novel approach is developed to improve spatial data modeling in surface manufacturing by fusing multidisciplinary information from similar but not identical manufacturing processes. The method is able to improve modeling precision without increasing measurements while help cost-effectively establish monitoring baseline when launching a new manufacturing process.

4 - Collaborative Degradation Modeling by Fusing Data on a Networked Structure

Shuai Huang, Assistant Professor, University of Washington, Industrial and Systems Engineering, United States of America, shuaihuang@usf.edu, Kaibo Liu

Degradation signals are sometime expensive to collect in many healthcare and manufacturing applications. Such a lack of data has imposed great challenges for degradation modeling and prognostics. To tackle this problem, we propose a collaborative degradation modeling method that can effectively fuse degradation signals of multiple entities that collectively form a network.

Cognition and Positioning

Cluster: Strategy Science

Invited Session

Chair: Dan Levinthal, University of Pennsylvania, Wharton School, Philadelphia, PA, United States of America, dlev@wharton.upenn.edu

1 - Cognition and the Resource-Based View of the Firm

Felipe Csaszar, Ross School of Business, U. of Michigan, 701 Tappan Ave #R4336, Ann Arbor, MI, 48104, United States of America, fcsaszar@umich.edu

This paper provides a psychological micro-foundation for the RBV by developing a behaviorally plausible model of how resources are assessed by managers and how, once acquired, resources affect firm production and value. The model sheds light on the question of under what conditions, strategies based on acquiring resources are more likely to create a sustainable competitive advantage. The model also helps to address some of the definitional problems of the RBV raised by Priem and Butler (2001).

2 - Strategic Foresight

Giovanni Gavetti, Dartmouth College, Tuck Business School, United States of America, Giovanni.Gavetti@tuck.dartmouth.edu

This presentation will focus on the concept of strategic foresight. It will use an intellectual historical perspective to interpret the current debate and shed some light on future avenues of research.

3 - Making Sense of Sound: The Technological and Cultural Evolution of Synthesizers

Mary Tripsas, Boston College, Carroll School of Management, Boston, MA, United States of America, tripsas@bc.edu

We leverage the historical case of sound synthesis technologies to explore whether technologies that are deeply embedded in cultural tastes may, in fact, exhibit atypical trajectories. Based upon both qualitative and quantitative analyses of more than 30 years of advertisements that appeared in the field's leading trade magazine, we analyze how changing cultural tastes can shape both the framing and the capabilities of emerging and abandoned technologies.

4 - The Effect of Abductive Reasoning on Early-Stage Innovation Decisions

Dan Lovallo, University of Sydney, Sydney, Australia, dan.lovallo@sydnedy.edu.au

This study examines the effect of the form of logical reasoning on accepting a potentially innovative design concept. An experiment was conducted to simulate an uncertain environment characterized by incomplete information with members of a committee called upon to decide whether or not to invest in innovation-oriented new product concepts. Under an abductive reasoning frame manipulation, a form of logical reasoning that introduces hypotheses and theories to explain given facts, individuals were more likely to accept concepts whereas under deductive reasoning they were more likely to reject concepts. We recommend that to increase the likelihood of product concepts being accepted during design concept selection, decision makers should not treat concept selection as a decision problem alone but also as a design problem. They should employ innovative abduction to think creatively about new ways to frame a proposed concept as something else than what is presented and new working principles underpinning the proposed concept.

Joint Session HAS/Analytics: Learning from Healthcare Data

Sponsor: Health Applications & Analytics Section

Sponsored Session

Chair: Donald Lee, Yale School of Management, 165 Whitney Ave, New Haven, CT, 06520, United States of America, donald.lee@yale.edu

1 - Identifying Impactable High-Risk Diabetes Patients

Margrét Bjarnadottir, University of Maryland, 4324 Van Munching Hall, University of Maryland, College Park, MD, 20742, United States of America, margret@rhsmith.umd.edu, David Anderson

Case management has been suggested as an option in fighting rising health care costs through coordinated care that advocates quality and cost effectiveness, but the evidence on the cost effectiveness is mixed. A key for cost-effectiveness is to identify not only high-cost patients, but impactable patients, that is patients where case management will both help the patient and the bottom line. We utilize modern data mining methods and upper bound methodologies to explore this problem.

2 - A Robust Approach to Designing Prostate Cancer Screening Strategies

John Silberholz, PhD Candidate, MIT, 77 Massachusetts Ave. E40-149, Cambridge, MA, 02139, United States of America, josilber@mit.edu, Dimitris Bertsimas

Prostate cancer is the most common non-skin cancer in US men, and many published mathematical models evaluate the effectiveness of screening strategies for the disease. In some instances the most effective screening strategy according to one model is evaluated as worse than not screening at all under a different model. Using robust and stochastic optimization, we identify screening strategies that are effective across multiple models, which provides evidence of the quality of these strategies.

3 - Stronger Instrumental Variables via Integer Programming for Healthcare Research

Jose Zubizarreta, Columbia University Business School, 3022 Broadway, Uris 417, New York, NY, 10027, United States of America, jz2313@columbia.edu

Weak instrumental variables constitute an important problem for estimation because confidence intervals do not have adequate coverage and because estimates are highly sensitive to biases from unmeasured confounders. Typically, the strength of an instrument is thought as given, but we present a new method that augments the strength of an instrument by solving an integer program. We use this method to estimate the effect of hospital length stay on readmissions of late-preterm babies in California.

Payment Innovations in Health Care

Sponsor: Health Applications

Sponsored Session

Chair: Christian Wernz, Virginia Tech, 205 Durham Hall, Blacksburg, VA 24061, United States of America, cwernz@vt.edu

Co-Chair: Hui Zhang, PhD Student, Virginia Tech, Blacksburg, VA, United States of America, corinnaz@vt.edu

1 - The Role of Provider Payment in the Primary and Secondary Prevention of Type 2 Diabetes

John Franklin, University of Southern California, 1136 1/2 N El Centro Ave #1, Los Angeles, CA, 90038, United States of America, jpfrankl@usc.edu

One way that alternative provider payment systems try to encourage higher quality and reduced costs in health care is through better facilitation of prevention-oriented programming at the clinic level. Yet to date there has been little analysis of the characteristics of these systems that actually encourage (or discourage) disease prevention. This paper uses a system dynamics model to examine the relationship between payment systems and prevention, using the example of type 2 diabetes.

2 - Impact of Pay for Performance Incentives on Primary Care Efficiency in the Military Health System

Lawrence Fulton, Rawls School of Business,, Texas Tech University, 703 Flint Ave, Lubbock, TX, 79410, United States of America, lf25@txstate.edu, Paul Griffin, Nathaniel Bastian

We determine the effectiveness of a pay-for-performance (P4P) incentive program at U.S. Army hospitals using DEA and regression models. We evaluate pre- (2001 to 2007) and post- (2007 to 2012) P4P program implementation on primary care efficiency. We also compare to the other branches of service not using P4P.

3 - Mitigating Specialty Provider Financial Risk in Prospective Bundled Payment Systems

Danny Hughes, Research Director, The Harvey L. Neiman Health Policy Institute, 1891 Preston White Drive, Reston, VA, 20191, United States of America, dhughes@neimanhpi.org, Nadia Bilal

Retrospective bundled payment models, which cover all medical services associated with an episode of care, are used with existing fee-for-service (FFS) payments and usually include stop loss provisions to manage financial risk. As payments shift beyond FFS to prospective bundled payments, the mechanisms and benchmarks for managing these stop loss provisions may no longer exist. Using simulation-based optimization models, we develop pricing strategies to mitigate provider risk.

4 - How Reimbursements and Incentives Affect Decisions in Radiology and Accountable Care Organizations

Hui Zhang, PhD Student, Virginia Tech, Blacksburg, United States of America, corinnaz@vt.edu, Christian Wernz, Danny Hughes, Anthony Slonim

The effect of new reimbursement structures and incentives on cost and quality of care are challenging to predict. To address this challenge, we apply multiscale decision theory to model the decisions of and the interdependencies between health care stakeholders, including payers, Accountable Care Organizations, physicians and radiologists, with a focus on imaging use and investment. We discuss the effect of incentives on agent decisions and the optimal distribution of incentives between agents.

Patient-Centric Healthcare and Personalized Medicine

Sponsor: Health Applications

Sponsored Session

Chair: Abe Zeid, Northeastern University, 360 Huntington Ave, Boston, United States of America, zeid@coe.neu.edu

1 - Modeling, Analysis and Improvement of Lung Cancer Diagnostic Procedure

Shan Jiang, University of Wisconsin-Madison, 1513 University Avenue, Room 3235, Madison, WI, 53706, United States of America, sjiang44@wisc.edu, Nicholas Faris, Xinhua Yu, Feng Ju, Jingshan Li, Raymond Osarogiagbon

To improve the care delivery process of lung cancer, we developed both simulation and analytic models to study the diagnostic procedure for lung cancer care delivery. In addition to performance evaluation, such as mean care delivery time and its variability, bottleneck analysis method is proposed to identify the most critical steps that impede the whole care delivery process. Such methods provide a quantitative tool to improve care delivery process for lung cancer patients.

2 - Patient Relationship Management in Healthcare

Sanjeev Bordoloi, University of St Thomas, 1000 LaSalle Ave TMH 443, Minneapolis, United States of America, sbordoloi@stthomas.edu

Healthcare organizations are starting to place higher priority to patient satisfaction. Satisfaction is measured through patient surveys and understanding patient's perceptions. One area that hospitals have found challenging is their service offered over the phone. We observed the call center operations within a hospital with the goal to improve overall patient relationship.

3 - Theoretical Modeling and Empirical Analysis of Canadian Joint Replacement Surgery Waiting Time Data

Qu Qian, Assistant Professor, Shanghai University of Finance and Econo, School of International Business Adminis, 100 Wudong Road, Shanghai, China, qian.qu@mail.shufe.edu.cn, Anming Zhang, Hong Chen

We empirically analyze joint replacement surgery waiting time data of 9 Canadian provinces from 2005-2012. The empirical analysis reveals surgeon's management of patient waiting list. By comparing the waiting times before and after January 2008, we assess the effectiveness of the policy of setting a waiting time target for joint replacement surgeries. Based on these empirical results, we develop a theoretical model to further investigate patient's waiting time problem.

4 - Data-driven Healthcare Service Opportunities in Korea

Chie-Hyeon Lim, Postdoctoral researcher, Postech, Eng. Bldg. 4-316, 77 Cheongam-Ro, Nam-Gu, Pohang, Korea, Republic of, freechon@gmail.com, Ki-Hun Kim, Kwang-Jae Kim, Chi-Hyuck Jun, Sung-Hong Kang

The National Health Insurance Service (NHIS) of Korea has collected insurance and medical record data of nearly all the citizens since 2001. Development of a big-picture of healthcare service opportunities utilizing the NHIS database is of national interest. Such picture would serve as a map for the healthcare policy and service development. In this talk, we discuss how we identified 138 data-driven healthcare service opportunities and present the big-picture which encompasses the opportunities.

5 - Design and Operations for Online-Offline-Integrated Healthcare Networks Facilitators

Jiun-Yu Yu, Assistant Professor, National Tawain University, No. 1, Section 4, Roosevelt Road, Da-An, Taipei, Taiwan - ROC, jyyu@ntu.edu.tw

Healthcare Networks Facilitators (HNFs) are organizations or platforms that help their members, including patients, families, doctors, and nurses, actively interact with one another so that everyone involved in the process benefits. HNFs are expected to create innovative healthcare services that are unlikely to be delivered in the past. This study aims to investigate the design and operations for online-offline-integrated HNFs so that these expectations can be met.

Using OR to Model Healthcare Policy

Sponsor: Health Applications

Sponsored Session

Chair: Michael Carter, Professor, University of Toronto, Mech & Ind Engineering, 5 King's College Rd., Toronto, ON, M5S 3G8, Canada, mike.carter@utoronto.ca

1 - Designing Optimal Policies for the Recruitment of Rural Health Professionals

Anna Graber, annagr26@gmail.com, Vedat Verter, Michael Carter

Rural areas worldwide experience shortages of health workforce. In Canada, government policies such as alternative models of care for rural areas, promotion of rural medicine programs, educational programs for future physicians and financial incentives were used in an attempt to improve the discrepancy in resources. We would like to determine which financial policies and education location alternatives are best in order to attract workforce to rural areas, considering professionals' preferences.

2 - Resource Allocation and Risk Analysis of Renal Dialysis Centres in Ontario

Mahsa Shateri, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, mahsa.shateri@gmail.com, Michael Carter

The number of facility-based hemodialysis patients increases about 3% every year in Ontario. Three alternative methodologies have been employed to develop a tool that enables these facilities to determine the nurse-to-patient ratio while considering the possible incidents requiring the dedication of a nurse's time to a patient due to treatment complications. This tool also takes into account different nurses and patients types.

3 - using Analytics to Manage and Improve Ontario's Chronic Care System

Ali Vahit Esensoy, Sr Manager, Strategic Analytics, Cancer Care Ontario, 505 University Avenue, Toronto, ON, M5G 1X3, Canada, AliVahit.Esensoy@cancercare.on.ca, Neal Kaw, Somayeh Sadat

We present highlights of the Strategic Analytics practice at Cancer Care Ontario, which assists the agency's programs in making planning decisions through analytic products that employ OR, statistics, and machine learning. After a summary of projects to date, we focus our work with the Ontario Renal Network in developing a 12-year dialysis capacity assessment model to inform planning considerations including dialysis station deployment and patient-based funding allocation.

Quadratic Assignment Problems and Applications

Sponsor: Computing Society

Sponsored Session

Chair: Peter Hahn, 2127 Tryon Street, Philadelphia, PA, 19146, United States of America, hahn@seas.upenn.edu

1 - A Biased Random-key Genetic Algorithm for Facility Placement to Minimize Total Flow Cost

Mauricio Resende, AT&T Labs Research, 200 S. Laurel Avenue, Room A5-1F34, Middletown, NJ, 07748, United States of America, mgcr@research.att.com, José Goncalves

We seek to place N rectangular facilities with unequal area on a rectangular floor space of dimension L x W such that all facilities fit in the space with no overlap and the sum of pairwise products of given distances and flows between facilities is minimized. A biased random-key genetic algorithm is proposed for this problem.

2 - On Solving a Hard Quadratic 3-Dimensional Assignment Problem

Hans Mittelmann, Arizona State University, Box 871804, Tempe, United States of America, mittelma@asu.edu, Domenico Salvagnin

We address the exact solution of a very challenging (and previously unsolved) instance of the quadratic 3-dimensional assignment problem, arising in digital wireless communications. Using special cutting plane and orbital shrinking techniques we are able to solve the target instance with moderate computational effort (the equivalent of one week of computations on a standard PC).

3 - Solving QAP with the Reformulation and Linearization Technique on a Heterogenous Cluster

Alexandre Goncalves, IFRJ - Instituto Federal de Rio de Janeiro, Str Dr José Augusto P. dos Santos s/n, São Goncalo, 24425-004, Brazil, alexandre.domingues.2000@gmail.com, Lucia Drummond, Artur Pessoa

The application of the Reformulation Linearization Technique (RLT) to the QAP leads to a tight linear relaxation with huge dimensions. The level 3 RLT (RLT3) is prohibitive in conventional machines for large instances due to memory limitations. The RLT2 obtains bounds with lower quality then RLT3, but with lower memory. This work presents a proposal of a application to solve the QAP on a heterogeneous clusters composed by machines with CPUs and GPUs using a combined RL2/RL3 B&B algorithm

4 - Solvable QAP Instances via the Level-1 RLT

Lucas Waddell, Graduate Student, Clemson University, Martin Hall, Clemson, SC, 29634, United States of America, lwaddel@clemson.edu, Warren Adams

Due to the difficulty associated with solving the QAP, researchers have directed attention to identifying polynomially-solvable special cases. We show that the level-1 RLT form serves as a unifying entity for many such cases, in that the continuous relaxation yields an optimal binary solution. The key challenge is the identification of complementary primal and dual solutions for which the primal variables are binary. These results build upon our earlier contributions.

Digital Content Distribution and Management

Sponsor: Information Systems

Sponsored Session

Chair: Hong Guo, University of Notre Dame, 356 Mendoza College of Business, Notre Dame, IN, 46556, United States of America, hguo@nd.edu

1 - PULL or PUSH? Website's Strategic Choice of Content Delivery Mechanism

Dan Ma, Singapore Management University, 80 Stamford Road, Singapore, Singapore, madan@smu.edu.sg

Websites can push online content to users through Really Simple Syndication feeds (RSS). I construct a model to study the impact of RSS use on users and websites and examine their adoption strategy. I find that RSS can increase or decrease website profit; in a competitive context, it can actually be a disadvantage. Moreover, in a sequential adoption setting, under certain conditions, a first-adopter disadvantage exists. Together, my findings suggest the complexity of RSS adoption strategy.

2 - Impact of Anti-piracy Effort on Software Firms' Competition and Profitability

Can Sun, School of Business, University of Alberta, Edmonton, Canada, can1@ualberta.ca, Yonghua Ji

Piracy is a big issue for software companies all over the world. We study a problem where high quality software faces competition from low quality one and also the one pirated from the high quality software. The use of pirated software can be reduced through anti-piracy measures which make the pirated version either less attractive or more costly to use. We find that different measures can have different (and sometimes surprising) implications on software firms' competition and profits.

3 - ISP Competition and Content Discrimination: Implications for Net Neutrality

Yu-Chen Yang, Assistant Professor, National Sun Yat-sen University, 70 Lienhai Rd.,, Kaohsiung, 80424, Taiwan - ROC, ycyang@mis.nsysu.edu.tw, Hong Guo, Arthur Lim, Subhajyoti Bandyopadhyay, Hsing Cheng

We investigate how competition between ISPs affects their ability to discriminate between content providers. We compare the potential packet discrimination outcomes under the duopoly versus monopoly ISP regimes within a game-theoretical framework, and find that the ISPs still have the incentive and ability to discriminate between content providers and extract payment from them for priority delivery. The findings have important implications for the ongoing net neutrality debate.

Inspections and Improvement Initiatives in Supply Chains

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Enno Siemsen, UMN, Minneapolis, Minneapolis, United States of America, siems017@umn.edu

1 - The Quality Management Implications of Dormitory Housing in Chinese Manufacturing

Enno Siemsen, UMN, Minneapolis, Minneapolis, United States of America, siems017@umn.edu, Elliot Bendoly

Quality inspections at source sites are essential to make global supply chains work. The inspectors that perform such inspections in China are often housed in company dormitories. We use data from an electronics manufacturer in southern China to examine the implications such an arrangement has on quality levels in the plant. We further examine the influence of individual attributes and social rewards on inspector behavior.

2 - Monitoring the Monitors: How Social Factors Influence Supply Chain Auditors

Jodi Short, Professor, UC Hastings College of Law, 200 McAllister Street, San Francisco, CA, 94102, United States of America, shortj@uchastings.edu, Michael Toffel, Andrea Hugill

Supply chain auditors provide companies with strategic information about the practices of suppliers, yet little is known of what influences their ability to identify and report dangerous or illegal conduct at factories. We find that reporting practices are shaped auditors' experience, gender, and professional training; ongoing relationships between auditors and audited factories; and gender diversity on audit teams. Our study suggests strategies for designing more credible monitoring regimes.

3 - Promoting Change from the Outside: Implementation Delays in Environmental Improvement Projects

Suvrat Dhanorkar, PhD Candidate, University of Minnesota, 321 19th avenue south, minneapolis, MN, 55455, United States of America, dhano002@umn.edu, Enno Siemsen, Kevin Linderman

Although challenging, externally promoting change in firms is vital to operations, supply chains and public policy settings. Combining proprietary and public data from state-level environmental agencies, we examine the factors that affect implementation of environmental improvement projects. We examine how factors such as recommendation structure as well as ongoing external influences impact implementation delays.

4 - Learning and Forgetting in Supply Chains

Anupam Agrawal, UIUC, 363 Wohlers Hall, Champaign, Il, 61821-6255, United States of America, anupam@illinois.edu, Suresh Muthulingam

Using a primary longitudinal dataset, we investigate how the depreciation of organizational knowledge (organizational forgetting) affects vendor quality performance. We find that quality gains from process improvement initiatives depreciate while those from quality assurance initiatives do not, and this depreciation is lower for knowledge embedded in technology than for knowledge embedded in organizational routines or members.

Advances in Discrete Optimization

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Santanu Dey, Georgia Tech, 765 Ferst Drive, NW, Atlanta, United States of America, santanu.dey@isye.gatech.edu

1 - GMI/Split Cuts using Lattice Information

Karen Aardal, Professor, Delft University of Technology, Delft Institute of Applied Mathematics, Mekelweg 4, Delft, 2628 CD, Netherlands, k.i.aardal@tudelft.nl, Andrea Lodi, Andrea Tramontani, Laurence Wolsey, Fred Von Heymann

We consider a heuristic separation procedure for generating split cuts. The procedure is based on a lattice reformulation of single-row integer programs.

2 - Computational Experiments with Split Cuts Induced by Lattice Reformulation

Andrea Tramontani, CPLEX Optimization, IBM Italy, Via Martin Luther King 38/2, Bologna, 40132, Italy, andrea.tramontani@it.ibm.com, Andrea Lodi, Karen Aardal, Fred Von Heymann, Laurence Wolsey

We report on computational experiments with split cuts induced by lattice reformulation of single-row integer programs.

3 - Almost Symmetries in Graphs

Bernard Knueven, University of Tennessee, 504 John D. Tickle Building, 851 Neyland Drive, Knoxville, TN, 37996-2315, United States of America, bknueven@utk.edu, Jim Ostrowski, Sebastian Pokutta

This work addresses the following question. Given an arbitrary graph, G, and a budget, k, find a subgraph of G formed by removing at most k edges that contains the most symmetry. If such a subgraph contains non-trivial symmetries, we call the symmetries "almost symmetries". We discuss how to find such symmetries and the affect that these have on solving combinatorial optimization problems.

Computational Methods for Stochastic Optimization and Variational Problems

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Farzad Yousefian, UIUC, Dept. of Industrial and System Eng, 104 S Mathews Ave, Urbana, IL, 61801, United States of America, yousefi1@illinois.edu

1 - Adaptive Sampling in Stochastic Recursions for Optimization and Root Finding

Raghu Pasupathy, Associate Professor, Purdue University, Dept. of Statistics, West Lafayette, United States of America, pasupath@vt.edu

There has recently been much interest in solving simulation optimization and stochastic root finding problems using recursions obtained by replacing derivatives in Newton-type methods with their sampled counterparts. We present a sequential sampling strategy that adaptively determines the sample size within such recursions by trading-off (estimated) structural and sampling errors. We analyze the resulting convergence rates.

2 - Stochastic Compositional Gradient: Optimizing Compositions of Stochastic Functions

Mengdi Wang, Assistant Professor, Princeton University, 6124 Kaitlyn Ct, West Windsor, NJ, 08550, China, mengdiw@princeton.edu, Ethan Fang, Han Liu

Classical stochastic gradient methods are well suited for minimizing expected values. However, they do not apply to the minimization of a nonlinear function involving expected values, i.e., $\min_x f(E_w[g_w(x)])$. We propose a stochastic compositional gradient descent (SCGD) method that updates using sample subgradients and a extrapolation step. For smooth problems, the SCGD converges at a rate of $O(k^{-2/7})$ in the general case and $O(k^{-4/5})$ in the strongly convex case.

3 - Algorithms for Derivative-free Stochastic Search for Learning of Noisy, Expensive Functions

Yingfei Wang, Princeton University, 35 Olden Street, Princeton, NJ, 08540, United States of America, yingfei@cs.princeton.edu, Warren Powell

We have developed a modular, optimal learning testing environment (MOLTE) for testing learning/stochastic optimization algorithms on a wide range of offline and online problems. We conduct a thorough series of comparisons of pre-coded competitive policies from different communities on pre-coded problems including standard test functions and real-world applications. We address the experimental issues that have been overlooked such as the difficulty of tuning and the construction of priors.

4 - Optimal Robust Smoothing Extragradient Algorithms for Stochastic Variational Inequality Problems

Farzad Yousefian, UIUC, Dept. of Industrial and System Eng, 104 S Mathews Ave, Urbana, IL, 61801, United States of America, yousefi1@illinois.edu, Angelia Nedich, Uday Shanbhag

We present two robust variants of extragradient algorithms for solving stochastic variational inequality problems. The first scheme employs an averaging technique. We show that using an appropriate choice for the weights, a suitably defined gap function attains the rate O(1/k^0.5). In the second scheme, under an assumption of weak-sharpness, we develop a recursive stepsize rule and we show almost-sure convergence and convergence in a mean-squared sense to the solution at the rate O(1/k).

Multistage Stochastic Optimization and Applications in Healthcare

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Oleg Shylo, Assistant Professor, University of Tennessee, 523 John D. Tickle Building, 851 Neyland Drive, Knoxville, TN, 37996, United States of America, oshylo@utk.edu

1 - Totally Unimodular Multistage Stochastic Programs

Ruichen Sun, PhD Student, University of Pittsburgh, 1048 Benedum Hall, 3700 O'Hara Street, Pittsburgh, PA, 15261, United States of America, rus19@pitt.edu, Oleg Shylo, Andrew Schaefer

We consider totally unimodular multistage stochastic programs, that is, multistage stochastic programs whose extensive-form constraint matrix is totally unimodular. Such stochastic programs may be solved as multistage stochastic linear programs, even if there are integrality restrictions. We establish several sufficient conditions to ensure a multistage stochastic program is totally unimodular, and provide examples that arise in practice.

2 - Integrating Proactive and Reactive Operating Room Management

Gabriel L. Zenarosa, PhD Student, University of Pittsburgh, 3700 O'Hara Street, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, glz5@pitt.edu, Andrew Schaefer, Oleg Prokopyev

The goal of this research is to provide approaches for the design of operating room (OR) schedules that are adaptable and flexible to unexpected events. We formulate, calibrate, and solve OR scheduling models under uncertainty. These models produce initial schedules that facilitate flexible reactions during the surgical day, including rescheduling. Outcomes include generalizable insights on the aspects of flexible OR schedules and applicable techniques for solving these difficult problems.

3 - Patient Scheduling under Uncertainty and Resource Constraint

Jeremy Castaing, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, jctg@umich.edu, Brian Denton, Amy Cohn

We develop a stochastic optimization that creates a patient appointment schedule aiming to reduce patient waiting times and total hours of operation of a Cancer Infusion Center. The resulting model is a large-scale integer programming model, intractable for large instances of the scheduling problem. We design an algorithm giving good approximations to the optimal solution and we validate the heuristic result using several bounds on the optimal objective.

Interdiction Models in Complex Networks

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Alexander Veremyev, University of Florida, 1350 N. Poquito Road, Shalimar, FL, 32579, United States of America, averemyev@ufl.edu

1 - Sequential Shortest Path Network Interdiction with Incomplete Information

Juan Borrero, University of Pittsburgh, 3700 O'Hara street, Pittsburgh, United States of America, jsb81@pitt.edu, Oleg Prokopyev, Denis Saure

We study sequential interdiction of evaders on a network when the interdictor has partial initial information about the network structure and costs. In each period, the interdictor removes up to k arcs from the network, after which an evader travels a shortest path. By observing the evaders' actions the interdictor learns about the network and adjusts its actions accordingly. We analyze a class of policies that remove a set of k-most vital arcs of the observed network, and assess its optimality.

2 - Stochastic Maximum Coverage Problem

Konstantin Pavlikov, Stochastic Maximum Coverage Problem, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611-6595, United States of America, kpavlikov@ufl.edu, Alexander Veremyev

The network maximum coverage problem under uncertainty is considered. In this problem, network vertices are assumed to cover their adjacent nodes with some probability, independently of each other. The emphasis is put on minimizing the risk of losing coverage in the presence of random failures of "covering" components. We formalize the stochastic coverage problem, formulate and further investigate the corresponding combinatorial optimization problems.

3 - On the Minimum Vertex Blocker Clique Problem

Foad Mahdavi Pajouh, University of Florida, 350 N Poquito Rd, Shalimar, Fl, 32579, United States of America, mahdavi@ufl.edu, Vladimir Boginski, Eduardo Pasiliao

Cliques are among the earliest concepts used to model cohesive clusters in graphs. A clique is a subset of vertices that induces a complete subgraph. Given an integer r>0, we consider the problem of removing a subset of vertices of minimum cardinality in a weighted undirected graph, such that the weight of any remaining clique is bounded above by r. A linear 0-1 programming formulation, polyhedral results, an exact algorithm for solving this problem, and its complexity will be presented.

Network Design in the Automotive Industry

Cluster: Network Design

Invited Session

Chair: Stefan Minner, Technische Universitat München, Arcisstr. 21, Munich, 80333, Germany, stefan.minner@tum.de

1 - Timing a Sequence of New Car Ramp-ups in Automotive Production Networks

Thomas Stäblein, TU München, Arcisstr. 21, München, 80333, Germany, thomas.staeblein@gmail.com, Annika Becker, Raik Stolletz

A quantitative model is developed to optimize the production technology installation and the ramp-up sequence for new cars. Additionally, phase-outs, platform development and the delivery to markets are considered. Based on real-world data from the premium car industry, we show first insights on the optimization of timing investments and ramp-ups with respect to cash-flows. We pay attention to decisions for multiple products with learning and technology know-how transfer among plants.

2 - Strategic Capacity Planning in Automotive Production Networks under Duties and Duty Drawbacks

Katharina Mariel, Daimler AG, HPC: E203, Stuttgart, 70546, Germany, katharina.mariel@daimler.com, Stefan Minner

High tariffs and complex customs procedures for automotive goods have a crucial impact on global production strategies. Motivated by real-world planning problems of an OEM, we develop a mixed-integer model that simultaneously considers strategic capacity adjustments and duties and drawbacks for multi-stage production processes. In a numerical case study the impact of duties and duty drawbacks on strategic capacity decisions is highlighted.

3 - Supply Network Design under Local Content and Exchange Rate Uncertainty

Stefan Minner, Technische Universität München, Arcisstr. 21, Munich, 80333, Germany, stefan.minner@tum.de

We present an analytical approach to design the optimal sourcing strategy and product configuration of an automotive supply chain under joint exchange rate and demand uncertainty. The model includes different legal constraints when determining the local content under different cost structures with fixed and variable costs.

Optimization for Large-scale Data Analysis and Optimization

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: George Lan, Assistant Professor, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, glan@ise.ufl.edu

1 - Accelerated First-Order Method for Convex Composite Optimization and the Applications in Image Analysis

Yuyuan Ouyang, Postdoctoral associate, Department of Industrial and Systems Engineering, University of Florida, Gainesville, FL, United States of America, ouyang@ufl.edu

We present an accelerated scheme for solving a class of convex composite optimization problems and its application in image analysis. The proposed AL-ADMM method, namely accelerating linearized alternating direction method of multipliers, has accelerated rate of convergence in terms of its dependence on Lipschitz constant of the smooth component. A backtracking technique for searching Lipschitz constant is also proposed for practical performance.

2 - Optimal Randomized First-order Methods for Saddle Point Optimization

Cong Dang, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32611, United States of America, congdd@ufl.edu, George Lan

We present novel randomized algorithms for solving saddle point problems whose dual feasible region is a direct product of many convex sets. Our algorithms can achieve the optimal O(1/N) rate of convergence by solving only one dual subproblem at each iteration. When applied to linearly constrained problems, they need to solve only one randomly selected subproblem per iteration instead of solving all as in the Alternating Direction Method of Multipliers.

3 - The Complexity and Optimal Algorithms for Convex Programming under Linear Optimization Oracle

Yi Zhou, Ph.D. Student, University of Florida, Industrial and Systems Engineering, Gainesville, United States of America, yizhou@ufl.edu, George Lan

We present new conditional gradient methods which possesses optimal complexity in terms of the number of call to the first-order oracle and linear optimization oracle.

4 - Extending the Scope of Uniformly Optimal Methods for General Nonlinear Programming

Saeed Ghadimi, University of Florida, 303 Weil Hall, P.O. Box 116595, Gainesville, FL, 32603, United States of America, sghadimi@ufl.edu, George Lan, Hongchao Zhang

We develop a generic framework to extend uniformly optimal convex programming algorithms to general nonlinear programming. Without requiring any problem parameters, these algorithms achieve the best known complexity for nonconvex problems, and the optimal complexity for convex ones. In particular, for the first time in the literature, we show that the level-type algorithms can be used for solving nonconvex problems uniformly.

Recent Progresses on Solving Markov Decision Processes

Sponsor: Optimization/ Linear and Conic Optimization

Sponsored Session

Chair: Yinyu Ye, Professor, Stanford University, Huang 308, Stanford, CA, 94025, United States of America, yyye@stanford.edu

1 - Reduction of Average-cost Markov Decision Processes to Discounting under an Accessibility Condition

Eugene Feinberg, Distinguished Professor, Stony Brook University, Dept. of Applied Math. & Statistics, Stony Brook, NY, 11790, United States of America, eugene.feinberg@stonybrook.edu, Jefferson Huang

We present sufficient conditions under which an average-cost MDP with Borel state and action spaces can be reduced to a discounted problem. Our assumptions include the existence of a continuous solution to the optimality equation for an embedded stochastic longest-path problem. Our results have applications to the existence of stationary optimal policies for infinite-state MDPs and strongly polynomial bounds for policy iteration and linear programming algorithms for certain MDPs and games.

2 - A Linear Programming Approach to Constrained Nonstationary Markov Decision Processes

Ilbin Lee, PhD Student, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, ilbinlee@umich.edu, Marina Epelman, Edwin Romeijn, Robert L. Smith

We study infinite-horizon constrained nonstationary Markov decision processes with discounted cost criterion and finite state space. This problem can equivalently be formulated as a countably infinite linear program (CILP), a linear program with countably infinite number of variables and constraints. We provide a complete algebraic characterization of extreme points of the CILP formulation and illustrate the characterization for special cases. We also suggest ideas for a simplex-type algorithm.

3 - Algorithms for Fast-Mixing Markov Decision Processes

Ian Post, University of Waterloo, Department of Combinatorics and Optimiza, 200 University Ave West, Waterloo, ON, N2L 3G1, Canada, ipost@uwaterloo.ca

We give an algorithm for solving Markov decision processes that have the property that any policy converges in polynomial iterations to its stationary distribution, even if the discount factor is very close to 1.

4 - Dantzig's Pivoting Rule for Shortest Paths, Deterministic MDPs, and Minimum Cost-Time Ratio Cycles

Thomas Dueholm Hansen, Postdoc, Stanford University, 385 Curtner Avenue, Apt. N, Palo Alto, Ca, 94306, United States of America, tdh@cs.au.dk, Haim Kaplan, Uri Zwick

Post and Ye recently proved an upper bound on the number of iterations required by Dantzig's pivoting rule when solving deterministic Markov decision processes. We improve the bound by Post and Ye and a similar bound by Orlin for shortest paths. Furthermore, we show that as a consequence Dantzig's pivoting rule solves the minimum cost to time ratio cycle problem in strongly polynomial time.

Mathematical and Statistical Analysis of High Frequency Tradings

Cluster: Optimization in Finance

Invited Session

Chair: Xin Guo, Coleman Fung Chair Professor, UC Berkeley, Dept of IEOR, berkeley, Ca, 94708, United States of America, xinguo@berkeley.edu

1 - Tools for Studying Relationship between Temperature Forecasts and Natural Gas Futures

John Wu, Lawrence Berkeley National Laboratory, 1 Cyclotron Road, Berkeley CA 94720, john kwu@lbl.gov

Natural gas is consumed by homes and businesses at a fairly steady rate, however the futures trading on natural gas is actually quite volatile. In this work, we employ a number of different tools to study the characteristics of the price fluctuation to understand its potential causes. In this process, we found two techniques to be particularly instructive: non-uniform fast Fourier transform (NUFFT) and co-integration. In this study, we find clear signature of automated trading. Furthermore, we find that the temperature forecast errors account for about half of the price variation. This observation underscores the importance of improving the accuracy of temperature forecast systems produced by earth system modeling efforts.

2 - Can Large Uninformed Selling Explain Oct. 1987 and 2010 Flash Crash?

Isaac(Yuan) Mao, Dept. IEOR, UC Berkeley, 4174 Etcheverry Hall, UC Berkeley, Berkeley, CA, United States of America, yuan.mao@berkeley.edu, Xin Guo, Terrence Hendershott

Our extension of Kyle's (1985) model predicts market-wide information effect have different impact on stocks. We can predict SP500 stock price change during the stock market crashes and recover the large uninformed selling empirically.

3 - Multi-stage Optimal Exposure Problem

Yuanyuan Chen, The Chinese University of Hong Kong, ERB 810A, CUHK, Shatin, N.T., Hong Kong, Hong Kong - PRC, yychen@se.cuhk.edu.hk, Duan Li, Xuefeng Gao

We study a multi-stage optimal exposure problem which a large buyer faces. The buyer needs to decide at each time t whether to submit limit order or hidden order, or both and how many for each. We identify certain market conditions under which the buyer would never use iceberg orders. We further present some findings on how the market parameters affect the choice made among limit, hidden and iceberg orders.

4 - High Frequency Limit Order Book Dynamics via Support Vector Machines

Alec Kercheval, Professor, Florida State University, 1017 Academic Way, Rm 208, Department of Mathematics, Tallahassee, FL, 3 2306-4510, United States of America, kercheva@math.fsu.edu, Yuan Zhang

To analyze high frequency electronic trading behavior, a machine learning framework using multi-class support vector machines is proposed to automate short term forecasting of order book events. Experiments with sample market data show the method can forecast mid-price movements and price spread crossings a short time into the future.

Sponsored Session

Chair: Tim Leung, Columbia University, 500 West 120th Street MC4704, New York, United States of America, tl2497@columbia.edu

1 - A Stochastic Model for Order Book and Price Dynamics

Xinyun Chen, Stony Brook University, Department of Applied Math and Stat, Stony Brook, NY, 11790, United States of America, xinyun.chen@stonybrook.edu, Jose Blanchet

We construct and study a continuous time model that incorporates the whole limit order book to inform the joint evolution of the spread and the price processes. The construction of the order book model is guided by empirical data. In particular, the model addresses the autocorrelation pattern of order flows. Under the multi-scale asymptotic regime suggested by empirical observations, we solve a jump-diffusion approximation for the spread-price process determined by the order book dynamics.

2 - Commodity Leveraged Exchange Traded Funds

Kevin Guo, Columbia University, 345 S.W. Mudd Building, 500 West 120th Street, New York, NY, 10027, United States of America, klg2138@columbia.edu, Tim Leung

We investigate the tracking errors of leveraged exchange traded funds (LETFs) based on commodity indices. We observe from empirical data the discrepancy of LETF and their reference indices returns. This leads us to define the tracking error associated with each LETF. We conclude that tracking errors can significantly deteriorate returns over the long run. Incorporating correlated tracking errors into LETF price dynamics, we examine the effectiveness of a some trading strategies.

3 - Static and Dynamic Trading Strategies for Leveraged ETF Portfolios

Zheng Wang, Columbia University, IEOR Department, Rm 315, SEAS, 500 West 120th Street, New York, NY, 10027, United States of America, zw2192@columbia.edu, Tim Leung

We discuss a number of ways to construct static and dynamic portfolios using liquidly traded leveraged ETFs. In order to model the portfolio value dynamics, it is crucial to account for the various leverage ratios, value erosion due to realized volatility, and expense fees. We examine the risk characteristics of these portfolio both analytically and empirically.

4 - Implied Volatility of Leveraged ETF Options: Consistency and Scaling

Tim Leung, Columbia University, 500 West 120th Street MC4704, New York, United States of America, tl2497@columbia.edu

The growth of the exchange-traded fund (ETF) industry has given rise to the trading of options written on ETFs and their leveraged counterparts (LETFs).We study the relationship between the ETF and LETF implied volatility surfaces under a general stochastic volatility framework. We derive analytic approximations for the implied volatilities and identify their dependence on the leverage ratio.

Optimization for Dimension Reduction

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Genevera Allen, Rice University, 6100 Main St. MS - 138, Houston, TX, 77005, United States of America, gallen@rice.edu

1 - Sparse PCA via Fantope Projection and Selection

Vince Vu, Assistant Professor, Ohio State University, Department of Statistics, 1958 Neil Avenue, 404 Cockins Hall, Columbus, OH, 43210-1247, United States of America, vqv@stat.osu.edu

Sparse PCA is dimension reduction and variable selection technique for high-dimensional data. This talk will present a recently developed convex relaxation of sparse PCA based on the convex hull of rank-k projection matrices (the Fantope). The resulting semidefinite program (SDP) can be solved efficiently by alternating direction method of multipliers and has near-optimal statistical properties. Insight into sparsity and the structure of the SDP enable its application to massive datasets.

2 - Sparse and Smooth Principal Components Analysis

Genevera Allen, Rice University, 6100 Main St. MS - 138, Houston, TX, 77005, United States of America, gallen@rice.edu

We present an optimization framework to simultaneously achieve sparsity and smoothness in both the left and right singular vectors. This framework generalizes existing approaches to Sparse PCA and Functional PCA, providing a unified optimization framework for regularization in PCA. We also propose a scalable alternating algorithm, study its convergence guarantees, and demonstrate its effectiveness on simulated data and an EEG example.

3 - Exact Data Reduction for Big Data

Jieping Ye, Associate Professor, Arizona State University, Tempe, AZ, 85287, United States of America, jieping.ye@asu.edu

Recent technological innovations have enabled data collection of unprecedented size and complexity. As an emerging and powerful tool for analyzing massive collections of data, data reduction has attracted tremendous attentions in the past few years. In this talk, I will present some of our recent work on exact data reduction in that the final model constructed from the reduced data is identical to the original model constructed from the complete data.

Applied Probability for Smart Cities

Sponsor: Applied Probability Society

Sponsored Session

Chair: Robert Hampshire, Carnegie Mellon University, Heinz College, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, hamp@andrew.cmu.edu

1 - Fork-join Queues in In-Network Function Computation

Samyukta Sethuraman, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, samyukta@tamu.edu, Natarajan Gautam

We consider a smart sensor network which measures data and transmits to a sink. The sink node is ultimately interested in a function of the measured values, e.g., the maximum, calculated in a distributed fashion. To efficiently perform this under stochastic conditions, we model the flow of information along predefined arborescences, as a fork-join queueing network. We obtain bounds on the performance under light and heavy traffic conditions, and thereby select the ideal set of arborescences.

2 - Congestion-Based Staffing Policy for Toll Booths

Katsunobu Sasanuma, PhD Candidate, Carnegie Mellon University, Heinz College, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, katz@cmu.edu, Robert Hampshire, Alan Scheller-Wolf

We study a traffic management policy for facilities with toll booths, that efficiently utilizes limited resources by dynamically changing the staffing level depending on the queue length. Our objective is to know when we need to add more operators and when to withdraw extra operators. The policy of changing the number of operators depending on the queue size is discussed and analytical results of performance indicators are shown.

3 - Is the Curb 80% Full or 20% Empty? A Dynamic Parking Pricing Experiment in San Francisco

Robert Hampshire, Carnegie Mellon University, Heinz College, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, hamp@andrew.cmu.edu

The city of San Francisco is undertaking a large-scale controlled parking pricing experiment. San Francisco has adopted a performance goal of 60-80% occupancy for its metered parking. The goal represents an heuristic performance measure intended to reduce double parking and cruising for parking, and improve the driver experience. We develop an empirical Erlang C formula, and evaluate the impacts of the first two years of the San Francisco program.

Fluid and Diffusion Approximations of Stochastic Systems

Sponsor: Applied Probability Society

Sponsored Session

Chair: John Hasenbein, University of Texas at Austin, Grad Program in OR/IE, Austin, United States of America, jhas@mail.utexas.edu

1 - Optimal Pricing and Capacity Sizing when Customers Abandon, Amy Ward, Chihoon Lee

We consider how to jointly set the price and capacity in order to maximize the steady-state expected profit in a GI/GI/1+GI queue with a high rate of prospective customer arrivals. We use the solution to an approximating diffusion control problem to provide a simple condition under which the optimal price and service rate are such that the system operates in heavy traffic. Then, we further use that solution to propose a price and service rate that we can prove is asymptotically optimal.

2 - Diffusion Approximations for Probabilistic Matching Systems

Hanyi Chen, PhD Candidate, The University of Edinburgh, School of Mathematics, JCMB King's Buildings, Edinburgh, EH9 3JZ, United Kingdom, H.Chen-29@sms.ed.ac.uk, Burak Buke

The internet portals which enable potential customers and suppliers to meet and match, e.g. employment and renting portals, dating and classified websites, have become increasingly popular in the last decade. In these systems, each supplier and customer pair matches probabilistically. We provide models for analyzing the user traffic in these systems. It can be shown that these systems are unstable if uncontrolled. We suggest fluid and diffusion limits to facilitate analysis of these systems.

3 - The Analysis of Provider Triage Systems in Emergency Rooms

Ozlem Yildiz, University of Rochester, Simon School of Business, 4-333 Simon Hall. Simon Graduate School, of Business, Universiy of Rochester, Rochester, NY, 14627, United States of America, ozlem.yildiz@Simon.Rochester.edu, Tolga Tezcan, Michael Kamali

We study when and how provider triage (PT) methods should be applied in an emergency room (ER) to maximize the economic contribution using multi-server fluid approximations. We show that PT should be applied when arrival rate to the ER must exceed a threshold, which is provided in closed-form. Testing the performance of our proposed solution using patient flow data from our partner ER via simulation, we show that it leads to near-optimal results.

4 - Dynamic Control of Collaborative Networks

Itai Gurvich, Kellogg School of Management, Northwestern University, 2001 Sheridan Road, Evanston, IL, 60201, United States of America, i-gurvich@kellogg.northwestern.edu

We study collaboration and resource sharing in processing networks. We first characterize sufficient conditions on the network's collaboration architecture that guarantee that the static planning problem truly captures the capacity of the process. We then proceed to study control of synchronization under non-preemption. We find that synchronization of collaborating resource under non-preemption introduces fundamental and non-trivial tradeoffs between throughput and controllability.

Chair: Matthew Plumlee, Georgia Institute of Technology, Atlanta, GA, United States of America, mplumlee@gatech.edu

1 - Joint Modeling of Point and Integral Responses in Computer Experiments

C. F. Jeff Wu, Coca-Cola Chair in Engineering Statistics and Professor, Georgia Institute of Technology, 755 Ferst Dr, atlanta, United States of America, jeffwu@isye.gatech.edu, Heng Su, Rui Tuo

In some computer experiments, the quantity of interest may be the average value of the responses over a specific region. One example is the diffuse solar irradiance on a building façade. We extend the standard Gaussian process framework so that it can handle both point and integral data. We find that a closed-form expression can be derived, and the predictions on new points and regions can be obtained with high accuracy. An illustration is made with real data from the irradiance study.

2 - A New Measure in Global Sensitivity Analysis: Shapley Values of Input Parameters

Eunhye Song, Northwestern University, 2145 Sheridan Road, Technological Institute, C210, Evanston, Il, 60208, United States of America, eunhyesong2016@u.northwestern.edu, Barry Nelson, Jeremy Staum

Global sensitivity analysis captures the variation in the model response over the range of the input parameters whose uncertainty is represented by probability distributions. We propose a new global sensitivity measure derived from the concept of Shapley value in cooperative game theory and compare its properties to other variance-based global sensitivity measures. Gaussian process modeling is used to facilitate efficient computation of the sensitivity measure for complex models.

3 - Local Gaussian Process Approximation for Large Computer Experiments

Robert B. Gramacy, Associate Professor, University of Chicago, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, rbgramacy@chicagobooth.edu, Daniel Apley, Jarad Niemi

By focusing expressly on desirable properties of the predictive equations, we derive a family of local sequential design schemes that dynamically define the support of a Gaussian process predictor based on a local subset of the data. Then we show how independent application of our local design strategy across the elements of a vast predictive grid facilitates a trivially parallel implementation.

4 - Sequential Algorithms for Generating Space-filling Designs with Unknown Constraints

Tirthankar Dasgupta, Associate Professor, Harvard University, 1 Oxford Street, 7th Floor, Harvard Statistics Department, Cambridge, MA, 02138, United States of America, dasgupta@stat.harvard.edu, Li Zhu, Robert B. Gramacy

We explore sequential strategies for obtaining a space-filling design within a feasible sub-region of the design space, where the feasibility constraints are unknown. Two criteria that are based on minimizing the prediction errors from Gaussian Process models are proposed for iteratively selecting new design points.

1 - Hierarchical Bayesian Kernel Models Applied to Event Data

Hiba Baroud, University of Oklahoma, 202 West Boyd St, Room 124, Norman, OK, 73019, United States of America, hbaroud@ou.edu, Kash Barker

We propose to use hierarchical Bayesian kernel methods to model count data and predict the number of occurrences of a particular event using historical data and component and event characteristics. The model is implemented using several data sets and compared to other count data models for validation purposes.

2 - Detecting Point Pattern of Multiple Line Segments using Hough Transformation

Yuhang Liu, Graduate Student, University of Wisconsin Madison, Department of Industrial Engineering, Madison, WI, 53711, United States of America, liu427@wisc.edu, Shiyu Zhou

Surface defects in manufacturing often exhibit particular spatial patterns. These patterns can help to identify the potential root causes. In this paper, we present a new method to detect the point patterns consisting of multiple line segments. The idea is to convert the point pattern detection problem into a simple point matching problem by using Hough Transformation. The proposed method is easy to implement and has a good performance. The algorithm and case studies are presented in the paper.

3 - Robust Parameter Design for Profile Quality Control

Lulu Bao, Tsinghua University, Department of Industrial Engineering, Tsinghua University, Beijing, 100084, China, baoll11@mails.tsinghua.edu.cn, Qiang Huang, Kaibo Wang

In certain manufacturing processes, product quality is characterized by spatial profiles. Such profiles are expected to meet specific shape requirements. This talk aims to improve profile quality using robust parameter design. A hierarchical model is built to reflect the spatial correlation the profile data has and linked with process variables. The performance of the proposed method is studied using a motivating example from nano-manufacturing.

4 - Reliability Optimization for Critical Components with Uncertain Component Reliability in the Design

Qianru Ge, Ph.D Candidate, Technology University of Eindhoven, Technology University of Eindhoven, Den, Eindhoven, 5612 AZ, Netherlands, q.ge@tue.nl, Geert-Jan Van Houtum, Ivo Adan, Hao Peng

We develop an optimization model to determine the reliability design of critical components in a system. Since the system is under a service contract, a penalty cost should be paid by the OEM when the total system down time exceeds a predetermined level, which complicates the evaluation of the life cycle costs. Furthermore, in the design phase for each critical component, all the possible designs are subject to uncertain component reliability. An efficient approximation method is proposed.

Simulation Methodology Applications

Sponsor: Simulation

Sponsored Session

Chair: Seong-Hee Kim, Associate Professor, Georgia Institute of Technology, Atlanta, GA, 30332, United States of America, skim@isye.gatech.edu

1 - Sampling from Manifolds without Derivatives

Enlu Zhou, Georgia Institute of technology, 755 Ferst Drive, NW, Atlanta, GA, 30319, United States of America, enlu.zhou@isye.gatech.edu, Chang-han Rhee

We introduce an algorithm that generates samples from a manifold, based only on the ability to evaluate the mapping defined by the parametrization of the manifold. In particular, we do not assume the ability to evaluate the derivatives of the mapping. Our approach is useful when the manifold is analytically intractable and highly nonlinear—-for example, in studying complex regulatory networks in systems biology where the mapping is typically defined by the solution of a system of ODEs.

2 - A Simulation Based Optimization Model for Workforce Scheduling in Call Centers

Amr Eltawil, Acting chairperson, Industrial Engineering and Systems Management, Egypt-Japan University of Science and Technology, 179 New Borg El-Arab City,Alexandria,Egy, Alexandria, 21934, Egypt, eltawil@ejust.edu.eg, Aya Seada

One of the key metrics used in evaluating call centers performance is the service level (SL).The SL is the percentage of incoming calls an agent can answer within a specified time. In this paper, we present a case study of using discrete event simulation for workforce scheduling in the largest home appliances company in Egypt. The model considers many factors that cannot be handled by the current workforce planning process that relies on using Erlang-C method.

3 - Simulating High Speed and Rate-Based Systems

David Krahl, Imagine That, Inc., 6830 Via Del Oro, Suite 230, San Jose, CA, 95119, United States of America, davek@extendsim.com, Cecile Pieper

Systems that process material at high speed or continuously are common. These include pulp and paper, manufacturing, petrochemical, and mining. These kinds of systems typically pose unique challenges for simulation modelers. This session will discuss various simulation modeling technologies including discrete event, continuous, and discrete rate. Real-world examples will be presented to illustrate these concepts.

4 - Building Metamodels for Cycle Time Quantiles in Manufacturing Systems

Demet Batur, Assistant Professor, University of Nebraska, CBA 209, Lincoln, NE, United States of America, dbatur@unl.edu, Jennifer Bekki

We present a procedure for building metamodels from discrete-event simulation models of manufacturing systems. The performance measure of interest is the quantiles of the cycle time distribution while the independent variables are controllable aspects of the production system itself such as arrival rate, service time, setup time, loading/unloading time, etc. Experimental results will be presented on a prototype simulation model of a semiconductor manufacturing system.

5 - Impact of Sensor Measurement Errors in Sensor Positioning in Water Quality Monitoring Networks

Chuljin Park, Assistant Professor, Hangyang University, Engineering Center #706-2, 222 Wangsimni-ro Seongdong-gu, Seoul, 133-791, Korea, Republic of, parkcj@hanyang.ac.kr, Seong-Hee Kim, Jisu Park, Mustafa Aral, Yongsoon Eun

We study the impact of sensor measurement errors in the problem of determining sensor locations in water quality monitoring networks. We develop a probabilistic model for sensor measurement errors and find sensor locations that minimize the expected time until spill detection subject to the reliability of detecting a spill is greater than a pre-specified threshold. Randomness in a contaminant spill and rain events is considered with various levels of bias and variability in sensor measurements.

Models for Electric Vehicle Charging Infrastructure Network

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Yongxi Huang, Assistant Professor, Clemson University, 314 Lowry Hall, Clemson University, Clemson, SC, United States of America, yxhuang@clemson.edu

1 - Optimal Electric Vehicle Charger Placement Problem: A Time-of-Day Parking Activity Based Approach

Jing Dong, Assistant Professor, Iowa State University, 350 Town Engineering Building, Ames, IA, 50011, United States of America, jingdong@iastate.edu, Changzheng Liu

This study optimizes the electric vehicle charger placement to minimize the unmet charging demand. The spatial and temporal distributed charging demands are derived from parking activities of GPS-tracked vehicles. A mixed integer programming approach is developed to solve the proposed problem.

2 - Concurrent Electric Vehicle Fleet Sizing and Charging Station Network Design

Scott Mason, Professor and Endowed Chair, Clemson University, 124 Freeman Hall, Clemson, SC, 29631, United States of America, mason@clemson.edu, Yongxi Huang, Navid Matin Moghaddam

We present a model for the capacitated electric vehicle routing problem that focuses on both fleet sizing and network design decisions simultaneously. We focus on determining the required routing for each electric vehicle, including required driving, waiting, and charging times, such that all customer demands are satisfied within required time windows. Any feasible solution must not violate vehicle capacity constraints, maximum range limitations, or customer-required delivery requirements.

3 - Life Cycle Analysis of Electric Vehicles using a Detailed Optimization Model of the Electricity Grid

Allison Weis, PhD Student, Carnegie Mellon, EPP Baker Hall 129, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, aeweis@andrew.cmu.edu, Paulina Jaramillo, Jeremy Michalek

The potential environmental benefit of electric vehicles over conventional vehicles depends heavily on the emissions resulting from charging the electric vehicles. In this work we use a MILP model of optimal power plant dispatch and unit commitment to characterize the criteria air pollutant and greenhouse gas emissions caused by charging. We combine these results with the emissions from other electric vehicle life cycle stages and compare them to life cycle emissions for conventional vehicles.

4 - A Dynamic Location Model for Electric Vehicle Charging Corridor

Shengyin Li, Graduate student, Clemson University, 139S Lowry Hall, Clemson University, Clemson, SC, 29634, United States of America, shengyl@clemson.edu, Yongxi Huang

We develop a dynamic flow-based location model for optimally deploying public electric vehicle charging stations on a transportation network to meet demand increases in a sequential manner. Mixed integer programming models were formulated to minimize the total system cost over planning horizon, considering realistic scenarios of relocations. We demonstrated the models using a South Carolina case study with probabilistic analysis based future demand changes on a geographic resolution.

Using Optimization for Wildfire Preparation and Mitigation

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Hugh Medal, Assistant Professor, Mississippi State University, 260F McCain Hall, Mississippi State, MS, 39762, United States of America, hugh.medal@msstate.edu

1 - Analyzing the Vulnerability of Landscapes to Pyro-terror Attacks: A Network Interdiction Approach

Eghbal Rashidi, Mississippi State University, 340C McCain Hall, Starkville, MS, 39759, United States of America, er442@msstate.edu, Hugh Medal

We study the potential impact of a pyro-terrorism attack on a landscape. A mathematical programming model is developed from a terrorist's point-of-view to optimally locate ignition points and maximize the damage caused by the fire. Considering fuels treatment as a strategy to reduce the loss due to fire, we also model a Stackelberg game in which a fire manager finds optimal locations for fuel treatments, and terrorists locate ignition points to maximize the damage.

2 - Forest and Wild Land Fire Management Resource Sharing

David Martell, Professor, University of Toronto, 33 Willcocks Street, Toronto, ON, M5S 3B3, Canada, david.martell@utoronto.ca, Bernardo Pagnoncelli, Cameron Buttazzoni, Adriana Piazza

Each year forest fire managers must decide what resources (e.g., airtankers and fire fighters) to acquire subject to uncertainty concerning when and where the fires might occur. Many have developed inter-agency resource sharing agreements that enhance their ability to cope with elevated fire loads. We developed a simulated multi-agency fire management system and used it to explore how specific deterministic and stochastic resource sharing models would perform in such planning environments.

3 - Arson Wildfire Damage Reductions through Displacement and Deterrence

Jeffrey Prestemon, Research Forester, USDA Forest Service, Southern Research Station, Forestry Sciences Laboratory, PO Box 12254, RTP, NC, 27709, United States of America, jprestemon@fs.fed.us, David Butry, Douglas Thomas

Little is known about how law enforcement efforts reduce arson wildfire counts, although studies confirm its effectiveness. Using temporally autoregressive arson wildfire production functions estimated for tribal lands in the U.S., we examine how law enforcement might temporally displace arson fires, reducing their ignition success and fire spread potential, yielding positive net benefits for landowners or society.

■ MB71

Procurement and Auction Markets

Cluster: Auctions

Invited Session

Chair: Gabriel Weintraub, Columbia Business School, gyw2105@columbia.edu

1 - Entrant Cost Uncertainty in Procurement Auctions: Theory and Experiments

Izak Duenyas, Professor, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI, 48109, United States of America, duenyas@umich.edu, Damian Beil, Brendan See, Stephen Leider

Although an incumbent supplier may know her cost to produce an item, an entrant supplier is usually less informed. We model this scenario and allow the entrant to learn additional information at a cost. The buyer can influence the learning cost. We study whether the entrant will learn prior to the auction or delay learning and make a less-informed bid. We derive theoretical results which we then test in the lab.

2 - Mechanism Design for Procurement with Differentiated Products Demand Systems

Daniela Saban, Columbia University, Uris Hall, 4I, New York, United States of America, dhs2131@columbia.edu, Gabriel Weintraub

We study the problem faced by a buyer who uses an auction to select an assortment and unit prices from a set of suppliers with private costs offering differentiated products. Once the assortment and prices are fixed, consumers can choose their most preferred product from this set. We use a mechanism design approach to optimize the trade-off between variety and price competition when maximizing consumer surplus. We use these results to analyze the performance of simple and practical mechanisms.

3 - Efficient Iterative Auctions for Multi-Featured Items: A Network Flow Approach

Sasa Pekec, Duke University, Durham, NC, United States of America pekec@duke.edu, Ozan Candogan

We focus on a setting in which every item is described by a given set of features. Bidders' values for bundles are the sum of individual feature valuation functions (with decreasing marginals). We determine (hypothetical) allocations of features, and link them to allocations of (actual) items via a network flow formulation. Using this formulation, we reveal a new class of valuations for which a Walrasian equilibrium exists, and construct an efficient iterative auction for multi-featured items.

4 - Optimizing Prices in Descending Clock Auctions

Tuomas Sandholm, Carnegie Mellon University, 5000 Forbes Ave., Pittsburgh, PA, 15213, United States of America, sandholm@cs.cmu.edu, Tri-Dung Nguyen

In a descending clock auction (DCA), bidder-specific prices are decremented during the auction. In each round, a bidder can accept or decline his offer. DCAs have been proposed for sourcing spectrum from incumbents in the FCC's imminent incentive auctions. We present the first techniques for determining the prices to offer the bidders in each round: a percentile-based approach and an optimization-based approach. We provide theory and experiments for homogeneous items and for incentive auctions.

Assorted Topics in Distributed Energy Generation

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Alexandra M. Newman, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, anewman@mines.edu

1 - Generating Load Profiles to Reduce Power use in a Forward Operating Base

Gavin Goodall, PhD Student, Colorado School of Mines, 1500 Illinois St., Golden, CO, 80401, United States of America, ggoodall@mines.edu

We present the methodology behind creating power demand profiles for forward operating bases(FOBs) based on five input parameters: latitude, longitude, number of people, mission type and duration of operations, for use in the design and dispatch strategy of renewable energy technologies at FOBs. Additionally, we demonstrate how to reduce the power consumption of the FOB by improving the configuration of heating and cooling units, lighting, and other power draws within facilities on the base.

2 - Solution Quality and Jackknife Estimators in Large Scale Hydroelectric Scheduling

A. Rodrigo de Queiroz, Professor, Federal University of Itajuba, Av. BPS, 1303, bairro Pinheirinho, Itajuba, MG, 37500-903, Brazil, ar_queiroz@yahoo.com.br, David Morton

In stochastic programs the assessment of solution quality is vital, especially when the size of the problem is too large to be solved to optimality. We model a hydroelectric scheduling problem as a large-scale multi-stage stochastic linear program. We solve this problem via a sampling-based decomposition algorithm. We use jackknife estimators to reduce bias when estimating the optimal value of the stochastic program.

3 - Quantifying the Net Value of Electric Power Generation Technologies in a Capacity Expansion Model

Kelly Eurek, National Renewable Energy Lab, Golden, CO, 80401, United States of America, kelly.eurek@nrel.gov

The Regional Energy Deployment System (ReEDS) is a linear programming model designed to explore the evolution of the electric sector infrastructure under a variety of economic, technology, and policy assumptions. Using the ReEDS model, we develop a method for quantifying the net value that new generation capacity provides to the reliable balancing of supply and demand resources. The net value can be an alternative metric for technology competitiveness, more useful than the ever-present LCOE.

4 - Optimal Power Generation Expansion Planning with Learning Consideration

Soheil Shayegh, Georgia Institute of Technology, North Ave NW, Atlanta, GA, 30332, United States of America, soheilsh@gatech.edu, Valerie Thomas

We introduce a novel optimization approach to the global power generation expansion planning problem. It incorporates an endogenous learning mechanism to update the construction cost and emissions as a function of operating generation for each technology. We include an energy balance system to translate the emissions into the change in temperature. The optimization was performed with two objective functions with or without considering the learning effect and the optimal solutions were compared.

Parc- Mission I

Uncertainty in Climate Policy Modeling

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Robert Barron, University of Massacusetts, 160 Governor's Drive, Room 219, Amherst, MA, 01003, United States of America, barron@ecs.umass.edu

Co-Chair: Erin Baker, University of Massachussetts, Amherst, MA, edbaker@ecs.umass.edu

1 - Grid Integration Cost Assumptions and the Optimal Electricity Supply Technology R&D Portfolio

Robert Barron, University of Massacusetts, 160 Governor's Drive, Room 219, Amherst, MA, 01003, United States of America, barron@ecs.umass.edu, Erin Baker, Noubara Djimadoumbaye

Many low carbon energy technologies are non-dispatchable, which imposes additional costs when these technologies are connected to the grid. This work examines the impact of assumptions about grid integration costs on the optimal R&D portfolio for minimizing the cost of climate change. Absent a budget constraint the optimal R&D portfolio is affected by grid integration cost assumptions, but given a budget constraint grid integration cost assumptions have little impact.

2 - Optimal Climate Policy under Uncertainty: Modeling Catastrophes with Stochastic Control

Delavane Turner, PhD Candidate, Stanford University, Huang Engineering Center, Stanford, CA, 94305, United States of America, delavane@stanford.edu

Greenhouse gas policies balance the costs of reducing emissions and the benefits of avoided climate change. This paper explores climate impacts from sea level rise in the face of an uncertain and potentially irreversible catastrophe. A benchmark integrated assessment model is reformulated with stochastic control to investigate whether precautionary action to reduce the threat of polar ice-sheet collapse is warranted. This work provides insight into managing downside risks of climate change.

3 - Minimizing Water Requirements for Electricity Generation in Water Scarce Areas

Erica Stults, Worcester Polytechnic Institute, 100 Institute Rd, ME Department, Worcester, Ma, 01609, United States of America, estults@wpi.edu, John Bergendahl, Andrew Trapp, Isa Bar-On

Thermoelectric power generation uses approximately 50% of the water withdrawn in the US. We explore the replacement of existing power generation plants by alternative technologies, and its effect on water use. We show how the replacement of traditional thermoelectric generation with renewable solar and wind technologies can reduce future water demands for power generation. A case study replacing a large generation plant in Texas demonstrates a significant decrease in water requirements.

4 - Stochastic Modeling of Energy Technology Portfolios

Ekundayo Shittu, The George Washington University, 1776 G St. NW, Washington, DC, 20052, United States of America, eshittu@email.gwu.edu, Ilka Deluque

In the context of climate change, we present models of energy technology choices and capacity additions under sequential and multiple uncertainties. The investment decisions that firms make on their energy technology portfolios are shaped by uncertainties in demand, technological success or learning and regulatory policy. We unpack the impacts of these layers of uncertainties to indicate that the influence of uncertainty on a firm's spending has different, and sometimes intriguing, outcomes.

■ MB74

Existing Challenges in Non-convex Electricity Markets

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Kory Hedman, Assistant Professor, Arizona State University, PO Box 875706, GWC 206 School of ECEE, Tempe, AZ, 85287-5706, United States of America, Kory.Hedman@asu.edu

1 - System Operator Modifications to Electricity Market Solutions

Mostafa Sahraei-Ardakani, Post Doctoral Scholar, Arizona State University, 519 ERC Building, Tempe, United States of America, mostafa@asu.edu, Kory Hedman

ISOs play the role of the invisible hand in electricity markets with the objective to maximize social welfare. Due to the size and complexities of these non-convex markets, ISOs make many approximations to obtain a solution within a reasonable timeframe. This presentation discusses ISO practices that involve adjustments to the market solution as well as the practice to choose market solutions that may have lower uplift payments, which may coincide with solutions that have less social welfare.

2 - Non-convexities in Electricity Markets: Theoretical and Practical Implications

Alex Papalexopoulos, Dr, President and CEO, ECCO International, Inc., 268 Bush Street, Suite 3633, San Francisco, CA, 94104, United States of America, alexp@eccointl.com, Panagiotis Andrianesis, George Liberopoulos

In centralized day-ahead electricity markets with marginal pricing, unit commitment costs and capacity constraints give rise to non-convexities which may result in losses to some of the participating generating units. We provide both theoretical and practical implications for several mechanisms developed to address the issue of non-convexities, and compare their performance and incentive compatibility.

3 - Challenges in Electricity Markets
Richard O'Neill, Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC, United States of America, richard.oneill@ferc.gov

In ISOs, complexity and transparency can co-exist. The ISO markets contain the necessary complexity to solve the complex operations problems. Financial market exists for those who want simplicity. The presentation will address the challenges in electricity markets including pricing in non-convex markets, stochastic issues, ancillary service markets, uplift or multi-part pricing, and ramp products.

4 - Challenges for Balancing Area Coordination Considering High Wind Penetration
Robin Broder Hytowitz, PhD Student, Johns Hopkins University, 3400 North Charles Street, Ames Hall 313, Baltimore, MD, 21218, United States of America, hytowitz@jhu.edu, Ozge Ozdemir, Ben Hobbs

In order to manage variability in wind generation, balancing area consolidation has been proposed. With an increase in network size, challenges arise in incorporating complexities into system operations and solving to optimality, so the putative efficiency improvements might not be realized. These impacts are assessed with day-ahead and real-time models that consider variability as well as uncertainty through deterministic, stochastic, and trade models, with an example using the COMPETES model.

■ MB75

Parc- Mission III

Simulation and Optimization II

Contributed Session

Chair: Suzanne Marcotte, Associated professor, ESG-UQAM, Dept Management and technology, P.O. Box 8888, Downtown Station, Montreal, Qc, H3C3P8, Canada, Suzanne.Marcotte@cirrelt.ca

1 - Robustness of Capacity Markets – A Stochastic Capacity Expansion Model Applied to the GB Case
Daniel Hach, PhD Student in OR, WHU - Otto Beisheim School of Management, Burgplatz 2, Vallendar, 56179, Germany, daniel.hach@whu.edu, Stefan Spinler

Electricity capacity markets are currently discussed in several countries worldwide – e.g. the U.K. and Texas. We quantitatively assess the effect of different design options on the electricity market. Using a long term stochastic electricity capacity investment model we compare the impact of these design options regarding cost, supply adequacy, and sustainability. Our model includes stochastic conventional plant outages and a robustness framework to reflect uncertain policy changes.

2 - A Chance-Constrained Optimization Model of Urban Land-use Allocation under Seismic Hazard
Chih-Hao Wang, Assistant Professor, California State University Fresno, 4691 Barrington Club Dr, COLUMBUS, OH, 43220, United States of America, cwang@csufresno.edu, Jean-Michel Guldmann

Seismic damages result from interactions between seismic hazards (ground motion/failure) and urban vulnerabilities (land-use pattern). A seismic damage model is statistically estimated with simulated data for Taichung, Taiwan, and is next incorporated into a chance-constrained optimization model allocating future land uses to city districts. This model maximizes the total economic benefits of future land development subject to chance constraints for maximum seismic damages in each district.

3 - Simulating Late Order Management Policies for Proactive Order Consolidation
Suzanne Marcotte, Associated professor, ESG-UQAM, Dept Management and technology, P.O. Box 8888, Downtown Station, Montreal, Qc, H3C3P8, Canada, Suzanne.Marcotte@cirrelt.ca, Walter Rei, Olivier D. Gadoury, Teodor Gabriel Crainic

In the context of global sourcing, Proactive Order Consolidation (POC) is an efficient strategy to perform shipments. However, giving uncertainty in sourcing, one of the main challenges is the management of late orders. In this study, we propose series of operational policies to manage the order delays in the context of organizing shipments. To evaluate these policies, we develop a simulation framework that formulates the general global sourcing process.

4 - Improvement of Work Process Performance with Task Assignments and Mental Workload Balancing
Cansu Kandemir, Ph.D. Candidate, Old Dominion University, 5115 Hampton Blvd., Norfolk, VA, 23529, United States of America, ckandemi@odu.edu, Holly Handley

This research aims to propose a simulation optimization model to evaluate the potential improvements in organizations for performance of work processes. The model created for this study will serve as a test-bed to evaluate different hypotheses on the optimal method to assign employees to tasks based on credentials, while still maintaining a workload balance among employees. The outcome of the study will provide guidance on identifying the region where both goals can be met successfully.

5 - A Reliability Based Approach to Supplier Selection
Layek Abdel-Malek, New Jersey Institute of Technology, University Heights Newark, Newark, 07102, United States of America, layek.abdel-malek@njit.edu, Marta Rinaldi, Eleonora Bottani, Roberto Montanari

A comparison between two scenarios is presented where a company should choose between two policies. The first is to retain one supplier with limited reliability and suffers possible stock out and the second is to have a backup supplier to make up for shortages in case they occur. The comparison aims at assessing the economic profitability of the two scenarios based on the operating conditions. The results of this comparison should provide companies with a tool in design this supply chains

Joint Session Analytics/CPMS: The Whys Hows and Whats of Analytics Certification

Sponsor: Analytics & CPMS, The Practice Section

Sponsored Session

Chair: Polly Mitchell-Guthrie, Sr. Manager, Advanced Analytics Customer Liaison, SAS, SAS Campus Dr., Cary, NC, 27513, United States of America, Polly.Mitchell-Guthrie@sas.com

1 - Why Should you Become a Certified Analytics Professional?
Elizabeth Nielsen, Quintiles, 4820 Emperor Boulevard, Durham, NC, 27703, United States of America, Elizabeth.Nielsen@quintiles.com

Being a Certified Analytics Professional can positively impact your career since it is an independent assessment of knowledge and understanding of business analytics. It can be used as a marketing tool with your customers to show that you take analytics seriously. If you're looking for a new opportunity using analytics, the CAP designation gives your prospective employer an unbiased verification of your qualifications. CAP is the gold standard for the business analytics field.

2 - CAP Exam Prep Tips
Matthew Windham, Director of Analytics, NTELX Inc., 1945 Old Gallows Road, Suite 700, Vienna, VA, 22182, United States of America, mwindham@ntelx.com

How does one effectively prepare for the exam? While each individual is different, with their own learning styles, this session is meant to provide attendees with insights on preparation techniques taken by those who have already passed the exam. The variety of approaches discussed should provide the audience with ample options to consider for their own preparation efforts. Since this is a panel discuss event, audience participation is encouraged.

3 - Gaining the Analytics Advantage through Professional Certification of your Employees
Freeman Marvin, Executive Principal, Innovative Decisions, Inc., 8230 Old Courthouse Road, Suite 460, Vienna, VA, 22182, United States of America, ffmarvin@innovativedecisions.com

The INFORMS Certified Analytics Professional program has obvious benefits to the individual analysts who earn a certificate. What you may not realize are the many benefits to your company, agency, or organization of having employees who are CAP certified. Learn the five advantages that your CAP certified employees can give you over your competition or in the accomplishment if your mission.

4 - From OR Credentialing to Analytics Certification: A Five-Plus Year Journey

Scott Nestler, Chair, Analytics Certification Board, 8419 Riverside Rd, Alexandria, VA, 22308, United States of America, acb@informs.org

In 2008, at the Military Operations Research Society Symposium in New London, CT I heard a short talk about a proposed credentialing program for OR practitioners that caused me to ask, "how can I get involved?" Six years and hundreds of meetings later, I serve as the Chair of the Analytics Certification Board. This talk will provide historical anecdotes about the development of the Certified Analytics Professional (CAP) program, and my thoughts on why it is a worthy venture for INFORMS.

Big Data Industry Applications

Sponsor: Analytics

Sponsored Session

Chair: Grace Lin, VP & Director General, Advanced Research Institute, Institute for Information Industry, Taipei, Taiwan, gracelin.ny@gmail.com

Co-Chair: Ya-Hui Chan, Manager, Big Data Analytics, Advanced Research Institute (ARI), Institute for Information Industry (III), Taipei, Taiwan, yhchan@iii.org.tw

1 - Problems and Solutions to Throughput Modeling and Predictive Maintenance for Semi-conductor Packaging

Raymond Yu, Big Data Analytics, Advanced Research Institute (ARI), Institute for Information Industry (III), fishyu@iii.org.tw, Ming-Chen Shen, Grace Lin, Roger Gung, Paul Chou

This paper introduces two problems, solutions, and experimental results in semiconductor packaging: throughput modeling and predictive maintenance. Throughput modeling is about predicting throughput incorporating statistical models and/or data mining techniques by exploring vast amounts of historical data for product/tool specifications and their corresponding throughputs. Predictive maintenance is designed to incorporate throughput models and real-time performance measures that predict failures and performance degradations in order to optimize maintenance policies.

2 - Smart Tourism and Big Data Analytics

Grace Lin, VP & Director General, Advanced Research Institute, Institute for Information Industry, Taipei, Taiwan, gracelin.ny@gmail.com, Tim Lin, Jesse Shih, Ko-Yang Wang

In this talk, a Smart Tourism Initiative that was designed to provide tourists with high quality services, and deeper and more authentic experiences using big data analytics - before, during and after their trips will be presented. Key features include real-time, interactive, heterogeneous tourism information integration and Smart Matching, and O2O personalized SoLoMo-Based Services and Social media connectivity. Some pilot results and next steps will also be discussed.

3 - Analytics in the Cloud

Ko-Yang Wang, Executive Vice President, Institute for Information Industry, kyw@iii.org.tw

The emerging Information and big data analytics technologies are changing the way decisions are made everywhere. In this talk, Dr. Wang will discuss trends in IT, from Service-oriented Architecture, Business Process Management, Smart System Services and Cloud, to SoLoMo, APP and API Economy. The opportunities in leveraging emerging Information Technology for better decision-making will also be discussed.

Decision Analysis in Organizations

Sponsor: Decision Analysis

Sponsored Session

Chair: Robert Bordley, Booz Allen Hamilton, 101 West Big Beaver, Troy, MI, 48085, United States of America

1 - Appreciating Decision Quality ... Learning from our Mistakes

Vince Barabba, Chairman, Market Insight Corporation, 308 Cherry Ave, Capitola, Ca, 95010, United States of America, vbarabba@sbcglobal.net

The presentation will illustrate how General Motors improved its enterprise decision making by incorporating the thinking pricess underlying Ron Howard and Howard Raiffa's pioneering efforts. Although the decision process is no longer operating as an enterprise-wide process, some of the key components are still being used within the company. The presentation will focus on the successful impact of the fully integrated system on General Motors between 1985 and 2005.

2 - Which Came First? DA Practice or DA Research?

Jeffrey Keisler, Professor, Univ. of Massachusetts, Boston, 100 Morrissey Blvd, Boston, Ma, 02125, United States of America, jeff.keisler@umb.edu

In decision analysis, research has informed practice and practice has informed research, benefiting the field overall. Important examples from the literature demonstrate this. From reviewing these examples and reflecting on personal experience, I will suggest principles for how we can consciously manage research-practice interactions to continue to make progress.

3 - How to Dispose of California's Defunct Offshore Oil Platforms?

Max Henrion, CEO, Lumina Decision Systems, 26010 Highland Way, Los Gatos, Ca, 95033, United States of America, henrion@lumina.com, Brock Bernstein

The 27 oil platforms off California's coast are reaching the end of their productive lives. Should they be removed at great cost to the oil companies? Or should they be left their with their rich marine ecosystems? An interdisciplinary team created a decision analysis tool with Analytica to help the initially conflicted decision makers find a solution satisfying almost everyone.

4 - Session Summary

Robert Bordley, Booz Allen Hamilton, 525 Choice Court, Troy, MI, 48085, United States of America, rbordley@umich.edu

Decision analysis at General Motors took several forms: (1) the Dialogue Decision Process,(2) Cost Driver Analysis based on Henrion's sophisticated influence diagram software, and (3) Technology Portfolio Mgt —- for which Jeff Keisler, former President of this Society, has recently received a best publication award. Vince Barabba's leadership across these efforts during GM's Golden Age of Decision Analysis highlights DA's value in facilitating enriched cross-functional dialogues.

Value of Information Analysis: Theory and Applications

Sponsor: Decision Analysis

Sponsored Session

Chair: Matthew Bates, Research Environmental Engineer, US Army Corps of Engineers, 696 Virginia Rd, Concord, MA, 01742, United States of America, Matthew.E.Bates@usace.army.mil

1 - Value of Sequential or Static Information in Models with Statistical Dependence

Jo Eidsvik, Professor, Department of Mathematical Sciences, Norwegian University of Science and Technology,, NTNU, NO-7491, Trondheim, Norway, joeid@math.ntnu.no, Gabriele Martinelli, Debarun Bhattacharjya

We describe static and sequential information gathering in multivariate and spatial decision making problems when there is statistical dependence. Value of information analysis is used to compare the static and sequential testing options for a Gaussian portfolio example and a Bayesian network model for petroleum prospects.

2 - Entropy Based Methodology for Valuation of Uncertainty Reduction

Adam Fleischhacker, Assistant Professor of Operations Management, University of Delaware, 222 Alfred Lerner Hall, Newark, DE, 19716, United States of America, ajf@udel.edu, Pak-Wing Fok

We propose a distribution-free entropy-based methodology to calculate the expected value of uncertainty reduction efforts without requiring sampled observations of demand or a priori assumptions regarding the underlying demand distribution. We leverage our results to answer an often overlooked question in demand management: "Is there value in further reducing my demand uncertainty or do I act on my currently available information?""

3 - Prioritizing of Research to Improve Environmental Remediation Decisions

Matthew Bates, Research Environmental Engineer, US Army Corps of Engineers, 696 Virginia Rd, Concord, MA, 01742, United States of America, Matthew.E.Bates@usace.army.mil, Magnus Sparrevik, Igor Linkov, Jeffrey Keisler

Environmental remediation projects are often characterized by high degrees of complexity and uncertainty that make selection of optimal management alternatives difficult, especially when tradeoffs are needed across multiple domains. We apply Value of Information analysis to selection of remediation alternatives for the contaminated sediments of the Grenland Fjord, Norway, based on tradeoffs across uncertain environmental impact, human health risk, societal benefit, and monetary cost objectives.

4 - Putting Qualitative Data to Work: The Other Half of the Data Puzzle
McCall Baldwin, Baldwin Advisory Services,
United States of America, mbaldwin@baldwinadvisory.com

In order to further reduce uncertainty in the decision-making process, we need to incorporate both quantitative and qualitative aspects of data. This paper demonstrates methods of identifying, implementing and integrating both quantitative and qualitative aspects of data. The result is a comprehensive approach to data deployment that further reduces uncertainty surrounding the decision-making process. With a reduction in uncertainty comes an improvement in the value of decisions.

Joint Session Data/AI/HAS: Big Data Analytics and Smart Health I

Sponsor: Data Mining, Artificial Intelligence, & Healthcare
Sponsored Session

Chair: Sung Won Han, New York University, 650 First Avenue, New York, NY, United States of America, sungwonhan2@gmail.com

1 - Blood Donation Tailoring Problem to Improve Blood Supply Management
Guven Kaya, Ph.D. Student, Industrial Engineering-University of Houston, E222 Engineering Building 2, Houston, TX, 77204, United States of America, gkaya@central.uh.edu, Ali Ekici

Blood donation tailoring is to identify blood donation types and collect blood products. Donors perform donation types that provide blood products to patients, having collection/inventory/spoilage costs. We collect data about donation types with demand, cost, time, eligibility percentages, compatibility from blood banks. We develop MIP models to find collected/spoiled/carried blood product amount on single and multi-period settings. We provide results based on data from blood donation centers.

2 - Heterogeneous Postsurgical Data Analytics for Effective Healthcare Services
Hui Yang, Assistant Professor, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, huiyang@usf.edu

The rapid advancements of healthcare information technology, biomedical sensors, and computing power have resulted in data-rich environments in hospitals. With massive healthcare recordings readily available, it becomes a challenge for physicians to improve the prediction of postsurgical complications. This paper presents our recent efforts to develop new decision-support methods and tools of heterogeneous postsurgical informatics.

3 - Quantitative Approach for Surgical Task Recognition
Mahtab Jahanbani Fard, Wayne State University, Detroit, United States of America, mahtab.jahanbanifard@wayne.edu, R. Darin Ellis

Recognition of surgical procedure from different granularity level becomes one of the recent interests of researchers. Due to the stochastic description of the physical environment, modeling surgical assessment systems should incorporate with higher level modeling such as HMM which known to be more robust and accurate classifiers. In this study we review existing models and introduce a new model to recognize surgical task using HMM.

4 - Analyze Patient Flow of Appointment System with Blocking by Semi-Markov Model
Jie Song, Peking University/Department of Industrial and Management Engineering, Room512,Founder Building,No.298, Chengfu Road, Haidian, Beijing, HD, 100871, China, songjie@coe.pku.edu.cn, Yu Li, Yaqing Bai

This paper develops a novel method to manage patients' access to its appointment intervals and slots that explicitly takes into account the Key Resource Appointment System(KRAS) in China. A short-run booking window KRAS with blocking and batch transfer has been formulated as a semi-Markov model. Along with the parameters approximation and recursion, we get the close form that can quantitatively estimate the patient indirect waiting time and the system blockages.

Multiple Criteria Decision Making Applications

Sponsor: Multiple Criteria Decision Making
Sponsored Session

Chair: Murat Köksalan, Middle East Technical University, IE Dept., METU, Ankara, Turkey, koksalan@metu.edu.tr

1 - Bi-Objective Energy and Environmental Policy Research
Sahan Yildiz, Research Assistant, Middle East Technical University, IE Dept. METU, ANKARA, 06530, ysahan@metu.edu.tr, Murat Köksalan, Ebru Voyvoda

We design a bi-objective decision support system for energy policy decisions. We consider maximizing total consumption and minimizing greenhouse gas emissions as objectives and explore the efficient frontier. We also investigate robust policies against external energy price changes.

2 - Finding Preferred Points for Multi-objective Integer Programs
Banu Lokman, Middle East Technical University, Department of Industrial Engineering, Ankara, Turkey, banulokman@gmail.com, Murat Köksalan

We approximate the nondominated set with a hypersurface and identify a preferred point interacting with the decision maker. We then define a small preferred region around the identified point and generate the nondominated points in that region. Computations show that preferred points are generated with little cognitive and computational effort.

3 - Generating Representative Subsets of Nondominated Solutions in Multi-objective Integer Programming
Gokhan Ceyhan, Middle East Technical University, Department of Industrial Engineering, Ankara, 06800, Turkey, gceyhan@metu.edu.tr, Murat Köksalan, Banu Lokman

Generating all nondominated solutions of a multi-objective integer program is neither practical nor useful. The computational burden could be prohibitive and the resulting set could be huge. We develop algorithms to generate a small representative subset of nondominated solutions and we present computational results.

4 - A Probabilistic Approach to Multiple Criteria Sorting
Sinem Mutlu, Middle East Technical University, Department of Industrial Engineering, Ankara, 06800, Turkey, sinemmutlu01@gmail.com, Murat Köksalan, Yasemin Serin

We address the problem of placing alternatives evaluated in multiple criteria into preference-ordered classes. Either the decision maker directly places an alternative or the approach places when the probability of misclassification is below a specified threshold. We demonstrate that the approach works well.

Optimization Models in Data Mining

Sponsor: Data Mining
Sponsored Session

Chair: Petros Xanthopoulos, University of Central Florida, 12800 Pegasus Dr., Orlando, United States of America, petrosx@ucf.edu

1 - Data-driven Analytic Tools for Studying Brain Concussion During Sports
Ioannis Pappas, PhD Student, University of Florida, 3751 SW 20th Avenue, Apt 22, Gainesville, FL, 32607, United States of America, ioannis.p.pappas@ufl.edu, Panos Pardalos

We conduct analysis of EEG readings that were retrieved during a unique live recording of High School athletes playing football in practice. We identified excerpts of EEG before and after a concussion incident that took place during practice. We depict signal interdependencies by quantifying signal correlations using graph theory. We use linear and non linear measures in order to explain the causality of the differences between the EEG before and after the concussion.

2 - Sparse Mixed-Membership Matrix Factorization via Mixed-Integer Programming
Andrew Trapp, Worcester Polytechnic Institute, 100 Institute Rd., Worcester, MA, 01602, United States of America, atrapp@wpi.edu, Patrick Flaherty

We consider regularized mixed-membership matrix factorization, where one factor matrix can have a limited number of non-zero entries, and the other has simplex constraints. This provides a mixed-membership representation for each column of the original matrix with sparse mixing components. We transform the original and NP-hard biconvex optimization problem into a mixed-integer linear program, and show that reasonable-size problems can be solved via a sequential refinement approach.

3 - A Robust Consensus Unsupervised Framework for Time Series Clustering

Siavash Haghtalab, University of Central Florida, 1341-North Gate Circle, Apt 105B, Oviedo, Fl, 32765, United States of America, s.haghtalab@gmail.com

Network clustering is an important task for many Manufacturing tasks. Unfortunately different clustering algorithms might give different clustering results for the same data. In unsupervised learning since we do not have any prior information on the data, we do not have any information on how to choose a best fitted algorithm. In this work we will purpose a robust unsupervised framework to show how much the results and robustness of a clustering can be improved even by using bad clustering.

4 - Constraint Subspace Classification Algorithm for High Dimensional Datasets

Orestis Panagopoulos, Graduate Assistant, University of Central Florida, 2220 SW 34th Street, Apt.315, Gainesville, FL, 32608, United States of America, ore.pan@hotmail.com, Panos Pardalos, Vijay Pappu

In this work, we propose the extended binary classification method Constrained Subspace Classifier (CSC). CSC optimizes Local Subspace Classifier (LSC) by accounting for the relative angle between the subspaces and utilizing the projection metric. An efficient alternate optimization technique is also proposed. Simulations demonstrate that the method improves the accuracy of LSC, showing the significance of considering the relative angle between subspaces while approximating the classes.

Monday, 12:30pm – 2:30pm

Hilton Grand Ballroom A-B

Cluster: Interactive Session

Invited Session

Chair: Anna Nagurney, University of Massachusetts-Amherst, Amherst, MA, United States of America, nagurney@isenberg.umass.edu

1 - Operating Room Allocation for Overtime Control with Chance Constraints

Zheng Zhang, University of Michigan, 1205 Beal Ave, Ann Arbor, MI, United States of America, zhazheng@umich.edu, Brian Denton, Xiaolan Xie

This study considers operating room (OR) allocation problems with multiple ORs and random service time. We present a new stochastic programming formulation for surgery planning that guarantees a given proportion of ORs close punctually. We show this can reduce cost and achieve a more equitable balance of overtime for nursing staff. Decisions include a combination of surgery allocation decisions prior to the start of the day and dynamic reallocation decisions throughout the day.

2 - Online Robotic Parameter Optimization for High Precision Manufacturing via Analytic Hierarchy Process

Binbin Li, Texas State University, 1014 Sagewood Trail, San Marcos, TX, 78666, United States of America, b_l77@txstate.edu, Heping Chen, Tongdan Jin

High precision robots are widely used in automobile assembly, remote surgery, and aerospace industry. We propose a Gaussian Process Regression (GPR) model to establish the relation between process parameters and robotic performance including First Time Through and cycle time. Analytic hierarchy process is employed to search for the best covariance function. Experimental data show that GPR outperforms design-of-experiment and meta-heuristics in terms of global optimality and computational time.

3 - Risk Assessment and Mitigation for Food Supply Chains

Yanling Chang, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, changyanling@gmail.com, Brian Kues, Alan Erera, Chelsea White

We propose a dynamic risk analysis method to evaluate and mitigate the risks to food supply chains posed by intelligent and adaptive adversaries. We justify the value of our model by comparison to the traditional risk analysis approach. Finally, we determine the value of the defender's information about the attacker.

4 - Optimization, Discrete-event Simulation and Game Theory to Redesign Hazardous Materials' Logistics

Diana Ramirez, CSO, FCIMEC, Carrera 53 No.74-86 Of. 402, Barranquilla, Colombia, dramirez@fcimec.org, Luis Ramirez, Linda Bendavid, Nilson Herazo, Santiago Nieto, Miguel Jimenez, Lauren Castro, Jairo Montoya

This work integrates Game Theory, Meta-heuristic Optimization and Computer Simulation to solve a real-life location-routing problem found in bulk liquids and hazardous materials' transport. The models search for optimal transport network configuration in order to minimize environmental impacts while improving economic performance. A DSS is developed in which stochastic travel times are considered for daily truck operation.

5 - Equilibrium and Optimal Location of Retail Stores Competing with Mail Order Business

Masaaki Ozawa, Keio University, 5-29-4 Hiyoshi, Kohoku-ku, Yokohama, Japan, ozawa0130@gmail.com

We present a competitive location model in a one-dimensional city model with two competing retail stores and one mail order business. Consumers' choice of store is modeled by the production constraint spatial interaction models. We investigate the characteristics of the equilibrium and optimal location for two stores using different parameter settings: attraction and decay parameter. As the attraction of the mail order business increases, the two retail stores move to two separate locations.

6 - Optimal Inventory Mirroring via Linear Integer Programming

Zhiwei (Tony) Qin, Data Scientist, Walmart Labs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, tqin@walmartlabs.com, Jagtej Bewli, Mohan Akella

Inventory mirroring concerns with problem of deciding how many warehouses in the fulfillment network an SKU should be stocked. In the context of online retailing, strategic inventory mirroring allows the retailer to reduce overall delivery and fulfillment costs. In this poster, we propose a practical methodology to approximately solve the optimal inventory mirroring problem, by formulating the problem as a binary integer programming problem.

7 - Seasonal Transmission Switching to Reducing the Cost of Electricity

Masood Jabarnejad, Instructor and PhD Student, Auburn University, 333 East Magnolia Ave., Auburn, AL, 36830, United States of America, masood@auburn.edu, Jorge Valenzuela

Electricity generation infrastructure has a critical role in any country's economy and national security. The more efficient these infrastructures are, the cheaper service and better reliability they can offer to the society. We propose to use and integrate seasonal transmission switching with dynamic thermal rating system to reduce the electric generation costs, save money for the companies and offer cheaper service to the customers.

8 - Value-chain Optimization for Complex Chemical Production Processes

Patrick Briest, McKinsey & Co., Kennedydamm 24, Düsseldorf, 40476, Germany, patrick_briest@mckinsey.com, Isabelle Patouillaud, Valerio Dilda

We propose a novel production planning approach for the chemicals industry centered around an end-to-end optimization model covering the full length of the value chain, from procurement over production to sales. Our model incorporates cost/price curves for raw materials and finished goods and a MIP production model detailed enough to mimic physical plant behavior across all possible production scenarios. We present results based on a first real-life application with a global chemicals company.

9 - Integrating Uncertain Data in Disaster Relief Facility Location

Bin Li, University of Arkansas, Bell Engineering Building 4110, Fayetteville, AR, 72703, United States of America, binli@email.uark.edu, Ashlea Milburn

A multi-objective formulation of the minimax regret for the facility location problem that allows decision makers to open an efficient number of facilities when there is demand uncertainty. The problem is motivated by the recent need of integrating social data from multiple sources in order to make optimal decisions. CPLEX is used for solving three different optimization problems based on three different facility location strategies.

10 - Social Media Usage in Static Disaster Relief Routing Plans

Emre Kirac, PhD Candidate, University of Arkansas, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, ekirac@uark.edu, Ashlea Milburn, Clarence Wardell III

Precise information about the affected people is required so as to perform a quick response in disaster relief. Traditionally, on-the-ground assessment teams collect this information, but it takes some time. Social media can provide additional information about needs in less time, but such needs are not verified. This research evaluates the tradeoff associated with considering unverified information in disaster relief planning. These approaches are compared across a variety of demand scenarios.

11 - Intellectual Map of Information Systems

Mohammadmahdi Moqri, University of Florida, Gainesville, FL, 32611 United States of America, moqri.mo@gmail.com

We improve and redefine the Invisible Networks of Knowledge models as a social network and use it to map the intellectual structure of the field of Management Information Systems. The results help us observe how the field has been evolving and identify the core and emerging areas of research.

12 - The Art of Revenue Management: Optimizing by the LoS in Airport Carparks

Andreas Papayiannis, University of Manchester, School of Mathematics, Manchester, United Kingdom, Andreas.Papayiannis@manchester.ac.uk, Paul Johnson

We investigate the revenue management (RM) problem encountered in airport carparks, where spaces are sold in advance online. Currently, most RM practices in this sector are simple adjustments of those developed for hotels, exploiting the strong similarities of the two industries. However, unlike in hotels where the day of the week strongly affects the price of a room, a distinct setting appears where the daily price of a parking space depends heavily on the length-of-stay (LoS) of the booking. A continuous-time formulation leads to a HJB-type PDE model; by optimizing over the LoS, the PDE is solved to generate the dynamic table of expected marginal values required for bid-price control.

13 - Exploring Scheduling Changes in Clinic Rotations of a Medical Residency Program

Akshit Agarwal, Rochester Institute of Technology, Rochester, NY, 14623, United States of America, aa9425@rit.edu, Ruben Proano

Resident rotational programs require residents to have a one week outpatient clinic assignment every month. We explore the implications of having two consecutive weeks of clinic rotation every two months. We use discrete optimization to generate rotational schedules, and we explore combined metrics to assess the quality of this policy change.

14 - Freeway Reliability Scenario Generation: A Hybrid Approach

SeyedBehzad Aghdashi, NC State University, 803 Essex Forest Dr, Cary, NC, 27518, United States of America, behzad_aghdashi@ncsu.edu

The main objective of the proposed Scenario Generation approach is to increase the quality of each scenario, making it more representative of the expected congestion patterns on the freeway. The proposed approach uses three core mathematical schemes: a) a deterministic mathematical model b) a Monte Carlo simulation, and c) an optimization.

15 - Assessment of Capacity and Stability in National Sustainable Transportation

Hamed Ahangari, PhD Candidate, University of Connecticut, 1 Northwood Rd, Storrs, CT, 06268, United States of America, hamed.ahangari@uconn.edu, Carol Atkinson-Palombo, Norman Garrick

In last three decades, transportation system was faced with sustainability concerns but few efforts have been made to develop national sustainable transportation index-NTSI. This research use a nested approach to estimate NTSI by 19 environmental, social, and economic indicators in 30 developed countries. We also suggest and measure two new dimensions to assess sustainable systems: capacity and stability. Results offer a three dimensions clustering model to classify different countries.

16 - A Multi-criteria Approach to Maritime Search and Rescue Location Analysis

Amin Akbari, PhD Student, Dalhousie University/ Industrial Engineering Department, 5269 Morris Street/ PO Box 15000, Room R1-203, Halifax, NS, B3H 4R2, Canada, amin.akbari@dal.ca, H.A Eiselt, Ronald Pelot

This study's aim is to analyze the optimal location-allocation of maritime search & rescue resources by applying customized versions of the maximal covering and p-median problems. The optimal solutions of these two models are compared in terms of three decision criteria: (1) coverage; (2) mean access time; and (3) service equity. The results show a significant increase in resource utilization based on coverage and response time criteria for the model solutions compared to the current situation.

17 - Tournament Scheduling for Recreational Leagues

Athena Alimirzaei, Clinical Assistant Professor, University of Texas at Dallas, 800 W Campbell Rd, Richardson, TX, 75080, United States of America, athena.alimirzaei@utdallas.edu

There are many thousands of recreational sports leagues worldwide for both youth and adults of all ages. The recreational league scheduling problem is to assign matches in a given league to the resources allocated to that league. This work is motivated by the scheduling problem faced by the local company AllPlayers.com. A goal programming model has been developed to generate sports schedules on-line with various goals and restrictions.

18 - A Novel, Simple Interpretation of Nesterov's Method as a Combination of Gradient and Mirror Descent

Zeyuan Allen-Zhu, MIT, 32 Vassar St, Rm 32-G636, Cambridge, MA, 02139, United States of America, zeyuan@csail.mit.edu, Lorenzo Orecchia

Almost all first-order methods rely on two types of algorithmic steps: gradient-descent and mirror-descent steps. We obtain a simple interpretation of Nesterov's accelerated gradient method by expressing it as a natural coupling of the two types of steps. This interpretation has facilitated some recent breakthroughs (of the same authors) in approximately solving packing and covering LPs in nearly-linear time.

19 - Admission Batches to Minimize Internal Shuffles in a Centralized or Decentralized Hospital

Bruno Alves Maciel, Rochester Institute of Technology, 979 Nathaniel Rochester Hall, Rochester, NY, United States of America, ba8641@rit.edu, Ruben Proano, Richard Latham

We analyze the impact of a batched bed assignment process on the number of internal movements in several hospital units. The process can be applied under a centralized or decentralized admission policy, varying the amount of time between batch admissions while trying to minimize the number of internal movements. Our preliminary results show that under a centralized policy the need for internal movements can be completely eliminated.

20 - Evaluating and Testing Contemporary Snow Removal Routing Models under Ongoing Weather Conditions

Nathan Arrowsmith, RIT, 298 Pennels Dr, Rochester, NY, 14626, United States of America, nea4305@rit,edu

Snow removal route scheduling is a major component of winter weather planning. Recent approaches have focused on plowing all streets as quickly as possible and have demonstrated notable reductions in deadheading. These approaches however have largely ignored the impact of ongoing snow accumulation in the decision making process. By considering weather and traffic behavior, these methods can be evaluated for their efficacy during snow events. An accumulation-aware model is also under evaluation.

21 - The Effect of Urban Form and Location in Consumer Satisfaction

Homa Atef Yekta, Sharif University of Technology, Azadi St., Tehran, Iran, homa.atefyekta@gmail.com, Hamed Ahangari

Determinant of consumer satisfaction includes series of endogenous and exogenous factors. This research hypothesizes that urban form and business location are exogenously contributing in consumer satisfaction. We use online rating as the proxy of satisfactions. For location and urban variables we consider parking number, walkability score, network scale, and network density. The findings show that there is a strong statistical relation between urban form and consumer satisfaction.

22 - Efficiency Initiatives in Catalyst Production Lines the Use of Simulation as a Tool to Support Energy

Alexandre Augusto Massote, Professor, FEI University, Campus of S„o Bernardo, S„o Bernardo do Campo, Brazil, massote@fei.edu.br

This work includes the energy efficiency variables within the context of manufacturing systems and the aims are: to emphasize the importance of planning the production including variables related to energy; to use the simulation for improving the efficiency of the energy into industries; to investigate the opportunities of saving energy.

23 - Analyzing Tweets to Inform a Model of Patient Choice, Arrival Rates and Wait in Emergency Rooms

Barry Barrios, Virginia Tech, 250 Durham Hall, Blacksburg, VA, 24061, United States of America, barriosb@vt.edu, Ekkehart Beck

Patients tweet about their experience in emergency departments (EDs). We show how these relate to observed arrival and waiting time patterns seen in US EDs. Using these data we develop a model to study the effect of patient tweets on patient choice of ED, arrival rates and waiting times.

24 - The Care Life Cycle: Linking Health and Social Care for an Ageing Population

Sally Brailsford, Professor of Management Science, University of Southampton, School of Management, Southampton, United Kingdom, s.c.brailsford@soton.ac.uk

The Care Life Cycle is a five-year multidisciplinary research program funded by the UK EPSRC. Its aim is to apply "complexity science" methods to study the links between supply and demand for health and social care in an ageing population. We have developed a suite of linked simulation models, including an agent-based model of family formation, a system dynamics model of social care provision, and a hybrid DES-SD-ABS model for the eye condition age-related macular degeneration.

25 - Managing Stakeholder Voices for the Development of a Novel Rehabilitation Device for Upper Limbs Rehabilitation

Aline Marian Callegaro, Universidade Federal do Rio Grande, Porto Alegre, 90035190, Brazil, nimacall@gmail.com, Amanda SÛria Buss, Carla Schwengbe ten Caten, M·rcia Elisa Soares Echeveste, Raffaela Leane Zenni Tanure

The development of new technologies for the health area must take into consideration customer requirements from different stakeholders of the product value chain. This study aims in managing requirements from different stakeholders to develop a novel rehabilitation device for upper limbs rehabilitation. The Customer Value Chain Analysis (CVCA) tool was used to identify stakeholders and the Quality Function Deployment (QFD) tool to analyze and prioritize the requirements. Study results are described according the engineering requirement process: elicitation, analysis, and documentation. The results of this new approach of managing requirements report technology inputs for the development process of new medical devices.

26 - Modeling and Assessing Health Care Services Utilization in Hospital Readmission for Cancer Patients

Hanqing Cao, Senior Scientist, Philips Research North America, 345 Scarborough Rd, Briarcliff Manor, NY, 10510, United States of America, hanqing.cao@philips.com, Usha Raghavan, Yugang Jia

Healthcare services utilization data have not been previously employed to assess the readmission risk for cancer patients, while both are at the high priority of US government aiming to cutting cost. We developed models to investigate the relationship between health care services utilizations with unplanned 30-day hospital readmission. A number of interesting insights were generated from healthcare services utilization and unplanned hospital readmissions for cancer patients.

27 - Literature Review of Mathematical and Simulation Models for School Closures in Pandemic Influenza

Yao-Hsuan Chen, CDC, 1600 Clifton Rd, Atlanta, GA, 30333, United States of America, xhj1@cdc.gov, Amra Uzicanin, Karen Wong, Hongjiang Gao

We reviewed assumptions, structures, parameters, and results of published models that evaluated effects of school closures implemented to mitigate impact of an influenza pandemic. Out of 1587 papers identified in the initial search in PubMed, 39 met inclusion criteria for further review. Despite great variety in model specifications, published models found school closures to be effective in mitigating a pandemic influenza outbreak when implemented quickly and for sufficient duration.

28 - Eliciting and Combining Expert Opinion ñ An Overview and Comparison of Methods

Mutsa Chinyamakobvu, Masters Student, Rhodes University, P.O. Box 94, Grahamstown, EC, 6140, South Africa, m.chinyamakobvu@ru.ac.za, Isabelle Garisch

This paper is an overview and comparison of the elicitation and combination methods available for Expert Judgement Analysis. These include the traditional committee method, the Delphi method, the paired comparisons method, the negative exponential model, the classical model, the histogram technique, using the Dirichlet distribution and the employment of overfitting. The supra Bayes approach, and combining the opinions of experts given as confidence levels, are also considered.

29 - Design of Fuel Supply Chain for Power Plants: A Hybrid Stochastic and Robust Optimization Approach

Anna Danandeh, University of South Florida, 4202 E Fowler Ave, Tampa, FL, United States of America, annadanandeh@mail.usf.edu, Bo Zeng

42 percent of the US electricity power is generated from burning coal, whose quality variations may cause violations of EPA regulations. In this project, we develop a stochastic-robust hybrid multi-stage and multi-generator optimization model in which the demand randomness is described by a set of scenarios and the concept of uncertainty set is adopted to bound quality variations.

30 - NP-Hardness Proof for the Maintenance Scheduling for Modular Systems Problem

Tamar Cohen, Technion Israeli Institute of Technology, 11 Hagalil St., Gival Ela, Israel, tamar.cg@gmail.com, Liron Yedidsion

The Maintenance Scheduling for Modular Systems problem consists of a tree of components with respective cycle limits. The cycle limit for each component specifies the time interval in which it must be repaired. In order to reach a component in the tree its predecessor module must also be disassembled. The goal is to find a periodic replacement policy that minimizes the cost associated with component maintenance and module disassembly. In this paper we provide a proof that the problem is NP-hard.

31 - A Scenario-based Approach to Inventory Routing Problem

Vinayak Dinesh, RIT, 6000 Reynolds Drive, Rochester, NY, 14623, United States of America, vxd9920@rit.edu, Scott Grasman

Inventory routing problems (IRPs) that integrate inventory & routing problems can be considered a shift towards centralized thinking, influenced by practices like VMIs. This research tries to solve an IRP using a scenario based approach, considering uncertain demands. Furthermore the number of scenarios has been reduced by grouping retail centers showing similar demands with techniques like K-means clustering. As per our knowledge this is the first attempt at solving IRPs using this approach.

32 - Optimal Sampling Times for a Partially-observable Growing Population

Ali Eshragh, Lecturer/Researcher in Statistics and Optimization, The University of Newcastle, School of Mathematical and Physical Science, Callaghan, NS, 2308, Australia, Ali.Eshragh@newcastle.edu.au

Our goal is to estimate the rate of growth of a population governed by a simple birth process. We may choose (n) time points at which to count the number of individuals present, but due to detection difficulties, we are able only to observe each individual with fixed probability (p). We discuss the optimal times at which to make our (n) observations in order to maximize the Fisher Information for the rate of growth and support our theoretical results by numerical experiments.

33 - Model-based Simulation Systems for Adaptive Training in Time-critical Decision Making

Kushal Abhyankar, Wright State University, Dayton, OH, United States of America, kushal.abhyankar@wright.edu, Subhashini Ganapathy

The main goal of education and training is to provide capabilities that can help humans improve performance and accelerate decision-making. Advances in mobile computing (e.g., sensor technology, context aware computing, and cloud computing) allow for the design of systems that goes beyond the traditional methods of simulation training to support adaptive learning. The focus of this paper will be to present a human performance model for disaster response through sensor-based information.

34 - Textbooks for Responsible Data Analysis in Excel

Nathan Garrett, Woodbury University, 7500 Glenoaks Blvd., Burbank, CA, 91510, United States of America, nathan.garrett@woodbury.edu

With 27 million users, Excel is the most common data analysis software. However, audits show that almost all complex spreadsheets have errors. This project examines textbooks to understand why; are we teaching responsible data analysis? These textbooks are compared against spreadsheet development best practices. The results show a wide range of approaches, and that none of the ten books fully covers both the features and methodologies needed to create well-rounded Excel data analysts.

35 - Scheduling Multiple Parallel Machines with Capacity Constraints

Lai Wei, University of Michigan, Ross School of Business, Ann Arbor, MI, United States of America, laiwi@umich.edu, Dongdong Ge, Simai He

This work studies the problem of scheduling n independent jobs on p identical machines, with a limit on the number of jobs (q) that can be assigned to each machine. The goal is to minimize the total weighted completion time of the jobs. We consider both its deterministic case and the 2-≠stage stochastic optimization model and provide constant approximation algorithms for both problems.

36 - Total Value-of-ownership Model for Analyzing the Economics of a Fleet of Electric Vehicles

Thomas Goerzen, PhD Student, University of Paderborn, Warburger Strafle 100, Paderborn, Germany, Thomas.Goerzen@wiwi.uni-paderborn.de

We present a total value of ownership model to analyze the economics of a commercial fleet of electric vehicles. In comparison to existing models, we consider a significantly larger number of different cost and value parameters. Thereby we provide a better insight into the economic potential of electrified car fleets.

37 - Maximizing Sandfly Mortality for Controlling Kala-Azar Transmission in India

Kaushik Gorahava, Senior Quality Engineer, Verotech Solutions, LLC, 6189 NW 72nd Way, Parkland, FL, 33067, United States of America, kgorahava@gmail.com

Leishmaniasis is a family of human infectious diseases spread by the bite of sandflies. The Indian state of Bihar has the highest Leishmaniasis mortality rate in the world. Currently in Bihar, DDT (for controlling Leishmaniasis) is distributed only according to human population size. Is this process of insecticide distribution optimal? In this research, we explore this question by using models which optimize sandfly mortality rate under limited budget scenario.

38 - Demand Substitution in a Dual Sourcing Problem

Mustafa Hekimoglu, PhD Student, Erasmus University, Postbus 1738, Rotterdam, 3000 DR, Netherlands, hekimoglu@ese.eur.nl, Alan Scheller-Wolf

We consider quality difference between products from two suppliers. A natural outcome of this quality difference is demand substitution between products from two suppliers. We prove that the cost function for this model is pseudoconvex, which indicates the optimality of dual index policy under a mild sufficient condition. Also, a heuristic policy is developed by exploiting the myopic cost function. Extensive numerical tests show the heuristic deviates 7% from the optimal cost.

39 - Optimized Surveillance for Mosquito-borne Infections in Louisiana

Alexander Gutfraind, University of Illinois at Chicago, 1603 W. Taylor Street Rm. 834, MC 923, Chicago, IL, 60612, United States of America, agutfraind.research@gmail.com, Justin Davis, Krishna Patel, Lauren Meyers

Mosquito-borne infections, such as the West Nile Virus, cause millions of infections every year around the globe and in the USA. Infection control requires monitoring of the mosquito vectors. Here we report on one of the first applications of OR methods to this problem. Based on multiple years of data from St. Tammany Parish, LA we developed a spatial statistical model for the surveillance network. Using the model we optimized the efficiency and sensitivity of the surveillance schedule.

40 - Failure at the Top: How Power Undermines Collaborative Performance

John Hildreth, UC Berkeley, 2220 Piedmont Avenue, Berkeley, CA, United States of America, angus@berkeley.edu, Cameron Anderson

How does leaders' power affect their ability to work with other leaders? Laboratory experiments and field studies of executives found that groups of high power individuals performed worse than other groups: High power individuals were less creative when working together in groups and less able to reach agreement on difficult negotiation tasks because these groups engaged in more status conflict, were less focused on their tasks, and shared task information less effectively with each other.

41 - Departure Process in Heavily-loaded Service Systems with General Service Times

Junfei Huang, Assistant Professor, The Chinese University of Hong Kong, No.12, Chak Cheung Street, Shatin, N.T., Hong Kong - PRC, junfeih@cuhk.edu.hk

We derive an approximation for departure process in heavily-loaded service systems with general service time distributions. The results is based on some comparison results between loss systems and systems with buffers.

42 - Impact of Operational Drivers on Repurchase Intention in E-fulfilment

Nikunj Jain, Indian Institute of Management Indore, Rau-Pithampur Road, Prabhand Shikhar, Indore, MP, 453331, India, f11nikunjk@iimidr.ac.in

This study empirically examines the relationship between repurchase intention of customers and order procurement, order fulfilment and reverse service exchanges processes in an online retail environment. After controlling for customers' preferential brands, partial least squares structural equation modelling(PLS-SEM)analysis shows that operational drivers(ease of return,product information,product availability and condition of product on arrival)significantly affect repurchase intention.

43 - Towards Zero-carbon Manufacturing Operation: An Advanced Analytics Decision

Tongdan Jin, Associate Professor, Texas State University, 601 university Drive, San Marcos, TX, 78666, United States of America, tj17@txstate.edu, Victor Santana-Viera, Binbin Li, Heping Chen, Jesus Jimenez

This research performs a feasibility analysis on operating large manufacturing facilities under one hundred renewables penetration. We integrate wind turbines and concentrated photovoltaics into large enterprise systems to achieve zero carbon emissions goal. Our numerical experiments show that 100% renewable energy penetration is virtually affordable to any manufacturing facility in the world.

44 - New Branching Rules for Integer Programming using Strong Branching and Sampling

Ezgi Karabulut, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States of America, ezgi.karabulut@gatech.edu, Pierre Le Bodic, George Nemhauser

In this research, we aim to utilize a sampling approach in branch-and-bound trees. For that purpose, we incorporate sampling and strong branching with multiple levels. The first round of experiments on multicommodity network flow problems with fixed charge yield promising results for optimality gap in fixed amount of time.

45 - Iterative Simulation-optimization Algorithm for the Ambulance Location Problem

Sun Hoon Kim, Yonsei University, Korea, Seoul, Korea, Republic of, misia789@hanmail.net, Kee Yong Shin, Hyuk Lee, Cheng Yu Hwang, Young Hoon Lee

This study suggests an iterative simulation optimization algorithm for an ambulance location problem to minimize the number of vehicles while achieving required reliability level. An optimization model in the suggested model provides information regarding location of ambulances, the simulation model is used to validate the solution and interaction parameters are updated based on the simulation results. The computational experiments show that the suggested model outperforms existing algorithms.

46 - A Gage R&R Study in a Healthcare Setting

Russell Krenek, Clemson University, 129 Freeman Hall, Clemson, SC, 29634-0920, United States of America, rkrenek@g.clemson.edu, Shannon Harris, George Helmrich, Joel Greenstein, Byung Rae Cho

Despite being paramount to healthcare quality improvement initiatives, Gage Repeatability and Reproducibility studies in a hospital setting are rarely studied in the literature. This poster discusses a Gage R&R experiment in a hospital setting by developing various aspects of the quality of measurement associated with medical devices and processes to identify what part of measurement variability is affected by repeatability and reproducibility. A strategy for collecting data is also presented.

47 - Demand Forecasting by Factorization Machines in Fashion Industry

Chongshou Li, Phd Candidate, Department of Management Sciences, City University of Hong Kong, To Yuen Building - 2802, Tat Chee Avenue, Kowloon,Hong Kong, Hong Kong - PRC, chongshli2-c@my.cityu.edu.hk, Andrew Lim, Brenda Cheang

Demand forecasting is a challenging problem because demands for fashion products are highly affected by season, region and short life cycle. Factorization Machines (FMs) have recently been proposed as generic predictors and solved such problems in many areas. In this study, a novel model based on FMs is proposed for fashion products demand forecasting based on sixteen months of sales data from a multinational fashion retailer. Experimental results show that our approach produces good results.

48 - Optimal Pairing of Single and Multi-occupancy Rooms in a Centralized or Decentralized Hospital

Richard Latham, RIT, 6000 Reynolds Dr., Box 509, Rochester, 14623, United States of America, rel5224@rit.edu, Ruben Proano, Bruno Alves Maciel

The study uses a response surface design with a Monte Carlo simulation experiment to determine the best room configuration for a hospital interested in reducing the number of internal shuffles. These shuffles result from the need to implement isolation requirements to control healthcare-acquired infections in multi-occupancy rooms. The model determines the optimal pairing of single and multi-occupancy rooms in each unit when using a decentralized or centralized scheduling methodology.

49 - A Multilevel Proximal Algorithm for Large Scale Composite Convex Optimization

Duy Luong, Dr, Imperial College London, South Kensington, London, SW7 2AZ, United Kingdom, vu.luong@imperial.ac.uk

Composite convex optimization models consist of the minimization of the sum of a smooth convex function and a non-smooth convex function. Such models arise in many applications where, in addition to the composite nature of the objective function, a hierarchy of models is readily available. We propose a novel method to take advantage of the hierarchy of models for computing the search directions. We establish the global convergence and compare with two popular algorithms (ISTA and FISTA).

50 - Improving Model Inference from FRAP Data – An Example from the Drosophila Wing Disc

Lin Lin, University of Minnesota, Twin Cities, 1618 Eustis St., Saint Paul, MN, 55108, United States of America, linlinbme2009@gmail.com

Fluorescence recovery after photobleaching (FRAP) is used to obtain quantitative information about diffusion and binding kinetics by fitting the experimental data to a mathematical model. However, when the system involves the complex interaction of transport and reaction steps, the question arises as to what level the system should be modeled and how one is to estimate the parameters. I will propose a theoretical approach to investigate these questions and to improve parameter estimation.

51 - Allocating Linear Rescheduling Cost with Machine Unavailability

Zhixin Liu, University of Michigan - Dearborn, 19000 Hubbard Dr, Dearborn, MI, 48126, United States of America, zhixin@umich.edu, Liang Lu, Xiangtong Qi

We study a rescheduling problem faced by multiple jobs owners, where jobs need to be rescheduled to minimize the total weighed completion time, when the machine becomes unavailable for a period of time and the initial optimal schedule becomes infeasible. We provide a simple closed form core allocation of the total cost saving for all the jobs, and also provide the Shapley value of the game in a computable form.

52 - Stochastic Modeling and Optimization of Biomanufacturing Operations

Tugce Martagan, University of Wisconsin-Madison, 4701 Sheboygan Ave Apt 302, Madison, WI, United States of America, martagan@wisc.edu, Ananth Krishnamurthy

We consider the manufacturing of custom-made proteins. We first develop reliability models and condition-based control policies for fermentation systems. Next, we investigate optimal protein purification strategies via dynamic programming to minimize costs. We collaborate with several local biomanufacturing companies to validate our models and implement our findings.

53 - Measuring Near Real-time Harm in the Hospital using Electronic Health Records (EHR)

Seyed Mani Marashi, PhD Student, Wayne State University, 4815 Fourth Street, Detroit, MI, 48202, United States of America, ez6964@wayne.edu, Jack Jordan, Kenneth Chelst

Harm occurs when a patient develops a new medical problem in a hospital. It is historically measured using billing data that lags the actual harm by weeks and also has accuracy issues. We used electronic health records to achieve better and faster measurement using cases of venous thromboembolism.

54 - Mathematical Analysis of Fireworks Displays with Respect to Solid Angles

Yohei Okimura, Keio University, 3-14-1 Hiyoshi, Kohoku-ku, Yokohama, 223-8522, Japan, youhei.o@a7.keio.jp, Yudai Honma, Takamori Ukai, Osamu Kurita

Fireworks displays are typical features of Japanese summer. We propose a mathematical model to evaluate the optimal viewing points for fireworks displays based on computational geometry algorithms. We calculate the solid angles of actual fireworks displays with respect to the shielding by millions of existing buildings in Tokyo metropolitan area.

55 - Evaluating Algorithms for Processing Nuclear Detection Sensor Data

Christie Nelson, Rutgers University, 23A Norwood Ct, Princeton, NJ, 08540, United States of America, christie.l.nelson.phd@gmail.com, William M. Pottenger, Fred Roberts, Paul Kantor

Many nuclear detection algorithms have been developed for scanning vehicles for threats and must be evaluated fairly. An approach is to conduct experiments with simulated data using sensor data as input, with a goal to find experimental configurations revealing meaningful differences between algorithms. Combinatorial Experimental Design provides a set of configurations which cover all levels and pairs of levels of important variables; these must be reviewed and valued by subject matter experts.

56 - Exact and Heuristic Anytime Algorithms for Solving the Knapsack Problem

Diego Mesquita, University of Alberta, 2-32 Athabasca Hall, Edmonton, AB, T6G2E8, Canada, parentep@ualberta.ca

In 1997, Richard E. Korf presented an approach for solving Combinatorial Optimization problems which has been successfully applied to problems such as Number Partitioning and Bin Packing. In this work we apply it to the Knapsack Problem and provide a critique of Korf's method.

57 - Group Buying: Retail Stores' Performance and Implications

Qijun Qiu, The University of Hong Kong, RM 723, 7/F, K.K. Leung Building, Pokfulam RD., Hong Kong, Hong Kong - PRC, angieq@connect.hku.hk, Benjamin Yen

We study a new promotion strategy, Group Buying (GB), in which consumers enjoy a price discount by forming a group. We build monopoly and competition models to examine if and how store offers GB in a sustainable manner. We find that store's decision depends on the market pattern and its regular pricing policy, while it still can manage to secure a reasonable profit. Further, store competition affects the equilibrium in a quite dramatic way. All these explain the prevalence of GB worldwide.

58 - Credit Card Holders Behavioral Modeling: Multistage Regression Approach

Denys Osipenko, Doctoral Researcher, University of Edinburgh Business School, 29 Buccleuch Place, Edinburgh, EH8 9JS, United Kingdom, denis.osipenko@gmail.com, Johnathan Crook

Because of the variety of the card holders' behaviour patterns and income sources each consumer account can move to different states. The key question is which approach gives more accurate results: multinomial logistic regression or multistage decision tree with binary logistic regressions. This paper investigates the approaches to credit cards profitability estimation at account level based on multistates conditional probability.

59 - AI-AFTER: Identifying the Right Goal of Forecast Combination

Craig Rolling, Assistant Professor, Lundquist College of Business, 1208 University of Oregon, Eugene, OR, 97403, United States of America, crolling@uoregon.edu

There are two potential goals of forecast combination: combining for adaptation or combining for improvement. It is important to know which goal is more appropriate for a given analysis so that a suitable combination method may be used. AI-AFTER first determines the appropriate goal of forecast combination, then combines the forecasts to achieve the proper goal. As a result of this approach, the combined forecasts from AI-AFTER perform well in both adaptation and improvement scenarios.

60 - Modeling Red and Yellow Alert Durations for Ambulance Systems as Partial Busy Periods

Amir Rastpour, University of Alberta, Edmonton, AB, Canada, rastpour@ualberta.ca

Ambulance system Red and Yellow alerts are time periods during which all or most ambulances are busy, respectively. Modeling such systems as Erlang loss systems, we obtain the first moment of alert period duration, and show that our results are consistent with empirical data from Calgary. We also obtain alert duration Laplace Transform and higher moments when the service time distribution is general. We study the impact on alert duration of increasing the number or service speed of ambulances.

61 - Development of Control Models for the Planning of Sustainable Transportation Systems

Alexander Paz, University of Nevada, PO BOX 454015, Las Vegas, NE, 89154, United States of America, apaz@unlv.edu, Pushkin Kachroo, Pankaj Maheshwari

The proposed research envisages how to incorporate sustainability considerations into the transportation planning process. A dynamic model for planning and development of sustainable transportation systems is presented. A system of three nonlinear differential equations is used to represent the dynamics of three states; namely Transportation, Activity, and Environmental systems. A policy scenario considering investment in energy efficient technologies and its effects is discussed.

62 - The Behavior of Government Subsidies to Low-carbon Products and Social Welfare Analysis

Jie Ren, University of Science and Technology of China, School of Management, 96 Jinzhai Road, Hefei, 230026, China, ahrj@mail.ustc.edu.cn

We study the effect of government subsidies to individual consumers, manufacturers or both subsidized by using three modes of game between government and enterprises. In order to provide a support for the government to make scientific subsidies decisions and for the manufacturers and consumers to make good decisions in the context of government subsidies, we analysis the impact of different government subsidies modes on the manufacturer's revenue, consumer surplus and social welfare.

63 - A Defender-Attacker-Defender Model for Railway Infrastructure

Hassan Sarhadi, PhD Student, Memorial University of Newfoundland, 57 Allandale Road, PO BOX 534, St.John's, NL, A1B 3S7, Canada, hassan.sarhadi@mun.ca, David Tulett, Manish Verma

Owners of railway facilities need to defend their assets, particularly railyards, against attack by terrorists. We use a Defender-Attacker-Defender framework to model this problem. The resulting mathematical formulation is very complex, but we are able to solve the problem optimally for a small number of protected/interdicted terminals.

64 - Buyer-supplier Relationship: The Impact of Service Logistics Level in Customer Satisfaction and Loyalty

Mauro Sampaio, FEI University, Campus of S„o Bernardo, S„o Bernardo do Campo, 09850-901, Brazil, msampaio@fei.edu.br

The objective of this research is to demonstrate the impact of logistics service on customer satisfaction and, consequently, on their loyalty. Empirical evidence is provided on the relationship between operational and relational performance, satisfaction, affective commitment, purchasing behavior and loyalty of buyers from the Brazilian industry.

65 - Using Big Data Analytic to Eliminate Empty Miles in Logistics

Haibo Wang, Texas A&M International University, 5201 University Blvd, Laredo, TX, 78041, United States of America, hwang@tamiu.edu, Wei Wang, Jun Huang, Wei Ning

This study presents a framework using information system based on big data analytic and cloud computing to eliminate empty miles to improve the efficiency of logistics. First, data and text mining tools are used to extract valuable information automatically for input, then a mathematical programming model is proposed to solve the problem of matching shipments with carriers in term of time and cost. The customer retention and dynamic pricing schedule are also implemented in the proposed system.

66 - Discounting over Subjective Time: One Step Towards a Unified Theory of Intertemporal Choice

Yitong Wang, Lecturer, University of Technology, Sydney, Cnr Quay Street and Ultimo Road, Haymarket NSW, NS, 2000, Australia, yitongwang@uts.edu.au, L. Robin Wang, Liangyan Wang

Discounted utility theory has been regarded as the normative theory when modelling inter-temporal choice. However, existing research suggests people in general don't obey discounted utility theory as their discount rates are context dependent. This paper incorporates decision makers' time perception into discounted utility model and finds relatively constant discount rates over subjective time. Our finding helps in developing a unified theory for inter-temporal decision making.

67 - Dynamic Optimal Inflow Control with Queues for Minimal Evacuation Time in a Tsunami Inundated Area

Junji Urata, The University of Tokyo, 7-3-1 Hongo, Bunkyo-ku, 1138656, Japan, urata@bin.t.u-tokyo.ac.jp, Eiji Hato

The optimal control is needed to prevent a traffic congestion for evacuation in a tsunami inundated area. This paper proposes a dynamic inflow control model on intersections and aims to minimize the evacuation time. This model treats the flow conservation, the FIFO and the physical queues in a many-to-one network. The Pontryagin's maximum principle is applied to get the earliest evacuation time. The dynamic optimization is formulated by the constrained conditions of DTA.

68 - Operations Research for Functional Neuroimaging
Svetlana Soloveva, PhD Student, Rutgers University, 617 Bowser Road, Piscataway, NJ, 08854, United States of America, svetsolo@rutgers.edu, Dimitris Metaxas

Our goal is to identify disease related features and common features of a healthy brain through characterization of changes in connectivity of functional networks. Our neuroimaging data is recorded with MEG and MRI. We solve inverse electromagnetic problem for realistic head models to localize sources of activity in the brain. Measures of functional similarity are used for network analysis.

69 - WLC-based Process Plan Decision and its Heuristic Approaches
Boxuan Zhao, Xi'an Jiaotong University, Xi'an, China, zbx.1067@stu.xjtu.edu.cn, Kun Chen, Jianmin Gao

This paper investigates WLC-based process plan decision which is a real-time dynamic and closed loop decision-making method for process planning, and derives nine heuristic approaches. The simulation results in the general job shop show the strategies considering order features outperform those considering shop status. The processing-time-related strategies perform best and present a good robustness as the workload control is relaxed. The locations of focused stations affect their performances.

70 - Common Pitfalls in "Common Practice"
Channing (Chang) Yan, Senior Consultant, Decision Strategies, Inc., Houston, TX, 77042, United States of America, cyan@decisionstrategies.com

Traditionally drilling time and cost have always been estimated deterministically. A typical approach is to develop an approximate average and then add enough contingency until we feel comfortable with the number. Few people realize the danger of this practice, and most consider it to be "conservative"; hence it is all "good". This paper challenges the convention and demonstrates what has always been done in the past is not necessarily always right or a best practice. It points out several common pitfalls in our common practice as well as challenges in influencing people with a new way of thinking.

71 - Modeling Brand Correlation through Iterative Sparsity Search
Qiong Zhang, Virginia Commonwealth University, 1015 Floyd Avenue Richmond, VA 23284-308, Richmond, va, 23294, United States of America, zhangqiong1985@gmail.com

We propose a novel statistical approach to estimate the covariance structure of multiple brands in grocery stores. The method can also be used for predicting brand performances in unexplored markets.

72 - A Simulated-based Approach for ED Patient Throughput and Med/surg Unit Workforce Optimization
Jingyu Zhang, Philips Research North America, 345 Scarborough Rd, Briarcliff Manor, NY, 10510, United States of America, jingyu.zhang@philips.com, Xiang Zhong, Zhichao Shu, Therese Fitzpatrick

Many hospitals in the US face serious patient throughput problems especially in their emergency department (ED). While new patients wait long time for ED beds, ED beds are still occupied by those patients who should have moved to other general med/surg units. A root cause is the workforce utilization problem in those general units. We developed a simulation-based approach to improve ED patient throughput and optimize med/surg unit workforce simultaneously.

73 - Modified Cell Transmission Model for Traffic Signal Control Optimization
Hao Yu, Southeast University, 2 Sipailou, Nanjing, 210096, China, seudarwin@gmail.com

The traffic signal timing optimization problem is formulated based on a modified cell transmission model. The node model of the new CTM is enhanced to capture complex traffic signal control strategies. Detailed model structure is proposed, as well as some numerical studies. It shows that the new model is able to simulate different traffic signal control strategies, with quite low additional computation."

Monday, 1:30pm - 3:00pm

Sensors and Weapons

Sponsor: Military Applications Society

Sponsored Session

Chair: Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - Optimizing Sensor Placement to Maintain Coverage and Connectivity Following Perturbations
Andrew Romich, Sandia National Laboratories, 7011 East Avenue, MS 9154, Livermore, CA, United States of America, aromich@sandia.gov, George Lan, J. Cole Smith

We consider a sensor placement problem in which the sensors must maintain coverage of a set of adversarial locations. Maximum intra-sensor communication, as determined by a function of distance between sensors, is desired. Complicating the sensor location problem are uncertainties related to final sensor positions due to unintended movement, e.g., due to air or water currents to which the sensors may be subjected.

2 - Optimal Positioning of Active Multistatic Sensors for Point Coverage Applications
Emily Craparo, Naval Postgraduate School, 1411 Cunningham Road, GL-238, Monterey, CA, 93943, United States of America, emcrapar@nps.edu, Mumtaz Karatas

We study the problem of optimally positioning active multistatic sonar sources for a point coverage application where all receivers and targets are stationary. We formulate exact and approximation algorithms for optimally placing sources under a various sensor models, and we extend these models to account for unreliable sensors.

3 - Approximate Dynamic Programming for the Dynamic Weapon Target Assignment Problem
Carl Parson, Air Force Institute of Technology, 2950 Hobson Way, Wright-Patterson AFB, OH, 45433, United States of America, carl.parson.ctr@afit.edu, Darryl Ahner

As the sophistication of air defense systems increases, traditional weapon's employment strategies no longer suffice. In many practical examples, weapon's effectiveness may not necessarily be independently multiplicative. This research formulates the dynamic weapon-target assignment problem with conditional weapons effectiveness and solves it using dynamic programming. A small example is solved exactly prior to presenting approximation methods to help mitigate the curse of dimensionality.

4 - Maritime Anomaly Detection
Cleber Almeida De Oliveira, Fundaç„o EZUTE, Rua do RÛcio, 313 - 11∫ andar, Sao Paulo, 04552-000, Brazil, oacleber@gmail.com

The challenge in this research is to determine the location of dependent sources for data collection in oil rig areas and to specify an effective information exploitation system for maritime situation awareness that reduces the operator's workload to detect maritime anomalies and allow a comprehensive association between anomalies and scenarios of interest so that follow-on decisions may be better rationalized.

Rx for Patent Fatigue in Innovation Research: New Data, New Causal Methods, and New Results

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Lee Fleming, UC Berkeley, 330 Blum Hall, Berkeley, CA, 94720, United States of America, lfleming@berkeley.edu

1 - What Does the Patent Allowance Rate Tell us About Examination Standards?

Alan Marco, Acting Chief Economist, U.S. Patent and Trademark Office, 600 Dulany St. MDE 2D39, Alexandria, VA, 22314, United States of America, Alan.Marco@uspto.gov, Micharl Carley, Deepak Hegde

Patents play a key role in companies' innovation strategies: this study analyzes factors that affect patent examination outcomes at the US Patent & Trademark Office (PTO). Controlling for application characteristics and stocks of pending applications, we find little evidence to support claims of widely varying quality. Apart from offering implications for patent policy makers, our study also contributes a novel methodology to estimate the effect of covariates on patent allowance and abandonment.

2 - Do Inventors Value Secrecy in Patenting? Evidence from the American Inventor's Protection Act of 1999

Stuart J. H. Graham, Georgia Institute of Technology, Atlanta GA, United States of America, stuart.graham@scheller.gatech.edu, Deepak Hegde

This study examines the revealed preferences of inventors towards secrecy in patenting by analyzing their disclosure choices before and after the enactment of the American Inventor's Protection Act (AIPA) of 1999. We find that about 7.5% of U.S. patent applications use AIPA's provisions to keep their inventions secret before patent grant. Small U.S. inventors, in particular, are more likely than large corporations to prefer disclosure over secrecy for their most important inventions. Our findings question the conventional wisdom — which seems to have shaped important policy — that the disclosure of patent applications harms U.S. invention by increasing the risk of imitation for small inventors.

3 - Friendly Boards and Innovation

Lee Fleming, UC Berkeley, 330 Blum Hall, Berkeley CA 94720, United States of America, lfleming@berkeley.edu, Benjamin Balsmeier, Gustavo Manso

We develop a model and present supporting evidence for how friendly boards influence the innovative search strategies of a firm. Shareholders hire a manager to run a firm for two periods. To supervise the manager, shareholders appoint a board of directors. In each period, the manager reports to the board of directors, proposing a strategy, which the board decides whether or not to approve. Riskier and "explorative" search strategies are more likely with friendlier boards. Empirical identification relies on regulatory changes that caused shareholders to appoint a majority of independent directors. We find that firms with friendly boards are more likely to explore less crowded and newer and new-to-the firm technologies and to hire younger and new-to-the firm inventors. Firms with less friendly boards tend to patent more and get more citations to their patents, though these effects are strongly mediated by an increase in claims and insignificant in the tales of the citation distributions (completely failed and breakthrough inventions are less influenced by the friendliness of the board).

4 - Patents and Cumulative Innovation: Causal Evidence from the Courts

Alberto Galasso, University of Toronto, Toronto, ON, Canada, alberto.galasso@rotman.utoronto.ca

This paper studies the causal effect of removing patent protection through court invalidation on subsequent research related to the focal patent, as measured by later citations. We exploit random allocation of judges at the U.S. Court of Appeal for the Federal Circuit to control for the endogeneity of patent invalidation. We find that patent invalidation leads to a 50 percent increase in citations to the focal patent but the impact is highly heterogeneous.

Data-Driven Analysis in eBusiness

Sponsor: eBusiness

Sponsored Session

Chair: Hong Guo, University of Notre Dame, 356 Mendoza College of Business, Notre Dame, IN, 46556, United States of America, hguo@nd.edu

1 - Large Scale Network Analysis for Online Social Brand Advertising

Kunpeng Zhang, Assistant Professor, University of Illinois at Chicago, 601 S Morgan St., Chicago, IL, 60607, United States of America, kzhang6@uic.edu

This paper proposes an audience selection framework for on-line brand advertising based on user historical activities on social media platforms. It builds implicit brand-to-brand networks and analyzes their structural properties. We propose hierarchical community detection, distributed influential brand identification, and sentiment analysis to find target users. The experiments conducted on Facebook data show that our framework can obtain performance improvement compared to baselines.

2 - Text Mining for Marketing Importance: Decomposing Firm Value

Brent Kitchens, University of Florida, 4046 NW 60th Ave, Gainesville, FL, 32653, United States of America, brent.kitchens@warrington.ufl.edu, Debanjan Mitra, Joseph Johnson, Praveen Pathak

We use a novel text mining technique to extract firm marketing news. This enables us to address a longstanding big picture question raised by marketing scholars – is marketing losing its importance? We compare marketing news to firm abnormal returns and find that marketing is important to investors. Moreover, we find no sustained diminishing trends in marketing's importance, but rather that this importance is counter-cyclical – decreasing with macroeconomic growth and increasing with adversity.

3 - Bidding Behavior in Sealed-bid Construction Contracts: An Empirical Study

Gulver Karamemis, University of Florida, Warrington College of Business Administr, Gainesville, United States of America, gkaramemis@ufl.edu, Anand Paul

We uncover patterns of bidding behavior in sealed bid contracting in the construction industry in a large US state by analyzing longitudinal data spanning several years, and across a wide range of construction projects. We compare and contrast our findings with predictions from contract theory.

4 - Hierarchical SVMs for Personal Event Detection in Social Networking Sites

Shengli Li, Xi'an Jiaotong University, Xianning West Road 28, Xi'an, China, lishengli@mail.xjtu.edu.cn, Hong Guo, Haldun Aytug, Praveen Pathak

Users announce and discuss their personal events with their friends on the social networking sites.This paper models personal event detection in social networking sites as a classification problem and proposes a hierarchical SVM model to capture the unique nested structure of social networking data.Using a large-scale real-life dataset, we test the performance of the proposed hierarchical SVMs and compare it to other existing methods.

New Topics in Supply Chain Network and Design

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Yehua Wei, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, yehua.wei@duke.edu

1 - Designing Flexible Systems

Andre Calmon, Assistant Professor, INSEAD, Boulevard de Constance, Fontainebleau, France, acalmon@mit.edu, Dragos Florin Ciocan

We propose a novel theoretical framework for flexibility in supply chains and service systems. Using this framework, we develop tools aimed at guiding the design of large scale flexible systems. In addition, we apply this approach to the design and analysis of an on-line resource allocation scheme. Finally, we illustrate our results through numerical experiments.

2 - Managing Disruptions with Uncertain Duration in Supply Chain Networks

Peter Y. Zhang, Massachusetts Institute of Technology, 77 Mass Ave., Cambridge, 02139, United States of America, pyzhang@MIT.EDU, William Schmidt, David Simchi-Levi, Yehua Wei

Firms with complex supply chains are exposed to a variety of risks, including low-probability / high-impact events that can completely halt the production of supplier sites for an extended duration. We use a linear optimization model to quantify the performance impact of disruptions, and identify inventory / flow decisions that minimize such impact. We also develop a Pareto robust strategy to identify dominant solutions if the disruption duration is uncertain.

3 - Competition in Supply Chain Networks in the Presence of Disruption Risk

Ozan Candogan, Fuqua School of Business, Duke University, Durham, NC, 27708, United States of America, ozan.candogan@duke.edu, Kostas Bimpikis, Shayan Ehsani

This paper considers multi-tier supply chains in the presence of disruption risk. A network structure determines the set of potential supply relationships and the extent of competition among firms in a given tier. We provide a characterization of the equilibrium of the strategic interaction between the firms, which highlights the interplay between the network structure and the resulting prices, production quantities, and profits associated with each of the firms.

4 - Approximation Algorithms for Perishable Inventory Systems with Setup Cost

Huanan Zhang, University of Michigan, 2797 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, zhanghn@umich.edu, Xiuli Chao, Cong Shi

This work studies perishable inventory systems with setup costs. Little is known about the structures of optimal policies for such systems in the literature. The design and computation of an effective heuristic policy has been an open challenge. We describe the first computationally efficient policy that admits a worst-case performance guarantee between 3 and 4 under a large class of correlated demand processes.

Operations and Marketing Interface

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Ozge Sahin, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21231, United States of America, ozge.sahin@jhu.edu

1 - Pricing of Conditional Upgrades in the Presence of Strategic Consumers

Yao Cui, PhD Candidate, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, 48109, United States of America, cuiyao@umich.edu, Izak Duenyas, Ozge Sahin

We study a conditional upgrade strategy that has recently become common in travel industry. A consumer can accept an upgrade offer after making a reservation and pay the fee to upgrade at check-in if the high-quality product type is still available. Consumers decide which product type to book and whether to accept an upgrade offer based on the anticipated upgrade probability. We characterize the firm's optimal upgrade pricing strategy and identify multiple benefits of conditional upgrades.

2 - B2B Pricing Optimization for Resellers

Ozden Engin Cakici, American University, Washington, DC, cakici@american.edu, Itir Karaesmen

In electronics, health care, and retail industries, it is common for surplus inventory, returned merchandise, used goods, or waste to be sold to resellers. A reseller (or broker) matches the demand for such goods with the supply. The resellers operational decisions include how much to bid for the supply and how to allocate the supply among its existing customers. We show how a reseller's problem can be formulated as a two-stage stochastic model and how the optimal solution can be obtained.

3 - Consumer Choice Models with Endogenous Network Effects

Ruxian Wang, Assistant Professor, Johns Hopkins Carey Business School, 100 International Dr, Baltimore, MD, 21202, United States of America, ruxian.wang@jhu.edu, Zizhuo Wang

Network externality arises when product utility not only depends on attribute valuations, but also the number of users. We propose and analyze a new class of choice models by taking into account the endogenous network effects. We show the optimality of a new class of assortments, called a quasi-revenue-ordered assortment, consisting of a revenue-ordered assortment plus one item. Empirical results by using a new iteration-based estimation method show that our model is statistically significant.

4 - Personal Selling in an Emerging Market

Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States of America, dai@jhu.edu, Jian Ni

We develop a principal-agent type model to study how a multinational manufacturer constructs its personal-selling networks when entering an emerging market. Under information asymmetry and product/cost differentiation, we show that a strong regulatory environment may facilitate the entry of the multinational manufacturer. Our paper helps explain asymmetric distribution structures empirically observed in emerging markets.

Cloud Computing for Optimization

Cluster: Tutorials

Invited Session

Chair: Jeff Linderoth, Professor, University of Wisconsin-Madison, United States of America, linderoth@wisc.edu

1 - Cloud Computing for Optimization

Jeff Linderoth, Professor, University of Wisconsin-Madison, United States of America, linderoth@wisc.edu

I will describe experiences with using ubiquitous, convenient, on-demand, shared computing resources to solve large-scale optimization problems. In olden days, these computing resources were known as a "metacomputer." In the early 2000's, the name changed to the "computational grid," and now using computing resources in this way is known as "cloud computing." I will also survey the landscape of cloud computing and its use and potential for Operations Research and Optimization.

George Dantzig's Continuing Impact on Advances in Optimization

Cluster: Celebrating George B. Dantzig's 100th Birthday and His Influence on MS/OR

Invited Session

Chair: Robert Freund, Professor, MIT, Sloan School of Management, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, rfreund@mit.edu

1 - How Good is the Simplex Method, Continued?
Ilan Adler, UC Berkeley, Berkeley CA, United States of America adler@ieor.berkeley.edu

Ever since G.B. Dantzig introduced the Simplex method in 1947, it has become a phenomenally successful tool for solving real world problems. However, for almost as long, researchers have been working intensely to develop a theory to explain its success. We will trace the practical success of the method as well as the underlying theoretical developments, highlighting Dantzigπs continuing impact.

2 - About George B. Dantzig's Homework
Roger Wets, Research Professor, University of California, Davis, Department of Mathematics, Davis, 95616, United States of America, rjbwets@ucdavis.edu

A famous anecdote about G. Dantzigπs student-time experience was that he arrived late for a class taught by his advisor, Jerzy Neyman, and he found on the blackboard a couple of questions. Surmising that these must be homework questions, he turned in his 'solution' and was surprised to learn that these where actually open questions related to the famous Neyman and Pearson lemma.

3 - Efficiency of the Simplex and Policy Iteration Methods for Markov Decision Processes
Yinyu Ye, Professor, Stanford University, Huang 308, Stanford, CA, 94025, United States of America, yyye@stanford.edu

We prove that the simplex method with the most-negative-reduced-cost pivoting rule is a strongly polynomial-time algorithm for solving discounted Markov decision processes (MDP) of any fixed discount factor. This is surprising since almost all such results on the simplex method are negative, while in practice it is widely successful. We also present a result to show that the simplex method is strongly polynomial for solving deterministic MDPs regardless of discount factors.

Hilton- Continental 6

Appointment Scheduling Models

Sponsor: Manufacturing & Service Operations Management/Healthcare Operations

Sponsored Session

Chair: Sarang Deo, Assistant Professor, Indian School of Business, Hyderabad, 500032, India, sarang_deo@isb.edu

1 - Dynamic Patient Scheduling For a Multi-Appointment Health Care Program
Adam Diamant, Adam.Diamant09@Rotman.Utoronto.Ca, Joseph Milner, Fayez Quereshy

We formulate a Markov Decision Process to dynamically schedule patients to appointments in a pre-surgical health care setting. Patients have a series of appointments, undergoing multiple assessments prior to being eligible for surgery. There are a significant numbers of no-shows. We use approximate dynamic programming to develop several heuristic policies and compare them via simulation. We apply our results to a dataset collected from a bariatric surgery clinic at a large hospital in Toronto.

2 - Combining the Advanced and Appointment Scheduling Problems
Jonathan Patrick, Associate Professor, University of Ottawa, 55 Laurier Avenue, Ottawa, ON, K2G 3A6, Canada, patrick@telfer.uottawa.ca, Antoine Sauré, Mehmet Begen

Appointment scheduling and advanced scheduling have generally been addressed as two separate problems despite being highly dependent on each other. We present work in which we attempt to join these two problems together by taking advantage of past work by the authors on both problems.

3 - Stochastic Scheduling for Chronic Care
Armagan Bayram, Northwestern University, 2145 Sheridan Road, Evanston, IL, United States of America, abayram@northwestern.edu, Seyed Iravani, Karen Smilowitz, Sarang Deo

We present a study motivated by an ongoing collaboration with a mobile asthma care provider. Our study focuses on appointment allocation rules by considering stochastic nature of the problem. Using actual data and integrating it into a stochastic dynamic framework, we identify some results on optimal appointment allocation rules.

■ MC10

Hilton- Continental 7

New Advancements in Classic Inventory Problems

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Li Chen, Associate Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, li.chen@duke.edu

Co-Chair: Jing-Sheng Song, Professor, Duke University, 100 Fuqua Drive, Durham, United States of America

1 - Serial Inventory Systems with Markov-Modulated Demand: Derivative Analysis, Solution Bounds, Insight
Yue Zhang, Duke University, 100 Fuqua Drive, Durham, NC, 27708, United States of America, yueyue.zhang@duke.edu, Li Chen, Jing-Sheng Song

We derive bounds for the optimal policies for serial inventory systems with markov-modulated demand (MMD). Our bounds generalize the existing newsvendor bounds for serial systems with stationary demand. We further prove that the relative errors between our bounds and the optimal solutions converge to zero as the lead time increases, with the rate of convergence being square root of the lead time.

2 - Conveying Demand Information in Serial Supply Chains with Capacity Limits
Rodney Parker, The University of Chicago, Booth School of Business, Chicago, IL, 60637, United States of America, rodney.parker@chicagobooth.edu, Roman Kapuscinski

We construct two mechanisms to manage inventory in serial multi-echelon systems subject to production capacity limits which utilize local knowledge only. We demonstrate that these mechanisms (which differ based on timing assumptions) can replicate the known optimal and equilibrium policies. That is, sufficient information about the market demand is conveyed through the orders only. Also, a strong relationship between the mechanisms is demonstrated for channels of differing lengths.

3 - Optimal Policies for Assembly Systems: Completing Rosling's Characterization
Alp Muharremoglu, Associate Professor, University of Texas at Dallas, Richardson, TX, United States of America, alp@utdallas.edu, Shaokuan Chen

We study an assembly system, the model studied in Rosling (1989), one of the classical papers in inventory theory. Rosling characterized the optimal policy as a balanced echelon base stock policy, assuming that the initial state of the system possesses a "long-run balance" property. We characterize the optimal policy starting with any arbitrary initial state. The optimal policy is essentially a balanced echelon base stock policy, but with dynamically evolving echelon base stock levels.

4 - Measuring the Bullwhip Effect with Material Flow Data: Biases and Remedies
Wei Luo, IESE Business School, Av. Pearson 21, Barcelona, Spain, wluo@iese.edu, Li Chen, Kevin Shang

This paper concerns the accuracy of estimating bullwhip effect with material flow data in serial supply chains. We derive conditions under which overestimation occurs and characterize four driving factors: stocking level, lead time, supply chain location, and demand correlation. We also provide simple remedies to correct such biases based on the sample autocovariances of the sales and shipment data.

Incentives for Socially-beneficial Goods

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Terry Taylor, Associate Professor, U.C. Berkeley, Haas School of Business, 2220 Piedmont Ave., Berkeley, CA, 94720, United States of America, taylor@haas.berkeley.edu

Co-Chair: Wenqiang Xiao, NYU, 44 W 4th St, New York, United States of America, wxiao@stern.nyu.edu

1 - Demand vs. Supply-side Investment in Humanitarian Operations

Karthik Natarajan, Carlson School of Management, 321 19th Ave South, minneapolis, MN, 55454, United States of America, knataraj@umn.edu, Jayashankar Swaminathan

Both supply- and demand-side constraints impact program coverage in humanitarian settings. We study the problem of identifying the optimal mix of supply- and demand-side investments in a budget-constrained environment and offer insights into the impact of supply- and demand-side parameters on the investment mix. We also consider a decentralized setting where demand mobilization activities are contracted to a third party and identify coordinating performance-based contracts.

2 - Subsidizing New Technology with a Strategic Supplier: Commitment vs. Flexibility

Ruben Lobel, University of Pennsylvania, 3730 Walnut St, JMHH - suite 500, Philadelphia, PA, 19104, United States of America, rlobel@wharton.upenn.edu, Jonathan Chemama, Maxime Cohen, Georgia Perakis

We study how policy adjustments in subsidy programs (e.g. solar panels) interact with production decisions. We model the interaction between a government and an industry player in a two-period game setting under uncertain demand. We show how the timing of decisions will affect the cost of the subsidy program. In particular, we show that when the government commits to a fixed policy, it spends less on the subsidy program because it signals the supplier to produce more in the earlier stage.

3 - Fleet Management Coordination in Decentralized Humanitarian Operations

Sameer Hasija, Assistant Professor of Technology and Operations Management, INSEAD, 1 Ayer Rajah Avenue, Singapore, Si, 138676, Singapore, Sameer.Hasija@insead.edu, Alfonso Pedraza-Martinez, Luk Van Wassenhove

We study incentive alignment for the coordination of operations in humanitarian settings. The incentive alignment issue is complex because traditional instruments based on financial rewards and penalties are not considered to be viable options. This problem is further complicated by information asymmetry in the system due to the dispersed geographical locations of the parties. We design a novel mechanism based on an operational lever to coordinate incentives in this setting.

4 - Donor Product-Subsidies: Implications of Consumer Awareness and Profit-maximizing Intermediaries

Wenqiang Xiao, NYU, 44 W 4th St, New York, United States of America, wxiao@stern.nyu.edu, Terry Taylor

In the developing world, consumption of socially-desirable products (e.g., recommended malaria drugs) depends on consumers' awareness of their benefits and prevailing prices. This paper studies how the consumer awareness level and the presence of profit-maximizing intermediaries in the distribution channel influences how donors should design subsidies for such products.

Green Business Models and Strategies

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Ioannis Bellos, Assistant Professor, George Mason University, 4400 University Drive, MS 5F4, Fairfax, VA, 22030, United States of America, ibellos@gmu.edu

1 - Bike Share: Accessibility and Availability Tradeoff

Ashish Kabra, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Ashish.Kabra@insead.edu, Karan Girotra

We study bike-share systems as implemented in large cities such as Paris, London, New York. We develop a structural empirical model that captures the elasticity of user demand w.r.t. distance to a station as well as long-term and short-term effects of service level. We find that station designs denser than the current designs can increase ridership by as much as 9% in Velib'.

2 - Measuring Consumer Willingness-to-Pay for Socially Responsible Products

Leon Valdes, PhD Student, Massachusestts Institute of Technology, Sloan School of Management, Boston, MA, 02142, United States of America, lvaldes@mit.edu, Tim Kraft, Karen Zheng

We study consumers' Willingness-to-Pay (WTP) for socially responsible products via an incentivized human-subject experiment. We are interested in how WTP is impacted by: (i) the effort a company exerts toward ensuring socially responsible practices within its supply chain; and (ii) the precision of the information the company presents to consumers. To better understand the motives behind consumers' decisions, we also examine the role reciprocity plays in determining consumers' WTP.

3 - Leasing vs. Selling and Product Modularity

Atalay Atasu, Associate Professor, Georgia Institute of Technology, 800 West Peachtree Street NW, Atlanta, GA, 30308, United States of America, atalay.atasu@scheller.gatech.edu, Vishal Agrawal, Sezer Ülkü

We analyze the interactions between lease-sell and product architecture (i.e., modular versus integral product design) choices of a firm. One would expect that leasing and modular product architectures would be complementary when jointly exercised. However, this combination is rarely observed in practice, with a few exceptions such as Xerox. In this paper, we investigate the drivers of this discrepancy.

4 - Toward Mass Adoption of Electric Vehicles: Impact of the Range and Resale Anxieties

Ying Rong, Assistant Professor, Shanghai Jiao Tong University, No. 535 Fahua Road, Shanghai, 200052, China, yrong@sjtu.edu.cn, Michael Lim, Ho-Yin Mak

We study the impact of two major barriers to mass adoption of electric vehicles (EVs), range and resale anxieties, on prevalent business models in the market. We find that the combinations of battery owning/leasing with enhanced charging service typically yield the best societal outcome. To induce the private sector to employ such business models, policymakers should carefully rebalance the surplus from consumers to the firm through proper policies.

Best Practices in Reviewing Papers

Sponsor: Junior Faculty Interest Group

Sponsored Session

Chair: Andrew Trapp, Worcester Polytechnic Institute, 100 Institute Rd., Worcester, MA, 01602, United States of America, atrapp@wpi.edu

Co-Chair: Ozgun Caliskan Demirag, Penn State Erie, 5101 Jordan Road Burke 259, Erie, PA, 16563, United States of America, ozc1@psu.edu

1 - Best Practices in Reviewing Papers

Andrew Trapp, Worcester Polytechnic Institute, 100 Institute Rd., Worcester, MA, 01602, United States of America, atrapp@wpi.edu, Ozgun Caliskan Demirag, Haresh Gurnani, Kim Needy, Ted Ralphs, J. Cole Smith

This panel discussion will focus on the best practices in reviewing scholarly articles. Panelists from different areas of OR/MS will discuss various aspects of the peer review process, including but not limited to: how to perform a constructive review, what makes a good referee report, how to respond to referees' comments, and tips for success. With live Q&A, the panel aims to help academics and research-active industry professionals alike to improve their paper-reviewing skills.

■ MC15

Hilton- Exec. Boardroom

Banking and Manufacturing Applications

Cluster: Data Envelopment Analysis

Invited Session

Chair: Kankana Mukherjee, Associate Professor, Babson College, Economics Division, 231 Forest Street, Babson Park, MA, 02457, United States of America, kmukherjee@babson.edu

1 - Operational Efficiency of Bank Branches: Evidence from Indian Banking

Kankana Mukherjee, Associate Professor, Babson College, Economics Division, 231 Forest Street, Babson Park, MA, 02457, United States of America, kmukherjee@babson.edu, Abhiman Das, Subhash Ray

In this study, we examine the efficiency of branches located in the main metropolitan Indian cities of a major Indian bank with national presence. We utilize Data Envelopment Analysis to analyze data for the year 2007. We conceptualize the role of bank branches along the production approach and estimate a non-radial input-oriented Russell type measure of efficiency with a special focus on labor use.

2 - Variable Selection Techniques for DEA – An Empirical Case from a Retail Bank

Juha Eskelinen, Dr., Aalto University, School of Business, P.O.Box 21220, 00076 Aalto, Helsinki, Finland, juha.p.eskelinen@aalto.fi

If there are too few units compared to inputs and outputs, the nonparametric efficiency evaluation suffers from lack of discrimination. Various statistical techniques have been proposed to support the variable selection. The variable reduction procedure of Jenkins and Anderson (2003) and the efficiency contribution measure (Pastor, Ruiz, and Sirvent, 2002) were compared in a retail bank context. They led to different interpretations of the performance complementing each other.

3 - Overcoming the Shortcomings of Energy Intensity Index: An Application on Japanese and Chinese Manufacturing Industries

Osman Zaim, Dean, Faculty of Economics Administrative and Social Sciences, Kadir Has University, Central Campus, Kadir Has Cad. Cibali, Istanbul, 34083, Turkey, osman.zaim@khas.edu.tr

In multilateral comparisons of environmental performance over time, energy intensity measures especially "real" energy intensity computed by index decomposition approach is one of the most commonly used measure. While its intuitiveness and computational ease make this index an attractive one, its time series properties create considerable challenges in performing informative and fair comparisons among the energy efficiency levels of units considered. The theoretical part of this paper shows how one can overcome the shortcomings of the energy intensity measure by constructing a new energy index using directional technology distance functions. The new index constructed in this study not only overcomes the shortcomings of the energy intensity measures but also satisfies the axiomatic properties of index numbers that are laid down by Fisher. An empirical application on Japanese and Chinese manufacturing industries further complements existing studies.

Mitigating Supply Risk

Sponsor: M&SOM/ iForm (Interface of Finance, Operations, and Risk Management)

Sponsored Session

Chair: Sammi Yu Tang, Assistant Professor, University of Miami, 5250 University Drive, Coral Gables, FL, 33146, United States of America, ytang@miami.edu

1 - Does Punishment Work? On the Value of Buyer's Commitment in Supplier's Dynamic Improvement

Morteza Pourakbar, Rotterdam School of Management, Erasmus University, BurgMeester Oudlaan 50, 3000 DR, Rotterdam, Netherlands, mpourakbar@rsm.nl, Mehmet Gumus, Saied Samiedaluie, Mohammad Nikoofal

There are evidences suggesting that the stability in buyer-supplier relationship influences supplier commitment to improve its reliability. We develop models allowing the supplier to improve its reliability through offering punishment and commitment contracts. Our analysis reveals that punishment contract is more effective in incentivizing supplier to improve its reliability.

2 - Quality in Downstream Supply Chain Encroachment

Xiaoyang Long, HKUST, LSK Building, Clear Water bay, Kowloon, Hong Kong - PRC, xlongaa@ust.hk, Albert Ha, Javad Nasiry

We incorporate quality as an operational consideration in downstream supply chain encroachment decision by a manufacturer. We show that the retailer is always worse off if the manufacturer determines the quality of the product to sell through the two channels. Further, in contrast to conventional understanding, we show that product differentiation is not always in the best interest of the retailer and this practice can negatively affect the retailer.

3 - Operational Strategies under Consumer-Driven Bankruptcy

Michelle Xiao Wu, University of Chicago, wuxiao.nw@gmail.com, John Birge, Rodney Parker, S. Alex Yang

Financially distressed retailers are often forced to run liquidation sales. Traditional and social media enable consumers to be better informed of these sale opportunities and time their purchases strategically. We show that strategic waiting in anticipation of a potential liquidation sale can exacerbate a firm's current financial distress significantly.

4 - Farm-yield Management When the Production Rate is Yield Dependent

Kwan Eng Wee, Singapore Management University, 50 Stamford Road #04-01, Singapore, 178899, Singapore, kewee@smu.edu.sg, Onur Boyabatli

This paper analyzes the impact of farm-yield uncertainty when the unit production rate is yield dependent. We model a firm that procures an input through a contract in advance of the selling season; and through the open market on the day in a single period so as to maximize its expected profit. We investigate the impact of yield uncertainty on the optimal contract volume and the profitability of the firm, and underline the role of yield-dependent production rate on our results.

5 - Production Chain Disruption: Inventory and Interruption Insurance

Sammi Yu Tang, Assistant Professor, University of Miami, 5250 University Drive, Coral Gables, FL, 33146, United States of America, ytang@miami.edu, Lingxiu Dong, Brian Tomlin

We analytically explore the use of BI insurance and inventory to mitigate disruption risk in a multi-stage production chain. We characterize the firm's optimal insurance policy-the deductible and coverage limit-and the optimal inventory level at each stage. We examine the interaction between insurance and inventory investments.

■ MC17

Pricing and Strategic Behavior in Queueing Systems

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Philipp AfËche, Rotman School of Management; University of Toronto, 105 St.George Street, Toronto, Canada, Philipp.Afeche@Rotman.Utoronto.Ca

1 - Paying More to Get it Faster: When Should it be Considered?

Tava Olsen, Professor, University of Auckland, 12 Grafton Road, Auckland, New Zealand, t.olsen@auckland.ac.nz, Riccardo Mogre

In this study, we identify efficient expediting policies, explicitly quantifying the cost reduction ensuing from the use of expediting. We also investigate the relationship between expediting and the ability to offer express orders, shedding new light on how expediting policies could be strategic for companies. Finally, we consider the interaction of such policies with the offering of super-saver discounts and how this interaction affects a company's revenues and costs.

2 - Revenue Maximization for Cloud Computing Services

Cinar Kilcioglu, Columbia Business School, ckilcioglu16@gsb.columbia.edu, Costis Maglaras

We study a stylized model of revenue maximization for cloud computing services. We analyze price data traces from the biggest cloud service provider, Amazon, providing some possible explanation for price spikes based on intuitive asymptotic analysis arguments in systems with large capacity and large market potential. We study the service provider's revenue maximization problem in an infinite capacity system and in a market with heterogeneous customers.

3 - Signaling Quality via Price or Wait Time?
Laurens Debo, Associate Professor, University of Chicago, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, laurens.debo@chicagobooth.edu, Uday Rajan, Senthil Veeraraghavan

When the quality of a capacitated service is not known to a fraction of the potential market, not only the price, but, also congestion (wait time) can signal high quality. Ex ante, it is not clear whether short or long wait times are signals of high quality. We study this question via the analysis of a queuing-game theoretic model. We find that the degree of convexity of the cost of capacity is a main determinant of the direction of distortion of a firm's waiting time to signal quality.

4 - Rational Abandonment from Priority Queues: Equilibrium Strategy and Pricing Implications
Vahid Sarhangian, Rotman School of Management; University of Toronto, 105 St.George Street, Toronto, ON, Canada, vahid.sarhangian11@rotman.utoronto.ca, Philipp AfËche

The literature on the economics of queues predominantly focuses on the queue-joining decisions of customers and ignores subsequent abandonment decisions. Such abandonment behavior is particularly important in priority queues, which are quite prevalent in practice. We study the equilibrium joining and abandonment behavior of utility-maximizing customers in the context of an observable two-class priority queue and identify novel pricing implications.

Practice-driven Revenue Management I

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: So Yeon Chun, Assistant Professor, McDonough School of Business, Georgetown University, 3700 O St NW, Washington, United States of America, sc1286@georgetown.edu

1 - Dynamic Management of Loyalty Programs
Dan Iancu, Stanford Graduate School of Business, 655 Knight Way, Stanford, United States of America, daniancu@stanford.edu, So Yeon Chun, Nikos Trichakis

We formulate a model that can guide the dynamic management of loyalty and reward programs. Our model touches on several important considerations that arise in practice, including accounting, financial and marketing functions, and discusses how these influence and are influenced by revenue management.

2 - Understanding Markdown Recommendations Overriding
Felipe Caro, Associate Professor, UCLA Anderson School of Management, fcaro@anderson.ucla.edu

Since 2008, Zara has been using a model-based process to support its markdown decisions during clearance sales. We study the adoption of the tool by the country managers and analyze the impact that key user interface modifications have had on pricing decisions.

3 - Personalized Bundle Recommendations: A Data-Driven Online Sales Approach
Anna Michelle Papush, Massachussetts Institute of Technology, Cambridge, MA, United States of America, apapush@mit.edu, Pavithra Harsha, Georgia Perakis

With the continuously growing trend in online shopping and sales, the development of a more sophisticated product recommendation system can provide the necessary competitive edge for any Internet retailer. By considering this problem from a new angle, this work presents a model that combines both diverse recommendations and personalized pricing based on a consumer's purchase history and inventory at risk of being marked down.

4 - Strategic Consumers, Revenue Management and the Design of Loyalty Programs
So Yeon Chun, Assistant Professor, McDonough School of Business, Georgetown University, 3700 O St NW, Washington, United States of America, sc1286@georgetown.edu, Anton Ovchinnikov

We study an interaction between revenue management and premium-status (e.g., Gold) loyalty program, and the role of strategic consumers. We compare volume-based and spending-based designs and show that when coordinated with revenue management, how the loyalty program allows the firm to benefit from the behavior of strategic consumers who would fly/spend more in order to qualify for the premium-status.

Hilton- Franciscan D

New Applications in Pricing and Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Mehmet Sekip Altug, Assistant Professor, George Washington University, School of Business, Washington, DC, 20052, United States of America, maltug@gwu.edu

1 - Quality and Pricing Decisions when Consumers Perceive Recycled Content Differently
Monire Jalili, PhD Student, University of Oregon, 1208 University of Oregon, Eugene, OR, 97405, United States of America, mjalili@uoregon.edu, Tolga Aydinliyim, Nagesh Murthy

We consider a monopolist selling ordinary and green product variants to consumers whose differential (dis)utility vary by consumer type, and is a function of the firm's quality decision (i.e., the amount of recycled content.) We discuss how the optimal quality and pricing decisions drive demand and profit.

2 - Loss Aversion and the Uniform Pricing Puzzle
Javad Nasiry, Assistant Professor, HKUST, LSK Building, HKUST, Hong Kong, Hong Kong - PRC, nasiry@ust.hk, Pascal Courty

We develop a behavioral model based on loss aversion to explain why a monopolist may sell high quality products at the same price as low quality ones despite the fact that quality is perfectly observable and that there are no obvious costs of adjusting prices.

3 - A Behavioral Study of Capacity Allocation in Revenue Management
Bahriye Cesaret, PhD Student, The University of Texas at Dallas, 800 West Campbell Road SM 30, Richardson, TX, 75080, United States of America, bahriye.cesaret@utdallas.edu, Elena Katok

We present a set of laboratory experiments that investigate how human subjects solve the two-class capacity allocation revenue management problem. We study the problem with ordered and unordered arrival, as well as a simplified version - making an upfront decision at the beginning of the selling season. We find that making decisions up-front improves (resp., does not hurt) performance in the ordered (resp., unordered) arrivals case. We also identify several behavioral regularities.

4 - The Impact of Endogenous Secondary Markets on Retailer's Profitability
Mehmet Sekip Altug, Assistant Professor, George Washington University, School of Business, Washington, DC, 20052, United States of America, maltug@gwu.edu, Garrett van Ryzin

One of the main assumptions in the newsvendor model is that the salvage value is exogenous and that retailers can sell their excess stock at this fixed salvage value. However, in retailing, the salvage value of excess stock is mostly determined endogenously in secondary markets by firms and that raises several interesting questions such as the value of consolidated vs. firm-specific secondary markets. We analyze these questions using a stylized model with an endogenous secondary market.

Joint Session Analytics/CPMS: Business Analytics in Higher Education Industry

Sponsor: Analytics & CPMS, The Practice Section

Sponsored Session

Chair: Roger Gung, Sr. Manager of Business Analytics and Optimization, University of Phoenix, 4025 S Riverpoint Parkway, Phoenix, AZ, 85040, United States of America, roger.gung@phoenix.edu

1 - Marketing Mix Optimization
Roger Gung, Sr. Manager of Business Analytics and Optimization, University of Phoenix, 4025 S Riverpoint Parkway, Phoenix, AZ, 85040, United States of America, roger.gung@phoenix.edu, Hussain Khaleeli, Suxing Zeng, Jason Holechek

Marketing spend allocation drives the volume of new marketing inquiries (NMI) and enrollments. Two-stage non-linear regression models were built to formulate NMI channels with respect to marketing spends which were defined as either endogenous, exogenous or instrument variables. The optimization model was formed by aggregating all NMI channels' regression models into one objective function. The optimal spend allocation was then derived from the model every quarter to guide marketing strategies.

2 - New Degree Enrollments Forecasting Model
Yun Ouyang, Operations Research Scientist, University of Phoenix, 4025 S Riverpoint Parkway, Phoenix, AZ, 85040, United States of America, yun.ouyang@phoenix.edu, Roger Gung, Suxing Zeng

New Degree Enrollments forecasting has been one of the keys for revenue management in higher education industry. We developed semi-parametric regression-based survival models to forecast enrollments for given market inquiries and registrations. We applied time-dependent variables to handle holidays and breaks where enrollments are pushed to the subsequent weeks. We compared K-M plot and fitted curve to check in-sample performance and performed holdout test to evaluate out-sample performance.

3 - Lifetime Value Modeling
Suxing Zeng, Operations Research Scientist, University of Phoenix, 4025 S Riverpoint Pkwy, Phoenix, AZ, 85040, United States of America, suxing.zeng@phoenix.edu, Roger Gung, Jason Holechek

Existing students' lifetime value has been one of the keys for revenue management in higher education industry. We developed semi-parametric regression-based survival models to estimate each student's expected lifespan, starting from the Degree Enrollments. We applied the results to profile students by attributes, and identified successful students and value propositions for the University.

4 - Analytics Framework for Higher Education
Grace Lin, VP, Advanced Research Institute, Institute for Information Industry, No. 133, Section 4, Minsheng East Road, Taipei, 105, Taiwan - ROC, gracelin@iii.org.tw

We present an end-to-end anlytics framework for higher education industry that covers solution methods with using big data for the management on enrollments, learning platform, academic performance and institutional finance.

Chair: Ilke Bakir, PhD Student, Milton H. Stewart School of Industrial and Systems Engineering, Georgia Institute of Technology, Atlanta, GA, United States of America, ilkebakir@gatech.edu

1 - Third Party Logistics Planning and Production Scheduling Integration
Farshid Azadian, Assistant Professor, Embry Riddle Aeronautical University, College of Business, 600 S Clyde Morris Blvd., Daytona Beach, FL, 32114, United States of America, azadianf@erau.edu, Ratna Babu Chinnam, Alper Murat

We address the operational problem of a make-to-order contract manufacturer that seeks to integrate production scheduling and transportation planning under commit-to-delivery model. The manufacturer produces customer orders on unrelated parallel processors, accounting for release dates and sequence dependent setup times. Set of shipping options with different costs and transit times is available for order delivery. The objective is to minimize total cost, including delivery tardiness penalties.

2 - Stochastic Auto-Carrier Loading Problem
Benita Mordi, PhD Student, Texas A&M University, College Station, TX, United States of America, bmordi@tamu.edu, Saravanan Venkatachalam, Lewis Ntaimo

This talk presents the tactical planning regarding the number and type of auto-carriers required under uncertainty in the demand of vehicles. This auto-carrier loading problem considers actual dimensions of the vehicles, regulations on total height of the auto-carriers and maximum weight of the axles, and safety requirements. The problem is modeled using two-stage stochastic integer programming and preliminary results using real data are presented.

3 - Outbound Logistics Optimization Coordinating Production-Distribution and Vehicle Routing Decisions
Gopalakrishnan Easwaran, United States of America, geaswaran@stmarytx.edu, Halit Uster

We consider an integrated approach to coordinate aggregate level production-distribution planning and operational level weekly vehicle route planning for outbound trucks from a production facility. We present a heuristic framework with production/inventory, vehicle routing, and multi-objective shipment splitting modules as well as computational results and analysis illustrating efficiency of the approach.

4 - Greening the Fleet with Alternative Fuel Long-Haul Trucks
Ilke Bakir, PhD Student, Milton H. Stewart School of Industrial and Systems Engineering, Georgia Institute of Technology, Atlanta, GA, United States of America, ilkebakir@gatech.edu

Recent increase in environmental concerns and petroleum prices initiated effort for transitioning to alternative fuel long-haul trucks. But fleet replacement planning under strict operational requirements remains a challenge. We present a fleet replacement model for greening the fleet while maintaining feasible operations, and propose a decomposition-based solution approach that provides economically justifiable replacement plans for the transition from a petroleum-fueled fleet to a greener one.

Application of Machine Learning in Transportation

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Mahdieh Allahviranloo, PhD Candidate, University of California Irvine, 4000 Anteater Instruction and Research B, Irvine, CA, 92697, United States of America, mallahvi@uci.edu

1 - Proactive Vehicle Routing with Inferred Demand to Solve the Bike Sharing Rebalancing Problem
Robert Regue, PhD Candidate, University of California Irvine, 4000 Anteater Instruction and Research B, Irvine, CA, 92697, United States of America, rreguegr@uci.edu

We use gradient boosting machines as a forecasting technique to feed a dynamic routing problem to rebalance a bike sharing system. The use of anticipated demands turns it into a proactive rather than responsive approach and increases system level of service and customer satisfaction.

2 - Closed-Loop Optimal Traffic Control using Reinforcement Learning: Traffic Signal and Ramp Control
Baher Abdulhai, Professor, Department of Civil Engineering, University of Toronto, 35 St. George St., #105, Toronto, ON, M5S 1A4, Canada, baher.abdulhai@utoronto.ca, Samah El-Tantawy, Kasra Rezaee

Optimal traffic control is the most environmentally sustainable and plausible solution to the today's traffic system's extensive congestion. We present a decentralized approach to optimal Ramp Metering, to control the entrance flow to freeways, and Adaptive Traffic Signal Control, to control the flow on surface streets, based on Reinforcement Learning and Game Theory. Evaluations of the methods using a high fidelity computer model of Downtown Toronto resulted in significant travel time savings.

3 - Data Mining Application to Infer Individuals' Activity Type, Socio-economic Attributes By GPS Data
Mahdieh Allahviranloo, PhD Candidate, University of California Irvine, 4000 Anteater Instruction and Research B, Irvine, CA, 92697, United States of America, mallahvi@uci.edu

Using boosting techniques we predict activity types and their sequence given only spatial-temporal data for southern California. Activity patterns are clustered to study the statistical distributions of socio-demographic characteristics for further pattern inferences. We compare the predicted spatial-temporal distribution of activities in the network with the observed pattern in TransCad. The methodology can be used to mine large amount of historical location data generated by smart devices.

Multimodal Transportation

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Irina Benedy, birina@purdue.edu

1 - Scenario-based Dynamic Model of Investment Decision Process for Multimodal Freight Facilities Under Stochastic Demand
Irina Benedy, birina@purdue.edu, Srinivas Peeta, Hong Zheng, Ananth Iyer, Yuntao Guo

Shift in world trade patterns and changes in the U.S. import/export commodity flows leads to demand uncertainty for multimodal freight facilities. This issue leads to an investment decision problem both for construction of new facilities and upgradation of existing ones. We use a dynamic model to formulate the investment decision process and investigate policy insights under various sources of perturbation.

2 - Integrated Intermodal Network Design Considering Non-linear Transportation Costs
Mohammad Ghane-Ezabadi, Graduate Research Assistant, Oregon State University, 204 Rogers Hall, Corvallis, OR, 97321, United States of America, ghaneezm@onid.oregonstate.edu, Hector A. Vergara

Logistics network topology has a significant effect on decisions at the tactical and operational levels in intermodal transportation systems. In this research study, decisions on route and mode selection are integrated within the mathematical formulation of the hub location problem to improve the performance of the intermodal transportation system as a whole. A heuristic that takes advantage of both genetic algorithms and the shortest path algorithm is applied to solve several instances of this problem in reasonable times. Heuristic solutions are compared to optimal solutions in small instances to evaluate the performance of the proposed solution method.

3 - Impact of ETA on the Capacity Utilization of the Actors in the MTC - A Simulation Based Approach
Fabian Walter, Chair of Management and Logistics, Technische Universität Darmstadt, Hochschulstr. 1, Darmstadt, D-64289, Germany, walter@bwl.tu-darmstadt.de, Ralf Elbert

In maritime transport chains (MTC) each actor needs to improve his capacity utilization. For the intermodal operator (IO) no containerized estimated time of arrival (ETA) exists. With increasing container vessel capacity, for IO decision on container disposition, this inter-related data have great influence. We gathered 261,361 real container based data. The results of a monte carlo simulation show, that based on ETA information IO can significantly improve the utilization of container wagons.

4 - Shipper Attitudes for Container Transportation on the North Sea Route
Irina Benedy, birina@purdue.edu, Srinivas Peeta

This study seeks to explore opportunities and barriers for freight shippers to use the North Sea Route. A stated preference survey is conducted for freight shippers in East Asia and Europe. Econometric models are used to investigate the attitudes towards the usage of the North Sea Route, and identify key factors which influence them.

Chair: Alireza Khani, Postdoctoral Fellow, University of Texas at Austin, 1616 Guadalupe St, Suite 4.202, Austin, TX, 78701, United States of America, akhani@utexas.edu

1 - An Efficient Algorithm for Solving Reliable Shortest Path Problem
Alireza Khani, Postdoctoral Fellow, University of Texas at Austin, 1616 Guadalupe St, Suite 4.202, Austin, TX, 78701, United States of America, akhani@utexas.edu, Stephen Boyles

The efficient frontier for the solution of path problem with minimum Mean and Std. Deviation (P1) is shown to be similar to those of path problem with minimum Mean and Variance (P2). An algorithm is developed to efficiently search in the P2 frontier and find the optimal solution for P1.

2 - An Algorithm for Non-additive Shortest Path Problem
Mehrdad Shahabi, mshahabi@mix.wvu.edu, Avinash Unnikrishnan, Stephen Boyles

An outer approximation algorithm has been customized for solving the multi-attribute non-additive shortest path problem. Theoretically, outer-approximation is capable of providing the exact global solution for problems with convex travel cost functions. Numerical experiments based on different utility functions show the promising performance of the outer-approximation in handling large size problems.

3 - Measures of Travel Time Variability of Emergency Vehicles on Arterials
Qing He, University at Buffalo (SUNY), 225 Ketter Hall, Buffalo, NY, 14260, United States of America, qinghe@buffalo.edu, Zhenhua Zhang, Jizhan Gou, Xiaoling Li

Travel time is very critical for emergency vehicle (EV) operations. This study obtains 2.5 year EV travel time data in North Virginia using preemption records at the signalized intersections. A utility-based model is proposed to measure the travel time reliability of the road links and several assumptions are made and validated.

4 - A Double-queue Model and Its Applications in Dynamic Network Modeling
Xuegang (Jeff) Ban, Associate Professor, RPI, 110 8th Street, Room JEC 4034, Troy, NY, 12180, United States of America, banx@rpi.edu, Rui Ma

A double-queue model was recently introduced in the literature to model traffic flow dynamics of a network link. The model captures realistic congestion effects such as queue spillbacks in a simplified mathematical framework. Some theoretical and numerical results of the model are presented. Applications of the model in dynamic network modeling problems are also discussed.

Recent Advances in Day to Day Traffic Assignment

Sponsor: TSL/Urban Transportation

Sponsored Session

Chair: Xiaozheng He, NEXTRANS, 3000 Kent Ave, West Lafayette, IN, 47906, United States of America, seanhe@purdue.edu

1 - A Marginal Utility Day-to-Day Traffic Assignment Model
Xiaozheng He, NEXTRANS, 3000 Kent Ave, West Lafayette, IN, 47906, United States of America, seanhe@purdue.edu, Srinivas Peeta

Inspired by the marginal decision rule in economics, this study proposes a conceptual shift in the definition of rationality in the modeling of day-to-day traffic evolution. A new marginal utility day-to-day traffic evolution model is developed by additionally introducing the notion of marginal cost rather than just the notion of marginal benefit considered in classical day-to-day traffic evolution models. Theoretical properties of the proposed model are rigorously analyzed.

2 - Day-to-Day Dynamics in a Traffic Network under Bounded Rationality
Srinivas Peeta, Professor, Purdue University, 550 Stadium Mall Drive, West Lafayette, IN, 47907, United States of America, peeta@purdue.edu, Amit Kumar, Xiaozheng He

We develop a dynamical system based model to represent the evolution of path flows resulting from the day-to-day dynamics in traffic disequilibrium under static demand. The proposed model is based on the proportional-switch adjustment process under the assumption of bounded rationality. The solution methodology is discussed and computational results are presented for a study network.

3 - Approximation Methods for a Link-based Day-to-Day Traffic Assignment Model
Jian Wang, Ph.D student, Purdue University, 3000 Kent Ave, West Lafayette, IN, 47906, United States of America, wang2084@purdue.edu, Xiaozheng He, Srinivas Peeta

Seeking to reduce the high computational cost for analyzing traffic evolutionary characteristics, this study proposes four sensitivity-analysis-based approximation approaches for a link-based day-to-day traffic assignment model. Sufficient conditions for applying these four approaches are identified. Numerical examples show that they can approximate well the link flow evolutionary trajectory when the sufficient conditions are satisfied.

New Directions in Location Research

Sponsor: Location Analysis

Sponsored Session

Chair: Dmitry Krass, Professor, Rotman School of Management, Univ. of Toronto, 105 St. George St., Toronto, ON, M5S 3E6, Canada, krass@rotman.utoronto.ca

1 - Discrete Budget Allocation in Competitive Facility Location
Tammy Drezner, California State University, Fullerton, CA, United States of America, tdrezner@fullerton.edu, Zvi Drezner

The competitive location problem using the gravity model with a limited budget constraint to improve the attractiveness of existing facilities and locating new ones is considered. The problem is optimally solved by assigning budgets which are multiples of a basic budget unit such as multiples of 0.1% of the available budget.

2 - Dynamic Long-Term Planning of Ambulance Locations and Assignments
Oleksandr Shlakhter, Senior Researcher, Alberta Health Services, 10030-107 Street, Edmonton, AB, T5J 3E4, Canada, alex.shlakhter@rotman.utoronto.ca, Dmitry Krass

In this paper we analyze Emergence Medical Services (EMS) with stochastic dynamic demand. We present new perspectives on the problem of long-term planning of emergency medical services, including station locations and ambulance assignments. The problem is formulated as multi-period location/queueing model with two non-preemptive priority classes of events (calls), with each class consisting of two types of events: events which require transport to a hospital and events without transport.

3 - Competitive Location Models and Comparison Shopping
Vladimir Marianov, Professor. Department of Electrical Engineering., Pontificia Universidad CatÛlica de Chile, Av. Vicuña Mackenna 4860. Macul., Santiago, 7820436, Chile, marianov@ing.puc.cl, HA Eiselt

Customers searching for a product require comparing at least two varieties sold by different competing facilities before purchasing. A new firm enters the market and competes with the existing firms. A mathematical optimization model is formulated that maximizes the market share of a new firm that enters the market.

4 - A Competitive Location Model with Multipurpose Shopping
HA Eiselt, professor, University of New Brunswick, Fredericton, NB, Canada, haeiselt@unb.ca, Vladimir Marianov

In contrast to traditional competitive location models, customers in our model purchase two goods at existing firms. A new firm then enters the market and competes with one of the existing firms. We formulate a mathematical optimization problem that maximizes the market share of the new firm.

Models for Fleet Management and Scheduling

Sponsor: Railway Applications

Sponsored Session

Chair: Xuesong Zhou, Associate Professor, Arizona State University, School of Sustainable Engineering and th, Tempe, AZ, United States of America, xzhou74@asu.edu

1 - An Integrated Model for Train Timetabling and Platforming in High Density Double Track Corridor
Mahendra Birhade, Nanyang Business School, Nanyang Technological University, Singapore, Singapore, Mahendra1@e.ntu.edu.sg, Rohit Bhatnagar, S Viswanathan

This paper is motivated by the train scheduling problem in high density, double track corridors. We develop a novel MIP formulation of the Integrated Train Timetabling and Platforming Problem(ITTPP). Unlike existing literature that treats Train Timetabling and Train Platforming as distinct problems, our ITTPP formulation directly generates feasible timetables. We develop two heuristic algorithms that provide close to optimal solutions for real problem sets from Indian Railways.

2 - Fleet Management in Rail Transport: Petroleum Rakes in Indian Railways
Vishal Rewari, MTech Student, IIT Bombay, IEOR Department, Roll Number- 123190002, Mumbai, MH, 400076, India, rewari.vishal@gmail.com, Raja Gopalakrishnan, Narayan Rangaraj

This paper presents a decision-support model for assignment of petroleum rakes using MILP for firm demands and a predictive method for deciding the direction of empty rake repositioning for meeting expected demands. It minimizes empty rake running while maintaining service levels for the industry taking into consideration the maintenance and rake-product compatibility constraints. It also attempts to answer long-term issues of investments in rakes and capacity of maintenance depots.

3 - Efficient Scheduling Operations for Dedicated Freight Corridors Corporation of India Ltd (DFCCIL)
Nomesh Bolia, Dr, IIT Delhi, Dept of Mechanical Egineering, IIT Delhi, New Delhi, 110016, India, nomesh@mech.iitd.ac.in, Amit Upadhyay

Empty car allocation, train formation and train scheduling are complex optimization problems for large railroads. Motivated by Indian dedicated freight corridors (DFC), an integer programming formulation of the dynamic problem of empty car allocation and train scheduling is developed by considering the unique characteristics of the DFC. A constructive heuristic is proposed as the solution method. Computational experiments show that the heuristic can provide high quality solution in a short time.

4 - Design of a Railway Network Resiliency Model
Carl Van Dyke, Managing Director, TransNetOpt, 6 Snowbird Ct, West Windsor, NJ, 08550, United States of America, carl@cvdzone.com

Railroads are complex, network enterprises, where disruptions such as the closure of a line due to flooding can cause ripple effects that impact many other parts of the network. The objective of this discussion is to provide a practical approach to modeling railroad networks that can be used to assess the impact of network disruptions to rail lines and yards, including the potential reroutes of traffic, and limitations on network throughput due to reduced network capacity.

Airline Operations

Sponsor: Aviation Applications

Sponsored Session

Chair: Jon Dunsdon, Chief Technology Officer, Taleris, 2623 Camino Ramon Suite 500, San Ramon, CA, 94583, United States of America, jon.dunsdon@taleris.com

1 - Flight Trajectory Optimization
Srinivas Bollapragada, Chief Scientist, GE Global Research, One Research Circle, Niskayuna, NY, 12309, United States of America, bollapragada@research.ge.com

We developed and implemented a novel algorithm to control the trajectory of an aircraft flight to reduce the costs it incurs. Our algorithm computes the values for the parameters to be entered into the aircraft's flight management system to minimize the fuel and schedule-adherence costs incurred on the flight. We implemented it in a prototype software system that is currently in use at GE Aviation Services.

2 - Fast & Furious with Feedback: The Machine for Next-Gen Airline Operations Optimization
Julian Loren, Senior Product Manager, GE Software, 2623 Camino Ramon, San Ramon, CA, 94583, United States of America, loren@ge.com

In complex, regulated, and competitive environments, we increase return on operations by finding better solutions that consider a growing number of factors in a shrinking period of time. We chase Operational Excellence down a path of increasing pressure and constraint. In this paper, we explore pressures related to decision support at scale and approaches to alleviate them—the motivations driving our development of a fast & furious operations optimization machine with feedback mechanisms.

3 - From Reactive to Proactive: Changing the Recovery Paradigm
Jon Petersen, Operations Research Scientist, Taleris, petersej@taleris.com

While industry practitioners and academics have made advancements in managing operations under irregularity, the prevailing assumption is that decisions are made reactively only after the disruption has been revealed. By mining over a vast field of aircraft sensor data, we introduce the ability to predict aircraft failure before it occurs allowing an airline to proactively manage its operations. We discuss how optimization is used in concert with big data and show the benefit of prediction.

4 - Anomaly Detection and Prognostics for Air-Conditioning System of Commercial Aircraft
Kyungjin Moon, Analytics Engineer, Taleris, 400 W 15th St., Suite 1000, Austin, TX, 78701, United States of America, Kyungjin.Moon@taleris.com

This paper describes Taleris' on-going anomaly detection and prognostics development for the air-conditioning (AC) system of commercial aircraft. In order to detect temporal anomalous patterns of the system behavior, data-driven static models are generated to represent nominal states of the system using Quick Access Recorder (QAR) data. Then these models are used to determine the possible anomalous deviations of the system from their estimated nominal states.

1 - Daniel H. Wagner Prize

C. Allen Butler, President, Daniel H. Wagner, Associates, Inc., Hampton, VA, United States of America, Allen.Butler@va.wagner.com

The competition for the 2014 Daniel H. Wagner Prize for Excellence in Operations Research Practice resulted in six finalists, who submitted papers to the judging committee and who will present their results in three sessions . In this keynote, the winner of the competition will be announced and the authors will give a reprise of the winning presentation.

2 - Identifying Risks and Mitigating Disruptions in the Automotive Supply Chain

Don Zhang, Technical Expert, Research & Advanced Engineering, Ford Motor Company, Dearborn, MI, United States of America, xzhang35@ford.com, William Schmidt, David Simchi-Levi, Yehua Wei, Michael Sanders, Oleg Gusikhin, Yao Ge, Keith Combs, Peter Y. Zhang

Firms are exposed to a variety of low probability / high impact risks which may disrupt their operations and supply chains. These risks are difficult to predict and quantify, and therefore difficult to manage. As a result, managers may deploy countermeasures sub-optimally, leaving their firms exposed to some risks while wasting resources to mitigate other risks that would not cause significant damage. In a three-year research engagement with Ford Motor Company, we address this practical need by developing a novel risk exposure model that assesses the impact of a disruption originating anywhere in the firm's supply chain. Our approach defers the need to estimate the probability associated with any specific disruption risk until after the company learns how the realization of such a disruption will impair its operations. As a result, the company can make more informed decisions about where to focus its limited risk management resources. We demonstrate how Ford has applied this model to identify previously unrecognized risk exposures, evaluate pre-disruption risk mitigation actions, and develop optimal post-disruption contingency plans, including circumstances in which the duration of the disruption is unknown.

3 - Statistical and Optimization Techniques for Laundry Portfolio Optimization at P&G

Ivan Oliveira, SAS, 100 SAS Campus Dr, Raleigh, United States of America, ivan.oliveira@sas.com, Kevin Miller, Kevin Norwood, Ming Zhao, Nats Esquejo, Rob Pratt

The Procter & Gamble (P&G) Fabric Care business oversees a broad portfolio of products, including household brands such as Tide, Dash, and Gain. We describe a novel analytical framework that uses visual statistical tools and advanced mathematical programming methods, helping P&G determine ingredient levels and product and process architecture to create some of the world's best laundry products. This framework has provided targeted consumer benefits while enabling cost savings in the order of millions of dollars.

4 - Gerrymandering for Justice: Redistricting U.S. Liver Allocation

Sommer Gentry, Associate Professor, United States Naval Academy, 572-C Holloway Road, Mailstop 9E, Annapolis MD 21402, United States of America, gentry@usna.edu, Eric K.H. Chow, Allan Massie, Dorry Segev

U.S. policy sequesters livers from deceased donors within arbitrary geographic zones, frustrating the intent of offering livers according to medical urgency. We used a zero-one integer program to partition the U.S. into districts that minimize disparity in access to livers. Redistricting liver allocation would save hundreds of lives and make transplantation more equitable. Our redistricting concept garnered unprecedented unanimous support in the Liver Committee that manages allocation policy.

Uncertainty and Cooperation

Cluster: Scheduling and Project Management

Invited Session

Chair: Nicholas G. Hall, The Ohio State University, 2100 Neil Avenue, Columbus, OH, United States of America, hall.33@osu.edu

1 - Cooperation and Contract Design in Project Management with Outsourcing

Xiaoqiang Cai, Professor, The Chinese University of Hong Kong, Dept of Systems Engineering, Shatin, NT, Hong Kong, Hong Kong - PRC, xqcai@se.cuhk.edu.hk, Nicholas G. Hall, Feng Zhang

We consider a project management problem where the prime contractor outsources tasks to a set of subcontractors, which involves (i) coordination among the subcontractors; and (ii) contract design by the prime contractor, to incentivize the subcontractors. We study the two issues by a cooperative game and a principal-agent model, respectively.

2 - Minimizing Value-at-Risk in Single-Machine Scheduling

Kerem Bulbul, Assoc. Professor, Sabanci University, Sabanci University, Orhanli, Tuzla, Istanbul, 34956, Turkey, bulbul@sabanciuniv.edu, Semih Atakan, Nilay Noyan

We consider single-machine scheduling problems with uncertain parameters. We impose a probabilistic constraint on the random outcome and introduce a generic risk-averse stochastic programming model with the objective of finding a non-preemptive static job sequence that minimizes the value-at-risk of the random outcome. Our solution approach relies on Lagrangian relaxation-based scenario decomposition with numerical results that demonstrate its efficacy and the value of the proposed model.

Service Queues

Sponsor: Service Science

Sponsored Session

Chair: Alan Scheller-Wolf, Professor, Carnegie Mellon University, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, awolf@andrew.cmu.edu

1 - Service Outsourcing with Strategic Collaboration of Competing Servers

Ying Xu, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, yingx1@andrew.cmu.edu

This paper studies a client who outsources service tasks to two service providers. Previous work mainly focused on how to incentivize or utilize capacity investments of the servers. We extend the literature by incorporating the option of strategic collaboration between servers. Collaboration reduces waiting but dampens capacity competition, so its impact on the client is unclear. This paper studies how the client could affect the degree of collaboration via demand allocation and SLA requirements.

2 - Value-driven Load Balancing

Sherwin Doroudi, Tepper School of Business; Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, sdoroudi@andrew.cmu.edu, Esa Hyytia, Mor Harchol-Balter

To date, the study of dispatching in server farms with Processor-Sharing servers has focused on response time, where all jobs are assumed to be equally delay sensitive. Our work departs from this assumption: we model each arrival as having a randomly distributed value, independent of its size. The correct metric is no longer response time, but rather, value-weighted response time. We propose new dispatching policies and deduce many unexpected results regarding dispatching with this metric.

3 - Non-asymptotic and Asymptotic Analysis for Extended Erlang A Models

Katsunobu Sasanuma, PhD Candidate, Carnegie Mellon University, Heinz College, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, katz@cmu.edu, Robert Hampshire, Alan Scheller-Wolf

We study an extension of the Erlang A model, which represents a system with customer abandonment under congestion-based control schemes. Our model may have either reneging or state-dependent balking, and can cope with possible adjustments to the arrival/service rates when there is a queue. We derive non-asymptotic and asymptotic Normal representations of performance indicators and discuss the congestion properties of the extended Erlang A model from non-asymptotic and asymptotic perspectives.

4 - Optimal Staffing for Sales Transaction Support Centers
Aliza Heching, IBM TJ Watson Research Center, Mathematical Sciences, Yorktown Heights, NY, 10598, United States of America, ahechi@us.ibm.com, Emre Barut

Sales transaction support centers reduce the amount of transaction work performed by sellers allowing them to spend more time with customers and increase revenue generation. Adequate staffing ensures that staff with appropriate skills is available to support incoming service requests. We describe a suite of analytical tools including hierarchical forecasting and request assignment to determine staffing requirements. These tools were deployed across multiple geographies and lines of business.

1 - Adaptive Mobile News Personalization using Social Networks
Roland Rust, U. of Maryland, R.H. Smith School of Bus., College Park, MD, 20742, United States of America, rrust@rhsmith.umd.edu, Michel Wedel, Tuck Siong Chung

We present an adaptive personalization system for personalizing news feeds on mobile devices. It learns from an individual's reading history, automatically discovers new material as a result of shared interests in the user's social network and adapts the news feeds shown to the user. We show that using article choices from an individual's social network improves the quality of personalization, leading to more readership of the news articles provided.

2 - Managing Customer Arrivals in Service Systems with Multiple Servers
Christos Zacharias, New York University, Stern School of Business, New York, NY, 10012, United States of America, czachari@stern.nyu.edu

We analyze a discrete multi-server queueing model for scheduling customer arrivals in service systems with parallel servers. Theoretical and heuristic guidelines are provided for the effective practice of appointment overbooking to offset no-shows. The benefits of resource-pooling are demonstrated in decreasing operational costs and increasing customer throughput.

3 - Impact of Economic Uncertainty on Product Line Design and Capacity Management
Muge Yayla-Kullu, RPI Lally School of Management, 110 8th Street, Troy, NY, 12180, United States of America, YAYLAH@rpi.edu, Jennifer K. Ryan, Jayashankar Swaminathan

We study the effects of uncertainty in consumer spending due to economic volatility on the product line decisions of a firm with limited resources. We consider a firm that offers services with differing qualities, unit costs, and resource consumption rates. Consumers are heterogeneous in their purchasing behavior and the parameters of this behavior is only resolved after capacity investments are made.

Managing Uncertainty in Innovation

Cluster: New Product Development

Invited Session

Chair: Pascale Crama, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, Singapore, pcrama@smu.edu.sg

Co-Chair: Fabian Sting, Rotterdam School of Management, Erasmus University, Burgemeester Oudlaan 50, Rotterdam, Netherlands, fsting@rsm.nl

1 - University Research Funding: The Benefits of Local Knowledge
Pascale Crama, Assistant Professor, Singapore Management University, 50 Stamford Road, Singapore, Singapore, pcrama@smu.edu.sg, Anand Nandkumar, Reddi Kotha

University research is financed through university and federal funds. The federal grant application process has been shown to be biased towards older PIs and less innovative projects. We study how university funding can address this issue by using a different selection process. This is particularly valuable for young researchers and innovative projects, which fare badly in the project selection process used by federal agencies. We test our predictions with data from a Midwestern university.

2 - Identifying Overestimated Ideas in Organizations: The Case of Process Innovations
Christoph Fuchs, Rotterdam School of Management, Erasmus University, cfuchs@rsm.nl, Maik Schlickel, Fabian Sting

Drawing on a process innovation database, we find that process innovation ideas are more likely to be overestimated by their creators. The degree of overestimation is stronger for ideas (1) that were created by higher- versus lower-ranked individuals, (2) that were generated collectively versus individually, and (3) that were generated by individuals with previously lower idea implementation success. These findings help companies to reduce uncertainty in the management of innovations.

3 - The Role of Decision Rights in Collaborative Development Initiatives
Nektarios Oraiopoulos, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, CB2 1AG, United Kingdom, n.oraiopoulos@jbs.cam.ac.uk, Vishal Agrawal

In this paper, we study initiatives for co-development of new products and technologies. In such settings, it may be difficult a priori to specify contracts contingent on the outcome. Therefore, we investigate the efficacy of different contractual structures, which instead specify the decision-making process.

4 - Competitive Intelligence and Market Research in R&D Markets
Yi Xu, University of Maryland, yxu@rhsmith.umd.edu, He Chen, Manu Goyal

We develop a dynamic model where two risk-neutral firms compete to develop a new product whose market value is uncertain and the firms can actively manage their information - acquiring information through market research or acquiring information on competitor's decisions through competitive intelligence. We show that competitive intelligence emerges endogenously as an optimal information acquisition strategy even though market research is costless and can perfectly resolve market uncertainty.

Humanitarian Logistics

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Bahar Yetis Kara, Associate Professor, Bilkent University, Bilkent, Ankara, Turkey, bkara@bilkent.edu.tr

1 - Compromising System and User Interests in Shelter Location and Evacuation Planning
Vedat Bayram, Bilkent University, Endustri Muhendisligi Bolumu, Ankara, 06800, Turkey, bayram@bilkent.edu.tr, Barbaros Tansel, Hande Yaman Paternotte

Traffic management and the decision of where to locate the shelters are critical for an evacuation plan. We develop a nonlinear MIP model that optimally locates shelters and assigns evacuees to the nearest shelter sites using shortest paths, within a given degree of tolerance, so that the total evacuation time is minimized. We develop a solution method that can handle practical size problems using second order cone programming techniques. This research is supported by TUBITAK grant no. 213M434.

2 - A Decision Support Tool for Post-Disaster Debris Operations
Alvaro Lorca, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, alvarolorca@gatech.edu, Pinar Keskinocak, Melih Celik, Ozlem Ergun

Effective management of post-disaster debris removal is crucial due to the size, cost, and complicated nature of the problem. In this talk, we present a decision support tool that makes use of a mixed integer programming model and addresses pre- and post-disaster debris removal decisions regarding processing facility location, process selection and debris flow. The impact of the tool is illustrated on a disaster dataset based on Hurricane Andrew.

3 - Evacuation Management under Hazardous Convective Weather Events
Hasan Manzour, University of Oklahoma, School of Industrial and Systems Eng, Norman, United States of America, smh.manzour@ou.edu, Suleyman Karabuk

Hazardous convective weather events (e.g., tornadoes) cause hundreds of fatalities and thousands of injuries in the US every year. We propose evacuation as a response policy; identify the challenges involved; discuss and assess the potential benefits and costs. We uncover important characteristics of optimal evacuation plans, which can affect practical implementations. In addition, we quantify the benefits of forecast lead time, contributing to the discussions in weather forecast research area.

4 - Locating Temporary Shelter Areas after an Earthquake: A Case for Turkey

Bahar Yetis Kara, Associate Professor, Bilkent University, Bilkent, Ankara, Turkey, bkara@bilkent.edu.tr, Firat Kilci, Burcin Bozkaya

In this study, we address the problem of locating temporary shelter areas after a disaster. We have developed a shelter location-allocation optimization model and a GIS-based decision support system for TRC. In this talk, we first propose a mixed integer linear programming based methodology for selecting the location of temporary shelter sites. We validate the mathematical model by generating a base case scenario using real data on Kartal, Istanbul, Turkey.

Socially Responsible Operations

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Betzabe Rodriguez Alamo, University of Puerto Rico - Mayaguez, Call Box 9000, Mayaguez, PR, 00682, United States of America, betzabe.rodriguez@upr.edu

1 - Finding Solutions to Cattle-Farmers Financial Crisis: Blasting the Payment System

Dhania Silva, University of Puerto Rico, Mayagüez, Mayagüez, PR, United States of America, Dhania.silva@upr.edu, Betzabe Rodriguez Alamo

The milk industry in Puerto Rico is the most important activity for the agricultural sector; hence, is heavily regulated. In the intent to ensure farmers' fair remuneration, some government policies have been prejudicial; resulting in a decrease of 1.6 percent on the number of farmers per year. We propose a mathematical model of the cattle farmer payment system that will consider social paradigms on equity and fairness, and focuses on influencing operational decisions towards societal needs.

2 - An Agent-based Model to Analyze the Emerging Advanced Biofuel Supply Chain

Leilei Zhang, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States of America, leileizh@iastate.edu, Guiping Hu

We develop an agent-based model to investigate the interactions of different stakeholders along the biofuel supply chain. Decisions are analyzed on famers' land allocation, biofuel production, biofuel blending, and biofuel market prices. The agent-based model is built upon decision making process faced by each entity along the advanced biofuel supply chain. The results from the agent-based model are evaluated and compared with a bottom-up equilibrium model.

3 - A Stochastic CVaR Approach to Disaster Relief with Social Costs

Amy Givler, Graduate Research Assistant, Rensselaer Polytechnic Institute, 2215 5th Ave, Troy, NY, 12180, United States of America, givlea@rpi.edu, John Mitchell

In many disaster relief problem formulations, social costs, or costs incurred by the population suffering from the disaster, are neglected. This stochastic scenario-based formulation focuses on pre-positioning of points of distribution (PODs) while incorporating social costs in the form of walking costs. Additionally, the risk measure used for these social costs is conditional value at risk (CVaR), a convex monotonic risk measure that focuses on the expectation in the worst scenarios.

4 - Vulnerability to Natural Disasters: A Decision Theory Approach

Saylisse Davila, saylisse.davila@upr.edu, Roy Ruiz, Fernando Salazar, Juan Ayala

This work presents an innovative application of decision theory as the conceptual model for tsunami vulnerability assessments. The model fuses expert knowledge in the form of qualitative data with high-dimensional quantitative data and addresses the gaps in the literature where models disregard the hierarchical nature of the data and the relationships among variables. Preliminary work on the vulnerability to tsunamis of Puerto Rican coastal communities will be shown.

5 - Design Factors for Medical Device Functionality in Developing Countries

Lourdes Medina, Assistant Professor, UPRM, Call Box 9000, Mayaguez, PR, 00680, United States of America, lourdes.medina@upr.edu, Ana Gauthier, Ilka Rodriguez, Giovanni Cruz

This study focuses on determining which design factors of medical devices are most important when designing for developing countries. The determination of the importance of a design factor is based on a literature review, a statistical analysis of current products designed for these countries and a survey developed to be sent to individuals who have had heavy involvement with medicine in the developing world.

Network Traffic Modeling

Sponsor: Telecommunications

Sponsored Session

Chair: Soumyo Moitra, Senior Member of Technical Staff, SEI/Carnegie mellon, 4500 Fifth Avenue, Pittsburgh, PA, 15213, United States of America, smoitra@sei.cmu.edu

1 - Entity-Centric Network Modeling

Markus De Shon, Founder and Principal Threat Scientist, E8 Security, 720 University Ave, Suite 200, Palo Alto, CA, 94301, United States of America, mdeshon@gmail.com

Raw network and log data is often only weakly identified with the real entities active on the network: users and hosts. We present a comprehensively entity-centric modeling approach that identifies hosts and users on the network, models those entities, associates ephemeral and permanent identifiers with those entities, and tracks them over time.

2 - Modeling and Visualizing Behavioral Anomalies for Network Security

Bryan Olsen, Cyber Security Engineer, Pacific Northwest National Laboratory, PO Box 999, Richland, WA, 99352, United States of America, bryan.olsen@pnnl.gov, Daniel Best, Ryan Hafen, William Pike

Identifying useful anomalies in high-volume computer network traffic (such as emerging threats or network configuration changes) is difficult due to evolving adversary tactics and the large number of network actors. We present CLIQUE, a modeling and visualization system that supports behavior-based situational awareness and investigation. CLIQUE detects and displays emerging anomalies in live network traffic, and supports drill down into details on the individual behaviors underlying them.

3 - Inferring Patterns in Network Traffic: Time Scales and Variation

Soumyo Moitra, Senior Member of Technical Staff, SEI/Carnegie mellon, 4500 Fifth Avenue, Pittsburgh, PA, 15213, United States of America, smoitra@sei.cmu.edu

In this paper we analyze time series from network traffic and develop some metrics related to variation in traffic patterns. These metrics depend on the time scale used in their estimation and therefore we explore the effect of varying time scales. The metrics are illustrated with public data and the implications of the results are discussed.

DM2: Data Mining in Decision Making with Theory & Applications

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Dr. Asil Oztekin, Assistant Professor, University of Massachusetts Lowell, One University Ave., Southwick 201D, Lowell, MA, 01854, United States of America, Asil_Oztekin@uml.edu

1 - A Data Analytic Approach to Predict the Success of Heart Transplants

Dr. Asil Oztekin, Assistant Professor, University of Massachusetts Lowell, One University Ave., Southwick 201D, Lowell, MA, 01854, United States of America, Asil_Oztekin@uml.edu, Ali Dag, Dr. Fadel Megahed, Ahmet Yucel

Predicting the survival of heart transplant patients is an important yet challenging problem for researchers. Without re-balancing the training set, data mining classification algorithms can generate deceptively high accuracy rates overall but still perform poorly on detecting the minority class. The objective of our study is to improve the prediction of 1-, 5- and 9-year survival outcomes following a heart transplant surgery by examining a large, nation-wide dataset.

2 - Automatic Recognition of Adverse Events in News: A Data Mining Approach

Weiguo Fan, Professor of Accounting & Information Systems, Virginia Tech, 3007 Pamplin Hall, Blacksburg, VA, 24061, United States of America, wfan@vt.edu, Alan G. Wang, Xuan Zhang, Mi (Jamie) Zhou

Corporate adverse events are important resources for investors. However, adverse events are often scattered across different news media and difficult to recognize. By using three years of news data collected for S&P 500 companies, we identify relevant adverse events, extract event features, train and optimize a classification model. This classification model can then be used to automatically recognize adverse events from multiple news channels.

3 - EMS Dispatch Priorities: Comparing Logistic Regression Model Performance with Established Protocol

Michael Dohan, Lecturer (Information Systems), Lakehead University, 955 Oliver Road, Thunder Bay, ON, P7B 5E1, Canada, msdohan@lakeheadu.ca, Joseph Tan, Tim Hardie, Norm Gale, Dave Johnson

Assessing ambulance call priority accurately is crucial to emergency medical service (EMS) performance. Calls dispatched at a priority higher than necessary amount to an inefficient use of EMS resources. This article shows that an established EMS prioritization protocol is outperformed by a proposed logistic regression model, created with a historical dataset of EMS calls. This research identifies factors associated with increased accuracy, providing direction for improving dispatch practice.

4 - Business Analytics for Undergrads

David Olson, Professor, University of Nebraska Lincoln, CBA 209, Lincoln, NE, 68588-0491, United States of America, david.olson@unl.edu, Demet Batur

We view business analytics as an evolution in emphasis to expose students to database concepts (extended to big data), knowledge management (from information systems), quantitative modeling (to include visualization as well as analytic/simulation modeling), and data mining (tools useful for making decisions in typical business data mining applications). This presentation describes what we found others doing, and presents our design of a business undergraduate core course in business analytics.

Scheduling Staff and Space in Healthcare

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Amy Cohn, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, amycohn@med.umich.edu

1 - Block Scheduling for a Pediatric Residency Program

Peter Mayoros, University of Michigan, Ann Arbor, MI, United States of America, pmayoros@umich.edu, Amy Cohn

In a residency program, the block schedule determines what service (e.g. inpatient, ICU, NICU, emergency department, etc.) each resident works on during each month across a full year. The schedule must meet both the patient care needs of the health system and also the educational and personal needs of the resident. We present an integer programming-based approach used to create the block schedule for incoming interns at the University of Michigan Mott Children's Hospital.

2 - Block Scheduling for a Surgical Residency Program

William Pozehl, University of Michigan, Ann Arbor, MI, United States of America, pozewil@umich.edu, Amy Cohn

Residents in a surgical residency program must complete many different rotations to complete their educational requirements. Meanwhile, program directors must schedule residents from multiple different programs and even different institutions to also ensure adequate coverage for patient care. We present models for and analysis of this complex, multi-criteria combinatorial optimization problem.

3 - Shift Scheduling in Pediatric Emergency Medicine

Young-Chae Hong, University of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, hongyc@umich.edu, Amy Cohn

When scheduling residents to staff a pediatric emergency department, many complex constraints must be satisfied to ensure a feasible solution. In addition, there are several different criteria (based on patient coverage, resident educational training, and resident personal preferences) upon which the quality of a schedule is judged. We present models and algorithms for addressing the multi-criteria nature of this problem, with real-world results from Mott Children's Hospital.

4 - Coordination of Surgical Blocks and Ambulatory Clinics at a Large Teaching Hospital

Brian Lemay, University Of Michigan, Industrial and Operations Engineering, 1205 Beal Avenue, Ann Arbor, MI, 48109-2117, United States of America, blemay@umich.edu, Amy Cohn

We consider the challenge of coordinating surgical block time and ambulatory clinic time across an array of heterogeneous surgeons at a major teaching hospital. Models, algorithms, and analysis are presented to address this multi-criteria combinatorial optimization problem.

Innovations in Healthcare Delivery Systems

Sponsor: Health Applications

Sponsored Session

Chair: Mili Mehrotra, University of Minnesota, 321 19th Ave South, Minneapolis, United States of America, milim@umn.edu

1 - Managing Office Revisit Intervals and Patient Panel Sizes in Primary Care

Hessam Bavafa, Assissant Professor, Wisconsin School of Business, 975 University Ave, Madison, WI, 53706, United States of America, bavafa@wharton.upenn.edu, Christian Terwiesch, Sergei Savin

In recent years, the drive to contain health care costs in the US has increased scrutiny of the traditional mode of delivering primary care where a patient is treated by his primary care physician during a face-to-face visit. In particular, two approaches, the use of "e-visits" and greater reliance on non-physician providers, have been suggested as lower-cost alternatives to the traditional set-up. We quantify the overall impact of using these two approaches on patients and physicians.

2 - Bundled Payments for Healthcare Services

Diwakar Gupta, University of Minnesota, 111 Church Street SE, Minneapolis, MN, 55455, United States of America, guptad@me.umn.edu, Mili Mehrotra

We model the proposer-selection and information-sharing problems that arise when implementing CMS' bundled payment for care improvement initiative. Possessing private information, proposers compete for beneficiaries but not for selection. We show that an optimal strategy for CMS, under its current approach, may be to either announce a fixed threshold or keep the selection process uncertain, depending on market characteristics. We also characterize parameters of an optimal menu of contracts.

3 - Stochastic Optimization for Multi-unit nurse Planning under Patient Volume Uncertainty

Kibaek Kim, Argonne National Laboratory, 9700 S. Cass Avenue, Argonne, IL, 60439, United States of America, kibaekkim@mcs.anl.gov

We study the problem of nurse planning for multiple care units in the presence of patient volume uncertainty. The problem is formulated as a two-stage stochastic integer program with mixed-integer recourse. We present a novel decomposition method, which allows us to solve real-world problems. Using patient census data from Northwestern Memorial Hospital, we analyze the value of the stochastic planning solutions and the cost implications of using cross-trained nurses.

4 - Towards Cost-effective Multiple Disease Screening

Mohsen Bayati, Stanford Graduate School of Business, Stanford, CA, 94305, United States of America, bayati@gsb.stanford.edu, Sonia Bhaskar, Andrea Montanari

Recently, in response to the rising costs of healthcare, companies have been investing in programs to improve the health of their workforce. These programs aim to reduce the incidence of chronic illnesses which impact future costs and require a low-cost annual screening to detect individuals with a high risk of developing chronic disease. We offer a multiple disease screening procedure that highly maximizes the predictive ability based on multi-task learning from machine learning.

Methodologies for Health Policy Making

Sponsor: Health Applications

Sponsored Session

Chair: Monica Gentili, Visiting Assistant Professor, Institute for People and Technology, Georgia Institute of Technology, Atlanta, Georgia, mgentili3@mail.gatech.edu

1 - Primary Care Network Development: The Regulator's Perspective

Vedat Verter, Professor, McGill University, 1001 Sherbrooke Street West, Montreal, QC, H3A 1G5, Canada, vedat.verter@mcgill.ca, Anna Graber, Michael Carter

A mixture of fee-for-service, capitation and salary remuneration schemes is often used for funding primary care. These payment mechanisms often vary with the type of facility in the primary care network. We propose a formulation that allows the regulator to identify the most appropriate primary care network configuration. The proposed framework focuses on cost, accessibility and appropriateness of provided care. We illustrate the model use on the geographical area of Kingston, Ontario, Canada.

2 - Modeling the Spread of HIV and HCV among Injection Drug Users: A Network-based Model

Rui Fu, Stanford University, 74 Barnes CT, Stanford, CA, 94305, United States of America, ruif@stanford.edu, Margaret Brandeau

To capture the biological and behavioral variability among IDUs, we construct a network-based model that simulate the transmission of HIV and HCV. We include two types of relationships (edges): sexual partner and needle sharing buddy. Empirical degree distribution derived from survey data informs the initialization and evolution of simulated network. Efficacy of several intervention programs that target the IDU population are evaluated using this model.

3 - What are the Areas in Need for Improving Spatial Access to Pediatric Primary Care?

Monica Gentili, Visiting Assistant Professor, Institute for People and Technology, Georgia Institute of Technology, Atlanta, Georgia, mgentili3@mail.gatech.edu, Nicoleta Serban, Julie Swann

We make inferences on the geographic access to pediatric primary care across 14 states in the U.S. Our measurement models for geographic access are based on optimization models that match patients with providers considering a series of user and provider system constraints. We will compare the derived measures for two population groups, children insured by Medicaid and/or CHIP and other children on private insurance or health insurance exchange.

Healthcare Operations and Scheduling

Sponsor: Health Applications

Sponsored Session

Chair: Greg Zaric, Ivey Business School, 1255 Western Road, London, ON, N6G 0N1, Canada, gzaric@ivey.uwo.ca

1 - Forecasting Patient Arrivals and Census in an Emergency Department

Azaz Sharif, PhD Candidate, Western University, 1151 Richmond Street, London, ON, N6A 3K7, Canada, asharif9@uwo.ca, David Stanford, Greg Zaric

Emergency Department (ED) physician pay in Ontario is determined in part on pay-for-performance contracts based on operational benchmarks. To assist in planning and meeting these benchmarks we built a forecasting model to produce short-term forecasts of arrivals and ED census. We used regression and time series techniques to model arrivals in each of the 5 'Canadian Triage and Acuity Scale' categories. This analysis provides ED managers with valuable insight to efficiently allocate ED resources.

2 - Distributed Surgical Case Scheduling via Logic-based Benders Decomposition

Vahid Roshanaei, PhD Student, University of Toronto, 5 King's college road, Toronto, Canada, vroshana@mie.utoronto.ca, Dionne Aleman, Curtiss Luong, David Urbach

We study the problem of surgical case scheduling where patients are collaboratively planned amongst a coalition of multiple hospitals in a strategic network. A novel general integer programming model along with a logic-based Benders decomposition approach are developed. Computational experiments demonstrate that our LBBD approach is able to find optimal solutions 98.7% faster than the integer model solved via Gurobi optimizer on small-to-medium test cases, and 75.3% faster on large test cases.

3 - Addressing Overcrowding in an Outpatient Clinic through New Room Allocation Policies

Jacqueline Griffin, Northeastern University, 334 Snell Engineering Center, 360 Huntington Avenue, Boston, MA, 02115, United States of America, ja.griffin@neu.edu, Vahab Vahdatzad, James Stahl

In order to examine overcrowding in a cardiovascular outpatient clinic, we construct a discrete-event simulation model focusing on patient flow, appointment room availability, and staffing. A simulation-optimization approach is used to define new policies for the reallocation of a fixed number of beds among different physicians within the clinic. Specifically, the impact of a hybrid allocation policy, using a balance of both pooled and designated room allocation is examined.

4 - Design and Scheduling of Home Health Care Services

Onur Ozturk, PhD, Ivey Business School, Western University 1255 Western Road, London, ON, N6G0N1, Canada, oozturk@uwo.ca, Mehmet Begen, Greg Zaric

Home health care (HHC) has become a growing service sector in most countries due to aging population, increasing costs and limited resources. In HHC, healthcare providers design and deliver medical care to patients with home visits. We investigate an efficient and robust design of HHC services to provide home visit schedules subject to limited resources and regulatory restrictions. Besides planning HHC visits, we also quantify trade-offs between HHC investment and desired service levels.

Decision Diagrams in Optimization I

Sponsor: Computing Society

Sponsored Session

Chair: John Hooker, Carnegie Mellon University, Tepper School of Business, Pittsburgh, United States of America, jh38@andrew.cmu.edu

1 - MDD-Based Lagrangian Relaxation

Andre Augusto Cire, University of Toronto Scarborough, 1265 Military Trail, Toronto, ON, M1C 1A4, Canada, andre.cire@gmail.com, Willem-Jan van Hoeve, David Bergman

Decision diagrams have been used to obtain tight relaxations for a number of practical applications, including single-vehicle routing problems and employee rostering. We demonstrate that such relaxations can be greatly enhanced by incorporating dual information in the form of Lagrangian multipliers. Computational experiments on scheduling problems indicate that this technique can improve solving times substantially in a branch-and-bound framework.

2 - Zero-Suppressed Binary Decision Diagrams

David Morrison, University of Illinois, Urbana-Champaign, 1624 T St Apt 4, Sacramento, CA, 95811, United States of America, drmorr0@gmail.com, Edward Sewell, Sheldon Jacobson

Zero-suppressed binary decision diagrams (ZDDs) are a modification of standard binary decision diagrams (BDDs) that exhibit better compression for many combinatorial optimization problems. In this talk we discuss the advantages of ZDDs over BDDs, and present a characterization of ZDDs for the maximal independent set problem.

3 - Dualization using Decision Diagrams and Its Application for Itemset Mining

Takahisa Toda, Graduate School of Information Systems, the University of Electro-Communications, 1-5-1 Chofugaoka, Chofu, To, 1828585, Japan, toda.takahisa@gmail.com

Dualization of Boolean functions is one of the most fundamental problems on Boolean functions. Many problems in data mining, logic, artificial intelligence etc are known to be equivalent to dualization. We present a dualization algorithm using decision diagrams over modern SAT solver, and propose its application for itemset mining.

4 - Compact Representations of All Members of an Independence System

Utz-Uwe Haus, IFOR, D-MATH, ETH Zurich, Raemistr 101, Zurich, Switzerland, uhaus@ethz.ch, Carla Michini

We show that for every independence system there exists a top-down construction rule for a binary decision diagram (BDD) representing all independent sets.For packing and covering problems with logarithmically bounded bandwidth the width of the BDD is bounded by the number of variables.Besides enumerating or counting all solutions and optimizing a class of nonlinear objective functions that includes separable functions,the results can be applied for effective evaluation of generating functions.

Multi-Channel Advertising

Sponsor: Information Systems

Sponsored Session

Chair: Vibhanshu Abhishek, Assistant Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PE, 15213, United States of America, vibs@andrew.cmu.edu

1 - Beyond the Last-Touch: Attribution in Online Advertising

Ron Berman, United States of America, ronber@wharton.upenn.edu

Advertisers that utilize multiple publishers typically compensate them based on effort (CPM) or performance (CPA) and Last-Touch attribution. Our analytical model shows that CPA causes moral-hazard while existence of a baseline conversion rate by consumers causes adverse selection. We resolve these issues using the Shapley value and requiring that publishers run an experiment as proof of effectiveness. We then proceed to demonstrate the advantages of this method on several live campaigns.

2 - Media Exposure through the Funnel: A Model of Multi-Stage Attribution

Vibhanshu Abhishek, Assistant Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PE, 15213, United States of America, vibs@andrew.cmu.edu

Consumers are exposed to ads across a number of channels, which can jointly affect the conversion behavior. In this paper, we propose a HMM of an individual consumer's behavior based on the conversion funnel to measure the effect of every ad and assign due credit. The model is estimated on a large online auto campaign. We observe that different ad formats affect consumers differently based on their underlying states. Finally, only a fraction of online conversions are driven by online ads.

Chair: Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu

1 - The Impact of Fit Information in Online Retail

Antonio Moreno-Garcia, Kellogg School of Management, 2001 Sheridan Rd, MEDS Department, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu, Santiago Gallino

We describe a field experiment studying the impact of offering better product fit information to customers in online retail.

2 - Dynamic Pricing in Online Retailing: Evidence from Field Experiments

Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu, Santiago Gallino, Marshall Fisher

Competition among online retailers is intense. Prices and availability have been made transparent to customers as well as to competing retailers. We designed a series of field experiments to measure price elasticity accounting for demand substitution among similar products and competing retailers, and to test a best response pricing algorithm in real business environment.

3 - Creating Reciprocal Value through Operational Transparency

Ryan Buell, Assistant Professor, Harvard Business School, Morgan Hall 429, Boston, MA, 02163, United States of America, rbuell@hbs.edu, Tami Kim, Chia-Jung Tsay

We investigate whether organizations can create value by introducing operational transparency between consumers and producers. Although existing theory posits that increased contact between the two parties can diminish performance, we conducted two field and two laboratory experiments in food service contexts that suggest that the introduction of transparency improves service quality and efficiency.

4 - Sharing Delay Information in Services: A Field Study

Qiuping Yu, Assistant Professor, Kelley School of Business, Indiana University, 1275 E 10th St, Bloomington, IN, 47405, United States of America, yqp2009@gmail.com, Gad Allon, Achal Bassamboo

We explore the impact of delay announcements by conducting a field experiment at a medium sized call center. The call center provides announcements to customers on certain days of the week, while provides no announcements to customers of the same type on other days of the week. With such experimental design, we investigate the problem of whether and how customers use the announcements as points of reference when they make abandonment decisions.

Sponsored Session

Chair: Miles Lubin, MIT Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, mlubin@mit.edu

1 - Modeling with Meaning: Metaconstraints and Semantic Typing

Tallys Yunes, University of Miami, School of Business Administration, Coral Gables, FL, 33146, United States of America, tallys@miami.edu, John Hooker, Andre Cire

Metaconstraints are constraints possessing behavioral parameters for relaxation, branching, and inference. Relaxations of metaconstraints create auxiliary variables related to other variables in the model. Semantic typing facilitates the detection and enforcement of such relations by giving specific meaning to variables, yielding stronger models. It also provides other modeling benefits, such as consistency checking and error detection. We motivate and illustrate these concepts through examples.

2 - Solver-independent MILP Callbacks in JuMP with Applications to Robust Integer Optimization

Iain Dunning, MIT Operations Research Center, 77 Massachusetts Avenue, Bldg. E40-149, Cambridge, MA, 02139, United States of America, idunning@mit.edu, Dimitris Bertsimas, Miles Lubin, Joseph Huchette

We present the unique solver-independent callback functionality of JuMP, a modeling language embedded in the Julia language. Users can write efficient code for lazy constraints, user cuts, and heuristics, which we demonstrate for classic problems like the travelling salesman problem. We then demonstrate a JuMP extension, JuMPeR, for robust optimization. We can solve robust MILPs with either reformulations or cutting planes while not concerning the user with details of the underlying solver.

3 - Leveraging Model Transformations in Algebraic Modeling Systems

John Siirola, Analytics, Sandia National Laboratories, P.O. Box 5800, MS 1326, Albuquerque, NM, 87185, United States of America, jdsiiro@sandia.gov, William Hart, Jean-Paul Watson

"Flat" algebraic representations force modelers to explicitly convert or relax high-level constructs, which can obscure much of the structure in the model. We will show how high-level non-algebraic modeling constructs in Coopr can be coupled with automated model transformations to improve model clarity and abstraction. This allows modelers to explicitly apply transformations that link the structured model to a solver, thereby separating the core model from subsequent reformulation decisions.

4 - Conveying Logical Conditions to MIP Solvers through an Algebraic Modeling Language

Robert Fourer, President, AMPL Optimization Inc, 2521 Asbury Ave, Evanston, IL, 60201, United States of America, 4er@ampl.com, David M. Gay, Victor Zverovich

Although algebraic modeling languages get their name from traditional numerical algebra, they are readily extended to "logical" constraints that appear naturally in applications. Logic extensions have indeed been available in modeling languages for some time. We describe our experiences incorporating logic into the AMPL language; the challenges have proved to be not so much in generalizing language forms and processing, as in communicating the resulting optimization problems to popular solvers.

Stochastic Optimization for Natural Resources

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Miguel Lejeune, Associate Professor, George Washington University, 2201 G Street, NW, Washington, DC, 20052, United States of America, mlejeune@gwu.edu

1 - Building a Stochastic Problem from its Roots: A Forestry Management Example

Ignacio Rios, Universidad de Chile, Jose Miguel Carrera 439 D215, Santiago, RM, Chile, irios@ing.uchile.cl, Roger Wets, Ignacio Rios, Andres Weintraub

We analyze how to deal with the uncertainty before solving a stochastic optimization problem and we apply it to a forestry management problem. In particular, we start from historical data to build a stochastic process for wood prices and for bounds on its demand. Then, we generate scenario trees considering different number of scenarios and different scenario generation methods. Finally, we describe a procedure to compare the solutions obtained with each approach and we apply it to our problem.

2 - Stochastic Programming with Reliability Requirements for Tactical Level Forest Harvesting

Janne Kettunen, Assistant Professor, The George Washington University School of Business, 2201 G Street, NW, Funger Hall 415, Washington, DC, 20052, United States of America, jkettune@gwu.edu, Miguel Lejeune

Major goals of private nonindustrial forest owners in harvesting include achieving a steady flow of revenues whilst reaching an overall satisficing revenue level. Accounting for these, we develop a stochastic programming framework. We use a Boolean reformulation method to linearize the proposed integer chance-constrained models and develop a computationally tractable approach. We demonstrate the model with real data and derive insights about optimal harvesting strategies.

3 - A Risk-averse Multistage Stochastic Programming Model in Forestry

Bernardo Pagnoncelli, Assistant Professor, Universidad Adolfo Ib·Òez, Diagonal las Torres 2640, Oficina 533-C, Santiago, RM, 7910000, Chile, bernardo.pagnoncelli@uai.cl, Adriana Piazza

An important source of uncertainty in forestry problems is timber price. I will present a one species model in which prices follow a geometric Brownian motion or an Ornstein-‹hlenbeck processes. Using stochastic dynamic programming techniques I will characterize the optimal policy for the first case and provide sufficient conditions for optimality in the second case. Risk aversion is represented by the Conditional Value-at-Risk and comparisons with the risk neutral case are provided.

4 - Stochastic Programming Models for Salmon Farming

Asgeir Tomasgard, NTNU- Trondheim, Norwegian University, Norway, asgeir.tomasgard@iot.ntnu.no

We present two models for the salmon farming value chain. The first model considers the fresh water stadium where the salmon is kept in tanks until it is ready for sea water (the smolt stadium) and minimizes the total expected costs related to smolt production. The next model considers making optimal smolt orders, deployment plans and finally harvesting in the seawater facilities. The most important sources of uncertainty are growth, temperature, price and mortality.

1 - Discovering and Exploring Overlapping Community Structures in Large Networks

Junming Yin, University of Arizona, McClelland Hall, Tucson, AZ, 85721, United States of America, junmingy@email.arizona.edu, Eric Xing, Qirong Ho

We present a novel scalable approach to detecting overlapping community structures in a large-scale network. Our approach builds on a new triangular characterization of networks and a fast stochastic variational inference (SVI) algorithm. Empirical results show that our triangular model SVI procedure is not only faster but also more accurate. We also demonstrate that our method is able to discover interesting communities on a massive IMDB co-actor network with 896K actors.

2 - Hybrid Statistical Data Mining Framework for Multi-Commodity Fixed Charge Network Flow Problems

Anurag Ladage, Graduate Student, Rochester Institute of Technology, 6000 Reynolds Drive, Rochester, NY, 14623, United States of America, aal1284@rit.edu, Scott Grasman, Ernest Fokoue

This paper presents a new approach to analyze the network structure in multi-commodity fixed charge network flow problems (MCFCNF). This methodology uses the historical data produced from traditional MCFCNF model as input for the machine-learning model. Further, we reshape the problem as a binary classification problem and employ machine-learning algorithms to predict the network structure. The quality of the solutions generated will be measured on basis of its feasibility and optimality gap.

3 - Whom Should we Tenure? Network Analysis for Predicting Research Impact

Shachar Reichman, Massachusetts Insitute of Technology, Sloan School of Management, 77 Massachusetts Ave, Cambridge, MA, 02459, United States of America, shachar@mit.edu, John Silberholz, Dimitris Bertsimas, Erik Brynjolfsson

We propose an analytics approach to support the tenure decision-making process at academic institutions. Using a large-scale bibliometric database of OR papers, we predict scholars' long-term performance using publication data from the first five years of their careers. These models select candidates with significantly better future citation counts and h-indexes than those selected by tenure committees, with similar performance on research awards, teaching awards, and journal editorships.

4 - A Numerical Method for Modelling Wavefront Propagation and Reflection from Rigid Boundary

Daisy Dahiya, Research Scholar, IIT Bombay, Department of Mathematics, Powai, Mumbai, 400076, India, daisydahiya@gmail.com

We present a numerical method based on the shortest path algorithm on graphs to model the propagation and reflection of a wavefront in an inhomogeneous moving medium with rigid boundary. The governing equation is the generalized eikonal equation. The solution of this equation may cease to be smooth and numerical methods are used to obtain the weak solution. Also if the medium of propagation has rigid boundaries then the wavefront may reflect after hitting the rigid boundary.

5 - Network Construction Problems with Maximum Lateness Minimization Objective

Jordi Pereira, Universidad Catolica del Norte, Avda. Angamos 0610, Antofagasta, Chile, jorgepereira@ucn.cl, Igor Averbakh

A network needs to be constructed by a single construction crew. A vertex is recovered when it becomes connected to the depot by an already constructed path. Each vertex of the network has a due date for its recovery time. The problem is to obtain a construction schedule that minimizes the maximum lateness of the vertices. We put forward the problem, discuss its computational complexity, and several solution methods. These methods are then compared on random and real life instances.

Networks Robustness and Vulnerability Analysis

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Foad Mahdavi Pajouh, University of Florida, 350 N Poquito Rd, Shalimar, Fl, 32579, United States of America, mahdavi@ufl.edu

1 - An Integer Programming Framework for Critical Elements Detection in Graphs

Alexander Veremyev, University of Florida, 1350 N. Poquito Road, Shalimar, FL, 32579, United States of America, averemyev@ufl.edu, Eduardo Pasiliao, Oleg Prokopyev

We study the problem of minimizing connectivity and cohesiveness of a graph by removing vertices and edges. We develop an integer programming approach under an assumption that the connectivity and cohesiveness metrics are general (possibly, nonlinear) functions of sizes of the remaining connected components and vertex degrees. Encouraging computational experiments are reported to illustrate the performance of the developed framework.

2 - The Minimum Edge Blocker Dominating Set Problem
Jose Walteros, University of Florida, Gainesville, FL, United States of America, jwalteros@ufl.edu, Foad Mahdavi Pajouh, Eduardo Pasiliao, Vladimir Boginski

The minimum edge blocker dominating set problem (EBDP) is to remove a subset of edges of minimum cardinality in a weighted undirected graph, such that the minimum weight of a dominating set in the remaining graph is bounded below by a given threshold. We develop an exact algorithm for solving the EBDP, which solves the proposed formulation via branch and cut where nontrivial constraints are added in a lazy fashion. We provide some computational results obtained by the proposed approach.

3 - An Integer Programming Approach for Fault-tolerant Connected Dominating Sets
Austin Buchanan, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, buchanan@tamu.edu, Je Sang Sung, Sergiy Butenko, Eduardo Pasiliao

This paper considers the minimum k-connected d-dominating set problem, which is a fault-tolerant generalization of the minimum connected dominating set (MCDS) problem. Three IP formulations are proposed and their integer hulls are studied. Despite having exponentially many constraints, the three LP relaxations can be solved in polytime. A lazy-constraint approach is proposed to solve the problem. For the MCDS problem (where k=d=1) the times are fastest in literature.

4 - New Analytical Lower Bounds for the Maximum Clique Number of a Graph
Vladimir Stozhkov, University of Florida, 2930 SW 23rd Ter, Apt 203, Gainesville, FL, 32608, United States of America, vstozhkov@ufl.edu, Eduardo Pasiliao, Grigory Pastukhov, Vladimir Boginski

We propose three new lower bounds for the maximum clique number of a graph. The first two are degree-adjacency-based and triangle-based, respectively. They both are derived from the Motzkin-Straus formulation. The third one is degree-based and derived from famous graph inequalities. We prove a variety of theoretical results for our new bounds. Finally, we conduct computational experiments to compare our three new bounds with well-known lower bounds by accuracy and complexity.

Service Parts Networks and Inventory Optimization

Cluster: Network Design

Invited Session

Chair: Stefan Minner, Technische Universität München, Arcisstr. 21, Munich, 80333, Germany, stefan.minner@tum.de

1 - Sustainable Multi-echelon Inventory Control with Shipment Consolidation and Non-linear Freight Costs
Johan Marklund, Professor, Lund University, Box 118, Lund, 22100, Sweden, Johan.Marklund@iml.lth.se, Olof Stenius, Sven Axsäter

We consider a 1-warehouse-N-retailer inventory system. Inventories are reviewed continuously while shipments from the warehouse are consolidated for groups of retailers and shipped periodically. We derive the probability distributions for the amount of goods on each shipment, enabling non-linear freight cost structures to be included in the model. The analysis is exact, encompassing joint optimization of multi-modal transportation and inventory decisions, with respect to costs and CO2 emissions.

2 - Determining Optimal Parameters of Expediting Level Policies
Ulrich Thonemann, University of Cologne, Albertus-Magnus-Platz, Koeln, 50923, Germany, ulrich.thonemann@uni-koeln.de, Raik Oezsen

We consider a situation where inventory managers have the option to expedite open orders. We incorporate an expediting level policy in a periodic-review base-stock inventory model and solve the model optimally. We numerically analyze the sensitivity of the inventory system with respect to the key parameters and quantify the benefit of order expediting using data from the service division of a global equipment manufacturer.

3 - Optimal and Heuristic Repairable Stocking and Expediting in a Fluctuating Demand Environment
Rob Basten, University of Twente, Postbus 217, Enschede, 7500AE, Netherlands, r.basten@utwente.nl, Joachim Arts, Geert-Jan Van Houtum

We consider a single stock point. Spare items are purchased at time zero and their demand follows a Markov modulated Poisson process. Defective items are sent to a repair shop that offers the option to expedite repairs. We formulate the decision to use this option as a Markov decision process, characterize the optimal policy, and propose a heuristic policy. We show how to compute optimal initial stocking levels in combination with those policies. A numerical study gives managerial insights.

Recent Advances in First Order Methods

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: Fatma Kilinc-Karzan, Assistant Professor, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, fkilinc@andrew.cmu.edu

1 - Stochastic Subgradient Mirror-Descent Algorithm with Weighted Averaging
Angelia Nedich, UIUC, 1308 West Main Street, Urbana, Il, 61801, United States of America, angelia@illinois.edu

The talk is on a stochastic subgradient mirror-descent method for solving convex minimization problems. A method with weighted iterate-averaging and its per-iterate convergence rate are presented. The novel part of the approach is the choice of weights that are used to construct the averages, which allow us to recover the known optimal rates with simpler algorithms than those currently existing in the literature. Some new convergence results can also be obtained.

2 - Mirror Prox Algorithm for Multi-Term Composite Minimization and Semi-Separable Problems
Niao He, Georgia Institute of Technology, 765 Ferst Drive, Atlanta, United States of America, nhe6@isye.gatech.edu, Anatoli Juditsky, Arkadi Nemirovski

We present a composite version of Mirror Prox algorithm for solving monotone variational inequalities of special structure, which inherits the favourable efficiency estimate of its prototype. We demonstrate that the proposed approach can be successfully applied to Lasso-type problems with several penalizing terms and to problems of semi-separable structures considered in the alternating directions methods, implying in both cases methods with the O(1/t) complexity bounds.

3 - Algorithms and Theory for Nonconvex Quadratic Optimization: Phase Retrieval and Beyond
Mahdi Soltanolkotabi, UC Berkeley, 736 Escondido Road, Aprt. 341, Stanford, CA 94305, United States of America, mahdisol@stanford.edu, Emmanuel Candes

We consider recovery of the seemingly hidden phase of an object from intensity-only measurements. We show that a nonconvex formulation of the problem recovers the phase information exactly from a minimal number of magnitude-only measurements. To solve this nonconvex problem, we develop an iterative algorithm that escapes all local minima and provably converges to the global optimum with a geometric rate. Our proposed scheme is near optimal in terms of usage of computational and data resources.

4 - Block Successive Upper Bound Minimization Method of Multipliers for Linearly Constrained Convex OPT
Mingyi Hong, Research Assistant Professor, University of Minnesota, 3626 E 44th Street, Apt 309, Minneapolis, United States of America, mhong@umn.edu

Consider the problem of minimizing the sum of a smooth convex function and a separable nonsmooth convex function subject to linear coupling constraints. Problems of this form arise in many contemporary applications. Motivated by the huge size of these applications, we study a new class of first order primal-dual algorithms called the block successive upper-bound minimization method of multipliers to solve this family of problems.

Chair: Hande Benson, Drexel University, 3141 Chestnut Street, Philadelphia, PA, 19104, United States of America, hvb22@drexel.edu

1 - Constraint Optimal Selection Techniques (COSTs) for Nonnegative Linear Programming Problems

Alireza Norozíroshan, PhD Student, University of Texas at Arlington, 600 Grand Ave, Apt#103, Arlington, TX, 76010, United States of America, alireza.norozíroshan@mavs.uta.edu, Bill Corley, Jay Rosenberger

We describe an active-set, cutting-plane approach called Constraint Optimal Selection Techniques(COSTs)and present an efficient new COST for solving nonnegative linear programming problems. We give a geometric interpretation of the new selection rule and provide computational comparisons of the new COST with existing linear programming algorithms for some large-scale sample problems.

2 - Preconditioners for Linear Programming

Javier Pena, Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, jfp@andrew.cmu.edu, Vera Roshchina, Negar Soheili

It is known that the behavior of algorithms for linear programming is determined by how "well conditioned" the problem instance is. We show that a combination of two preprocessing steps typically improves the conditioning of a problem. Our approach is based on a comparison among three different but related notions of conditioning for linear programming.

3 - Central Path Curvature for LP

Yuriy Zinchenko, University of Calgary, 2500 University Dr NW, MS524, Calgary, AB, T2N1N4, Canada, yzinchen@ucalgary.ca

Similarly to the diameter of a polytope, one may define its curvature based on the worst-case central path associated with solving an LP posed over the polytope. A continuous analogue of the Hirsch conjecture and a discrete analogue of the "average curvature" result of Dedieu, Malajovich and Shub may be introduced. A continuous analogue of a diameter d-step equivalence result may also be proved. We demonstrate how to construct a family of polytopes attaining the largest conjectured curvature.

4 - Fast Algorithms for Online Stochastic Convex Programming

Shipra Agrawal, Researcher, Microsoft Research, C702 Mantri Sarovar, Bangalore, India, shipra@microsoft.com, Nikhil Devanur

We introduce the online stochastic Convex Programming (CP) problem, a very general version of stochastic online problems, which allows arbitrary concave objectives and convex feasibility constraints. We present fast algorithms for these problems, which achieve near-optimal regret guarantees for both the i.i.d. and the random permutation models of stochastic inputs. Applications include many dynamic resource allocation and revenue management problems.

1 - A Drift Switching Jump-Diffusion Model for Reserve Management

Ning Cai, Hong Kong University of Science & Technology, Clear Water Bay, Kowloon, Hong Kong - PRC, ningcai@ust.hk

We propose a drift switching reflected jump-diffusion model for international reserve management to capture both the jump behavior in reserve dynamics and the leptokurtic feature of the reserve increment distribution. The model is simple and produces a closed-form expression for the total expected discounted cost of managing reserves.

2 - Multiperiod Portfolio Optimization with Many Risky Assets and General Transaction Costs

Victor DeMiguel, avmiguel@london.edu

We analyze the optimal portfolio policy for a multiperiod mean-variance investor facing many risky assets and general transaction cost. For proportional transaction costs, we give a closed-form expression for a no-trade region. For market impact costs, we show that at each period it is optimal to trade to the boundary of a state-dependent rebalancing region. Finally, we show empirically that the losses associated with ignoring transaction costs may be large.

3 - Dynamic Portfolio Optimization with Transaction Costs

John Birge, Jerry W. and Carol Lee Levin Professor of Operations Management, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu

Dynamic portfolio optimization presents multiple challenges, such as parameter estimation and incorporation of transaction costs. This talk will discuss results comparing comparing various approaches to this issue.

4 - Tax-Aware Dynamic Asset Allocation

Chun Wang, Columbia University, 323 S. W. Mudd Building, 500 W. 120th Street, New York, NY, 10027, United States of America, cw2519@columbia.edu, Martin Haugh, Garud Iyengar

The asset allocation problem with taxes has several variations depending on: (i) whether we use the exact or average tax-basis and (ii) whether we allow the full use of losses or the limited use of losses. It is a challenging problem due to high-dimension and path-dependence. We consider all of these variations, develop several sub-optimal trading policies and use duality techniques based on information relaxations to assess their performances. We show that much larger problems can be tackled.

Chair: Agostino Capponi, Johns Hopkins University, 3400 North Charles Street, Baltimore, MD, 21218, United States of America, acappon1@jhu.edu

1 - Repo Chains

Alireza Tahbaz-Salehi, Columbia Business School, 3022 Broadway, Uris 418, New York, NY, 10027, United States of America, alirezat@columbia.edu, Marco Di Maggio

We study the financial institutions' role as intermediaries between cash lenders (e.g. money market funds) and borrowers (e.g. hedge funds), and study how a chain of repurchase agreements can function as a mechanism for propagation and amplification of risk.

2 - Funding without Tears: A Unified Approach to XVA

Stephan Sturm, Assistant Professor, WPI, 100 Institute Road, Worcester, MA, 01609, United States of America, ssturm@wpi.edu, Agostino Capponi, Maxim Bichuch

The financial crisis lead to an opening of the LIBOR-OIS spread. Default risk has become a real possibility and banks can no longer borrow and lend at the same rate. Also traders face different rates when financing their hedging positions. Many large banks have created unified XVA desk that takes care of the total value adjustment. We propose a unified methodology for the calculation of the XVA and provide a detailed study of hedging a stock option with defaultable corporate bonds.

3 - Likelihood Estimation for Large Financial Systems

Justin Sirignano, Stanford University, 3 Gibbs Court, Irvine, CA, 92617, United States of America, jasirign@stanford.edu, Gustavo Schwenkler, Kay Giesecke

We consider the problem of parameter estimation for large interacting stochastic systems. Maximum likelihood estimation is computationally intractable due to the scale and complexity of such systems. Weak convergence results are exploited to develop approximate maximum likelihood estimators for such systems. An important application is systemic risk in banking systems and other large financial systems.

4 - Systemic Risk and Network Topology

Peng-Chu Chen, PhD Student, Purdue University, 315 N. Grant Street, West Lafayette, 47906, United States of America, chen621@purdue.edu, Agostino Capponi

We provide an analytical framework to rank financial networks based on level of systemic risk. We introduce the concept of majorization to quantify the degree of network homogeneity and compare the losses generated after interbank clearing occurs. We analyze balancing and unbalancing networks. Given two balancing networks, if one majorizes the other, it generates smaller losses. Oppositely, given two unbalancing networks, one generates smaller losses than the other only if it is majorized by it.

1 - Global Optimization of Mixed-integer Nonlinear Optimization Problems in BARON

Mustafa Kilinc, Carnegie Mellon University, Department of Chemical Engineering, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, mkilinc@andrew.cmu.edu, Nick Sahinidis

We report recent developments in BARON. New features include integrality-based techniques, such as preprocessing, probing, constraint management, branching and node selection rules. Specific cutting plane generation now produces knapsack cuts, GUB cuts, clique cuts, implication cuts and flow cuts. Mixed-integer linear programming relaxations are solved to construct new feasible solutions and improve relaxations at nodes of the search tree. Extensive computational results will be presented.

2 - A Risk-averse Two-stage Stochastic Programming for Retrofitting Transportation Networks

Jie Lu, Clemson University, 102 Calhoun St., Apt. 130, Clemson, SC, 29631, United States of America, jlu3@clemson.edu, Yongxi Huang, Akshay Gupte

We develop a risk-averse two-stage stochastic programming model with the conditional-value-at-risk (CVaR) as the risk measure. This approach considers a variety of random outcomes to provide more robust solutions and generalizes prior modeling efforts. A mixed integer nonlinear programming problem is formulated with integer variables appearing in the second stage. We develop a decomposition algorithm based on generalized Benders decomposition method and present numerical implementations.

3 - On Convex Relaxations of Network Interdiction Problems

Danial Davarnia, University of Florida, 303 Weil Hall, Gainesville, FL, 32611, United States of America, d.davarnia@ufl.edu, Jean-Philippe P Richard, Mohit Tawarmalani

Network interdiction problems are often reformulated as bilinear mixed integer programs through dualization of the inner problem. We develop convex relaxations for these models. In particular, we give a procedure to derive the convex envelope of a single bilinear term over a relaxation of the model. We also describe the corresponding triangulation. We conclude by comparing these results to those obtained through KKT reformulations of interdiction problems.

1 - Bayesian Inventory Management with Change-Points in Demand

Adam Mersereau, Associate Professor, UNC Chapel Hill, CB 3490, Chapel Hill, NC, 27599-3490, United States of America, ajm@unc.edu, Zhe Wang

We consider an adaptive inventory control problem in which at some known points in time, the demand process may change abruptly with some probability. The underlying demand process is never revealed to the decision maker. Using a Bayesian framework, we analyze the optimal policy as demands are observed. We prove structural properties and we construct two novel lower bounds. From our bounds we develop two heuristic policies that exhibit small optimality gaps in numerical testing.

2 - Improving Intelligence Collection through Social Networks

Nedialko Dimitrov, Naval Postgraduate School, Monterey, Monterey, United States of America, ned@nps.edu, Moshe Kress

Intelligence analysts face a glut of information. To produce a complete analysis quickly, an analyst has to identify relevant information within that glut. In this talk, we discuss novel methods of assisting this intelligence collection task by exploiting social network structure.

3 - Near-optimal Regret Bounds for Reinforcement Learning in Factored MDPs

Ian Osband, Stanford University, MS&E Dept, Stanford, Ca, 94305, United States of America, iosband@stanford.edu, Benjamin Van Roy

Any learning algorithm over MDPs will have worst-case regret which grows with the square root of the number of state-action pairs. In many cases of interest the state and action spaces are so huge that it is impossible to guarantee good performance on any reasonable time frame. We show that, if the system can be represented as a factored MDP, we can obtain regret bounds polynomial in the number of parameters of the MDP, which may be exponentially smaller than the number of states or actions.

4 - Duality and Observability in Partially Observable Markov Decision Processes

Stefan Rampertshammer, Duke University, 100 Fuqua Dr, Durham, United States of America, stefan.rampertshammer@duke.edu, David Brown

We examine a continuation-value iteration technique for studying POMDPs which operates without reference to beliefs. We propose a relaxation of the observation structure which leverages the geometry of continuation-value iteration to greatly improve tractability.

Alexander Stolyar, Bell Labs, Alcatel-Lucent, 600 Mountain Ave., 2C-322, Murray Hill, NJ, 07974, United States of America, Sasha.Stolyar@alcatel-lucent.com, Guodong Pang

We consider a system where service agents are invited on-demand, and respond (accept or decline) after a random delay. Arriving customers and accepting agents are matched in the order of their arrival/acceptance. We study asymptotic behavior of a queue-based feedback agent invitation scheme, as the system scale becomes large.

2 - An Infinite-dimensional Skorokhod Map, with Applications to Fluid Limits

Kavita Ramanan, Professor, Brown University, 182 George St, Providence, RI, 02912, United States of America, kavita_ramanan@brown.edu

Scheduling policies such as Earliest-Deadline-First and Shortest-Remaining-Processing-Time serve jobs according to a continuous parameter priority. For both policies, we obtain new formulations of fluid equations and establish convergence to these equations. Our main tool is the introduction of an infinite-dimensional Skorokhod map on the space of measure-valued processes, which may be of independent interest. This is joint work with Rami Atar, Anup Biswas and Haya Kaspi.

3 - Insensitivity of Proportional Fairness in Heavy Traffic

Bert Zwart, CWI, Science Park 123, Amsterdam, Netherlands, Bert.Zwart@cwi.nl, Maria Vlasiou, Jiheng Zhang

A Bandwidth Sharing Network is a mathematical abstraction of a communication network like the Internet. For a network with proportial fairness and a dense class of service requirement distributions, we establish a diffusion limit through a state space collapse result. The invariant distribution is determined by first moments only, confirming a conjecture of Kelly et al.

4 - Improving the Scalability of Search in Networks Through Multiple Random Walks

Mark Squillante, IBM T.J. Watson Research Center, 1101 Kitchawan Rd, Yorktown Heights, United States of America, mss@us.ibm.com, Don Towsley, Sean Barker

Efficient search is of fundamental importance in communications/social networks. Assuming an underlying n-node network topology of expander graphs with bounded degree, we derive hitting time results for multiple random walks (RWs) and establish that multiple RWs scale very well: O(log n) search latency, asymptotically zero search failure probability, and O(1) overhead per query. However, to achieve these properties, it is important to tailor the number of RWs to the popularity of the content.

1 - Ensemble Modeling for Data Fusion in Manufacturing Process Scale-up

Ran Jin, Virginia Tech, Virginia Polytechnic Institute and State, University, 111 Durham Hall,, Blacksburg, VA, 24061, United States of America, jran5@vt.edu, Xinwei Deng

In manufacturing scale-up, design of experiments is widely used to identify optimal process settings, followed by production runs to validate the settings. Both experimental and observational data are collected. However, a single type of data set is often used to model the process. We propose an ensemble modeling strategy to integrate the two types by constrained likelihood approach. Simulations and a case study of wafer manufacturing are provided to illustrate the merits of the proposed method.

2 - High-dimensional Process Monitoring using Embedding Distribution in Reproducing Kernel Hilbert Space

Shuai Huang, Assistant Professor, University of Washington, Industrial and Systems Engineering, United States of America, shuaihuang@usf.edu

We propose a novel RKHS-based control chart and a change point detection method that can be applied to high-dimensional processes with sophisticated process distributions, to detect a wide range of process changes beyond the ones that are detected by traditional SPC methods. Extensive experiments on both simulated and real-world processes demonstrated that the proposed methods lead to improved statistical stability, fault detection power, and robustness.

3 - Optimal Offline Compensation of Shape Shrinkage for 3D Printing Processes

Qiang Huang, Associate Professor, University of Southern California, 3715 McClintock Avenue, Los Angeles, CA, 90089, United States of America, qiang.huang@usc.edu, Jizhe Zhang, Arman Sabbaghi, Tirthankar Dasgupta

Dimensional accuracy is a key control issue in direct 3D printing. We develop a new approach to (1) model and predict part shrinkage, and (2) derive an optimal shrinkage compensation plan to achieve dimensional accuracy. Experimental results demonstrate the ability of the proposed compensation approach to achieve an improvement of one order of magnitude in reduction of geometric errors for cylindrical products.

Recent Trends in Composing Heterogeneous Simulation Models

Sponsor: Simulation

Sponsored Session

Chair: Peter Haas, IBM Almaden Research Center, 650 Harry Road, San Jose, CA, 95120, United States of America, phaas@us.ibm.com

1 - Complex Events Modeling, Simulation, and Analysis (CEMSA)

Nabil Adam, Distinguished Professor and Assoc Provost for Research, Rutgers University, 1 Washington Park, Newark, NJ, 07102, United States of America, adam@adam.rutgers.edu

CEMSA enables analysts quickly integrate data, simulation models, and expertise to arrive at credible consequence analysis of complex events (e.g., a coordinated cyber/physical attack that disables transportation and causes the release of a toxic chemical plume). CEMSA aims to reduce turnaround time and costs, provide enhance interoperability within and across organizations. We present technical detail of some CEMSA components and discuss an example of its possible use.

2 - A Reflective Middleware Framework for Next Generation Multisimulations

Sharad Mehrotra, Professor, University of California, Irvine, 2084 Donald Bren Hall, Irvine, CA, 92617, United States of America, uci.sharadmehrotra@gmail.com, Nalini Venkatasubramanian

We present a reflective middleware framework, RAISE, to integrate multiple autonomous simulators to model complex scenarios. RAISE extracts metamodels from simulators, observes their execution, facilitates information exchange, and reflects the modified features in the integrated simulation. Using a case study from emergency response, we discuss several challenges in enabling accurate multisimulations.

3 - Accelerating the Execution of Stochastic Composite Simulation Models

Peter Haas, IBM Almaden Research Center, 650 Harry Road, San Jose, CA, 95120, United States of America, phaas@us.ibm.com

Stochastic composite simulation models can be used to study complex stochastic "systems of systems". For a composite model made up of loosely coupled component models, we provide a method for speeding up composite-model simulations. To run n Monte Carlo replications of the composite model, we execute certain component models fewer than n times, re-using results as needed. The number of component-model replications is chosen to maximize an efficiency measure as in Glynn and Whitt (1992).

4 - AROMA: A Spatial Agent-Based Software Platform for Integrated Modeling of Natural Resources

Saeed Ghafghazi, PostDoctoral Fellow, Institute for Energy and Environmental Policy, Queen's University, #2312-2424 Main Mall, Vancouver, BC, V6T1Z4, Canada, saeed.ghaf@queensu.ca

This paper presents the development and use of AROMA (Agent-based Resource Optimization Modeling Arena). AROMA is a GIS- and agent- based software platform that allows integrated modeling of natural resources related systems. A case study investigating the impact of supplier-buyer and lumber market dynamics on wood fiber supply chain in Northeastern Ontario is presented and implications for economic and environmental sustainability of the emerging biorefineries in the region are discussed.

Carbon Footprint and the Management of Supply Chains

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Arda Yenipazarli, Assistant Professor of Operations Management, Georgia Southern University, College of Business Administration, Department of Management, Statesboro, GA, 30460, United States of America, ayenipazarli@georgiasouthern.edu

1 - Cap and Trade Emissions Trading: An Economic Analysis

Arda Yenipazarli, Assistant Professor of Operations Management, Georgia Southern University, College of Business Administration, Department of Management, Statesboro, GA, 30460, United States of America, ayenipazarli@georgiasouthern.edu

Carbon emissions trading emerges as an effective market-based mechanism to curb the carbon emissions. Using a utility-based model, this paper studies the optimal policy of production and carbon trading decisions of a firm operating in a segmented customer market, and examines the impacts of carbon trade, carbon price and carbon cap on these decisions.

2 - Optimal Carbon Capture and Storage Contracts using Historical CO2 Emissions Levels

Wenbo (Selina) Cai, Assistant Professor, New Jersey Institute of Technology, MEC 308, University Heights, Newark, NJ, 07102, United States of America, cai@njit.edu, Dashi Singham

In an effort to reduce carbon emissions to the atmosphere, carbon capture and storage technology is developed to collect carbon from emissions generators and store it underground. We develop optimization models to facilitate a storage operator's decisions on the price and volume of service contracts to maximize his expected profit subject to the limited capacity at the storage site while encouraging the participation of the emissions sources.

3 - Modeling Carbon Control Policies: Tax versus Cap-and-Trade

Arvind Sainathan, Nanyang Business School, NTU, S3-B2A-03 50 Nanyang Avenue, Singapore, Singapore, asainathan@ntu.edu.sg, S. Viswanathan

We consider and compare the performance of two key carbon control policies: tax and cap-and-trade. We characterize the Stackelberg equilibrium under the tax policy, and the unique trading equilibrium in the cap-and-trade policy. We also consider other well-known mechanisms for carbon control, and compare them with these two policies. Finally, we propose two new schemes and derive key insights based on our analysis.

4 - Adjusting Closed Loop Transportation Capacities to Uncertain Carbon Tax with Stochastic Demands

Seyyed Ali Haddad Sisakht, Iowa State University, 3004 Black Engineering Bldg., Ames, United States of America, alihadad@iastate.edu, Sarah M. Ryan

We formulate a closed-loop supply chain network design problem under carbon tax uncertainty and stochastic demands. We propose a solution approach with adjustable robust optimization where mode transportation capacities and product flows can adapt to changing tax rates and product flows also vary by scenario. Solving the mixed-binary stochastic semidefinite program indicates that increasing carbon tax uncertainty in the initial periods expands the benefit of adjustability.

Incorporating Ecological Concerns into Harvest Scheduling

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Erin Belval, Colorado State University, Campus Delivery 1472, Fort Collins, CO, United States of America, mccowene@gmail.com

1 - Incorporating Edge Effects Into Harvest Scheduling

Kai Ross, PhD. Student, University of Washington, Loew Hall 304, Seattle, WA, 98195, United States of America, mailkaiross@gmail.com, Sandor Toth

When a forest is cut, new edges are formed altering many ecological factors such as sun exposure and risk to wind throw. We introduce a new harvest scheduling model that incorporates the edge effects of these factors on yield. The mechanics of the model will be illustrated with a case study where the potential loss of yield to wind throw is commercially significant.

2 - Can Sustainable Forest Management Help Mitigate Climate Change?

Marc-André Carle, Assistant Professor, Université Laval, 1065, Avenue de la Médecine, Québec, QC, Canada, Marc-Andre.Carle@osd.ulaval.ca, Mathieu Bouchard, Steve Vallerand, Sophie D'Amours, Martin Simard

In the past decade, carbon concentration in the atmosphere has increased significantly. The potential of forests to help mitigating climate change has been widely acknowledged. This talk presents several modeling strategies for incorporating carbon accounting and sequestration into strategic forest management models. Three case studies from the Province of Quebec will be presented and discussed.

Analysis of Matching Markets

Cluster: Auctions

Invited Session

Chair: Thayer Morrill, NC State University, NC, United States of America, thayer_morrill@ncsu.edu

1 - New Algorithms for Fairness and Efficiency in Course Allocation

Hoda Atef Yekta, PhD Candidate, University of Connecticut, School of Business, 2100 Hillside Road Unit 1041, Storrs, CT, 06269, United States of America, Hoda.AtefYekta@business.uconn.edu, Robert Day

This research formulates the course allocation problem as a multi objective mathematical model considering both efficiency and measures of fairness. Results of four proposed heuristic algorithms are compared with existing mechanisms and we show that our new algorithms can improve both efficiency and fairness of the results.

2 - Internally Stable Matchings and Exchanges

Yicheng Liu, liuyicheng1991@hotmail.com, Pingzhong Tang

We propose an alternative notion of stability for matchings and exchanges, coined internal stability, which only requires stability among matched agents. For internal stability, we analyze the social welfare bounds and computational complexity. Our results indicate that internal stability addresses both the social welfare and computational difficulties associated with traditional stability.

3 - The Secure Boston Mechanism

Thayer Morrill, NC State University, NC, thayer_morrill@ncsu.edu, Umut Dur, Robert Hammond

We introduce a new algorithm that is a hybrid between the Boston and Deferred Acceptance algorithm. While not strategy-proof, this "secure" Boston algorithm significantly reduces the incentive for students to strategically manipulate their reported preferences while maintaining the desirable feature of the Boston mechanism of assigning as many students as feasible to their favorite school. We run an experiment in order to test the performance of our new assignment procedure.

4 - Two-sided Matching with Incomplete Information

Sushil Bikhchandani, UCLA Anderson School of Management, University of California, Los Angeles, CA, United States of America sushil.bikhchandani@anderson.ucla.edu

Stability in a two-sided matching model with non-transferrable utility (NTU), interdependent preferences, and one-sided incomplete information is investigated. The notion of incomplete-information stability used here is similar to that of Liu et al. (2014). With anonymous preferences, all strictly individually-rational matchings are incomplete-information stable. An ex post incentive-compatible mechanism exists for this model. Extensions to two-sided incomplete information are investigated.

Optimization and Analysis of Smart Grids with Renewable Energy and Storage

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Masood Jabarnejad, PhD Student, Auburn University, 333 East Magnolia Ave. APT 44, Auburn, AL, 36830, United States of America, masood@auburn.edu

1 - Electricity Markets and Operations with Multi-stage Optimization

Alberto J. Lamadrid, Assistant Professor, Lehigh University, 621 Taylor Street, r451, Bethlehem, PA, 18015, United States of America, ajlamadrid@Lehigh.EDU

We present a two stage program for operations and market clearing of the electricity system with high penetrations of renewable energy sources. The formulation is a stochastic program with robust operational reserves for the system operator. The first stage is a multi-period, security constrained Optimal Power Flow (SC-OPF), with Markovian transitions over time, forecasting a fixed time horizon. The second stage is a single period SC-OPF, incorporating the realizations of stochastic variables.

2 - Financial Rights for Energy Storage

Josh Taylor, Asst. Professor, U. Toronto, 10 King's College Rd., Toronto, Canada, josh.taylor@utoronto.ca

The strong analogy between energy storage and transmission motivates us to ask: should storage buy and sell power at wholesale market prices, or should its physical and financial operations be decoupled? The latter case is non-traditional and is the subject of this talk. We define financial storage rights, which enable passive storage to recover costs, redistribute the system operator's budget surpluses, and enable market participants to hedge against nodal price volatility.

3 - Optimization Models and Algorithm for Layouts of Ocean Wave Energy Farms

M. Mohsen Moarefdoost, Lehigh University, 200 W Packer Ave, Bethlehem, PA, United States of America, mom211@lehigh.edu, Lawrence V. Snyder

We present models and algorithms for choosing optimal locations of wave energy conversion (WEC) devices within an array, or wave farm. The location problem can have a significant impact on the total power of the farm due to the complicated hydrodynamic interactions among the devices and ocean waves. The wave energy converter location problem (WECLP) is non-linear and non-convex, so we propose an iterative heuristic for the general problem as well as the model's analytical properties.

4 - Techno-Economic Optimization of a High-Flux Solar Thermal Receiver using Surrogate Models

Michael Wagner, Mechanical Engineer, National Renewable Energy Laboratory, 15013 Denver West Parkway, Golden, CO, 80401, United States of America, Michael.Wagner@nrel.gov, Alexandra M. Newman, Rob Braun

We optimize a novel concentrating solar power tower receiver technology by choosing geometry and optical design. We use computationally expensive engineering models to generate surrogates that represent the objective function, which accounts for revenue as a function both of the design of the system and of the annual plant electricity production. Solar flux and material temperature constraints are highly nonlinear, making it difficult to determine a feasible solution; we present results.

■ MC73

Parc- Mission I

Investment in Electricity Markets

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Golbon Zakeri, Dr., University of Auckland, #70 ymonds street, Auckland, New Zealand, g.zakeri@auckland.ac.nz

1 - A Column Generation Approach for Generation Expansion Planning with High Renewable Penetration

Angela Flores, Research Assistant, Energy Center, University of Chile, Av. Tupper 2007, Santiago, Chile, angelafq@gmail.com, Rodrigo Moreno, Rodrigo Palma, Golbon Zakeri

The high penetration of renewables that is envisaged in future power systems will significantly increase the need for flexible operational measures and generation technologies. These sources of flexibility will need to be properly considered in system expansion models. In this framework, we propose a column generation approach that permits the consideration of Unit Commitment constraints in long-term system planning problems in an efficient fashion.

2 - Investment in Electricity Markets with Risk Averse Agents

Golbon Zakeri, Dr., University of Auckland, #70 ymonds street, Auckland, New Zealand, g.zakeri@auckland.ac.nz, Corey Kok, Andy Philpott

We will present investment results from competitive equilibrium models over electricity markets with risk averse generators and retailers. We will compare investment levels under different risk mitigating structures such as vertical integration with when risk trade through instruments such as contract for differences are implemented.

3 - The Value of Electricity Storage for Intermittent Renewable Integration: A Hybrid Modeling Approach

Claudia Octaviano, Research Associate, MIT, 77 Massachusetts Ave, E19-411, Cambridge, MA, 02139-4307, United States of America, claus@mit.edu

Renewable electricity faces several integration challenges due to its intermittency. While critical to decarbonize the power sector, renewables require storage devices and demand response to reach large-scale deployment. To assess the value of storage, a capacity expansion model with renewable resources at the hourly time-scale is coupled to the MIT EPPA model, a global general equilibrium model. We discuss economy-wide implications of the availability of storage for long-term climate policy.

4 - Including Short-Term Operation Details in Strategic Generation Expansion Models

Adelaida Nogales, Research Assistant, Institute for Research in Technology, Alberto Aguilera, 23, Madrid, Ma, 28015, Spain, adelaida.nogales@iit.upcomillas.es, Efraim Centeno, Sonja Wogrin

Renewable technologies are expected to reach large penetration levels in electric power systems. These technologies are changing the unit commitment of the rest of the generation facilities and therefore, operation-related issues become more relevant for an adequate analysis of generation expansion problems. We propose a generation expansion equilibrium model including an oligopolistic market representation and with key operation-related details. An efficient resolution methodology is proposed.

■ MC74

Parc- Mission II

Stochastic and Robust Optimization in Electric Power Systems Operations and Planning

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Andy Sun, Assistant Professor, Georgia Institute of Technology, 765 Ferst Drive NW, Atlanta, GA, 30332, United States of America, andy.sun@isye.gatech.edu

1 - Strategic Offering for a Wind Power Producer: A Stochastic MPEC Approach

Luis Baringo, Postdoctoral researcher, ETH Zurich, EEH - Power Systems Laboratory, Physikstrasse 3 - ETL G 23, Zurich, 8092, Switzerland, luis.baringo@eeh.ee.ethz.ch, Antonio J. Conejo

A stochastic mathematical program wind equilibrium constraints (MPEC) is proposed to derive the optimal offering strategy of a wind power producer participating in the day-ahead and balancing markets. This producer owns a large enough wind power capacity and is able to behave strategically in order to alter market prices according to its own interest. Uncertainties concerning wind power productions, market prices, and rivals' offering decisions are efficiently modeled using a set of scenarios.

2 - Distributionally Robust Congestion Management with Dynamic Line Ratings

Jianhui Wang, Decision and Information Sciences Division/Argonne National Laboratory, 9700 S. Cass Avenue, Bldg. 221, Argoone, IL, 60439, United States of America, jianhui.wang@anl.gov, Feng Qiu

Dynamic Line Rating or DLR, which monitors the ambient environment to estimate the thermal rating of a transmission line, has been shown to be very effective in utilizing the capacity of transmission lines. In this work, we propose a new distributionally robust optimization based congestion management model that selectively uses DLR to alleviate system congestion while keeping the overloading risk at the system level within a safe range.

3 - Multistage Stochastic Power Generation Expansion Planning
Jikai Zou, Graduate Research Assistant, Georgia Institute of Technology, 765 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, jikai.zou@gatech.edu, Shabbir Ahmed, Andy Sun

We consider a power generation expansion problem with uncertainty in demand and fuel price. In particular, we develop a multistage stochastic mixed integer programming approach to determine the numbers of power plants to be built during the planning horizon. The differences among two-stage, multistage and a "hybrid" models are addressed. We propose an efficient approximation scheme by exploiting a special substructure, and give an analytical bound on the optimality gap of the algorithm.

4 - Do-Not-Exceed Limits for Renewable Resources with Robust Corrective Topology Control
Kory Hedman, Assistant Professor, Arizona State University, PO Box 875706, GWC 206 School of ECEE, Tempe, AZ, 85287-5706, United States of America, Kory.Hedman@asu.edu, Akshay Korad

Do-not-exceed (DNE) limits specify a desired dispatch range that a renewable power producer must stay within in order to maintain reliability. These DNE limits can be determined with robust optimization. Corrective transmission topology control can be used to manage congestion and renewable uncertainty in the smart grid. This talk will present how corrective topology control can be used to improve do-not-exceed limits for renewable resources.

Parc- Mission III

Operations Research to Inform Health Policies

Sponsor: Minority Issues Forum

Sponsored Session

Chair: Maria Mayorga, Associate Professor, North Carolina State University, 111 Lampe Dr., Raleigh, NC, 27695, United States of America, memayorg@ncsu.edu

1 - A Dynamic Programming Model to Assess when it is Optimal to Stop a Trial of Labor
Karen Hicklin, North Carolina State University, 111 Lampe Drive, Campus Box 7906, Raleigh, NC, 27695, United States of America, kthickli@ncsu.edu, Vidyadhar Kulkarni, Meera Viswanathan, Evan Myers, Julie Ivy

The cesarean section rate in the U.S. was reported to be 32.8% in 2011, rising from 4.5% in 1970. Due to the increased risk of short-term complications associated with cesarean sections, among other things, there is general consensus that current rates are too high. A dynamic programming decision model was created to provide time-based thresholds conditional on dilation for when to stop a trial of labor in order to maximize the expected utility of healthy outcomes for the mother and child.

2 - Modeling Smoking Cessation Aid Choices and Outcomes
Rachel Townsley, North Carolina State University, 400 Daniels Hall, College of Engineering, NCSU, Raleigh, NC, 27695, United States of America, rmtownsl@ncsu.edu, Maria Mayorga

Despite declining prevalence, cigarette smoking remains the leading cause of preventable death in the developed world. We use discrete event simulations informed by statistical choice models to model behavior and disease progression and evaluate policy strategies to improve cessation rates in a heterogeneous US population. We focus on quantifying the impact of incentivizing the use of cessation aids to alter smoker choice in a quit attempt, evaluating policies by QALYs gained and societal cost.

3 - The Effect of Mindfulness Meditation on Decreasing the Stroke Incidence in the US
Raj Ambavane, Clemson University, 220 Elm St #321, University Place, Clemson, SC, 29631, United States of America, rambava@g.clemson.edu, Amin Khademi, Lu Shi

Mindfulness meditation has shown promise in clinical trials in reducing systolic blood pressure, one of the main causes of stroke. We develop an agent-based simulation model simulating the stroke trend in the US to estimate the effect of mindfulness meditation on the incidence of strokes. Our results show that mindfulness meditation, if properly utilized along with the regular antihypertensive medication, could be effective in ultimately reducing the incidence of strokes.

4 - A Microsimulation Population Model to Evaluate Sodium Reduction Initiatives in Los Angeles County
Irene Vidyanti, Los Angeles Department of Public Health, 3530 Wilshire Boulevard, Los Angeles, CA, 90010, United States of America, irenevidyanti@gmail.com, Ricardo Basurto-Davila

The Future Elderly Model (FEM) is a microsimulation model originally developed to examine health and health care costs among the elderly national Medicare population. FEM is adapted for use in Los Angeles (LA) County by re-weighting and calibrating to various data sources to form FEM-LA. FEM-LA is then used to evaluate long term health impact of Los Angeles County Department of Public Health's sodium reduction initiatives in population 51 years old and older.

The Data Lifecycle - Selected Case Studies

Sponsor: The Practice Track

Sponsored Session

Chair: Rainer Dronzek, Director-Operations Research, McDonald's, 1253 N Schmidt Road, Romeoville, IL, 60446, United States of America, rainer.dronzek@us.mcd.com

1 - The Data Lifecycle: A QSR Case Study
Rainer Dronzek, Director-Operations Research, McDonald's, 1253 N Schmidt Road, Romeoville, IL, 60446, United States of America, rainer.dronzek@us.mcd.com

The lifecycle of data begins with collection and progresses through preparation, analysis, presentation, activation, storage, reuse and destruction. Several specific data sets in the Quick Service Restaurant industry will be presented and the lessons learned, successes and opportunities for each step of the data lifecycle will be discussed. The session will also highlight the realities of dealing with real world data.

2 - So Much Data, So Little Time - A Customer Analytics Perspective
Ben Fuqua, Vice President, Elicit, 525 Third Street North, Suite 509, Minneapolis, MN, 55401, United States of America, ben.fuqua@elicitinsights.com, Jim Sawyer

Analytics professionals can encounter real world problems and wrestle with Big Data with a pragmatic perspective. Understanding what data is important, such as deciding how to gauge Customer's response a retailer's value proposition affords us the opportunity to consider novel solution possibilities and data combinations. The data lifecycle and quality are always restrictions. But navigating those restrictions and leading Senior Executives to data driven decisions requires additional skills.

3 - Sentiment Analytics with Automatic Facial Expression Recognition Software
Marian Bartlett, Co-Founder & Lead Scientist, Emotient, 4435 Eastgate Mall, Suite 320, San Diego, CA, 92121, United States of America, marni@emotient.com, Ed Colby

Dr. Bartlett will explain a state-of-the-art approach applying machine learning, computer vision and cognitive science to facial expression recognition. She will demonstrate the data lifecycle from collection via a standard camera; frame-by-frame processing (detecting emotions, overall sentiment and gender demographics); and show the aggregate, anonymous data visualized as emotion-based heat maps. She will conclude by discussing how this data can be interpreted to derive key business insights.

4 - Too Much Data - When to Focus on What
Oliver Bandte, Customer Analytics Team Manager, The Boston Consulting Group, 35 State St, Boston, MA, United States of America, oliver.bandte@bcg.com

As traditional data scientists have always longed for higher quantities of data to feed the prevalent statistical techniques, we may have come in many organizations to a point where data integrity has to be called into question due to the variety of its sources. Dr. Bandte will demonstrate a few real life examples where "more data" did not always mean "more insght"as data integrety, analytical rigor, and insight actionability started to suffer from data abundance.

Joint Session Analytics/HAS: Predictive and Prescriptive Analytics for Reducing Health Risks

Sponsor: Analytics & Healthcare

Sponsored Session

Chair: Doug Popken, Chief Data Scientist, Next Health Technologies, 5347 S Valentia Way, Englewood, CO, 80111, United States of America, doug.popken@nexthealthtechnologies.com

1 - An Adaptive Risk Grouper for Predicting Health Plan Member Health, Cost, and Attrition Risks

Tony Cox, Chief Sciences Officer, Next Health Technologies, 5347 S Valentia Way, Englewood, CO, 80111, United States of America, tony.cox@nexthealthtechnologies.com

We consider how to optimize the performance of multi-criteria risk "groupers" that predict individual member risks (health, cost, and attrition risks) by adaptively clustering members based on high-information combinations of predictor values. Performance is improved by re-training as new data arrive and using an ensemble of the resulting models to make final predictions. Cross-validation shows the lift from adaptively optimized grouping compared to traditional non-adaptive risk groupers.

2 - E-Cigarettes: Promise, Peril, and Probabilistic Population Prediction

Bill Poland, VP & Lead Scientist, Pharsight, A Certara Company, 100 Mathilda Place Suite 160, Sunnyvale, Ca, 94086, United States of America, bill.poland@certara.com

E-cigarettes, which deliver nicotine without carcinogenic tar, hold the promise to save the lives of many smokers who switch to them, but risks include failure to quit cigarettes (dual use), increased initiation to nicotine products among youth, relapse of former smokers to e-cigarettes, and e-cigarettes becoming a "gateway to smoking." To capture these uncertainties and weigh benefits vs. risks, prediction of e-cigarette health impacts must use a broad range of probability-weighted scenarios.

3 - Big Data Assembly for Optimizing Health Care Metrics

Doug Popken, Chief Data Scientist, Next Health Technologies, 5347 S Valentia Way, Englewood, CO, 80111, United States of America, doug.popken@nexthealthtechnologies.com

Health care insurers want to manage their members in order to maximize retention, minimize costs, and maximize health. Prescriptive approaches being developed by NextHealth Technologies include "nudging" member behavior via targeted messaging. Implementation requires assembling a wide array of historical data at the member level to feed into the models. This talk discusses the content and structure of data required to enable our prescriptive modeling framework.

Dynamic Decision Making

Sponsor: Decision Analysis

Sponsored Session

Chair: Robert Winkler, Duke University, Fuqua School of Business, Box 90120, Durham, NC, 27708-0120, United States of America, rwinkler@duke.edu

1 - Idea Generation and Idea Execution

Kevin McCardle, Professor, UCLA Anderson School of Management, 110 Westwood Plaza, Los Angeles, CA, 90095, United States of America, kevin.mccardle@anderson.ucla.edu, Ilia Tsetlin, Robert Winkler

We develop a stochastic dp to determine whether to start and when to stop investing effort on a research project. A project is characterized by: probability it can be successfully completed, arrival rate of that conditional success, payoff if successful, fixed start-up costs, and opportunity cost. The idea is to make opportunity cost endogenous, in the sense that if the current project is abandoned, the only option is to search for similar projects. Analytic and numeric results are presented.

2 - Risk Aversion, Information Acquisition and Technology Adoption

Canan Ulu, Georgetown University, McDonough School of Business, Georgetown University, Washington, DC, 20057, United States of America, cu50@georgetown.edu, James E. Smith

We study the impacts of risk aversion and uncertainty on technology adoption decisions, using a dynamic programming model. The effects of risk aversion on optimal policies can be complex and subtle.

3 - Empirical Stopping Rules

John Mamer, Professor, UCLA Anderson School of Management, Suite D518, 110 Westwood Plaza, Los Angeles, CA, 90095, United States of America, john.mamer@anderson.ucla.edu, Manel Baucells

The classical solution to the optimal stopping problem depends heavily on the decision maker's knowledge of the offer distribution. We explore a general approach to the optimal stopping problem when the offer distribution is not known. Our approach replaces knowledge of the offer distribution with the empirical distribution function, and offers simple decision rules. We explore the performance of these rules both analytically and with Monte Carlo simulation.

4 - Dismissing Decision Tasks: The Optimality of the M-Shaped Structure

Saed Alizamir, Yale University, New Haven, CT, United States of America, saed.alizamir@yale.edu, Francis de Vericourt, Peng Sun

We consider a sequential hypothesis-testing problem where the Decision Maker faces a random stream of decision tasks that accumulate over time, creating congestion. The agent needs to dynamically choose when to terminate the information collection process and make a final decision. The DM can also dismiss tasks from the queue, in the sense that she makes her decision a priori without running any test. We model the problem as a MDP and our analysis reveals the optimality of an M-shaped structure.

50th Anniversary Update from Some Ramsey Award Winners

Sponsor: Decision Analysis

Sponsored Session

Chair: Sam Bodily, John Tyler Professor, Darden School, UVA, 100 Darden Boulevard, Charlottesville, VA, 22903, United States of America, BodilyS@Darden.virginia.edu

1 - Description of Session by Session Chair

Sam Bodily, John Tyler Professor, Darden School, UVA, 100 Darden Boulevard, Charlottesville, VA, 22903, United States of America, BodilyS@Darden.virginia.edu

The 3 speakers will each present 20 minutes of new expository material about what is important to the DA community today. This may include their work on some aspect of DA that has been advanced since they received their award. They have been asked to leave the audience with some provocative questions regarding work in our field. After they speak, I will moderate about 30 minutes of interactive discussion involving the speakers and the audience on their questions and the future of DA.

2 - MultiAttribute Utility: The Next 40 Years

David Bell, Harvard Business School, Boston, MA, United States of America, dbell@hbs.edu

In the early 1970's Keeney and Raiffa started this branch of Decision Analysis. A lot has been accomplished. Is it now a mature field? Or has this been just the beginning?

3 - DA Challenges and Opportunities: An Idiosyncratic View of Decision Analysis

Bob Clemen, Professor Emeritus, Duke University, 100 Fuqua Dr, Box 90120, Durham, NC, 27707, United States of America, robert.clemen@duke.edu

I will present my own view of challenges that decision analysis faces now and in the foreseeable future. Those challenges provide many opportunities, but there are substantial barriers. The future of DA, in my opinion, is not for the weak of heart.

4 - The Past Suggests the Future

James Dyer, The University of Texas at Austin, 2110 Speedway Stop B6500, Austin, TX, United States of America, j.dyer@mccombs.utexas.edu

Experiences from the past still suggest research on unsolved problems, such as conditional probabilities in decision trees and descriptive utility models.

Price, Ambiguity and Value of Information

Sponsor: Decision Analysis

Sponsored Session

Chair: Emanuele Borgonovo, Full Professor, Bocconi University, Via Roentgen 1, Milan, Italy, emanuele.borgonovo@unibocconi.it

1 - Prescriptive Modeling of Ambiguity Aversion: Is it Necessary?
Gordon Hazen, Full Professor, Northwester University, United States of America, gbh305@northwestern.edu

After Ellsberg, we know that individuals tend to be ambiguity (uncertainty) averse for probabilities, a behavior inconsistent with expected utility theory (EU). Here we remind listeners that many decision models have plausible reformulations in which ambiguity aversion can still occur but as a consequence of EU risk aversion. We present examples involving plant licensing, accident analysis, and medicine. We thereby question the need for prescriptive modeling of ambiguity averse preferences.

2 - A Model of Mental Accounting and Reference Price Adaptation
Woonam Hwang, PhD Candidate, London Business School, Regent's park, London, NW14SA, United Kingdom, whwang@london.edu, Manel Baucells

We propose a model of mental accounting for consumption and payment decisions. Consumers hold reference prices in mind, which they use to compare with the benefit of consumption and with the price paid for an item. Reference prices are determined by a memory-based psychological process of adaptation to "price reminders". The model explains a wide array of observed anomalies such as sunk-cost effects, payment depreciation, reluctance to trading, preference for pre-payment, and the flat-rate bias.

3 - Ambiguity-Risk Model and Ambiguity Measure: Separating Ambiguity from Risk in Preference Model
Ying He, Assistant Professor, University of Southern Denmark, Campusvej 55 DK-5230 Odense M, Odense, Denmark, ying.he08irom@utexas.edu, James Dyer, John Butler, Jianmin Jia

We propose a preference condition to separate ambiguity from risk in utility model where ambiguity is modeled by second order lottery. Such a separation model provides an ambiguity measure based on preference. Applying Taylor expansion to this measure, we show that this ambiguity measure is reduced to the variance of the second order lottery. Finally, by assuming further preference conditions, we obtain an additive utility model over three components, namely, value, risk, and ambiguity.

4 - Decisions and Reliability
Alessandra Cillo, Bocconi University, Italy, alessandra.cillo@unibocconi.it, Emanuele Borgonovo

It is critical to understand the relative importance of systems in a decision-making process. Importance measures serve for this purpose. However, the value-sensitivity measures might not be fully informative when the selection among competing alternatives is of concern. While value of information has been invoked as an appropriate sensitivity measure, its link to traditional importance measures has not been discussed yet. This work provides such link.

5 - Probabilistic Sensitivity Analysis: Foundations and Estimation
Emanuele Borgonovo, Full Professor, Bocconi University, Via Roentgen 1, Milan, Italy, emanuele.borgonovo@unibocconi.it, Elmar Plischke, Gordon Hazen

Value of information, density-based, variance-based sensitivity measures can all be obtained from a common rationale. We prove a convergence result for all these techniques that shows that they can be estimated from the same Monte Carlo sample.

Joint Session Data/AI/HAS: Big Data Analytics and Smart Health II

Sponsor: Data Mining, Artificial Intelligence, & Healthcare

Sponsored Session

Chair: Sung Won Han, New York University, 650 First Avenue, New York, United States of America, sungwonhan2@gmail.com

1 - A Stochastic Appointment Scheduling System for an Outpatient Physical Therapy Service
Peifang Tsai, Assistant Professor, National Taipei Univ of Technology, 1, Sec. 3, Zhongxiao E. Rd., Taipei, 10608, Taiwan - ROC, p.jennifer.tsai@gmail.com

Motivated by an outpatient physical therapy service, the aim of this research is to develop a stochastic overbooking model to enhance the service quality and to increase the utilization of multiple resources. When patients call, they are assigned to appointment blocks. A patient might require more than one resource and a probability of no-show. Two estimation methods were proposed and a numerical example was used to compare this stochastic model with traditional appointment systems.

2 - Recent Development in Methodology for Gene Network Problems and Inferences
Sung Won Han, New York University, 650 First Avenue, New York, NY, United States of America, sungwonhan2@gmail.com, Judy Hua Zhong

This presentation discusses the recent development of methodologies for estimating cancer gene networks, which has been a very important problem in genomic projects for decades. To estimate the network, a directed acyclic graph in terms of probabilistic graphical modeling has been used. However, with those ultra-high dimensional data, the estimation of the gene networks is a very challenging problem. We discuss the recent development based on the score-and-search approach.

3 - Predicting Outcomes of Chemotherapy for Non-Small-Cell Lung Cancer (NSCLC) By Aggregate Level Data
Frank Puk, PhD Student, University of Texas at Arlington, pukkinming@gmail.com, Haomiao Jin, Shinyi Wu

This study aims to develop prediction models that forecast outcomes of chemotherapy for NSCLC using aggregate level data collected from a systematic review. Two methods were explored: 1) a multivariate meta-regression model was developed to predict outcomes of new clinical trials; and 2) a patient-level prediction model was developed using individual data simulated from aggregate level characteristics. The derived models can assist both new clinical trial design and customized chemotherapy.

Big Data Analytics for Various Applications

Sponsor: Data Mining

Sponsored Session

Chair: Seoung Bum Kim, Associate Professor, Korea University, Anam-Dong, Seongbuk-Gu, Seoul 136-713, Seoul, Korea, Republic of, sbkim1@korea.ac.kr

1 - Adaptive Clustering-based Control Chart for Time-varying and Multimode Process Control

Jihoon Kang, PhD Candidate, Korea University, Anam-dong, Seongbuk-gu, Chang-ee guan 816, Seoul, Korea, Republic of, jihoon.kang82@gmail.com, Seoung Bum Kim

Traditional control charts have become restricted in that many manufacturing processes now have unprecedented characteristics. A clustering-based mahalanobis (CBM) control chart integrating a control chart with a clustering algorithm has recently been introduced, and it effectively handles the limitations caused by the distributions containing multimode in-control observations. In the present study, we enhance CBM chart for adaptive monitoring of multimode process under time-varying situation.

2 - Exploring the Relation of Twitter Activity with the Movements in Turkish Stock Market

Mustafa Gökce Baydogan, Assistant Professor, Department of Industrial Engineering, Bogaziçi University, Bebek, Istanbul, 34342, Turkey, mustafa.baydogan@boun.edu.tr, Özgür Güney, Hazan Deniz Marti, Hande Acet

This study explores if social media (especially Twitter) can provide information about the future movements in Turkish Stock Market. Specifically, various features are extracted from tweets for each day to predict the next day activity (i.e. trading volume, percent change in the index). We also explore the use of these features at different granularities (i.e. hourly) to see whether Twitter activity within the day or between the days has better predictive power.

3 - A New Spatial Anomaly Detection Algorithm with Multiple Spatial Maps in Multistage Manufacturing System

Byunghoon Kim, PhD Student, Rutgers University, United States of America, byungkim@scarletmail.rutgers.edu, Young-Seon Jeong, Seung Hoon Tong, In-Kap Chang, Myong-Kee Jeong

The prompt detection of abnormal dynamic random access memory (DRAM) wafers based on multiple spatial maps is one of the primary issues that challenge the process to increase yield rates and product qualities. In this talk, we present a new spatial anomaly detection algorithm for detecting abnormality of a DRAM wafer with multiple spatial maps. The proposed procedure is validated using real-life DRAM wafers for practical viability.

Analytics for Surviving Austerity: Doing More with Less

Sponsor: Military Applications Society

Sponsored Session

Chair: Aaron Burciaga, Senior Manager, Operations Analytics, Accenture, Arlington, VA, United States of America

1 - Optimizing Marine Security Guard Assignments

Maro Enoka, Senior Operations Research Analyst, United States Marine Corps, 14014 Trawler Drive, Woodbridge, VA, 22193, United States of America, maro.enoka@gmail.com

The USMC manually assigns 1,500 Marines to 149 embassies annually while attempting to satisfy many assignment requirements. Historically, this has been a laborious process requiring over 6,000 hours per year. This paper introduces an assignment tool that uses a multi-commodity network flow formulation to optimally assign Marines to embassies. The tool dramatically reduces labor hours and creates assignments that are superior to manual assignments with regard to several measures of effectiveness.

2 - Manpower Reductions: Leveraging Existing Tools to Solve Problems beyond Their Design

Randal Allen, Lone Star, 4555 Excel Parkway, Suite 500, Addison, TX, 75001, United States of America, rallen@lone-star.com, Don Hanks

Decision support tools, created to solve specific problems associated with predictive analytics, can be leveraged to answer questions beyond the designer's original intent. Understanding how to map new problems into existing architectures and translate data into tool inputs, is the key to success in extending the utility of existing tools. A powerful example is the use of a decision support tool to measure the impacts of manpower reductions in air traffic control resources.

3 - Delivering High Performance Analytics to USA DoD/GSA Supply Chain Clients

Will Donovan, Accenture, Sowwah Square, 9th Floor, Abu Dhabi, United Arab Emirates, william.c.donovan@accenture.com

The USA General Services Administration was seeking a supply chain solution for war fighter and contractor clients in Afghanistan via supply sourses in Central Asia, and required a complex algorithm to understand actual cost avoidances by consolidating freight in Almaty, Kazakhstan. By combining data from ERP, Transport, Cataloging and a Cloud Based Meta Data Repository into a powerful data application (based in Qlikview), the client received contract mission impact assurance in real-time.

Experimental Economics in E-Commerce

Sponsor: eBusiness

Sponsored Session

Chair: Rajiv Mukherjee, Assistant Professor, Southern Methodist University, 6212 Bishop Blvd., Dallas, TX, 75275, United States of America, rmukherjee@mail.smu.edu

1 - Evolution of Trust under Information Sharing, Advice and Delegation

Yu Wang, Assistant Professor, The University of Texas at Dallas, 800 W Campbell Rd, United States of America, yuwang@utdallas.edu, Özalp Özer, Upender Subramanian

Trust has been identified as a crucial success factor for channel cooperation. For example, despite the potential for opportunistic behavior, some retailers rely upon manufacturers who have more information about their product to assist them in store-level decisions. Using laboratory experiments, we study (i) to what extent trust develops or deteriorates over time and (ii) how different forms of assistance affect the evolution of trust and cooperation.

2 - Flexibility and Consumption: An Experimental Investigation

Sreekumar Bhaskaran, Associate Professor, Southern Methodist University, 6212 Bishop Blvd., Dallas, TX, 75275, United States of America, sbhaskar@mail.cox.smu.edu, Sanjiv Erat, Rajiv Mukherjee

In this paper, we investigate how the flexibility to defer or advance consumption affects a consumer's decision about to when to actually consume a product or service. The effect of this flexibility on capacity choice is also considered.

3 - Learning under Uncertainty with Multiple Priors - An Experiment
Yaroslav Rosokha, Assistant Professor, Purdue University, yrosokha@purdue.edu

We investigate the learning process under uncertainty using the multiple priors model of Epstein and Schneider (2007). We gather data for subjects making a sequence of decisions that are concurrent with arrival of new information (signals). We estimate the set of priors, the worst- and the best- case scenarios considered by subjects at different moments in time.

4 - Prediction Markets and Biases
Karthik Kannan, Purdue University, 403 W State Street, West Lafayette, IN, United States of America, kkarthik@purdue.edu

We analyze how biases such as homophily and social influence affect the efficacy of prediction markets. Using an analytical model as well as an experimental setup, we confirm the negative impact of such biases on information aggregation and suggest insights into mitigating the negative effects. Thus, we evaluate the role of network structure on the efficacy of the wisdom of crowd activities.

Social Operations Management

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Ming Hu, Assistant Professor, Rotman School of Management, University of Toronto, 105 St George Street, Toronto, ON, Canada, Ming.Hu@rotman.utoronto.ca

1 - Dynamic Pricing in the Presence of Social Learning and Strategic Consumers
Yiangos Papanastasiou, London Business School, Regent's park, London, United Kingdom, yiangosp@london.edu, Nicos Savva

When a product of uncertain quality is first introduced to market, consumers may be enticed to strategically delay their purchasing decisions in anticipation of the product reviews of their peers. This paper investigates how the presence of social learning affects the strategic interaction between a dynamic-pricing monopolist and a forward-looking consumer population.

2 - Dynamic Pricing of Experience Goods: The Impact of Consumer Reviews
Man Yu, HKUST Business School, Clear Water Bay, Hong Kong, Hong Kong - PRC, manyu@ust.hk, Laurens Debo, Roman Kapuscinski

In this talk, we focus on dynamic pricing of experience goods whose quality is initially unknown both to consumers and to the firm, but the early buyers can communicate their experiences after consumption via e.g. word-of-mouth, websites, smartphones applications or other media.

3 - Peer Effect of iPhone Adoption in Mobile Communication Networks
Tony Ke, UC Berkeley, IEOR, Etcheverry Hall, Berkeley, CA, 94720, United States of America, kete@berkeley.edu, Zhuqing Yang

We construct a social network using one year's mobile calls between all subscribers in a big city in China. The strength of social ties is measured by call duration. Based on the network, we identify the peer effect of iPhone adoptions, by using subscribers' birthdays as an instrument variable. Implications on how network ties and network structures modulate the peer influence will be covered.

Nonprofit Operations

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Sripad Devalkar, Indian School of Business, ISB Campus Gachibowli, Hyderabad, India, sripad_devalkar@isb.edu

1 - Nonprofit Logic Models as Production Process Maps
Natalie Privett, Assistant Professor of Management and Policy, Robert F. Wagner Graduate School of Public Service, 295 Lafayette St, 2nd Floor, New York University, New York, NY, 10012, United States of America, natalie.privett@nyu.edu

Nonprofit organizations ultimately strive to produce social change by means of delivering specific goods and services. In the nonprofit sector, the logic model is a popular strategic management tool that visually links an organization's resources, activities, outputs, and outcomes. From an operations perspective, logic models have the potential to be leveraged as production process maps to increase operational efficiency, bridge nonprofit and operations theory and ultimately achieve outcomes.

2 - Signaling Operational Efficiency through Intermediate Results in Non-profit Markets
Milind Sohoni, Associate Professor, Indian School of Business, milind_sohoni@isb.edu, Sripad Devalkar

A common concern with non-profit markets is the lack of credible information about a NPO's operational efficiency. We study a model that allows a NPO to monitor, and release information about, intermediate benefits delivered to signal efficiency to donors. The trade-off, in such situations, is between the additional overhead and the increased probability of raising donations. We analyze when such a model could result in higher sustainability of a development project.

1 - High Performance Second-Order Procedures for Dense SVM and Quantile Regression
Yan Xu, Senior Manager, SAS Insitute Inc., 100 SAS Campus Dr., Cary, NC, 27519, United States of America, yan.xu@sas.com, Joshua Griffin

Quantile Regression and SVM classifiers require solutions to large-scale linear and quadratic optimization problems respectively. In special cases, a low-rank factorization of the reduced primal-dual Augmented system is available. This factorization can be exploited in a parallel computing environment, permitting dense problems with billions of observations to be efficiently solved.

2 - Quasi-Newton Extensions of an Active-set Approach for Mixed Linear Models
Wenwen Zhou, SAS Institute Inc., Cary, United States of America, Wenwen.Zhou@sas.com

A primal-dual regularized augmented Lagrangian active-set approach is modified to accept inexact second-order Quasi-Newton approximation. This is crucial for many optimization problems arising in statistics and data mining where the true Hessian is expensive and or unavailable

3 - Distributed Hessian-Free Optimization for Data Mining Applications
Joshua Griffin, SAS Institute Inc., 100 SAS Campus Drive, Cary, United States of America, joshua.griffin@sas.com, Ben-Hao Wang

This talk focuses on several Hessian-free approaches in a distributed environment for bound constrained optimization with expensive function evaluations, where Hessian matrices, as well as Hessian-vector products, are either prohibitive computationally or unavailable.

Sponsored Session

Chair: Vibhanshu Abhishek, Assistant Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PE, 15213, United States of America, vibs@andrew.cmu.edu

1 - Agent Behavior in the Sharing Economy: Evidence from AirBnB
Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu, Dennis Zhang, Antonio Moreno-Garcia

Using availability and pricing data from a rising peer-to-peer online hospitality service platform — AirBnB, we study agent behavior in the sharing economy.

2 - Agent Behavior in the Sharing Economy: Evidence from AirBnB
Dennis Zhang, Kellogg School of Management, Evanston, IL, 60208, United States of America, zjj1990228@gmail.com, Antonio Moreno-Garcia, Jun Li

Using availability and pricing data from a rising peer-to-peer online hospitality service platform — AirBnB, we study agent behavior in the sharing economy.

3 - Sharing Economy - A Model of Shared Resource Utilization
Vibhanshu Abhishek, Assistant Professor, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PE, 15213, United States of America, vibs@andrew.cmu.edu, Jose Guajardo

The emergence of shared resource utilization as a consumer trend in many markets is imposing new challenges for incumbent firms in certain markets. These enjoyed economies of scale and hence created high entry barriers for new entrants to compete profitable. However, the use of spare capacity to provide services has started to present a credible threat to incumbent firms in these markets. In this paper, we formulate a model that characterizes the supply side when faced with a sharing economy.

4 - Channel Integration & Sales Concentration: Empirical Evidence
Ioannis Stamatopoulos, PhD Student, Northwestern University, 1400 Chicago, Evanston, IL, 60201, United States of America, aikalaaa@gmail.com, Antonio Moreno-Garcia, Santiago Gallino

Competing for an increasingly demanding customer pool, retailers progressively integrate their B&M and Online channels. In this paper, using a proprietary dataset coming from the implementation of a Ship to Store (StS) capability of a large US housewares retailer, we find that StS causes a statistically and economically significant drop in sales concentration.

Hilton- Continental 8

Managing Relationships in Supply Chains

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Sammi Yu Tang, Assistant Professor, University of Miami, 5250 University Drive, Coral Gables, FL, 33146, United States of America, ytang@miami.edu

1 - Inspection and Cooperation in Supply Quality Management
Cuihong Li, University of Connecticut, 2100 Hillside Road, Storrs, CT, United States of America, Cuihong.Li@business.uconn.edu

We study a buyer purchasing from a supplier with the concern of quality. The buyer can inspect the incoming units to penalize the supplier for defects, or cooperate with the supplier to improve the quality. We consider both complementary and substitutable relationships between the buyer's and supplier's quality improvement efforts.

2 - Resource Allocation in Humanitarian Setting: Inventory and Disease Progression
Jayashankar Swaminathan, Professor, UNC-CH, McColl Bldg., Chapel Hill, NC, United States of America, msj@unc.edu, Karthik Natarajan

In this paper we study inventory management in the context of supplementary food and disease progression in a finite time horizon. In addition to presenting structural properties, we will explore the efficacy of pragmatic heuristics in this context.

3 - Supplier Diversification under Random Yield and Price Dependent Demand
Nan Yang, Assistant Professor, Olin Business School, Washington University in St. Louis, Campus Box 1156, 1 Brookings Drive, St. Louis, MO, 63130, United States of America, yangn@wustl.edu, Lingxiu Dong, Guang Xiao

We consider a firm's supply diversification problem when it faces supply random yield and price sensitive demand. We study two pricing schemes: responsive pricing and ex ante pricing. We characterize the sourcing decisions under each pricing scheme and compare them to study the strategic relation between diversification and pricing in hedging against supply uncertainty.

4 - Managing Competition and Cooperation in Supply Chains
Shuya Yin, University of California, Irvine, Merage School of Business, Irvine, CA, 92697, United States of America, shuya.yin@uci.edu, Saibal Ray, Yuhong He

Upstream suppliers often need to decide whether or not to reply on dominant retailers in the market place when they sell through the downstream partners. On one hand, powerful retailers would help the upstream suppliers gain strong market shares. But on the other hand, these retailers may use their market dominance to negotiate better contract terms with their suppliers. We propose an economic model to gain some understanding of the basic trade-offs involved in such decision making processes.

5 - Procurement Contracting under Product Recall Risk
Gang Wang, University of North Carolina at Chapel Hill, Kenan-Flagler Busienss School, Chapel Hill, NC, 27599, United States of America, Gang_Wang@kenan-flagler.unc.edu, Lauren Lu, Jayashankar Swaminathan

Managing product quality and mitigating the financial impact of product recalls pose great challenges to manufacturers due to demand uncertainty and non-contractibility of suppliers' quality effort. To understand the interdependence of supply chain quantity and quality decisions, we develop a procurement contractual framework under both demand and recall risks.

Empirical Operations Management and Sustainability

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: Ruben Lobel, University of Pennsylvania, 3730 Walnut St, JMHH - suite 500, Philadelphia, PA, 19104, United States of America, rlobel@wharton.upenn.edu

1 - Drivers of Product Expiration in Retail Supply Chains
Arzum Akkas, MIT, 77 mass ave, cambridge, ma, 02142, United States of America, aakkas@mit.edu, David Simchi-Levi, Vishal Gaur

Using a zero inflated negative binomial model applied to propriety archival data, we examine the degree to which product expiration of consumer packaged goods at retail stores is related to store operations, supply chain practices, and product configuration decisions. Our work identifies how much manufactures versus retailers contribute to the drivers of expiration. This will help alleviate the incentive issues related to reimbursement schemes for the cost of expired products.

2 - Understanding Customers Retrials in Call Centers: An Empirical Study
Gad Allon, Northwestern University - Kellogg, 2001 Sheridan Rd., Evanston, IL, United States of America, g-allon@kellogg.northwestern.edu, Achal Bassamboo, Kejia Hu

We study the impact of waiting times and service quality on the retrial behavior of customers in a call center.

3 - An Empirical Investigation of the Productivity Paradox
Kamalini Ramdas, London Business School, Regent's Park, London, United Kingdom, kramdas@london.edu, Jonathan Williams

Research in economics and operations management has identified huge variation in productivity within the same geographic regions, industries, and even firms. Using data from the US automotive industry, we examine key drivers of variation in productivity in automotive assembly plants. We develop insights for managers and highlight avenues for future research.

4 - Operations Management in Sustainable Production Systems
Farnaz Ghazi Nezami, Assistant professor, Kettering University, Industrial and Manufacturing Engineering Department, 1700 University Ave., Flint, MI, United States of America, fghazinezami@kettering.edu

In this study, a mathematical model is presented to investigate the integrated maintenance-production planning problem. The objective is to minimize the total cost of production, maintenance and energy with respect to demand, reliability and energy consumption profile of the machine in a multi-period, multi-product environment.

Applications of DEA

Cluster: Data Envelopment Analysis

Invited Session

Chair: John Ruggiero, University of Dayton, Dayton, OH, United States of America, jruggiero1@udayton.edu

1 - Evaluating MMA Judging Nonparametrically
John Ruggiero, University of Dayton, Dayton, OH, United States of America, jruggiero1@udayton.edu

In this paper, we analyze decision making of mixed martial arts judges. We extend the nonparametric DEA model to estimate indifference curves. The approach allows us to derive a measure of consistency of a given judges performance. Our application focuses on controversial fights in the UFC.

2 - Likelihood Ranking of Decision Making Units
Markku Kallio, Professor, Aalto University, Runeberginkatu 22-24, Helsinki, Finland, markku.kallio@aalto.fi

For decision making units (DMUs), we assume that the input-output vectors represent a random sample of some probability distribution, for example, a multivariate log-normal distribution. For efficiency analysis of the DMUs we employ common prices for all DMUs and choose such prices based on maximum likelihood estimates. We define the profit based ranking criterion for each DMU by the likelihood that the random profit is at most the profit of that DMU. Return based ranking is defined similarly.

3 - Malmquist and Hicks-Moorsteen Productivity Indexes for Cluster Analysis
Diogo Filipe Cunha Ferreira, Dr, Instituto Superior Tècnico (IST), University of Lisbon, Av. Rovisco Pais, Lisbon, 1049-001, Portugal, diogo.cunha.ferreira@tecnico.ulisboa.pt, Rui Cunha Marques

This work discusses the usefulness of Malmquist and Hicks-Moorsteen indexes for cluster efficiency spread and productivity gaps analysis. It is proposed working out with geometric distance functions and super-efficient slack-based directional distance functions that may account for subjective criteria. Finally, a robust three-step bootstrap-based algorithm is presented, which overcomes a lot of non-parametric methods shortcomings and incorporates environmental information when it is required.

4 - Input Substitutability in English Higher Education
Jill Johnes, Senior Lecturer Economics, Lancaster University, LUMS, Lancaster, LA14YX, United Kingdom, j.johnes@lancaster.ac.uk

This paper investigates input substitutability in English higher education and compares merging and non-merging institutions. A stochastic frontier translog output distance function is estimated using a thirteen-year panel of data for all institutions in England. Some differences between merging and non-merging institutions in labour and capital substitutability are revealed, and administrative input becomes an abundant resource for merged institutions. Policy implications are discussed.

5 - Performance Benchmarking of School Districts in New York State
Thomas Sexton, Stony Brook University, 317 Harriman Hall, Stony Brook University, Stony Brook, NY, 11790-3775, United States of America, Thomas.Sexton@StonyBrook.edu, Kelly Stickle, Shane Higuera, Christie Comunale

We apply DEA as a benchmarking methodology to measure the performance of New York State school districts and provide detailed alternative improvement programs for each district. In the 2011-12 academic year, New York State's 695 school districts spent $53.7 billion to educate almost 2.7 million elementary and secondary pupils, at a cost of over $19,000 per pupil. Elementary and secondary education accounts for nearly one-quarter of all state and local expenditures in New York State.

New Models in Revenue Management and Pricing

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Sami Najafi-Asadolahi, Assistant Professor, Santa Clara University, Leavey School of Business, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, snajafi@scu.edu

1 - Impact of Sourcing on Retailers' Optimal Store-Brand Quality and Pricing Decisions
Candi Yano, Professor, IEOR Dept. and Haas Sch. of Bus., UC Berkeley, Berkeley, CA, 94720, United States of America, yano@ieor.berkeley.edu, Bo Liao

Store brand products may be produced in-house, by a third-party supplier, or by a national-brand manufacturer of competing products. We derive equilibrium results to show how the combination of sourcing and pricing power affects the retailer's optimal store-brand quality and prices for both the store- and national-brand products. Among other things, we find that the retailer may use the lever of store-brand quality in unintuitive ways to improve his profitability in this competitive setting.

2 - Price Incentives for Online Retailers using Social Network Information
Ludovica Rizzo, MIT, lrizzo@mit.edu, Xubo Sun, Georgia Perakis, Maxime Cohen, Marjan Baghaie

We consider an online retailer with social network information about its customers (friends, referrals, etc.). Since its customers are heterogeneous, we propose and analyze a clustering model according to social network information to estimate the buying probability of customers and subsequently a model for providing targeted discounts to "influencers". This gives rise to a bilevel optimization problem. We test our approach with real data. This work is in collaboration with an online retailer.

3 - A La Carte or Buffet: Pricing for Grocery Delivery
Elena Belavina, Assistant Professor, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, United States of America, belavina@uchicago.edu, Karan Girotra

Grocery delivery is a market that many try to conquer. Appropriate pricing is key for success. There is little consensus among different players (at times even within one firm operating in different locations) on what is the best pricing scheme. For example, Amazon Fresh in Seattle is using per order pricing while in San Francisco - subscription fee. We provide recommendation for the preferred pricing scheme based on various characteristics (delivery logistics, demand variability etc.).

4 - Is Over-Promising of Product Features Desirable When Consumers are Loss-Averse?
Sami Najafi-Asadolahi, Assistant Professor, Santa Clara University, Leavey School of Business, 500 El Camino Real, Santa Clara, CA, 95053, United States of America, snajafi@scu.edu, Nishant Mishra, Andy Tsay

We consider a firm selling two versions of a single product at different times to consumers who are loss-averse. In the first period, each consumer decides whether to buy a single unit of the first version, and if he does, whether to continue buying a single unit of the second version when it is released. We find that over-promising the features in the first version may benefit the firm's profitability by increasing consumers' willingness to buy the second version.

Innovation in Services and Retail

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Antonio Moreno-Garcia, Kellogg School of Management, 2001 Sheridan Rd, MEDS Department, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu

1 - Inventory Showrooms in Online Retail
Antonio Moreno-Garcia, Kellogg School of Management, 2001 Sheridan Rd, MEDS Department, Evanston, IL, 60208, United States of America, a-morenogarcia@kellogg.northwestern.edu, David Bell, Santiago Gallino

Using data from a leading online retailer of eyewear, we study the effect of opening brick and mortar showrooms to display inventory that can be ordered online.

2 - User-Path Approach and Efficient Implementation in Online Content Recommendation Services
Yonatan Gur, Assistant Professor, Stanford University, 655 Knight Way, Stanford, CA, United States of America, ygur@stanford.edu, Omar Besbes, Assaf Zeevi

A new class of online services allows media sites to direct readers from articles they currently read to other suggested web-based content. Based on a rich database we propose a class of user-path focused heuristics for creating recommendations. We validate and measure the value captured by suggested policies compared to current practice through a controlled experiment. Our work is based on collaboration with a leading provider of online content recommendations.

3 - Learning Local Relationships in Networks with Observational or Experimental Data
Spyros Zoumpoulis, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, szoumpou@mit.edu

We infer local relationships between networked entities based on data, focusing on quantifying the rate of learning. Our theoretical results are guarantees on the rate of learning expressed in terms of the number of needed samples/experiments. We show applications in (i) making marketing decisions; (ii) inferring how consumers influence one another in the context of mobile app installations; (iii) inferring causal relations between brain regions during epileptic seizure events.

4 - Inventory Management for Luxury Goods
Ruslan Momot, INSEAD, Boulevard de Constance, Fontainebleau, 77305, France, Ruslan.Momot@insead.edu, Elena Belavina, Karan Girotra

Firms selling conspicuous goods face a trade-off: producing more allows for extracting more revenues but compromises the product's reputation for exclusivity. We capture this trade-off in a dynamic model of strategic customer and firm behaviour that includes limited memory. Firms should follow stationary cyclic strategies alternating scarcity and overproduction. The former builds a reputation whereas the latter exploits it. The longer the customer memory, shorter is the overproduction phase.

Practice-driven Revenue Management II

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: So Yeon Chun, Assistant Professor, McDonough School of Business, Georgetown University, 3700 O St NW, Washington, United States of America, sc1286@georgetown.edu

1 - Dynamic Pricing and Inventory Control for Nonperishable Products with Demand Learning
Boxiao Chen, University of Michigan, 1919 McIntyre Drive, Ann Arbor, MI, 48105, United States of America, boxchen@umich.edu, Xiuli Chao, Hyun-Soo Ahn

We consider a finite horizon problem of dynamic pricing and inventory control for a nonperishable product. We develop an data-driven policy that does not require explicit information about random demand and show that it is asymptotically optimal with a provable bound.

2 - Dynamic Pricing and Loyalty-reward Program
Hakjin Chung, University of Michigan, Tappan St 701, R4431, Ann Arbor, MI, 48109, United States of America, hakjin@umich.edu, So Yeon Chun, Hyun-Soo Ahn

We study the impact of loyalty program on the seller's pricing strategy and revenue. In particular, we examine how the option to pay with reward points influence a consumer's choice on how she/he buys. We then incorporate the consumer's behavior into a dynamic pricing problem and study how the terms of reimbursement (i.e., the revenue that the seller receives from reward sales) affect the seller's pricing strategy.

3 - Optimal Pricing of Reservations and Advance Selling in Queues
Jaelynn Oh, Assistant Professor, University of Utah, jaelynn.oh@business.utah.edu, Xuanming Su

Customers who make reservations in advance do not have to wait in line when they arrive for service. We study whether and how firms should charge for reservations and relate our results to advance selling strategies.

4 - Pricing Sponsored Content in Wireless Networks with Multiple Content Providers
Martin I Reiman, DMTS, Alcatel-Lucent Bell Labs, 600 Mountain Ave., Murray Hill, NJ, 07974, United States of America, martyreiman@gmail.com, Matthew Andrews, Yue Jin

We consider a wireless service provider (SP) that offers a 'sponsored content' service to multiple content providers (CPs), modeling it as a sequential game. The SP moves first, setting prices for sponsoring. Then the CPs react by deciding how much content to sponsor. Finally the end users react by accessing content depending on what has been sponsored. We solve this problem under a variety of assumptions related to the SP's knowledge of parameters and ability to price discriminate.

Product Quality, Information, Social Learning, and Pricing

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Xuying Zhao, University of Notre Dame, 361 Mendoza College of Business, Notre Dame, IN, 46545, United States of America, Xuying.Zhao.29@nd.edu

1 - The Impact of Online Consumer Review Valence on a Firm's Pricing
Xuying Zhao, University of Notre Dame, 361 Mendoza College of Business, Notre Dame, IN, 46545, United States of America, Xuying.Zhao.29@nd.edu, Zhan Pang

For experience products or services, prior users' experiences and review ratings will impact the remaining potential consumers' willingness to pay (or valuation). We study the the impact of online consumer review valence on a firm's pricing and profit.

2 - Quality Provision with Heterogeneous Consumer Reservation Utilities
Rachel Chen, University of California at Davis, 3208 Gallagher Hall, Davis, CA, 95691, United States of America, rachen@ucdavis.edu, Lian Qi, Leon Zhu

We study how a monopolist selects its optimal quality level and price when consumers differ in their willingness-to-pay (WTP) for quality and reservation utility for the basic product. We find that firms might want to offer higher quality products during an economic recession. For the optimal product line, we show that due to the heterogeneity in consumer reservation utilities the concern for cannibalization may distort the product quality upwards.

3 - Optimal Procurement Design in the Presence of Asymmetric Yield and Cost Information
Xiang Fang, University of Wisconsin-Milwaukee, 3202 N Maryland Avenue, Milwaukee, WI, 53211, United States of America, fangx@uwm.edu, Yuanjie He

We study a two-tier decentralized supply chain with a supplier and a retailer. The supplier's production process is subject to a random yield. The retailer faces uncertain demand. The supplier may hold private information regarding its random yield distribution and/or production costs. We derive the optimal menu of contracts for the retailer and then we analyze the value of information to the supplier, the retailer and the entire supply chain.

4 - Overbooking and Cancellation under Dynamic and Static Policies
Wei Wang, Scientist, PROS Inc, 3100 Main St, #900, Houston, TX, 77002, United States of America, weiwang@pros.com, Darius Walczak

Overbooking and cancellation are important topics for revenue management and pricing, and much research including a dynamic programming based solution have been done on these topics. However in practice airlines today are still applying static approaches. We present a comparison on modelling overbooking and cancellation using both dynamic and static policies.

Sponsored Session

Chair: Sudip Bhattacharjee, University of Connecticut, 2100 Hillside Road, U-1041, Storrs, CT, United States of America, sbhattacharjee@business.uconn.edu

1 - Stack Train Aerodynamic Optimization
Steven Tyber, General Electric, 1 Research Circle, K1-4A66, Niskayuna, NY, 12309, United States of America, tyber@ge.com, Bex Thomas, Amal Desilva

Over the past 20 years, the growth of intermodal (IM) freight has exceeded that of every other commodity group transported via rail. Revenues generated by IM freight are currently on pace to supplant coal as the largest single source of revenue for railroads. Despite its widespread use, IM trains are generally less fuel efficient than other rolling stock owing to greater aerodynamic drag. We explore the role of loading on drag and develop a MIP approach to produce aerodynamic load assignments.

2 - Rail Fleet Optimization
Amal Desilva, General Electric, 3475 Piedmont Road, NE, Suite 250, Atlanta, GA, United States of America, amal.desilva@ge.com

Many companies use Railroads to ship products and commodities using various types of railcars. An optimization model that optimizes the use of railcars is presented. Shippers can own or lease their own private railcars or they can use railcars owned by railroads. The output from the model is an optimal shipping plan for the planning period using either shipper's cars or railroad cars. A Mixed Integer Linear Programming solver is used to solve the optimization model.

3 - Mitigating Passenger Impacts under Airline Disruptions
Jon Petersen, Operations Research Scientist, Taleris, petersej@taleris.com

Airlines continually face irregularities which preclude their original schedules from being operated. Recovering from disruptions are of central importance but extraordinarily complex, so airlines typically decompose the problem into separable components at the cost of solution quality. We show how passenger delays and misconnections are improved upon by concurrently optimizing schedule and passenger resources through the use of mixed integer programming over a superimposed time-space network.

4 - Big Data Analytics to Improve Operational Decision Making in Rail Networks
Sudip Bhattacharjee, University of Connecticut, 2100 Hillside Road, U-1041, Storrs, United States of America, sbhattacharjee@business.uconn.edu, Erdem Telatar, Onur Dulgeroglu, Kimberly Mallory

Rail schedules are complex operations, where multiple categories of trains share the same network and infrastructure. To ensure that the different categories of trains run efficiently, scheduling and planning take center stage. We present a data analytics framework on a large data set to measure key performance indicators (KPI), and identify root causes of delays, to help scheduling and planning operations. We also discuss big data challenges and data quality issues of field data.

Electrical Vehicles Routing

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Mahyar Nejad, Wayne State University, United States of America, mahuar@wayne.edu

1 - Electric Vehicle Routing and Recharging with Uncertain Charging Station Availability

Irina Dolinskaya, Assistant Professor, Northwestern University, Evanston, IL, 60208, United States of America, dolira@northwestern.edu, Diego Klabjan, Timothy Sweda

Planning long-distance trips with an electric vehicle depends on both the locations and availabilities of charging stations. We consider an adaptive routing problem in which an electric vehicle driver chooses his or her path and recharging stops based on the availability of nearby charging stations. We present a dynamic programming algorithm for finding an optimal routing and recharging policy and derive properties of optimal policies.

2 - Route Choice Decisions of Electric Vehicle Drivers under Different Traffic Conditions

Shubham Agrawal, United States of America, shubham@purdue.edu, Srinivas Peeta

The limited range of electric vehicles makes drivers more sensitive to trip energy consumption than conventional vehicles for route choice decisions. This study analyzes the impact of traffic condition on electric vehicle routing decisions by computing generalized user travel costs that factor battery discharge patterns. Computational results are illustrated using a simulation framework.

3 - Evaluation of Market Penetration Rate of Electric Vehicles on Network Performance

Amit Kumar, Purdue University, West Lafayette, IN, United States of America, kumar44@purdue.edu, Shubham Agrawal, Hong Zheng, Srinivas Peeta

This study seeks to establish the linkage between market penetration rates of electric vehicles and network performance that can be leveraged by the policy makers to improve system performance. We analyze the route choice behavior of electric vehicle drivers by factoring battery recuperation profiles in a dynamic user equilibrium setting. Numerical results are illustrated.

4 - Optimal Routing for Plug-in Hybrid Electric Vehicles

Mahyar Nejad, Wayne State University, United States of America, mahuar@wayne.edu, Ratna Babu Chinnam

We introduce the Energy-Efficient Routing problem (EERP) for Plug-in Hybrid Electric Vehicles (PHEVs). The objective of the EERP is to not only find a path to any given destination, but also to identify the predominant operating mode for each segment of the path in order to minimize the fuel consumption. We propose two exact algorithms, and a Fully Polynomial Time Approximation Scheme to solve the EERP. The results show that incorporating our proposed algorithms during route planning leads to significant energy savings for PHEVs.

Energy Logistics and Supply Chains

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Yao Zhao, Associate Professor, Rutgers University, 1 Washington street, Newark, NJ, 07102, United States of America, yaozhao@andromeda.rutgers.edu

1 - Energy Supply Chain: Future Energy Security of Pakistan

Raza Rafique, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, razaalirafique@gmail.com, KwonGi Mun, Yao Zhao

Pakistan is experiencing 25-40% shortfall of electricity supply nation-wide which hampers economic growth, and give rise to political turmoil and social instability. We formulated a dynamic model to gradually build up end-to-end energy supply chain with limited budget. Results obtained demonstrated great potential and can provide guideline to ensure future energy security of Pakistan.

2 - A Design of Energy Supply Network: Insights, Security, and Sustainability

KwonGi Mun, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, kwongmun@pegasus.rutgers.edu, Yao Zhao, Endre Boros, Rafique Raza

By testing an optimal energy supply network in Pakistan, we found that a design of energy supply network may cause an inefficient supply of electricity unless it is optimized with an integrated network. We test and design heuristics and an optimal decision model for introducing new strategies to design energy supply network. A main contribution is that well-formulated energy supply network can explain how to ensure energy supply and energy security.

3 - Fast Algorithms for Two-stage Robust Security Constrained Unit Commitment Problem

Wei Yuan, PhD candidate, IMSE,USF, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, weiyuan@mail.usf.edu, Tongxin Zhen, Eugene Litvinov, Bo Zeng

Unit Commitment (UC) is the cornerstone in energy industry. Two-stage Robust UC has been developed to deal with the uncertainties in power systems: renewable energy, demand uncertainty, etc. However, this tri-level optimization model is difficult to solve considering large-scale power systems. In this research, we investigate the strong formulations for basic UC model, derive new valid inequalities considering network constraints and implement a novel cutting plane generation procedure.

Same-Day Delivery and Routing

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Alejandro Toriello, Assistant Professor, Georgia Tech ISyE, 765 Ferst Dr NW, Atlanta, GA, 30332, United States of America, atoriello3@isye.gatech.edu

1 - Same Day Delivery for Online Purchases

Stacy Voccia, PhD Candidate, University of Iowa, 108 John Pappajohn Business Building, Room S210, Iowa City, IA, 52242, United States of America, stacy-voccia@uiowa.edu

Same day delivery for online purchases is a recent trend in online retail. Same day delivery, however, is a logistically complicated and expensive service to operate. We introduce a dynamic pick-up and delivery problem with deadlines that incorporates key features associated with same day delivery logistics. In order to make better-informed decisions, our solution approach incorporates information about future orders into routing decisions.

2 - Strategies for Handling Temporal Uncertainty in Pick-up and Delivery Problems with Time Windows

Niels Agatz, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3000DR, Netherlands, nagatz@rsm.nl, Jordan Srour

We develop and compare different routing strategies for a pickup and delivery problem with inaccurate advance time window information. In this problem, the pickup locations are known in advance but the time window information is inaccurate until shortly before the desired service.

3 - The One-dimensional Dynamic Dispatch Waves Problem

Mathias Klapp, Ph.D. Student, Georgia Tech ISyE, 765 Ferst Dr NW, Atlanta, GA, 30332, United States of America, maklapp@gatech.edu, Alan Erera, Alejandro Toriello

We study same-day delivery (SDD) distribution systems by formulating the dynamic dispatch wave problem (DDWP) that models a warehouse where orders arrive randomly throughout the day. The decision maker dispatches a vehicle to serve a subset of open orders at each action period (wave), to minimize operational costs and charges for unserved requests. We study the DDWP with requests over a line; we efficiently solve the deterministic case and give heuristics and dual bounds for the stochastic case.

Sponsored Session

Chair: Yingyan Lou, Assistant Professor, Arizona State University, P.O. Box 873005, Tempe, AZ, 85287-3005, United States of America, yingyan.lou@asu.edu

1 - Parking Search Equilibrium on a Network

Shoupeng Tang, Stephen Boyles

All the vehicles need to park at some location on a network, but before arriving at the location, a vehicle does not know if there are available parking spaces. However, the probability of existing a specific number of available parking spaces can be calculated based on the flow arriving rate and the leaving rate of that location. While the leaving rate is known, the arriving rate should be calculated through the equilibrium process. A solution algorithm is developed with the help of a transformed network to get to stochastic traffic equilibrium with parking search uncertainties.

2 - A Dynamic User Equilibrium Formulation with Dynamic Parking Pricing

Rui Ma, University of California, Davis, CA, United States of America, drma@ucdavis.edu, H. Michael Zhang

We extend the differential complementarity system based dynamic user equilibrium formulation with the impacts of dynamic parking pricing for urban networks. We show that this formulation can simultaneously capture departure-time, route, mode and parking choices. We also show how the proposed framework can be used to determine the optimal dynamic parking pricing schemes to maximize the social welfare.

3 - Impacts of Traveler Information Provision Strategies on Parking Searching Problem

Peiheng Li, Arizona State University, P.O. Box 873005, Tempe, AZ, 85287-3005, United States of America, peihengl@asu.edu, Xuesong Zhou, Yingyan Lou

We analyze the parking search problem using a simple network, with explicit considerations of spatial capacities of parking lots and travelers' searching processes between and within each parking lot. The impacts of information provision on route choices of travelers and on network performance are further evaluated under three different information provision strategies.

4 - The Optimal Control of Day-to-day Traffic Dynamics under Hysteresis

Feng Xiao, Southwest Jiaotong University, Chengdu, China, xiaofeng@swjtu.edu.cn, Hai Yang, Hongbo Ye

Understanding the mechanism of network flows' evolution can help design more efficient demand-control schemes.Inspired by previous studies, the optimal control of the new system developed in this study is realized by utilizing the link-based dynamic congestion pricing. The Pontryagin's maximum principal is used in our paper to find the optimal toll scheme with various targets, such as the minimum total convergence time, minimum toll revenue or minimum system cost towards system optimum and combined objectives. Necessary conditions for optimal congestion prices are analyzed to uncover bang-bang charging strategy. Numerical examples will be provided to illustrate the resulting trajectory of the flow evolution under the optimal control schemes.

1 - A Network Equilibrium Model to Evaluate Distance-based Fare Pricing Policies in Toronto

Anchor Chin, Ryerson University, 350 Victoria Street, Toronto, ON, Canada, anchor.chin@ryerson.ca, Joseph Y.J. Chow

We propose a systematic way to analysis the adoption of distance- or path-based fare system for a public transit network. A stochastic user equilibrium model was developed to evaluate distance-based fare pricing policies by modifying Lam et al's (1999) model to include paths that belong in two OD sets (station-to-station, zone-to-zone). The model is applied to an original network constructed from the Toronto Transportation Commission subway system to derive insights for adoption of smart card fare system.

2 - Parking Management to Improve Urban Efficiency: A Dynamic Performance-based Pricing Game

Daniel Mackowski, University of Illinois at Urbana-Champaign, Urbana, IL, United States of America, mackows2@illinois.edu, Yanfeng Ouyang, Yun Bai

In this paper we develop a dynamic pricing model for parking spaces in urban areas that is implementable with current technologies. Given real-time demand information, the bi-level model adjusts prices regularly with the objective of eliminating unnecessary vehicle circling (while looking for parking). An illustration shows the benefits of frequent, informed pricing updates as provided by this model compared to current "smart parking" systems.

3 - Transportation Network Design Model for Maximizing Activity-Travel Accessibility

Lu Tong, Beijing Jiaotong University, School of Traffic and Transportation, Beijing Jiaotong University, Beijing, 100044, China, tonglu57@gmail.com, Xuesong Zhou, Harvey Miller

Accessibility is an important performance measure which is often neglected in transportation network design models. This talk presents a linear integer programming model to maximize end-to-end accessibility within space-time constraints. A time-dependent network representation and a Lagrangean relaxation based solution method are then developed to solve this problem in real-world applications.

Reliable Facility Location Models

Sponsor: Location Analysis

Sponsored Session

Chair: Kayse Maass, University of Michigan, 1205 Beal Ave., Ann Arbor, MI, 48109, United States of America, leekayse@umich.edu

1 - Decomposition of Facility Disruption Correlations via Augmentation of Virtual Supporting Stations

Siyang Xie, University of Illinois at Urbana-Champaign, 3150 Newmark Civil Engineering Lab, 205 N. Mathews Ave, Urbana, IL, 61801, United States of America, sxie13@illinois.edu, Xiaopeng Li, Yanfeng Ouyang

This paper proposes a new framework for analyzing service facility disruptions under general spatial correlation. We show equivalence among multiple types of correlation representations, and develop transformation and decomposition methods that can transform any correlated disruption pattern into one (by adding auxiliary supporting stations) with independent disruptions only. Numerical studies are conducted for insights.

2 - Reliable Facility Location under Uncertain Correlated Disruptions

Mengshi Lu, University of California, Berkeley, 4141 Etcheverry Hall, University of California, Berkeley, CA, 94720-1777, United States of America, mengshi@berkeley.edu, Zuo-Jun Max Shen

We present a reliable facility location model that allows disruptions to be correlated with an uncertain joint distribution, and minimizes the expected cost under the worst-case distribution. We believe this robust optimization model could serve as an alternative approach for solving reliable facility location problems. Compared to the traditional approach, it better captures disruption propagation effect, requires much less computational effort, and delivers more favorable designs.

3 - Service Reliability, Availability and Survivability Models on Vulnerable Stochastic Networks

Jose Santivanez, Associate Porfessor, Universidad del Turabo, PO Box 3030, Gurabo, PR, 00778, Puerto Rico, santivanezj@suagm.edu, Emanuel Melachrinoudis

Networks providing some critical service in the form of flow are vulnerable to intentional or unplanned disruptions. This paper focuses on the comparison of different network topologies using survivability-based metrics and on the location of facilities on existing networks so that service availability/survivability is maximized when demands for service and disruptions occur.

4 - Location Problem for Interdependent Critical Infrastructure Networks under Disruption Risks

Xiaopeng Li, Assistant Professor, Mississippi State University, PO Box 9546, 235L Walker Hall, 501 Hardy Road, Starkville, MS, 39762, United States of America, xli@cee.msstate.edu, Fang Zhou, Jiaqi Ma

This paper studied a location design problem that determines optimal facility location of multiple types of facilities where each facility is subject to a capacity loss risk. The system interdependence is specified as that the productivity of a facility of a type may be dependent of resource inputs from facilities of other types or transshipment from facilities of the same type. We construct a mathematical model with a customized solution approach to describe and solve this problem.

Sponsored Session

Chair: Matthew Petering, Associate Professor, University of Wisconsin-Milwaukee, P.O. Box 784, Milwaukee, WI, 53201, United States of America, mattpete@uwm.edu

1 - Cyclic Timetabling and Platforming of Heterogeneous Traffic on a Unidirectional Railway Line

Matthew Petering, Associate Professor, University of Wisconsin-Milwaukee, P.O. Box 784, Milwaukee, WI, 53201, United States of America, mattpete@uwm.edu

We present the literature's first two MILP models of a cyclic, combined train timetabling and platforming problem. The objectives of these models are to minimize (1) the timetable period and/or (2) the total journey time of all train types. The first model falls outside the framework of the well-known periodic event scheduling problem (PESP) and considers objectives 1 and 2. The second model nearly falls within the PESP framework and focuses on objective 2. Experimental results are discussed.

2 - Cyclic Timetabling and Platforming of Mixed Train Types on a Bidirectional Railway Line

Mojtaba Heydar, mheydar@uwm.edu, Matthew Petering

We consider cyclic timetabling and platforming of heterogeneous traffic on a single-track, bidirectional railway line. Two objectivesóminimizing timetable cycle length and the total journey time of all train types dispatched during one cycleóare considered. Constrains include headways on the main line and on the sidings in each station. Heuristic and exact methods are combined with a math model to solve large, real-world problem instances. The impact of various factors on capacity is discussed.

3 - Freight Rail On-time Performance in Scandinavia

Hans Boysen, Lic.Eng., Royal Institute of Technology (KTH), Department of Transport Science, Stockholm, SE-10044, Sweden, heboysen@kth.se

Shipper and consignee supply chain reliability, operator asset utilization and network capacity all depend on on-time operation and arrival of freight trains. The experience of on-time performance of freight rail operations in Scandinavia is reviewed, including definitions, performance targets and levels achieved.

4 - Delivering Actionable Intelligence to Point of Performance

Kandukuri Raju, Consultant, Tata Consultancy Services, Kensington B, Powai, Hiranandani, Mumbai, 400072, India, kandukuri.raju@tcs.com, Kshitij Goel

Paper describes structured process to arrive at appropriate performance metrics to monitor and organize them in a meaningful dashboard view to convey actionable intelligence to the decision maker at point of performance on real time and it brings out an approach to utilize historic data from different sources. Customer order prioritization to improve customer retention will be presented as an example.

Contemporary Scheduling

Cluster: Scheduling and Project Management

Invited Session

Chair: Joseph Leung, Distinguished Professor, New Jersey Institute of Technology, University Height, Newark, NJ, 07102, United States of America, joseph.y.leung@njit.edu

1 - Fast Approximation Algorithms for Bi-criteria Scheduling with Machine Assignment Costs

Kangbok Lee, Assistant Professor, York College, CUNY, 94-20 Guy Brewer Bldv., Jamaica, NY, 11451, United States of America, klee5@york.cuny.edu, Joseph Leung, Bertrand Lin, Zhao-hong Jia, Wenhua Li, Michael Pinedo

Parallel machine scheduling problems are considered where the processing of the jobs on the machines involves two types of objectives. The first type is one of two classical scheduling objectives (total completion time or the makespan) while the second type involves an actual cost associated with the processing of a specific job on a given machine. Fast heuristics are proposed and their worst-case analysis is presented.

2 - Scheduling Jobs with Release Dates, Equal Processing Times, and Inclusive Processing Set Restriction

Chung-Lun Li, Chair Professor of Logistics Management, The Hong Kong Polytechnic University, Hung Hom, Kowloon, Hong Kong - PRC, chung-lun.li@polyu.edu.hk, Qingying Li

We consider the problem of scheduling a given set of n jobs with equal processing times on m parallel machines to minimize the makespan. Each job has a given release date and is compatible to only a subset of the machines. The machines are ordered and indexed in such a way that a higher-indexed machine can process all the jobs that a lower-indexed machine can process. We present a solution procedure to solve this problem in O(n^2 + mn log n) time. Some extensions of our results are discussed.

3 - Scheduling Jobs on Parallel Batch Machines with Non-identical Capacities to Minimize Makespan

Jun Qiang Wang, Professor, Northwestern Polytechnical University, POX 504, NPU, Xi'an, Xi'an, China, wangjq@nwpu.edu.cn, Joseph Leung

We schedule a set of equal-processing-time jobs with arbitrary job sizes on a set of batch machines with different capacities to minimize makespan. We show that there is no polynomial algorithm with an absolute worst-case ratio less than 2, unless P = NP. We then give a polynomial algorithm with an absolute worst-case ratio exactly 2. Moreover, we give a polynomial algorithm with asymptotic worst-case ratio of 3/2. Computational experiments show that our algorithm performs very well in practice.

4 - Production and Logistics Scheduling with Batching in Steel Industry

Lixin Tang, Chair Professor, Northeastern University, 3-11 Wenhua Road, Heping District, Shenyang, 110004, China, lixintang@mail.neu.edu.cn

The optimization of production and logistics scheduling problems is a kind of key issues in steel industry. Since these problems are mainly characterized by huge equipment and high operating cost, they are organized in batches in order to reduce the total setup and operating cost. In this talk we will discuss three important problems in operation management in the steel industry: the batching decision problem, production scheduling with batching, and logistics scheduling

with batching.

5 - Level Workforce Planning for Multistage Transfer Lines

George Vairaktarakis, Professor, Case Western Reserve University, 10900 Euclid Ave, 323 PBL, Cleveland, OH, 44106, United States of America, gxv5@po.cwru.edu, Joseph Szmerekovsky, Jiayan Xu

We study the maximin workforce size and the min workforce range leveling objectives for serial paced transfer lines. The number of workers needed to complete each operation of a job in precisely c periods is given. For two stations we develop fast algorithms even though the range problem is NP-complete. For 2-stations, we show that level workforce schedules perform well even when evaluated on other metrics. Our algorithms are shown to perform less well for m-stations.

Digital Services in the Sharing Economy

Sponsor: Service Science

Sponsored Session

Chair: Siva Viswanathan, Associate Professor, University of Maryland College Park, 4313 Van Munching Hall, R.H. Smith School of Business, UMD, College Park, MD, 20742, United States of America, sviswana@rhsmith.umd.edu

1 - Finishing School for Entrepreneurs? Invisible Work and Innovation in the Sharing Economy

Arun Sundararajan, Professor of Information, Operations and Management Sciences, Leonard N. Stern School of Business, NYU, 44 West 4th Street, New York, United States of America, asundara@stern.nyu.edu, Vivian Li

We model the supply-side mechanisms by which peer-to-peer platforms like Airbnb, eBay, Etsy, Lyft, and Kickstarter are gateways for innovation, catalyze entrepreneurship and induce economic growth, testing our theories using transactional data from two large peer-to-peer marketplaces, and supplemented by data from a nationwide survey. (This research is supported by grants from the Ewing Marion Kauffman Foundation and Google Inc.)

2 - Understanding Effects of Message Design on Platform-mediated Information Sharing: A Field Experiment

Tianshu Sun, PhD Candidate, Smith School of Business, University of Maryland, 3330 Van Munching Hall, PhD Student Office, College Park, MD, 20742, United States of America, tianshusun@rhsmith.umd.edu, Siva Viswanathan, Elena Zheleva

Information Sharing is central in sharing economy. Despite digital platforms increasing ability to mediate information sharing, few studies have examined their optimal design choices. We examine whether and how a platform can enhance effectiveness of information sharing, by varying message shared between customers. Through a randomized field experiment on a digital deal platform, we test effectiveness of two pieces of information in message: sender's purchase and existence of referral rewards

3 - Design of Effective Reward Scheme on Crowdfunding Platform

Yong Tan, Professor, University of Washington, Michael G. Foster School of Business, Seattle, WA, 98195-3226, United States of America, ytan@u.washington.edu, Shengsheng Xiao, Jane Xue Tan

Designing effective reward schemes on online crowdfunding platform is a problem faced by project creators. In this paper, we investigate the effect of reward scheme on project success. Specifically, we examine the factors such as the number of reward tiers, price of each tire, and two popular strategies (i.e. "above all" and "backer limitation").

Workforce Planning I

Cluster: Workforce Management and Engineering

Invited Session

Chair: Yun Fong Lim, Associate Professor, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, yflim@smu.edu.sg

1 - Makespan Minization with Individual Learning

Huan Jin, University of Iowa, huan-jin@uiowa.edu, Michael Hewitt, Barrett Thomas

We consider the problem of minimizing the makespan of a set of tasks while accounting for the impact of learning. The challenge is that learning models are nonlinear, limiting exact methods. We use a recent linear reformulation technique to overcome the nonlinearity. The resulting linearity at the cost of increased problem size. To overcome the problem size, we introduce a computationally efficient method of finding an initial solution and introduce bounds for some of the problem variables.

2 - Effects of Work Structure on Worker Allocation Models with Learning and Forgetting

Austin Chacosky, Rochester Institute of Technology, atc7417@mail.rit.edu, Scott E. Grasman

This talk presents the expansion of worker allocation models with human learning and forgetting to include work structures. Utilizing a reformulation technique to counteract the increased solve times of learning curve incorporation, realistically-sized production systems are modeled. Results advise production managers on assignment and cross-training levels, as well as how their production structure may impact those responses.

3 - Workforce Agility and Workforce Flexibility: What are the Differences?

Ruwen Qin, Missouri University of Science and Technology, United States of America, qinr@mst.edu

Workforce agility, the strategic management of organizational labor capability in dynamic business environments, is a key facet of an organization's overall agility. However, the literature dealing specifically with workforce agility is limited. In this paper we review the research literature on workforce agility to define and clarify distinctions between workforce agility and workforce flexibility. We further identify key gaps in the literature to promote the development of this area.

4 - Cellular Bucket Brigades with Hand-Off Times

Yun Fong Lim, Associate Professor, Singapore Management University, Lee Kong Chian School of Business, 50 Stamford Road, Singapore, 178899, Singapore, yflim@smu.edu.sg

We introduce a new design of bucket brigades to boost their productivity. We assume hand-off times are significant and propose simple rules for workers to share work. We identify a sufficient condition for the system to self-balance. Our results suggest that the new design could be substantially more productive than traditional bucket brigades.

■ MD33

Hilton- Union Sq 13

Organizing for Successful Product Development

Cluster: New Product Development

Invited Session

Chair: Svenja Sommer, HEC Paris, 1 Rue de la Libération, Jouy en Josas, France, sommers@hec.fr

1 - The Role of Customer Interaction on Product Innovation Success

Philipp Cornelius, UCL, Management Science and Innovation, London, United Kingdom, philipp.cornelius.12@ucl.ac.uk, Bilal Gokpinar

Using a large-scale dataset of new product development projects from a crowdfunding platform, this paper first provides strong causal evidence on the beneficial economic effect of customer interaction on product development success. We then address two important questions regarding customer interaction. First, do organisations actually incorporate and benefit from ideas generated as a result of customer interaction? Second, what kind of customers should organisations listen to for NPD success?

2 - Incentivizing Collaboration in Global Product Development Teams

Sara Rezaee Vessal, HEC Paris, 1 Rue de la Liberation, Jouy en Josas, FR, 78350, France, sara.rezaee-vessal@hec.edu, Svenja Sommer

To successfully compete on an international scale, multinationals increasingly turn towards globally dispersed product development teams, both to draw on a diverse set of expertise and to access more accurate local market knowledge. However, dispersion also creates additional challenges for collaboration, which can have negative effects on project performance. In this study, we compare dispersed and co-located teams and address the question how to incentivise them.

3 - Modular Product Development for Risky Programs: Co-development versus Collaboration

Suri Gurumurthi, University of North Carolina, 1210 Environ Way, Chapel Hill, NC, 27517, United States of America, Suri_Gurumurthi@kenan-flagler.unc.edu

Using simple optimization models, we compare the benefits of just having a modular design of the product, to those resulting from a modular approach to pairing key resource groups and tasks in the development process. The benefits to time-to-market and development cost are compared. Further, we show that deploying self-contained and modular co-development teams (as opposed to independent collaborating teams) can yield greater dividends in the presence of risk and uncertainty.

Community-Based Operations Research

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Michael Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu

1 - Optimal Physician Traveling Assignment for Improving Care Access in an Outpatient Care Network

Yan Li, Purdue University, West Lafayette, IN, 47907, United States of America, li528@purdue.edu, Nan Kong, Qipeng Zheng

We develop a mixed integer programming model to assign physicians for outpatient care networks to improve patient access to care. We term our model the multi-commodity capacitated traveling facility location problem. We use mental health in the veterans integrated service networks as a case study. Our numerical studies demonstrate conditions under which the idea of scheduling sessions at satellite clinics is appealing and show the efficiency of our column generation-based primal heuristics.

2 - Food Retailers and Obesity in US Adults

Paul Griffin, Penn State, University Park, State College, United States of America, pmg14@engr.psu.edu, Renfei Yan

Food environment has been shown to be associated with obesity rate. We estimate the marginal effect on obesity rate in U.S. adults based on the addition of a new food retailer type in a community. We consider loan and grant subsidies to strategically design a food store establishment plan.

3 - Evaluating the Effectiveness of Tutoring and Mentoring Programs at Homewood Children's Village

Ran Bi, Graduate Student, University of Pittsburgh, 2700 O'Hara St., Pittsburgh, United States of America, rab172@pitt.edu, Xin Jin, Louis Luangkesorn

Many community organizations seek to improve their communities through providing children and teenagers with tutoring and mentoring. However, there is little understanding on the effect of these interventions on academic and behavioral outcomes. We analyze interventions and academic data for students with a goal of identifying interventions that have the most effect on academic outcomes at a community based program working with Pittsburgh Public Schools.

4 - Community-engaged Decision Modeling for Local Economic Development

Michael Johnson, Associate Professor, University of Massachusetts Boston, 100 Morrissey Blvd., McCormack Hall Room 3-428A, Boston, MA, 02125-3393, United States of America, Michael.Johnson@umb.edu, Sandeep Jani, Leibiana Feliz

Main Street organizations develop local development initiatives that support economic and social goals. This requires appropriate data and capacity to apply analytic methods. We discuss a pilot study for Boston Main Streets that links values, data, communication, analysis and action. Results demonstrate the benefits of qualitative and quantitative methods to enable practitioners to make best use of primary and secondary data for decision-making and information systems design.

5 - Pro Bono O.R.: an Operational Research Society initiative

Graham Rand, g.rand@lancaster.ac.uk

The Operational Research Society recently appointed a O.R. Pro Bono Manager, to oversee a scheme that provides free O.R. support by O.R. professionals to Third Sector organisations (mainly charities). How projects and volunteers are found and matched will be described. The advantages for the organisations, for the ORS and for the volunteers will be explained, as well as some of the difficulties faced. Examples will be given of completed projects.

Operations Research in Public Policy Analysis

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Ronald McGarvey, Assistant Professor, University of Missouri, E3437 Lafferre Hall, Columbia, MO, 65211, United States of America, mcgarveyr@missouri.edu

1 - Structuring a Waste Collection Contract using Robust Optimization

Maryam Nikouei Mehr, University of Missouri, Columbia, OH, 65211, mcgarveyr@misssouri.edu, Ronald McGarvey

The University of Missouri has a contract with the City of Columbia to provide waste collection services on campus. An interesting aspect of this contract is that the University is charged according to a fee structure that is different for different types of receptacles. Our research aims to analyze the location and utilization of receptacles across the campus in order to identify a strategy that minimizes the contract expenses to accommodate the University's demand for waste services.

2 - Technical Barriers to, and Policy Options for, Large-Scale Solar Electricity Deployment in India

Aimee Curtright, Physical Scientist, RAND Corporation, 4570 Fifth Avenue, Pittsburgh, PA, 15213, United States of America, acurtrig@rand.org, N.C. Thirumalai, Zhimin Mao, Oluwatobi Oluwatola

RAND and CSTEP are studying the technical barriers and policy options for meeting India's aggressive solar goal of 22 GW by 2022. CSTEP's techno-economic models explore the economic viability of solar, specifically in the Indian context (e.g., locational-specific solar resource data). This presentation examines the sensitivity of costs to different financial mechanisms, technology improvements, and solar resource assumptions, and the policy implications of tradeoffs between them.

3 - Integrating the Location and Inventory Decisions of a Supply Chain

Fang Fang, Ph. D. Student, School of Business Administration, University of Miami, University of Miami, Coral Gables, FL, 33146, f.fang@umiami.edu, Harihara Natarajan

Jointly determining location and inventory decisions in a supply chain is important to ensure low costs. To integrate these decisions, we develop a model that employs a novel approach, incorporating both cycle and safety inventories without introducing nonlinearities. Preliminary computational results suggest that our model and method can be effective.

4 - Optimal Design of Personalized HPV Vaccination Program

Shengfan Zhang, Assistant professor, University of Arkansas, United States of America, shengfan@uark.edu, Fan Wang

The human papillomavirus (HPV) is the most common sexually transmitted virus in the U.S. To prevent multiple cancers attributable to the HPV, HPV vaccine is recommended for preteens and teens who have not been exposed to HPV. We develop a simulation model for the optimal design of personalized HPV vaccination program, which incorporates multiple social-behavioral and demographic risk factors. The efficacy of the HPV vaccination program is evaluated in terms of the HPV-related health outcomes.

Topics In Telecommunications

Sponsor: Telecommunications

Sponsored Session

Chair: Stanko Dimitrov, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca

1 - A Defragmentation Problem of Wavelength Assignment for the Next Generation ROADM Networks

Youngho Lee, Korea University, Sung Buk Ku, Seoul, Korea, Republic of, yhlee@korea.ac.kr, Gilhyun Do, IkKyun Jeong, Jeongyi Moon, Junsang Yuh, Binnam Kim

This talk presents a defragmentation problem of channel assignment in deploying the next generation network of reconfigurable optical add drop multiplexers (ROADM). We develop mixed integer programming models for the problem and propose a novel branch and cut procedure for solving large-scale problems. Promising computational results are presented.

2 - On the Geographic Expansion and Integration Strategies of Telecommunications Service Providers

Steven Powell, Professor Emeritus, CIS Department, California State Polytechnic University, Pomona, 3801 W. Temple Avenue, Pomona, CA, 85248, United States of America, srpowell@csupomona.edu

In order to achieve higher growth and economies of scale telecommunications service providers (TSPs) have expanded their wireless and wireline services geographically and integrated their service offerings. Using a decision model based on the performance and risk characteristics of a TSP's business portfolio, this paper analyzes the geographic expansion and service integration strategies of a cross-section of major TSPs from 2000 to 2012.

3 - A Game-theoretic Model of Network Throughput and Reliability: Survey & Prospects

Yupo Chan, University of Arkansas at Little Rock, 2801 South University Ave, Little Rock, United States of America, yxchan@ualr.edu

A network is only useful if it is reliable, secure, and functioning properly. It has to be devoid of unexpected failures due to natural/technological disasters and outside attacks. A stochastic network, characterized by arcs (links) and nodes that can fail unexpectedly, is proposed to mimic such unpredicted interruptions. Through such a stochastic-network model, we identify game-theoretic strategies and tactics to prevent disruptions caused by natural/technological hazards and hostile tampering.

Supply Chain Optimization and Analytics

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Dahai Xing, Data Scientist, Walmart Labs, 2000 Sierra Point Parkway, Brisbane, CA, 94005, United States of America, DXing@walmartlabs.com

1 - Multivariate Time Series Forecasting using Matrix Completion Algorithms

Ashin Mukherjee, Staff Data Scientist, WalmartLabs, 850 Cherry Avenue, San Bruno, CA, 94066, United States of America, AMukherjee1@walmartlabs.com

Forecasting multivariate time series data is a common problem in business and industrial statistics. In this work we propose a novel matrix completion based algorithm when the underlying data shows strong correlations across time series. The proposed method is completely non-parametric and does not require extraneous estimation of seasonality or trend. The effectiveness of the proposed methodology is demonstrated through a multivariate demand forecasting problem in an e-commerce setting.

2 - Supply Chain Analytics: Simple vs. Complex

Homarjun Agrahari, Director, Supply Chain Analytics, FleetPride, Inc., 600 E. Las Colinas Boulevard, Irving, TX, 75039, United States of America, homarjun.agrahari@fleetpride.com

Most Supply Chain Analytics projects deal with complex solutions for complex problems. However, there is beauty (and lots of money) in simple solutions. I will talk about how simple Analytics has helped FleetPride supply chain. I will also discuss skills every student must have if she/he plans to build a career in industry.

3 - Transportation Challenges in the Multi-channel Retail World

Dahai Xing, Devadas Pattathil

The speakers will introduce the challenges and solutions in the multi-channel retail world. A multi-channel retailer not only has to transport inbound goods from offshore and domestic vendor, but it also has to handle outbound small package delivery. The operational challenges and complexity multiplies when the retailer also handles returns process; and provides warehouse-to-warehouse transfers, inter-store transfers, etc.

4 - Optimal Lead Time and Stocking Levels under Dynamically Evolving Demand in Multi-Channel Retailing

Nevin Mutlu, PhD Candidate, Virginia Tech, 607 Clay St. Apt 10., Blacksburg, VA, 24060, United States of America, nmutlu@vt.edu, Ebru Bish, Erick Wikum

As traditional brick-and-mortar retailers expand their sales channels to online and mobile orders, the consumer adoption rates of these emerging channels is increasing over time. We develop a novel, dynamic demand model to realistically represent the demand across channels in our multi-period optimization model. We perform numerical studies to show that the retailers' optimal decisions in this dynamic environment differ significantly from those under the presence of static demand.

5 - Use of Optimization in Store Selection for Online Order Fulfillment

Guru Pundoor, Scientist, Supply Chain Optimization, Walmart eCommerce, 850 Cherry Avenue, San Bruno, CA, 94066, United States of America, GPundoor@walmart.com

A primary consideration in eCommerce is customer order fulfillment. Different companies employ different strategies with the conflicting objectives of improving service level while controlling costs. In this talk, we will focus on how a multi-channel retailer can use optimization technology to make strategic sourcing decisions by using the brick and mortar network for fulfilling online orders.

OR Techniques to Improve Patient Scheduling

Cluster: Healthcare Systems and Medical Informatics

Invited Session

Chair: Amy Cohn, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, amycohn@med.umich.edu

1 - Reducing Patient Delays in Outpatient Infusion Centers

Sarah Bach, University of Michigan, Ann Arbor, MI, United States of America, sbach@umich.edu, Amy Cohn

Patients receiving chemotherapy in outpatient infusion centers often must get blood work done in the lab, visit their physician in the clinic, and have the pharmacy prepare their drugs before receiving the infusion. We use collaboration with nurses and physicians in the clinical environment, data collection and analysis, simulation, and optimization techniques to develop ways to improve the patient experience and reduce delays in this complex series of activities.

2 - Improving Patient Access for an Outpatient Endocrinology Clinic

Joanna Fleming, University of Michigan, Ann Arbor, MI, United States of America, flemjo@umich.edu, Amy Cohn

A new weight loss and management program for high-risk patients has is under investigation, but requires a frequent and carefully-structured series of visits to the endocrinology clinic. Limits in clinic capacity are hampering the ability of the program to be implemented and effectively evaluated. We use observation, data analysis, simulation, and optimization to assess potential for improving access to timely appointments.

3 - Causal Analysis of Emergency Department Delays

Shervin AhmadBeygi, Director of Systems Redesign, Deparment of Veterans Affairs - Washington DC Medical Center, 50 Irving Street N.W., Washington DC, DC, 20422, United States of America, shervin@umich.edu

Emergency Department (ED) delay is a widespread problem that negatively affects patient safety, quality of care, and patient and provider satisfaction. We employ novel data analytics approaches such as causal networks and competing risk analysis and use historical data to study the causes of ED delays. The results of this analysis provide recommendations on how to alleviate the problem of excess ED delays.

Operations Analysis for Health Care

Sponsor: Health Applications

Sponsored Session

Chair: Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States of America, dai@jhu.edu

1 - Optimal Mix of Elective Surgical Procedures under Stochastic Patient Length of Stay

Hessam Bavafa, Assissant Professor, Wisconsin School of Business, 975 University Ave, Madison, WI, 53706, United States of America, bavafa@wharton.upenn.edu, Sergei Savin, Lerzan Ormeci

We consider the problem of allocating daily hospital service capacity among several types of elective surgical procedures. Our focus is on the interaction between two major constraining hospital resources: operating room and bed capacity. In our model, each type of surgical procedure has an associated revenue, deterministic procedure duration and stochastic hospital length of stay.

2 - Pricing and Operational Performance in Outpatient Services of China's Public Hospitals

Xiaofang Wang, Associate Professor, Renmin University of China, School of Business, 59 Zhongguancun St, Haidian, Beijing, China, wangxiaofang@rbs.org.cn

Inefficient and unnecessary care has contributed the growing cost and increased congestion at government-run public hospitals in China. Among other healthcare reform policies, adjusting fees for outpatient services plays an important role in eliminating Yi Yao Yang Yi to make health care more accessible and affordable. We develop a model to jointly determine the optimal pricing and the optimal service policy to maximize the benefits collected by the hospital and provide policy insights.

3 - Resource Allocation Considering Quality of Care in Hospice Operations

Leela Nageswaran, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, lnageswa@andrew.cmu.edu, Alan Scheller-Wolf, Aliza Heching

We study the problem of allocating nurses in hospices, factoring in the interplay between staffing choices and realized quality of care. The hospice has a choice of overworking their full-time nurses or hiring per diem nurses. The resulting quality of care impacts the rates at which new patients enroll with, and existing patients leave, the provider. We model the problem as a discrete time Markov chain and obtain characteristics of the optimal resource allocation policy.

4 - If You'd Give, You'll Get: Analysis and Remedies of Donor Priority Rule

Tinglong Dai, Assistant Professor, Johns Hopkins University, 100 International Drive, Baltimore, MD, 21202, United States of America, dai@jhu.edu

It has been proposed that registered organ donors should be given a higher priority over non-donors when they need organ transplants in the future. We use a queueing and game theoretic model to predict the equilibrium under this policy. Our analysis provides insights into potential policy-induced welfare distortions. As a result, the overall social welfare can be lower due to the policy. We provide simple and effective remedies to correct these distortions.

Bundled Payments and Payment Systems

Sponsor: Health Applications

Sponsored Session

Chair: Margret Bjarnadöttir, Assistant Professor of Management Science and Statistics, University of Maryland, 4324 Van Munching Hall, College Park, MD, 20742, United States of America

1 - Opportunities for OR/MS in Healthcare Payment Reform

Renata Konrad, Worcester Polytechnic Institute, 100 Institute Rd, Worcester, United States of America, rkonrad@wpi.edu, Margret Bjarnadöttir, Ruben Proano, David Anderson

Healthcare reimbursement is at the forefront of healthcare reform debates in the US. Bundled payment systems have been proposed as a practical and promising reimbursement alternative to induce incentives that lower healthcare expenditures. Significant evidence suggests that such systems achieve improved quality outcomes, and better coordinated care at a lower cost. This talk provides an overview of bundled payments and discusses directions for operations research and management science.

2 - Bundled Payments: A Post-Acute Care Provider Prospective

Brenda Courtad, University of Cincinnati, 2925 Campus Green Dr, Cincinnati, OH, 45221, United States of America, courtabl@mail.uc.edu, Michael Magazine

Taking part in the Bundled Payment for Care Improvement Demonstration with Medicare requires many decisions to be made. We will present and discuss some of these decisions from a post-acute care provider prospective.

3 - Optimal Facility In-network Selection for Healthcare Payers under Reference Pricing

Aurelie Thiele, Visiting Associate Professor, MIT, 77 Mass Ave, Rm E40-121, Cambridge, MA 02139, United States of America, aut204@lehigh.edu, Victoire Denoyel, Laurent Alfandari

In reference pricing (RP), a payer determines a maximum amount for a procedure; patients who select a provider charging more pay the difference. This has strong potential in cost reduction for payers, quality increase for patients & visibility for high-value providers. Inspired by a CalPERS program, we use robust optimization to set a reference price and providers subject to it. We present & analyze a MIP to fill the gap of quantitative insights on RP w.r.t price, quality & geographic coverage.

4 - Automatic Detection of Episodes of Care in an Insurance Claims Repository

Ruben Proano, Assistant Professor, Rochester Institute of Technology, Rochester, NY, United States of America, rpmeie@rit.edu, Margrét BjarnadÛttir, Renata Konrad, David Anderson

This talk presents the ongoing efforts to automatically determine what medical services should be bundled as an episode of care. The ability to determine these bundles is key for an eventual adoption of bundled payments as a healthcare cost reimbursement strategy, instead of the commonly used fee-for-service. This talk focuses on the efforts to mine a large aggregated insurance claims repository with six years of data for Upstate New York.

Hilton- Union Sq 21

Stochastic Models in Healthcare Delivery

Sponsor: Health Applications

Sponsored Session

Chair: Mucahit Cevik, University of Wisconsin - Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, cevik2@wisc.edu

1 - Hypertension Management under Noise-Free Paradigm: Insights to the Optimal Medication Prescriptions

Abdolmanaf Zargoush, PhD Candidate, McGill University, 1001 Sherbrooke, Montreal, QC, H3A1G5, Canada, abdolmanaf.zargoush@mcgill.ca, Stella Daskalopoulou, Vedat Verter, Mehmet Gumus

We formulate the "antihypertensive prescription problem" as a finite-horizon Markov Decision Process (MDP). The optimal policies, which are of threshold nature, provide valuable insights on the key question in hypertension management: "which medication" and "when" should be prescribed given the patient's blood pressure level and age?

2 - A MDP Model for Breast and Ovarian Cancer Intervention Strategies for BRCA1/2 Mutation Carriers

Mehrnaz Abdollahian, PhD. Student, University of South Florida, 4202 East Fowler Avenue, ENB 118, Tampa, FL, 33620, United States of America, mehrnaz@mail.usf.edu, Tapas Das

Women with BRCA1/2 mutations have higher risk for breast and ovarian cancers. Available interventions vary significantly in cost, cancer prevention, and in resulting death from other causes. We developed a Markov decision process model to obtain optimal intervention strategies using both cost and quality-adjusted life years as rewards.

3 - Multi-dose Vial Administration with Non-Stationary Demand and Delayed Service

Maryam Hasanzadeh Mofrad, PhD. Student, University of Pittsburgh, Pittsburgh, PA, 15261, United States of America, hasanzadeh.mofrad@gmail.com, Jayant Rajgopal, Lisa M. Maillart, Bryan A. Norman

Previous work on determining dynamic vaccine administration policies to minimize open vial waste assumes that unvaccinated customers are lost and that the arrival rate is stationary both throughout the replenishment cycle as well as within each session. We reformulate the Markov decision process model to account for these factors and present the results of extensive numerical study for both clinic-level and country-level performance.

4 - Effects of Budgetary Restrictions on Mammography Screening Policies

Mucahit Cevik, University of Wisconsin - Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, cevik2@wisc.edu, Turgay Ayer, Oguzhan Alagoz

The consideration of a budget constraint on the total available resources for mammography screening becomes a necessity especially for resource-limited countries. We formulate an MDP model to assess changes on mammography screening decisions and risk of getting cancer, when only a limited budget per woman is available.

Hilton- Union Sq 22

Health Care Supply Chain, Competition, and Risks Management

Sponsor: Health Applications

Sponsored Session

Chair: Wen-Ya Wang, San Jose State University, One Washington Square, San Jose, CA, United States of America, wenya.wang@sjsu.edu

1 - Integrated Pharmaceutical Supply Chains: Dynamic and Oligopolistic Competition Perspectives

Sung Chung, New Mexico Institute of Mining and Technology, 801 Leroy Place, Socorro, United States of America, schung@nmt.edu, Changhyun Kwon

We propose an integrated pharmaceutical supply chain management framework that allows us to explicitly consider the dynamic control of medication inventories at distribution centers and demand markets. We address the issues pertaining to pharmaceutical supply chains such as price fluctuations as a result of competition across firms, and changes in pharmaceutical supply flows over time. We also provide a case study in which managerial insights are derived.

2 - No Silver Bullet: Identifying Security Vulnerabilities Of Hospital Databases

Liam O'Neill, Associate Professor, University of North Texas - Health Science Center, 3500 Camp Bowie Blvd, Fort Worth, TX, 76107, Liam.ONeill@unthsc.edu, Guatam Das, Nan Zhang, Heng Huang

Analytical processing was used to identify security vulnerabilities in public hospital databases. Using medical domain knowledge, we recovered the real age of 64 patients, the gender of 796 patients, and the zip codes of 1,219 patients. We demonstrate that standard methods to mask personal health information can be reversed, thereby increasing the risk of re-identification of individual patients.

3 - Inventory Management of Reusable Surgical Instruments

Adam Diamant, Adam.Diamant09@Rotman.Utoronto.Ca, Joseph Milner, Fayez Quereshy

We study inventory policies for surgical instruments that must be sterilized between uses. We model the process as a discrete-time Markov chain, obtaining the steady-state probabilities for the amount of usable inventory on-hand at the beginning of each day. By showing several structural properties, we derive an expression for the optimal number of instrument sets to carry. We apply our theoretical results to a dataset collected from a surgical unit at a large hospital in Toronto.

4 - Price Competition under Subsidization: Application to Medicare Reform

Lijian Lu, PhD, Columbia Business School, 3022 Broadway, New York, NY, 10027, United States of America, llu16@gsb.columbia.edu, Awi Federgruen

We consider price competition models, in which a significant part of the price is subsidized by a third party. We characterize the equilibrium behavior and derive comparison results for the price equilibria under alternative subsidy schemes. Applying our results to the Medicare insurance market, we estimate the impacts of various proposals, in particular the Wyden-Ryan plan, on government cost, insurer, and beneficiary's welfare.

Decision Diagrams in Optimization II

Sponsor: Computing Society

Sponsored Session

Chair: John Hooker, Carnegie Mellon University, Tepper School of Business, Pittsburgh, United States of America, jh38@andrew.cmu.edu

1 - Solving Binary Quadratic Programming Problems with Binary Decision Diagrams

David Bergman, School of Business, University of Connecticut, One University Place, Stamford, United States of America, david.bergman@business.uconn.edu, Andre Augusto Cire

Binary decision diagrams (BDDs) have recently been proposed as a mechanism for solving discrete optimization problems. This talk discusses an extension of this work to the binary quadratic programming problem. A set of instances is described for which the BDD technique outperforms existing state-of-the-art technique.

2 - Parallel Combinatorial Optimization with Decision Diagrams

Willem-Jan van Hoeve, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, vanhoeve@andrew.cmu.edu, David Bergman, Andre Cire, Vijay Saraswat, Horst Samulowitz, Ashish Sabharwal

We propose a new approach for parallelizing search for combinatorial optimization that is based on a recursive application of approximate decision diagrams. This generic scheme can, in principle, be applied to parallelize MIP, SAT, or CP search, provided that a decision diagram representation for the problem is available. We demonstrate our method on the maximum independent set problem, and show that our parallel search scales effectively up to 256 workers.

3 - Weighted —AND/OR Multivalued Decision Diagrams (AOMDD) for Sum and Max Queries

Rina Dechter, Professor, UCI, Irvine, CA 92697-3425, Irvine, United States of America, dechter@ics.uci.edu, William Lam

I will present Weighted AOMDDs which capture problem decomposition, multi-valued variables, and can express real-valued functions. I will show that the AOMDD size exponential in the problem's semantic-width, a new, and more informative parameter (though hard to compute). Specific demonstration as well as empirical evaluation will be given.

4 - Optimization with Zero-suppressed BDDs: Case Study Research in Power Distribution Networks

Takeru Inoue, NTT Network Innovation Labs., Hikarinooka 1-1, Yokosuka, Ka, 2390847, Japan, inoue.takeru@lab.ntt.co.jp, Ryo Yoshinaka, Keiji Takano, Takayuki Watanabe, Jun Kawahara, Akihiro Kishimoto, Koji Tsuda, Shin-ichi Minato, Yasuhiro Hayashi

Determining loss minimum configuration in a power distribution network is a hard discrete optimization problem involving many variables. Since existing methods employ local updates, they eventually get stuck at local minima. We present an optimization method providing global optimal solution utilizing a compressed search space represented by zero-suppressed BDDs. Our method is also remarkably efficient; optimization of a large-scale network with 468 switches was solved just in a minute.

Information, Information Accuracy and Information Policy in E-commerce Applications

Sponsor: Information Systems

Sponsored Session

Chair: Juan Feng, Associate Professor, City University of Hong Kong, Kowloon Tung, Hong Kong, Hong Kong - PRC, juafeng@gapps.cityu.edu.hk

1 - Does Screening Mechanism Hurt or Help Crowdsourcing Contests?

Jiahui Mo, Assistant Professor, Nanyang Technological University, jiahui.mo@utdallas.edu

In crowdsourcing contests platforms, seekers are allowed to adopt screening mechanism within a contest. Some seekers use two stage contests, with the first stage as the screening stage to select candidates and the second stage as the winner selection stage. Some other seekers do not have screening stage but select winners directly. This research explores how screening mechanism in crowdsourcing contests influences solvers, seekers and platforms.

2 - IT Investment under Competition: The Role of Value Uncertainty

Mingdi Xin, Assistant Professor, University of California at Irvine, United States of America, mingdi.xin@uci.edu, Vidyanand Choudhary

How does competition impact firms' incentive to invest in information technology (IT)? On one hand, firms in highly competitive industries may be more motivated to invest in IT to improve performance and competitive position. On the other hand, firms' investment incentive depends on their ability to appropriate the return, and the value of IT investment is more likely to be competed away in competitive industries. This paper examines firms' IT investment decisions in a game theoretic model.

3 - The Effect of Consumer Rating Behavior in an App Market

Lin Hao, Assistant Professor, Mendoza College of Business, University of Notre Dame, lhao@nd.edu, Xiaofei Li, Jiuping Xu, Yong Tan

This paper investigates the influence of consumer rating behavior on three players in an app market, the app developer, app consumers, and the platform owner. Specifically we studies under the uncertainty about the horizontal characteristics of an app, how consumers' different rating behaviors could affect their app purchase decisions, the developer's quality and price decision, and the platform owner's decision on the sharing percentage in the app revenue sharing contract.

4 - When Online Reviews Meets Sales Volume Signal: Does More Information Leads To A Happy Ending?
Juan Feng, Associate Professor, City University of Hong Kong, Hong Kong, Hong Kong - PRC, juafeng@cityu.edu.hk, Yang Liu, Xiuwu Liao

We study the impact of two types of information, that is, sales volume signal and online review, on consumers' purchase decision and on firms' optimal pricing strategies over time. We find that more information, or more accurate information, does not always lead to a welfare increase to firms or consumers.

Opportunities in Behavioral Operations: Different Perspectives

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Andrew Davis, Assistant Professor, Cornell University, 401J Sage Hall, Ithaca, NY, 14853, United States of America, adavis@cornell.edu

1 - Laboratory Experiments on the Operations-Finance Interface
Vishal Gaur, Cornell University, Johnson School, Ithaca, NY, United States of America, vg77@cornell.edu

I shall identify some opportunities for testing theoretical models on the interface of operations management and finance through controlled experiments in the lab or the field.

2 - Human Behavior in Production and Supply Chain Systems
Wallace Hopp, University of Michigan, Ross School of Business, Ann Arbor, MI, 48109, United States of America, whopp@umich.edu

Considering human behavior can alter the structure of operations management problems in some classical settings, and can present entirely new problems in other settings. In this talk, we will explore the impact of behavioral issues, such as motivation, trust and fairness in production and supply chain settings. The focus will be to identify common threads apparent from results so far, and to highlight areas of potential future research interest.

3 - Behavioral Opportunities in Revenue Management and Pricing
Serguei Netessine, Professor, INSEAD, 1 Ayer Rajah Avenue, Singapore, 138676, Singapore, serguei.netessine@insead.edu, Jun Li

Behavioral work in operations management has paid relatively little attention to the issues if revenue management and pricing. In this talk we will discuss empirical evidence suggesting that there are ample opportunities for behavioral researchers.

■ MD46

Cutting Plane and Formulation Techniques for Mixed Integer Programming

Sponsor: Optimization/Integer and Discrete Optimization

Sponsored Session

Chair: Sina Modaresi, Graduate Research Assistant, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, sim23@pitt.edu

1 - Valid Inequalities for the Pooling Problem
James Luedtke, Associate Professor, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, jrluedt1@wisc.edu, Jeff Linderoth, Claudia D'Ambrosio

We investigate relaxations for the non-convex pooling problem, which arises in production planning problems in which products with are mixed in intermediate pools in order to meet quality targets at their destinations. We derive valid nonlinear convex inequalities, which we conjecture define the convex hull of this non-convex set for some special cases. Numerical illustrations will be presented.

2 - Obtaining Deeper Intersection Points for Generalized Intersection Cuts
Aleksandr Kazachkov, Ph.D. Student, Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, akazachk@cmu.edu, Egon Balas, Francois Margot, Selvaprabu Nadarajah

Generalized intersection cuts offer a non-iterative method to generate cuts for mixed-integer linear programs, by finding a collection of intersection points that can be used to generate cuts through a linear program. We demonstrate theoretical properties of proper collections of intersection points and empirically evaluate several procedures for generating points. The goal is to obtain deeper intersection points, so that the corresponding cut-generating program yields better cuts.

3 - Lifted Mixing Inequalities for a Generalized Mixing Set
Ayse Arslan, University of Florida, 3700 Windmeadows Blv., P180, Gaineville, FL, 32608, United States of America, nur.arslan@ufl.edu, Jean-Philippe P Richard, Yongpei Guan

In this paper, we study a generalization of the mixing set introduced by Pochet and Gunluk, 2001. We show that the traditional mixing inequalities can be used to obtain facet-defining inequalities for the set in consideration through lifting. We further prove that the associated lifting function is subadditive. We therefore use an efficient lifting procedure to obtain a family of facet-defining inequalities for the set in consideration.

4 - On Some Generalizations of Split Cuts
Diego Moran, Dr., United States of America, dmoran@gatech.edu, Sanjeeb Dash, Oktay Gunluk

Split cuts form a well-known class of valid inequalities for mixed-integer programming problems (MIP). Cook et al. (1990) showed that the split closure of a rational polyhedron P is again a polyhedron. In this paper, we extend this result from a single rational polyhedron to the union of a finite number of rational polyhedra. We also show how this result can be used to prove that some generalizations of split cuts, namely cross cuts, also yield closures that are rational polyhedra.

Joint Session Optim/ MIF: Developments in Stochastic Integer Programming Methods

Sponsor: Optimization/Optimization Under Uncertainty & Minority Issues Forum

Sponsored Session

Chair: Lewis Ntaimo, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ntaimo@tamu.edu

Co-Chair: Saravanan Venkatachalam, Texas A&M University, Industrial and Systems Engineering Dept, College Station, TX 77843, United States of America, saravanan@entc.tamu.edu

1 - A Branch-and-Bound Method for Stochastic Integer Bilinearly-Constrained Programs
Christopher Hagmann, Purdue University, 480 Stadium Mall Dr., West Lafayette, United States of America, chagmann@purdue.edu, Nan Kong, Pratik Parikh

The warehouse-inventory-transportation problem was developed to integrate warehousing decisions in developing distribution plans in supply chain practice. The resultant problem is a two-stage stochastic integer bilinearly-constrained program. We propose an algorithm that decomposes the problem by branching on variables responsible for the bilinearity. The resulting tree of SIPs is searched and fathomed using scenario decomposition. Various strategies are compared for the test instances.

2 - Fenchel Decomposition for SIP with Second-Stage Integer Variables
Saravanan Venkatachalam, Texas A&M University, Industrial and Systems Engineering Dept, College Station, TX 77843, United States of America, saravanan@entc.tamu.edu, Lewis Ntaimo

This talk presents a computational study of a Fenchel decomposition algorithm for two stage stochastic integer programs having integer variables in second stage with special structure. A Benders' decomposition framework is used and a new heuristics is devised to aid in generating Fenchel cuts in a stage-wise decomposition setting.

3 - Exploiting Submodularity in Integer Programming under Uncertainty
Shabbir Ahmed, Professor, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332-0205, United States of America, sahmed@isye.gatech.edu

Various classes of integer programming models under uncertainty can be reformulated into deterministic mixed integer nonlinear programming (MINLP) formulations involving nonlinear functions of binary variables that exhibit a diminishing marginals property known as submodularity. This talk will discuss various approaches to exploit this submodularity to develop effective mixed integer linear programming (MILP) based methods for such MINLP problems.

4 - Fenchel Disjunctive Decomposition for Mean-Risk Stochastic Integer Programs

Lewis Ntaimo, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, ntaimo@tamu.edu, Michelle Alvarado, Guglielmo Lulli

Mean-risk stochastic integer programs (SIPs) include both expectation and a dispersion statistic in the objective function and are difficult to solve. We derive an integrated Fenchel and disjunctive decomposition method for mean-risk SIPs with fixed recourse for the absolute semideviation mean-risk measure. Fenchel decomposition cuts are generated based on a subset of scenarios and are lifted and translated using disjunctive programming so that they are valid for the rest of the scenarios.

Network and Graphs 2

Contributed Session

Chair: Yongwhan Lim, PhD, MIT, 70 Pacific Street, Cambridge, MA, 02139, United States of America, yongwhan@mit.edu

1 - Multi-factor Stock Analysis using Graph Theory

Deepika Pardasani, Columbia University, 116th St and Broadway, New York, NY, 10027, United States of America, dp2673@columbia.edu, Yared Nigussie, Bo Zhang

We use graph theory to understand structural properties of stock markets. We consider different market graphs: one based on stock returns, others with vertices weighted by factors like liquidity measure, Dividend Yield, and Price-to-Earnings Ratio. We investigate portfolios at various time horizons to derive meaningful economic information by examining clustering coefficients, correlation distributions and changing temporal properties of market graphs.

2 - Dynamical Network Structures in Multi-Layered Networks

Rene Janssen, Netherlands Defence Academy, Faculty of Military Sciences, Enys House, Het Nieuwe Diep 8, Den Helder, 1781 AC, Netherlands, rhp.janssen@nlda.nl, Herman Monsuur, AriÎn van der Wal

In modeling (inter)actions and cooperation as networks, actors may be represented as nodes that simultaneously belong to multiple interdependent networks. We present a method that is used to implement, analyze and evaluate basic principles that may be used by the actors in an organization to drive the process of constant change. We demonstrate our approach to networks in which two basic principles are operational: reciprocity and covering.

3 - Stochastic Linear Threshold Model of Diffusion in Networks

Yongwhan Lim, PhD, MIT, 70 Pacific Street, Cambridge, MA, 02139, United States of America, yongwhan@mit.edu, Alex Teytelboym, Asuman Ozdaglar

We provide an analytical expression for the expected number of adopters in any network with any seed in terms of a new centrality measure. We describe network topologies that maximize and minimize diffusion when the seed is random. We also pin down the topology that maximizes overall diffusion when the seed can be targeted. For certain topologies, we derive the exact number of adopters, as the network grows large. We discuss how the structure of the network affects early history of diffusion.

4 - Efficient Parallel Algorithms for Network Interdiction Problems

Dia St. John, University of Arkansas, Bell Engineering Center, Fayetteville, AR, 72701, United States of America, destjohn@uark.edu, J. Cole Smith, Chase Rainwater

Network interdiction is a well-known problem class with many important applications, including disruptions in supply chain infrastructures and communication networks. This work focuses on decreasing the computational run time required to solve large-scale network interdiction models to optimality through the use of new parallel computing methodologies.

Supply Chain Network Competition: Advances in Models, Methods, and Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Anna Nagurney, John F. Smith Memorial Professor, Isenberg School of Management, University of Massachusetts Amherst, Amherst, MA, United States of America, nagurney@isenberg.umass.edu

1 - Supply Chain Network Competition with Information Asymmetry in Quality and Minimum Quality Standards

Dong Li, Doctoral Student, Isenberg School of Management, University of Massachusetts, 121 Presidents Drive, Amherst, MA, 01003, United States of America, dongl@som.umass.edu, Anna Nagurney

We construct a supply chain network model with information asymmetry in product quality. The competing firms with, possibly, multiple manufacturing plants, which may be located on-shore or off-shore, are aware of the quality of the product that they produce but consumers only know the average quality. We propose the models and demonstrate how minimum quality standards can be incorporated. The numerical examples, accompanied by sensitivity analysis, reveal interesting results and insights.

2 - The Closed-loop Supply Chain Network with Competition and Design for Remanufactureability

Qiang Qiang, Penn State Univ., 30 E. Swedesford Rd., Malvern, PA, 19355, United States of America, qzq10@psu.edu

A two-period closed-loop supply chain network is investigated. In the first period, each manufacturer decides on the production quantity and level of remanufactureability, which has impact on the cost of both new and remanufactured products. In period two, manufacturers can manufacture and/or remanufacture products, taking into account that consumers have different valuations of new and remanufactured products. Through a series of case studies, we answer several important research questions.

3 - Supply Chain Network Sustainability under Competition and Frequencies of Economic Activities

Min Yu, Assistant Professor, Pamplin School of Business, University of Portland, Portland, OR, United States of America, yu@up.edu, Jonas Floden, Anna Nagurney

We develop a competitive supply chain network model with multiple firms, each of which produces a differentiated product by brand and weights its generated emissions in an individual way. The supply chain network economic activities have associated with them distinct capacities and the firms seek to determine their optimal product flows and frequencies of operation so that their utilities are maximized where the utilities consist of profits and weighted emissions.

4 - Supply Chain Supernetwork Model with Suppliers Risk Diversification

June Dong, Professor, School of Business, SUNY, Oswego, NY, United States of America, june.dong@oswego.edu, Jun Ma

Recently, supply chain risks are getting higher and higher. Firms are now seeking ways to diversify their suppliers. We consider multiple competitive supply chains that serve multiple demand markets. Each player seeks to maximize its profit, while each manufacturer also manages to diversify its suppliers. We develop a supernetwork model to capture the nature of the problem. Risk parameters are introduced. Variational Inequality formulations are derived and numerical examples are provided.

1 - The Least Cost Influence Problem (LCIP) in Dynamic Social Networks

Dilek Gunnec, Assistant Professor, Ozyegin University, Cekmekoy, Istanbul, Turkey, dilek.gunnec@ozyegin.edu.tr, Raghu Raghavan

Identifying critical nodes on a social network is an important problem in both marketing and epidemiological settings. The LCIP is an NP-Hard problem that is polynomially solvable on tree networks under the assumption that all neighbors of a node exert equal influence. We explore the extensions of the LCIP to a dynamic social network setting. The two important aspects of the problem include modeling of dynamic social networks and the integration of these dynamic effects to spreading behavior.

2 - Optimizing Social Media Message Dissemination Problem for Emergency Communication

Xin Ma, Texas A&M University, 3131 TAMU, College Station, TX, 77843, United States of America, xma@tamu.edu, Justin Yates

We introduce a formal model for the Social Media Message Dissemination (SMMD) problem, which includes emphasis on single and multiple message scenarios and examines key communication characteristics in the development of more targeted messaging strategies in extreme events. We present a detailed experimental design on random networks and real Twitter sub-networks and discuss our findings. We also include analysis of heuristics for SMMD and discuss the potential use in real-world applications.

3 - Transmission Expansion Planning Considering Energy Storage Systems

Cameron MacRae, Phd candidate, School of Mathematical and Geospatial Sciences, RMIT University, GPO Box 2476, Melbourne, 3001, Australia, cameron.macrae@rmit.edu.au, Andreas Ernst, Melih Ozlen

In the electricity grid, energy storage systems (ESS) provide a way of both smoothing supply and matching demand. We develop an extension to the transmission network expansion planning (TEP) problem that considers the installation of both ESS and additional circuits. The model is tested on the well known Garver 6-bus and IEEE 25-bus test circuits and some preliminary results are discussed.

4 - Optimizing Information Flow In an Adaptive Network

Mohsen Dadashi, University of Arkansas, Department of Industrial Engineering, 4207 Bell Engineering Center, Fayetteville, AR, 72701, United States of America, mdadashi@uark.edu, Chase Rainwater, Edward Pohl

In this talk, information flow in an organization is modeled as a social network. Actors are classified into different levels. Actors have multiple states which represent their willingness to reveal their known information. The model analyzes the information received by a specific targeted actor. First, a sensitivity analysis is done to identify the influence of current network parameters on the result. Second, network modifications are examined in order to optimally create new connections.

First-order Methods for Large-scale Convex Optimization

Sponsor: Optimization/Nonlinear Optimization

Sponsored Session

Chair: Necdet Serhat Aybat, Assistant Professor, Penn State University, Dept. of Industrial Engineering, University Park, PA, 16802, United States of America, nsa10@psu.edu

1 - Practical Inexact Proximal Quasi-Newton Method with Global Complexity Analysis

Xiaocheng Tang, Lehigh University, Industrial and Systems Engineering Dept., United States of America, xiaocheng.t@gmail.com, Katya Scheinberg

Recently several methods were proposed for sparse optimization which make careful use of second-order information to improve local convergence rates. Here we propose a general framework, and also a new algorithm, which uses limited memory BFGS Hessian approximations, and provide a global convergence rate analysis in the spirit of proximal gradient methods, which includes analysis of method based on coordinate descent.

2 - Low-rank Matrix and Tensor Recovery: Theory and Algorithms

Donald Goldfarb, Professor, Dept. of Industrial Engineering and Operations Research, Columbia University, New York, NY, 10027, United States of America, goldfarb@columbia.edu, Cun Mu

To exploit structured data, convex low-rank completion and robust PCA models for matrices have been extended to tensors. We establish recovery guarantees for these models and introduce a new convex relaxation for the tensor Tucker rank, which is theoretically and empirically much better than the one most commonly used. We propose first-order algorithms to solve both models, and empirically investigate their recoverability properties, and the computational performance of our algorithms.

3 - A Parallel Method for Large Scale Convex Regression Problems

Zi Wang, PhD Candidate, Penn State University, Dept. of Industrial Engineering, University Park, PA, 16802, United States of America, zxw121@psu.edu, Necdet Serhat Aybat

Convex regression (CR) problem deals with fitting a convex function to a finite number of observations. Computing the least squares (LS) estimator via solving a quadratic program (QP) is the most common technique. However, computing the LS estimator is not practical using interior point methods when the number of observations is very large. The first-order method proposed in this paper efficiently solves large-scale instances of CR problem with limited memory through parallelization.

4 - An Evolving Gradient Resampling Method for Machine Learning

Stefan Solntsev, Northwestern University, stefans@u.northwestern.edu, Jorge Nocedal

We propose an optimization method for machine learning that is neither purely batch nor purely stochastic method. It belongs to the class of semi-stochastic methods that have recently received much attention, and that include the Stochastic Average Gradient and Stochastic Variance Reduced Gradient methods. The novel feature of our algorithm is that, unlike the two methods just mentioned, it is appropriate even in the case of an infinite training set.

1 - Distributed Optimization over Directed Graphs

Alexander Olshevsky, University of Illinois, 1308 West Main Street, Urbana, IL, 61801, United States of America, olshevsky.alex@gmail.com, Angelia Nedich

The widespread availability of copious amounts of data has created a pressing need to develop optimization algorithms which can work in parallel when input data is unavailable at a single place but rather spread throughout multiple locations. We consider the problem of optimizing a sum of convex functions in a network where each node knows only one of the functions and develop a stochastic gradient method which is fully decentralized and robust to unpredictable node and link failures.

2 - A New Exact Algorithm for the Bilevel Linear Programming Problem

Lizhi Wang, Associate Professor, Iowa State University, Iowa State University, Ames, IA, 50011, United States of America, lzwang@iastate.edu, Pan Xu, Mohammad Rahdar, Bokan Chen

We present a new exact algorithm for the bilevel linear programming problem. This algorithm adopts a branch-and-bound framework but uses a new approach to the separation problem to eliminate bilevel infeasible solutions from the linear programming relaxation. We will report preliminary numerical results.

3 - Complementarity Formulation for l0 Norm Minimization Problems

Xin Shen, Rensselaer Polytechnic Institute, 110 8th Street, Troy, NY, United States of America, shenx5@rpi.edu, Mingbin Feng, John Mitchell, Jong-Shi Pang, Andreas Waechter

Recently l0 norm minimization has become a remarkably active area of research in optimization. The problem is NP-hard and replacing it by the l1 norm is a common way to get an approximate solution. We consider an alternative way of formulating the problem as a mathematical program with complementary constraints. We further discuss the completely positive relaxation and compare the properties of various formulations, including stationary conditions, local and global optimality.

Portfolio Optimization and Solution Methods

Cluster: Optimization in Finance

Invited Session

Chair: David Brown, Duke University, 100 Fuqua Drive, Durham, NC, United States of America, dbbrown@duke.edu

1 - Dynamic Portfolio Choice and Learning for a Regime Switching Model

Andrew Lim, Professor, National University of Singapore, 15 Kent Ridge Drive, Singapore, 119245, Singapore, andrewlim@nus.edu.sg, Poomyos Wimonkittiwat

We discuss approximate methods for solving dynamic portfolio choice problems with learning when the underlying market is driven by a hidden markov model with unknown parameters and unobserved regime. These methods illustrate how sampling methods from Bayesian statistics can be used to approximately solve dynamic portfolio choice problems.

2 - A Fast Regression Approach to Solving the Dual Problems of Dynamic Programs

Helin Zhu, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, 30332, United States of America, hzhu67@gatech.edu, Enlu Zhou, Fan Ye

In recent years, the primal-dual approach has become a powerful procedure in solving (reward maximization) dynamic programs by providing lower-upper bound pairs of the value functions. In practice, obtaining tight upper bounds on the value function requires good approximations of the optimal penalty function, which might be a time-consuming process. In this talk, we present an efficient least-squares regression approach to generate good approximations of the optimal penalty function.

3 - Accounting for Risk Measure Ambiguity when Optimizing Financial Positions

Jonathan Li, Assistant Professor, Telfer School of Management, 55 Laurier Avenue East Ottawa, Ottawa, Canada, jonathan.li@telfer.uottawa.ca, Erick Delage

While many risk measures have been proposed in the past, it is still a great challenge today to select a risk measure that faithfully represents a decision maker's true risk attitude. In this work, we present new robust forms of measures that account precisely for the risk preference of a decision maker when comparing and optimizing financial positions. Such measures can be evaluated and optimized through solving linear programs. Examples of portfolio optimization are provided.

1 - Optimal Dynamic Portfolio Liquidation Strategies

Somayeh Moazeni, Princeton University, Princeton, NJ, United States of America, somayeh@Princeton.edu

In the execution cost problem, an investor wants to minimize the total expected cost and risk in the execution of a portfolio of risky assets in order to achieve desired positions. In this talk, we discuss optimal stochastic dynamic programming strategies with linear temporary and permanent price impact models and the importance of market condition on the computed strategy.

2 - Asset Allocation under Generalized Hyperbolic Distribution: Optimal Portfolios and Performance

Luis Chavez-Bedoya, Research Professor, Esan Graduate School of Business, Alonso de Molina 1652, Surco, Lima, Peru, l.chavezbedoya@gmail.com, John Birge

We analyze the asset allocation problem under generalized hyperbolic (GH) distribution of returns. We provide expressions to compute the optimal portfolio weights. Also, the optimal mean-variance (MV) portfolio is studied and new conditions under which the MV framework is consistent with expected utility maximization are derived. Finally, we define general measures of performance to assess the effectiveness of a set of common portfolio rules.

3 - Optimal Portfolio Liquidation with a Markov Chain Approximation Approach

Jingnan Chen, Assistant Professor, Singapore University of Technology and Design, Singapore, amy11011@gmail.com

We consider the optimal portfolio liquidation problem where the objective is to minimize trading cost and risk when financial portfolios are liquidated over a short period of time. We propose Markov chain approximation approaches for computing the optimal trading strategies numerically and for studying analytical properties of such strategies.

Optimization Modeling and Methodologies in Big Data

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Jiming Peng, University of Houston, Houston, United States of America, jopeng@uh.edu

1 - Optimization via Clustering in Machine Learning

Young Woong Park, Northwestern University, 2145 Sheridan rd, Evanston, IL, 60208, United States of America, ywpark@u.northwestern.edu, Diego Klabjan

We propose a clustering-based iterative algorithm for optimization problems, where we start by aggregating the original data and then in subsequent steps iteratively disaggregate. We apply the algorithm to common machine learning problems such as the least absolute deviation regression and support vector machine. We derive problem-specific data aggregation/disaggregation procedures. We also show optimality, convergence, and optimality gap in each iteration. A computational study is provided.

2 - Alternating Direction Methods for Penalized Classification

Brendan Ames, Assistant Professor, University of Alabama, Department of Mathematics, Tuscaloosa, AL, 35487, United States of America, bpames@ua.edu

Linear Discriminant Analysis is a classical technique for dimension reduction in supervised classification. However, this technique relies on the fact that the data being processed contains fewer features than observations, which typically fails to hold in a high-dimensional setting. In this talk, we present a modification, based on l1-regularization and the alternating direction method of multipliers, for performing LDA in the high-dimensional setting.

3 - The Bundle Recommendation Problem

Tao Zhu, Data Scientist, WalmartLabs, 850 Cherry Ave, San Bruno, CA, 94066, United States of America, tzhu@walmartlabs.com

Recent research on recommender systems has been mainly concentrating on improving the relevance or profitability of individual recommended items. But in reality, users are usually exposed to a set of items and they may buy multiple items in a single order. Thus, the relevance or profitability of one item may actually depend on the other items in the set. In this paper, we introduce a novel problem called the Bundle Recommendation Problem (BRP) and discuss how to solve it in practice."

Invited Session

1 - Statistics.com - XLMiner V2015: Text Mining, Ensemble Methods, Feature Selection and More

Peter Bruce, President, Statistics.com, 612 N Jackson Street, Arlington, VA, 22201, United States of America, peterbruce@statistics.com, Daniel H. Fylstra

XLMiner software, used for years in MBA education, is now an industrial-strength data mining tool, enabling you to easily create forecasting, classification, prediction and affinity analysis models, using datasets far exceeding traditional Excel worksheets. Attend this session for a preview of XLMiner V2015 and learn how you can apply powerful text mining methods, ensemble methods, and feature selection methods for better-than-ever results – rivalling the best enterprise data mining software with far less cost and risk.

2 - ARTELYS Corp. - Artelys Crystal Super Grid, a Power Systems Modeling Software for Cost-Benefit Analysis of Energy Projects

Guillaume Tarel, Vice President, Artelys Corp., Montreal, QC, H3H2P5, Canada, guillaume.tarel@artelys.com

This presentation focuses on the use of Artelys Crystal Super Grid, a power systems modeling software developed by Artelys. Our users are investors, regulation authorities and independent system operators (ISO), ministries, consultants or transmission system operators (TSO/RTO). Their objective is to evaluate in detail the interest of specific projects (generation/transmission/storage) in terms of revenue, social welfare, pollutant emissions and security of supply in a region. To this purpose, Artelys Crystal Super Grid uses built-in libraries of power assets and indicators, along with a powerful optimization engine, to simulate systems with tens of interconnected regions on an hourly basis. Its intuitive interface allows for efficient analysis, comparison and evaluation of large number of scenarios.

1 - Perspectives on Traffic Modeling

Peter Glynn, Stanford University, Huang Engineering Center 357, Stanford CA 94305, United States of America, glynn@stanford.edu

A fundamental "model input" to most stochastic models used in operations settings is the "traffic model" describing the exogenous flow of work into the system. Many of the major research contributions in our field relate to limit theorems and approximations developed for such systems. Such limit theorems are usually used as a tool for predicting key performance measures associated with model outputs. But such theory also can be interpreted as providing insights into the main features of the model input that determine performance. In this talk, we will propose some general principles for traffic modeling, and discuss the role that limit theorems play in offering insight into the key features that must be captured in order to obtain model predictions of reasonable quality. This work is joint with Harsha Honnappa, Jeff Hong, and Xiaowei Zhang.

Modeling & Simulation in Healthcare Service Delivery

Sponsor: Simulation

Sponsored Session

Chair: Taesik Lee, Associate Professor, KAIST, 291 Daehak-ro, Yuseong-gu, E2-2102, Daejeon, Korea, Republic of, taesik.lee@kaist.edu

1 - Primary Care Design: Appointment Template and Staffing Model

Jingshan Li, Associate Professor, University of Wisconsin - Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, jingshan@engr.wisc.edu, Tingmao Wang, Molly Williams, Jeffrey Sleeth, Sally Kraft, Xiang Zhong

This work is dedicated to investigating the optimized appointment template and staffing model in primary care clinics under different clinic settings. A discrete event simulation model is developed to analyze the patient flow in the primary care processes with complex interactions among patients, care providers, and resources. Using the simulation model, different appointment templates and team structures are investigated.

2 - Selecting Hierarchical Facility Locations for Healthcare Planning

Taesik Lee, Associate Professor, KAIST, 291 Daehak-ro, Yuseong-gu, E2-2102, Daejeon, Korea, Republic of, taesik.lee@kaist.edu, Hoon Jang

We develop a location model to analyze locations of EDs in three-level EMS system in Korea. This problem is a multi-flow, nested, and non-coherent hierarchical facility location problem. While most hierarchical location models use median, covering, and fixed charge objectives, we use a cooperative covering objective. The cooperative covering objective is a more appropriate choice for assessing the accessibility to EMS, which provides more useful information to decision makers in public health.

3 - A Simulation Study of a Hospital Emergency Department in Hong Kong

Yong-Hong Kuo, Research Assistant Professor, The Chinese University of Hong Kong, Big Data Decision Analytics Res. Centre, The Chinese University of Hong Kong, Shatin, New Territories, Hong Kong - PRC, yhkuo@cuhk.edu.hk, Janny Leung, Colin Graham, Omar Rado, Benedetta Lupia

This paper presents a case study which uses simulation to analyze patient flows in a hospital emergency department in Hong Kong. We will talk about the challenges that we faced when developing our simulation model and present our findings by using the model.

4 - Optimization and Simulation Analyses for Optimal Liver Allocation Boundaries

Chun-Hung Chen, Professor, George Mason University, 4400 Univ Dr, Fairfax, VA, 22030, United States of America, cchen9@gmu.edu, Rajesh Ganesan, Naoru Koizumi, Monica Gentili

The U.S. organ transplant system has geographic disparities in access to and outcomes of transplantation. Researchers still report that a number of key elements that determine equity in transplantation vary significantly depending on the location of a patient. This study used a mathematical programming model to explore: (i) optimal locations of liver transplant centers; and (ii) optimal lowest boundaries as an alternative to the existing OPO boundaries across the contiguous United States.

5 - Real-time ECG Monitoring for the Early Diagnosis of Myocardial Infarction

Heeyoung Kim, Assistant Professor, KAIST, 291 Daehak-ro, Yuseong-gu,, Daejeon, Korea, Republic of, heeyoungkim@kaist.ac.kr

The electrocardiogram (ECG) is the most important source for the early diagnosis of myocardial infarction. We propose a new wavelet-based method to extract ECG features that discriminate the normal and abnormal subjects, and to monitor the extracted features for a real-time fault detection. The proposed method is shown to be computationally efficient and effective in monitoring the health condition via numerical experiments.

Applied Probability and Bayesian Models for Industrial Statistics

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Refik Soyer, George Washington University, Washington, DC, United States of America, soyer@gwu.edu

1 - Utility-based Inventory Management

Suleyman Ozekici, Professor, Koc University, Department of Industrial Engineering, Istanbul, Turkey, sozekici@ku.edu.tr, Filiz Sayin, Fikri Karaesmen

We take a utility-based approach to the newsvendor model where we suppose that there is random demand and supply which may be correlated with the financial markets. The newsvendor exploits this correlation and manages his risks by investing in a portfolio of financial instruments. The decision problem therefore includes not only the determination of the optimal ordering policy, but the selection of the optimal portfolio that reduces inventory risks.

2 - New Maximum Entropy Methods for Modeling Lifetime Distribution

Ehsan Soofi, Distinguished Professor, University of Wisconsin-Milwaukee, Lubar School of Business, P.O. Box 742, Milwaukee, WI, 53201, United States of America, esoofi@uwm.edu

We introduce two new maximum entropy methods for modeling the distribution of time to an event. One method is within the classical maximum entropy framework and provides characterizations of change point models such as the piecewise exponential distribution. The second method uses the entropy of the equilibrium distribution for the objective function and provides new characterizations of the exponential, Weibull, Pareto, and uniform distributions. With the same moment constraints, the two methods provide different models for the inter-arrival time are different.

3 - Bayesian Perspectives in Reliability Growth Testing

Refik Soyer, George Washington University, Washington, DC, United States of America, soyer@gwu.edu, Thomas Mazzuchi

In this talk we consider inference and decision problems that arise in reliability growth tests. In doing so, we present a general Bayesian framework that enables us update our inferences as well as our decisions in a dynamic manner. We illustrate the implementation of our methods using actual data and discuss computational issues.

4 - Monitoring Remaining Project Completion Uncertainty, a Bayes Network Approach

Johan Rene van Dorp, Professor, George Washington University, 1776 G Street, NW, Suite 101, Washington, DC, 20052, United States of America, dorpjr@gwu.edu, Ifechukwu Nduka

A Bayesian Network approach is presented modeling statistical dependence amongst activity duration uncertainties in a project network using AGENA RISK. Traditional approaches, such as PERT, ignored statistical dependence or, when taking it into account, did not allow for monitoring of remaining project completion uncertainty given partial project completion in a coherent manner. Early results show a strong Bayes learning effect of in a small project example under a mild degree of dependence.

Chair: Abe Zeid, Northeastern University, 360 Huntington Ave, Boston, United States of America, zeid@coe.neu.edu

1 - Hospital 30-Day Non-index Readmission and Care Transitions

Wei Liu, Ph.D. Student, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47906, United States of America, liu317@purdue.edu, Ping H. Huang, Steven M. Witz

We explored three types of care transition as measured by 30-day hospital readmissions. Descriptive statistic analyses were conducted to investigate the variations among these care transitions. In addition, hospital utilizations were compared among patient groups classified by the type of care transitions that they experienced. We also identified patient risk factors to assist decision support of care coordination among providers.

2 - Operating Room (OR) Scheduling under Uncertainty

Yazhuo Liu, University of South Florida, 4202 E. Fowler Ave., ENB 118, Tampa, FL, 33613, United States of America, yazhuoliu@mail.usf.edu, Peter Fabri, Jose Zayas-Castro

In this presentation, we propose an operating room (OR) scheduling model which considers doctors' preferred blocks, uncertain surgery durations, emergency levels of surgeries, and etc. We apply a stochastic programming approach to minimize operation cost while ensuring the quality of care for patients. Computational results based on the data from a local surgery center (SC) will be reported.

3 - Benefits of Distribution Flexibility using Newsvendor Model for Health-care Services

Yolanda Obaze, PhD Student, University of North Texas, 1155 Union Circle, Denton, TX, 76203, United States of America, yolanda.obaze@unt.edu, Victor Prybutok, Shailesh Kulkarni

This research examines a multi-process, multi-distribution newsvendor healthcare model. The contribution of the work includes examining the transportation, inventory and storage costs associated with meeting demand. The parameters for the constraints are the result of qualitative research conducted with Community Based Organizations that provide healthcare services.

4 - The Impact of Insurance Coverage and Unobservable Health Status on Readmission Rates

Sezgin Ayabakan, UT Dallas, 800 W Campbell Rd, UTD Naveen Jindal School of Management, Richardson, TX, 75080, United States of America, ayabakan@utdallas.edu, Zhiqiang (Eric) Zheng, Indranil Bardhan

Hospital readmission rate is adopted as a hospital quality metric. However, non-clinical factors such as patients' insurance coverage and unobservable health status can also impact readmissions. We develop a Hidden Markov Model to investigate their impact on readmissions. We utilize a comprehensive panel dataset of inpatient visits in North Texas. Our analyses reveals that focusing solely on readmission rates can be misleading, without regard to patients' health status and insurance coverage.

Recent Advances in Simulation Metamodeling Techniques

Sponsor: Simulation

Sponsored Session

Chair: Xi Chen, Assistant Professor, Virginia Polytechnic Institute and State University, Industrial and Systems Engineering, 1145 Perry St., Blacksburg, VA, 24060, United States of America, xchen.ise@vt.edu

1 - A Bayesian Framework for Quantifying Uncertainty in Stochastic Simulation

Wei Xie, Rensselaer Polytechnic Institute, 110 8th Street, Center for Industrial Innovation 5207, Troy, NY, 12180-3590, United States of America, xiew3@rpi.edu, Russell Barton, Barry Nelson

When we use simulation to estimate the performance of a stochastic system, the simulation often contains input models that were estimated from real-world data; therefore, there is both simulation and input uncertainty in the performance estimates. We propose a Bayesian framework to measure the overall uncertainty while simultaneously reducing the influence of simulation estimation error due to output variability. Our approach is supported with both theoretical analysis and an empirical study.

2 - Regularized Radial Basis Function Models for Stochastic Simulation
Yibo Ji, National University of Singapore, 1 Engineering Drive 2, #06-25, Singapore, 117576, Singapore, jiyibo@nus.edu.sg, Yibo Ji

In this paper, we study radial basis function models for stochastic simulation. We construct a RBF model by minimizing the regularized loss over a reproducing kernel Hilbert space (RKHS). We then show how the regularized RBF (R-RBF) model can be efficiently improved by a rank-one update, and derive the closed form of the leave-one-out cross-validation error for RBF models. We discuss connections between stochastic kriging and R-RBF based on RKHS duality theory and present numerical results.

3 - Large Scale Simulation Optimization with Additive Gaussian Process Models
Szu Hui Ng, National University of Singapore, 1 Engineering Drive 2, Singapore, 117576, Singapore, isensh@nus.edu.sg

Metamodels are commonly used as fast surrogates for the objective function to facilitate the optimization of simulation models. The Gaussian process model is a popular metamodeling tool due to its flexibility in global fitting. However, for large data sets, computational complexity hinders its application. In this research, we propose an additive Gaussian process model that eases the computational burden and incorporated in a sequential search algorithm for simulation optimization.

4 - Sequential Experimental Designs for Stochastic Kriging
Xi Chen, Assistant Professor, Virginia Polytechnic Institute and State University, Industrial and Systems Engineering, 1145 Perry St., Blacksburg, VA, 24060, United States of America, xchen.ise@vt.edu, Qiang Zhou

We establish a sequential experimental design framework for applying stochastic kriging to predicting performance measures of complex stochastic systems. The proposed framework enjoys the flexibility to adapt to a variety of design criteria and the ability to correctly account for sampling uncertainty inherent in a stochastic simulation. We propose several novel design criteria under the proposed framework, and compare their performances through illustrative examples.

Sponsored Session

Chair: Max Henrion, CEO, Lumina Decision Systems, 26010 Highland Way, Los Gatos, Ca, 95033, United States of America, henrion@lumina.com

1 - Decision Frameworks for Energy Technology R&D Portfolio Analysis
Erin Baker, University of Massachussetts, Amherst, MA. edbaker@ecs.umass.edu

In this paper we apply two decision frameworks to a decision on public energy technology R&D portfolio selection in the face of climate change. We compare the results of the two frameworks across three expert elicitation studies (used to estimate probability distributions over technological outcomes) and three Integrated Assessment Models (used to estimate how the outcomes of technological change impact the economy and the cost of abatement), to look for robust policy insights.

2 - Optimal Energy R&D Investment Allocation under Uncertainty for a Low-carbon Future
Valentina Bosetti, Fondazione Eni Enrico Mattei (FEEM), corso Magenta 63, Milan, Lo, 20123, Italy, valentina.bosetti@feem.it, Giacomo Marangoni, Gauthier De Maere, massimo Tavoni

This paper provides insights on the optimal portfolio of EU RD&D energy investments, given the intrinsic and endogenous uncertainty of learning. The goal is to find optimal first stage R&D investments that maximize total welfare, where the second stage depends on the cumulated first stage R&D investments and the conditional realization of learning parameters which reflect expert elicitation data. We solve the problem using approximate dynamic programming.

3 - Keep it Simple to Keep it Cool: Understanding the Performance of Energy and Climate Forecasts
Ines Azevedo, Associate Professor, Carnegie Mellon University, Baker Hall 129, 5000 Forbes Avenue, Pittsburgh, 15213, United States of America, iazevedo@cmu.edu

Energy and climate modelers have often been using sophisticated and complex model to forecast energy and climate related quantities. In this work, I focus on forecasts of energy quantities, and assess in which cases simpler models could have performed better, and draw key conclusions for clime and energy policy.

4 - How to Recalibrate and Combine Overconfident Experts
Max Henrion, CEO, Lumina Decision Systems, 26010 Highland Way, Los Gatos, Ca, 95033, United States of America, henrion@lumina.com

Overconfidence in expert elicitations may be evident from low overlap between probability distributions from different experts. We use this evidence to estimate the degree of overconfidence by expert, and recalibrate them to obtain better calibrated aggregate distributions. We demonstrate the practical value of the method on expert elicitations of the future cost and performance of low-carbon energy technologies.

5 - using Expert Judgment, Modeling and Optimization to Inform Energy R&D Decisions
Gabriel Chan, Harvard Kennedy School of Government, Cambridge, MA, 02138, United States of America, gabe_chan@hksphd.harvard.edu, Laura Diaz Anadon

We propose design principles and a method to support public R&D decision-making. Our method utilizes inputs from an expert elicitation exercise that collected inputs from 100 experts. The elicitations parameterize an energy system model, which we use in a sampling and optimization framework to support public energy R&D allocation decisions.

Supply Chain Management in the Forest Sector

Sponsor: Energy Natural Resources and the Environment/ Natural Resources

Sponsored Session

Chair: Marc-André Carle, Assistant Professor, Université Laval, 1065, Avenue de la Médecine, Quebec, QC, Canada, Marc-Andre.Carle@osd.ulaval.ca

1 - Supply Chain Design under Uncertainty for Advanced Biofuel Production Based on Bio-oil Gasification
Qi Li, Iowa State University, 0076 Black Engineering, Ames, IA, 50010, United States of America, qili@iastate.edu, Guiping Hu

A two-stage stochastic programming is formulated to maximize biofuel producers' annual profit considering uncertainties in supply chain. A case study based on Iowa illustrates that it is economically feasible to meet the desired demand using corn stover as the biomass feedstock. Also, farmers' participation can have a significant impact on the profitability and robustness of this supply chain.

2 - Industrial Routing Problem
Mikael Rönnqvist, Professor, Université Laval, Département de Génie Mécanique Pavillon, 1065, Avenue de la Médecine, Quebec, QU, G1V 0A6, Canada, mikael.ronnqvist@gmc.ulaval.ca, Patrik Flisberg, Marc-André Carle, Vincent Monbourquette, Philippe Marier

Routing problems in industrial setting can be very challenging with all extra real world constraints imposed. We propose an efficient solution method which accounts for many products, multiple periods with strict inventory considerations, several goals, special loading patterns, backhaul rules and many desirable characteristics for queuing issues. We report on its use at a large forest company and analyse its performance compared to manual planning.

3 - Stochastic Approaches to Sawmill Operations Planning Problem in a Rolling Horizon
Jorge Vera, Professor, Pontificia Universidad Catolica de Chile, Dept. Industrial and System Engineering, Vicuna Mackenna 4860, Santiago, 7820436, Chile, jvera@ing.puc.cl, Alfonso Lobos

Operations planning in sawmills is an example of decision making in different time horizons, where tactical decisions might not be optimal for short term operations, due to various sources of uncertainty. We address this problem using various stochastic and robust optimization models and we show how these could be solved in such a way to increase the probability that tactical decisions will be compatible with operational decisions. We simulate various cases in a rolling horizon decision process.

4 - Strategic Planning of Forest Residues Supply Chains with Environmental Considerations
Claudia Cambero, PhD Candidate, University of British Columbia, 2943-2424 Main Mall, Vancouver, BC, V6T1Z4, Canada, cambero.claudia@gmail.com, Taraneh Sowlati

We present an optimization model to design regional forest residues supply chains for the production of bioenergy and biofuels. The objective is to maximize the NPV of the entire supply network. The model considers expected changes in biomass supply and cost as well as in products' demand and price when deciding on the facilities' installation period. A case study is presented where we compare the environmental impact of the optimal solution against the current situation in the region.

Dynamic Matching Markets

Cluster: Auctions

Invited Session

Chair: John Dickerson, CMU, 9219 Gates-Hillman Center, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, dickerson@cs.cmu.edu

1 - Dynamic Matching using Approximate Dynamic Programming
Nikhil Bhat, Columbia University, nbhat15@gsb.columbia.edu, Ciamac Moallemi

We provide tractable algorithms for a large number of challenging dynamic decision making problems such as 1) Allocation of cadaveric kidneys to patients, 2) Matching ads with impressions, 3) Cyclic paired transfer of kidneys, by analyzing them using a general model. Our policies are easy to compute and interpret, and further come with approximation guarantees. With simulation experiments on kidney allocation, we show that we obtain gain over existing algorithms in literature.

2 - Dynamic Matching Market Design
Mohammad Akbarpour, Stanford University, 579 Serra Mall, 265F, Stanford, CA, 94305, mohamwad@stanford.edu, Shayan Oveis Gharan, Shengwu Li

We show that, in dynamic matching markets, waiting to thicken the market can be substantially more important than increasing the speed of transactions. In particular, simple local algorithms that wait to thicken the market can perform very close to optimal algorithms. We prove our claims by analyzing a simple but illuminating model of dynamic matching in networked markets where agents arrive and depart stochastically.

3 - The Roles of Common and Private Information in Two-Sided Matching with Interviews
Sanmay Das, Associate Professor, Washington University in St. Louis, sanmay@seas.wustl.edu, Zhuoshu Li

We consider two sided matching markets where employers have a fixed budget for the number of applicants they may interview. Employers receive noisy signals of how good each applicant is, and these signals include common and private components. We analyze how the strengths of these two components affect matching outcomes (both differentially across different quality candidates, and in the aggregate number of matches) when decisions about whom to interview are strategic.

4 - FutureMatch: Learning to Match in Dynamic Environments
John Dickerson, CMU, 9219 Gates-Hillman Center, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, dickerson@cs.cmu.edu, Tuomas Sandholm

Kidney exchange, an innovation where willing but incompatible donor-patient pairs can exchange organs, is inherently dynamic. We present FutureMatch, an empirical framework for learning to match in a general dynamic model. We validate it on real data. Not only does dynamic matching result in more expected transplants than myopic, but even dynamic matching under economically inefficient (equitable) objectives can result in significant increases in social welfare over efficient myopic matching.

Chair: Harikrishnan Sreekumaran, Doctoral Candidate, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, harikrishnan@purdue.edu

1 - Investigation of Bidder Asymmetry in Japanese Electric Power Procurement Auction
Shigeharu Okajima, Waseda University, 1-6-1 nishi waseda Shinjyuku ku, Tokyo, Japan, shigeharu.okajima@gmail.com, Hiroko Okajima

This paper investigates the differences in the bidding patterns between incumbents and entrants in Japanese electric power procurement auctions. we analyze Japanese electric power auction data to examine bidder asymmetry, which potentially reduces competition as shown in auction theory. We find that strong bidders change depending on types of auctions.

2 - Equilibrium Wind Hedge Contract Structures through Nash Bargaining
Harikrishnan Sreekumaran, Doctoral Candidate, Purdue University, 315 N. Grant Street, West Lafayette, IN, 47907, United States of America, harikrishnan@purdue.edu, Andrew Liu

Wind hedge contracts are to help wind project developers secure financing and manage risk. In such a contract, a strike price of electricity and a quantity are to be specified. We use Nash bargaining to study the equilibrium contract structures as a result of bargaining between the two parties involved. The resulting model is a bilinear, stochastic program, which is solved by the sample average approximation approach. Numerical results as well as comparative statics are provided.

3 - Security of Gas Supply in Europe: A Model-based Analysis
Tobias Baltensperger, ETH Zurich, ETL K22, Physikstrasse 3, Zurich, ZH, 8092, Switzerland, t.baltensperger@control.ee.ethz.ch

The security of gas supply is an intensely discussed issue in Europe since the continent relies heavily on external suppliers for its needs. In this talk, we try to provide insight into the mechanics of today's gas markets. To this end, we propose an equilibrium model of the global natural gas market and we show the consequences of potential supply disruptions on European consumers. Furthermore, we discuss cost-efficient ways of increasing security of supply for European countries.

4 - An Integrated Framework to Study Electricity and Reserve Markets with Storage Systems
Yang Chen, Mississippi State University, PO Box 9542, Mississippi State, MS, 39762, United States of America, yc352@msstate.edu, Mengqi Hu, Zhi Zhou

In this research, a general modeling framework for an electricity market with thermal units, renewable energy, storage devices and demand response is proposed, where energy and reserve services are jointly dispatched. A MIQP model is implemented based on the modified IEEE 118-bus data, and several metrics (e.g., system cost, electricity/reserve price) are used to analyze the impacts of different components (e.g., renewable energy, storage) to electricity and ancillary service markets.

5 - Delta-hedging of a Hydro Power Plant with Focus on Revenue from Ancillary Services using Stochastic
Hubert Abgottspon, ETH Zurich, Physikstrasse 3, Zürich, 8092, Switzerland, abgottspon@eeh.ee.ethz.ch

Provision of ancillary services offers revenue opportunities for hydro power producers. Such products influence the production schedule of the power plant considerably. It is however difficult to predict if ancillary services will be provided in future time stages, thus resulting to production risk. A stochastic program is proposed, which estimates the sensitivity of the production schedule for varying remuneration of ancillary services, which could then be used to lower the risk exposure.

1 - The Use of Rate-Based Constraints to Control CO2 Emissions
David Young, Senior Technical Leader, Electric Power Research Institute, 3420 Hillview Ave, c/o EPRI, Palo Alto, CA, 94304, United States of America, dyoung@epri.com

The EPA recently proposed regulations under the Clean Air Act 111(d) to limit carbon dioxide emissions from existing generation units. The proposed restrictions take the form of a constraint on the average emissions rate by state, rather than by the more familiar cap on total emissions. This work considers the challenges in modeling rate-based constraints, and compares compliance outcomes at the national level against equivalent caps using the US-REGEN model.

2 - Complementarity Modeling of Overlapping Biofuel Policies: Cost Containment Strategies in the LCFS

Adam Christensen, NSF SEES Fellow and Postdoctoral Researcher, Johns Hopkins University, 3400 N Charles ST, Ames Hall 313, Baltimore, MD, 21218, United States of America, adam.christensen@jhu.edu, Ben Hobbs, Sauleh Siddiqui, Chris Malins

The two most influential biofuel policies in the US are the federal Renewable Fuel Standard (RFS) and California based Low Carbon Fuel Standard (LCFS). In many cases a single gallon of biofuel can qualify for compliance under both programs. However, in the event of a lack of supply of low carbon fuels, it is possible that the LCFS compliance cost could grow to unreasonable levels. A detailed market model of both the RFS and LCFS is developed and cost containment strategies are presented.

3 - R&D Portfolio Allocation in Response to Climate Change

Olaitan Olaleye, PhD Candidate, University of Massachusetts, 120A Marston Hall, University of Massachusetts, Amherst, Amherst, MA, 01003, United States of America, oolaleye@umass.edu

We examine the role of technical advancement in a portfolio of Solar, Nuclear, CCS, Bio-Fuels, Bio-Electricity and Electric Transportation. We show that Bio-Electricity complements CCS, while most technology pairs are substitutes. We find that scenarios without CCS have significant cost drawback reaching full abatement. Portfolios with CCS stochastically dominate those without; and renewables-only portfolios are dominated. We also show how the optimal portfolio varies with risk.

4 - How to Choose an Appropriate Mathematical Model for Energy/climate Policy Analysis?

James Merrick, Stanford University, Huang Engineering Center, Stanford, CA, 94305, United States of America, jmerrick@stanford.edu

For certain classes of problems, the suitability of model structure cannot be tested via predictive power. So, how to choose an appropriate model? A framework is proposed to provide a logical basis for thinking about this issue. Conditions are stated where a given structure can be logically 'more appropriate' than an alternate. The corollary follows that in other cases, appropriateness comes down to subjective judgement. For illustration, the framework is applied to energy-economic modelling.

Stochastic Control and Optimization of Power Systems with Renewables

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Harsha Gangammanavar, Visiting Assistant Professor, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States of America, gangamma@usc.edu

1 - Real-time Pricing in Smart Grid: An ADP Approach

Andrew Liu, Assistant Professor, Purdue University, 315 N. Grant Street, West Lafayette, IN, United States of America, andrewliu@purdue.edu, Jingjie Xiao

We propose an approximate dynamic programming (ADP)-based modeling and algorithm framework to integrate wholesale markets' dispatch operation with demand response under electricity real-time pricing (RTP). With controllable charging/discharging of plug-in electric vehicles, our numerical results show that RTP can lower the expected values of wholesale electricity prices, increase capacity factors of renewable resources, and reduce system-wide CO_2 emissions.

2 - On the Identification of Generator Bid Stack from Public Market Data

Boris Defourny, Assistant professor, Industrial system engineering department at lehigh university, H.S. Mohler Laboratory, 200 West Packer, Bethlehem, Pa, 18015, United States of America, defourny@lehigh.edu

We study the problem of identifying aggregated bids from power generators, using high-frequency price data and load data publicly posted by independent system operators. We consider gas price data to identify bids sensitive to gas prices. We discuss results obtained with an inverse optimization approach based on the spot price formation mechanism.

3 - 99 Percent from Renewables? A Fresh Look at the Question of Maximum Penetration

Warren Powell, Professor, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08544, United States of America, powell@princeton.edu, Javad Khazaei, Luke Cheng

We re-examine recent claims that we can provide 99 percent of our electricity using renewables and storage. We also use a streamlined, aggregate model which ignores grid capacity, but we introduce the important dimension that energy from fossil fuels can be purchased from the current generator stack, or at a very high price. We show that properly modeling the marginal cost of energy resources limits the maximum an economic portfolio would produce from renewables.

4 - Simulation and Optimization of Wind Energy for Modeling Sub-hourly Economic Dispatch

Harsha Gangammanavar, Visiting Assistant Professor, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States of America, gangamma@usc.edu, Suvrajeet Sen, Victor Zavala

We present a two-stage stochastic optimization method to address the operating paradigm change from hourly to sub-hourly dispatch in the presence of intermittent generation. The method is based on stochastic decomposition which can accommodate scenarios from external simulators. The scalability and performance of this method is demonstrated on a real scale power system for the state of Illinois.

Joint Session MIF/HAS: Healthcare Analytics

Sponsor: Minority Issues Forum & Healthcare

Sponsored Session

Chair: Shannon LaToya Harris, University of Pittsburgh, 241 Mervis Hall, Pittsburgh, PA, 15213, United States of America, sharris@katz.pitt.edu

Co-Chair: Jerome Niyirora, Assistant Professor, SUNYIT, 100 Seymour Rd, Utica, NY, 13502, United States of America, jerome.niyirora@sunyit.edu

1 - The Analytics of a Service Network in Emergency Department

Jerome Niyirora, Assistant Professor, SUNYIT, 100 Seymour Rd, Utica, NY, 13502, United States of America, jerome.niyirora@sunyit.edu

Many factors that cause ED overcrowding are outside of the control of ED managers, except bottlenecks in the clinical processes. We propose using service-based networks in ED to streamline patient care. We construct a service network using CPT codes and then use centrality measures to identify services that are more influential and are more likely to help improve throughput, if administered at the point of care or resources are allocated to them appropriately.

2 - A Predictive Model for Advance Appointment Cancellations

Shannon LaToya Harris, University of Pittsburgh, 241 Mervis Hall, Pittsburgh, PA, 15213, United States of America, sharris@katz.pitt.edu, Jerrold May

Outpatient scheduling is complicated by advanced cancellations and patient no-shows. We built a model to predict advance cancellations, and how far in advance of the appointment such cancellations occur. The model is validated using data from VA Healthcare System outpatient clinics.

3 - Admission Control in a Two Class Loss System with Periodically Varying Parameters and Abandonments

Gabriel Zayas-Caban, Cornell University, 1731 Broadview Lane, Ann Arbor, MI, 48105, United States of America, gz63@cornell.edu

Customer demand and service processes for many service systems are time dependent, and customers in such systems may renege prior to or during service. Motivated by these considerations, we consider the control of admissions for a two class loss system with periodically varying parameters and where customers may abandon before completing service. We use a Markov decision process formulation and sample path arguments to determine properties of the optimal dynamic policy.

4 - The Erlang – A Model for Healthcare Applications

William Massey, Professor, Princeton University, Princeton University, Princeton, NJ, 08544, United States of America, wmassey@princeton.edu

The Erlang-A has many healthcare applications. As a Markov process, we can assume non-homogeneous Poisson arrivals for a multi-server queue with exponentially distributed service and abandonment times. Using fluid limits, we can use the resulting dynamical system to approximate controls for the transient, time-dependent behavior. We demonstrate how these techniques are relevant to the management of emergency rooms, hospital bed cleaning services, and nursing homes.

O.R. Approaches to Plan and Build Data Networks

Sponsor: The Practice Track

Sponsored Session

Chair: Brian Eck, Quantitative Analyst, Google, Inc., 1300 Crittenden, Building CL3, Office 2S5, Mountain View, CA, 94043, brianeck@google.com

1 - How Data Network Traffic Measurement Effects Pricing, Behavior and Strategy

Muntazir Mehdi, Capacity Planner, Microsoft Corporation, 15803 Bear Creek Pkwy, E232, Redmond, 98052, United States of America, mumehdi@microsoft.com, Elena Helmer, Ivan Philips, Denver Maddux

Data traffic is monitored every second. The data has to be aggregated and mined for insights. Four aggregation schemes are used: Max,95P,Sum and Avg. These agg schemes have unique relevance in the data network context. By changing the order of operations; we can predict the peering/exchange contracts that best suit the bidirectional demand profiles. We demonstrate that such analysis can be leveraged to the entire span of data network strategy:capacity, peering contracts, interconnect/edge strategy.

2 - Optimization Techniques used in Fibre Optic Network Design

Chris Forbes, Optimisation Consultant, Biarri, 9 Vendale Ave, Brisbane, 4105, Australia, chris.forbes@biarri.com

With the increased popularity of fiber to the home networks across the world a commercial need arose to produce minimum cost designs. Construction costs often reach into the billions so even small percentage savings can have a significant impact for businesses. We will explore optimization techniques used in commercial fibre optic network design today; including a staged MIP approach as well as some more recent heuristic approaches based on the Capacitated Minimum Spanning Tree problem.

3 - Intra-Datacenter Network Capacity Planning at Google

Behdad Masih, Qauntitative Analyst, Google Inc., 1600 Amphitheatre Parkway, Mountain View, CA, 94043, United States of America, behdadm@google.com

In this talk, we will review how statistical techniques are used to provision networking resources at Google's infrastructure. By merging and aggregating the performance metrics of thousand of servers across Google's fleet, we forecast the required networking capacities at different layers of the network as a function of other hardware resources such as cpu and disk.

Decision Analysis 1

Contributed Session

Chair: Purushothaman Ethiraj, Analytics Manager, Hewlett Packard, CV Raman Nagar, Bangalore, India, purushothaman.ethiraj@hp.com

1 - An Approximate Dynamic Programming Approach to Stochastic Resource Planning

Stan Solomon, Doctoral Candidate, University of Missouri-St. Louis, 1 University Blvd., 236 Express Scripts Hall, St. Louis, MO, 63121, United States of America, ssbcd@umsl.edu, Cipriano Santos, Haitao Li, Keith Womer

This research addresses the problem of assigning resources to tasks in a stochastic environment. Classic dynamic programming methods using Bellman's optimality equation suffer from the well-known curses-of-dimensionality and cannot be applied to large scale applications. To resolve the curse-of-dimensionality found in large applications, this research focuses on developing an Approximate Dynamic Programming algorithm. Hewlett-Packard's resource planning problem will be studied as an application.

2 - Resource Reallocation and Target Setting Based on Efficiency and Fairness

Wonghong Li, University of Science and Technology of China, Jinzhai Road 96, Hefei, 230026, China, liwh@mail.ustc.edu.cn

We develop a novel method for a resource reallocation problem that typically appears in organizations such as governmental agencies, universities, business firms and army units. The decision maker is interested in maximizing the efficiency and fairness simultaneously when reallocating available resources to decision-making units. We develop an approach based on data envelopment analysis to obtain a most preferred allocation plan. Numerical examples are used to illustrate the approach.

3 - A Decision Model for Supplier Selection

Baichun Feng, Webster University, 545 Garden Ave, St. Louis, MO, 63119, United States of America, baichunfeng18@webster.edu, Hong Ren

This paper proposes an new approach based on artificial intelligence to solve the supplier selection problem. This approach will learn the decision makers' preference from the historical data and solve the supplier selection problem subsequently. A numerical example is used to demonstrate the usefulness of this approach. Contribution to research in strategic supplier selection and suggestions for future research are discussed.

4 - Big Data, Databases and Decision Systems Interactions

Orhan Güvenen, Professor, Bilkent University, Bilkent University IISBF Z-03, Bilkent / «ankaya, Ankara, 06800, Turkey, gorhan@bilkent.edu.tr

Big data plays important role in every part of research, analysis and decision making. Effective, optimal and ethical decision making requires technologically advanced big data analysis techniques, databases in their analytic use, endogenizing security, minimum error margins and information distortion. Those requirements are necessary conditions in every strata for predictive, scientific, operational decision making and scientific management.

5 - Predicting Winning Probability of Open Deals of Sales Pipeline using Logistic Regression

Purushothaman Ethiraj, Analytics Manager, Hewlett Packard, CV Raman Nagar, Bangalore, India, purushothaman.ethiraj@hp.com, Atul Yadav

Effective sales pipeline management is one of critical part of sales management and forms an important lever in managing sales performance of an Organization. The present research will focus on identifying key variables that influence the deal conversions and predict the winning probability of all open deals in pipeline. Using binary logistic regression we have been able to predict the deal status correctly in 73.8% of total deals leading to accurate forecast and better business planning.

Decision Analysis Society Awards

Sponsor: Decision Analysis

Sponsored Session

Chair: Jeffrey Keisler, Professor, Univ. of Massachusetts, Boston, 100 Morrissey Blvd, Boston, MA, 02125, United States of America, jeff.keisler@umb.edu

1 - 2014 Decision Analysis Student Paper Award

Seth Guikema, Assistant Professor, Johns Hopkins University, 313 Ames Hall, Department of Geog & Env. Engineering, Baltimore, MD, 21218, United States of America, sguikema@jhu.edu

The Student Paper Award is given annually to the best decision analysis paper by a student author, as judged by a panel of the Decision Analysis Society of INFORMS. Students who did not complete their Ph.D. prior to May 1, 2013 are eligible for this year's competition.

2 - 2014 Ramsey Medal Award

Jim Matheson, Chairman, SmartOrg, Inc., 855 Oak Grove Ave, Ste 202, Menlo Park, CA, 94025, United States of America, jmatheson@smartorg.com

The Ramsey Medal of the Decision Analysis Society is awarded for distinguished contributions in decision analysis. Distinguished contributions can be internal, such as theoretical and procedural advances in decision analysis, or external, such as developing or spreading decision analysis in new fields. We will introduce the 2014 Ramsey Medal winner, followed by a presentation by the winner.

3 - 2014 Decision Analysis Publication Award

Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu

This award is given annually to the best decision analysis article or book published in the second preceding calendar year (i.e. calendar year 2012 for consideration in 2014). The intent of the award is to recognize the best publication in "decision analysis, broadly defined." This includes, but is not limited to, theoretical work on decision analysis methodology (including behavioral decision making and non-expected utility theory), descriptions of applications, and experimental studies.

Joint Session Data/Computing: Statistical Learning in Stochastic Optimization

Sponsor: Data Mining & Computing

Sponsored Session

Chair: Victoria Chen, Professor, The University of Texas at Arlington, Dept. Industrial & Manuf. Sys. Engr., P.O. Box 19017, Arlington, TX, 76019, United States of America, vchen@uta.edu

1 - Two-stage Stochastic Programming for Adaptive Interdisciplinary Pain Management

Na Wang, Ph.D student, The University of Texas at Arlington, 500 West First Street, Arlington, TX, 76019, United States of America, na.wang@mavs.uta.edu, Jay Rosenberger

This research proposes two-stage stochastic programing (2SP) to optimize personal treatment strategies for adaptive pain management. Previous research has predicted pain outcomes using non-convex quadratic statistical models. Based upon these nonconvex quadratic models, this research refits piecewise linear prediction models that have almost no loss of fidelity. With the piecewise linear models, 2SP can be modeled as a mixed integer linear program to optimize treatment.

2 - A Generalized MILP and DACE based Approximate Dynamic Programming and its Application

Zirun Zhang, Ph.D. student, The University of Texas at Arlington, 500 West First Street, P.O. Box 19017, Arlington, TX, 76019, United States of America, zirun.zhang@mavs.uta.edu, Victoria Chen, Jay Rosenberger

We develop a generalized Approximate Dynamic Programming method for finite horizon and non-stationary process by Mixed Integer Linear Programming, and Design and Analysis of Computer Experiment. Tree based supervised learning methods are employed to approximate value functions. A real world large scale stochastic multistage decision problem is formulated and solved by the method. The solution quality is compared by various methods and we conclude MILP and DACE based ADP is the best approach.

3 - A Design and Analysis of Computer Experiments-based Approach to Approximate Dynamic Programming

Asama Kulvanitchaiyanunt, asama.kulvanitchaiyanunt@mavs.uta.edu, 500 West First Street, Woolf Hall Room 420, Arlington, TX, 76019, United States of America, asama.kulvanitchaiyanunt@mavs.uta.edu, Victoria Chen, Jay Rosenberger

This research seeks to develop a solution method called Design and Analysis of Computer Experiment (DACE)-based approach to solve an infinite horizon dynamic programming. Multivariate Adaptive Regression Splines (MARS) is used to approximate future value functions in stochastic dynamic programming (SDP) problems with continuous state variables. The training data set is updated sequentially based on the conditions. Three different algorithms presented based on the conditions of sampling process.

4 - Local Linear Regression and Low-Discrepancy Sampling for Approximate Dynamic Programming

Danilo Maccio, National Research Council, Via De Marini 6, Genoa, Italy, danilo.maccio@cnr.it, Victoria Chen, Cristiano Cervellera

Approximate Dynamic Programming is the standard method for the numerical solution of the well-known Bellman's equations. With such technique, two main issues arise: (i) the choice of a class of models to approximate the value functions; (ii) the definition of an efficient sampling of the domain where estimates of the value functions are computed. In this work the use of local linear regression based models is investigated when low-discrepancy sampling methods are used to sample the state space.

Preferences and Multiple Objectives

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Gülser Köksal, Middle East Technical University, IE Dept., METU, Ankara, Turkey, koksal@metu.edu.tr

1 - An Interactive Approach to Two-Response Design Optimization Problem

Melis Ozates, Research Assistant, Middle East Technical University, METU, Industrial Engineering Department, Ankara, 06800, Turkey, mozates@metu.edu.tr, Murat Köksalan, Gülser Köksal

We develop an interactive approach to aid in determining the design parameter values for the case of two responses. The approach incorporates decision maker preferences interactively using an achievement scalarizing function. We capture the random nature of the responses statistically and guide the decision maker towards preferred solutions.

2 - Representing Preferences by Choquet Integral: Guideline to Specify Capacity Type and a Modification

Leman Esra Dolgun, Anadolu University, Endustri Muhendisligi Bolumu, Eskisehir, Turkey, ledolgun@anadolu.edu.tr, Nimetullah Burnak, Gülser Küksal

This study considers representing decision maker preferences by Choquet integral in existence of interactions among criteria. Structures of interactions that can be handled by different capacity types are studied and represented via interaction plots with the purpose of providing a guideline for specifying the capacity type in practical applications. A dummy region solution is proposed to relax some of these conditions and thus improve the ability of Choquet integral in handling interactions.

3 - A Chinese Postman Problem with Multi Objectives

Ezgi Eroglu, Graduate Student, Middle East Technical University, METU Universiteler Mah. Dumlupinar Blv., No:1 «ankaya, Ankara, 06800, Turkey, eroglu.ezgi.90@gmail.com, Meral Azizoglu

Our study considers a Chinese postman problem having multiple weights for each edge. Our aim is to minimize the total weight of the first weights while keeping the sum of the second weights below a threshold value. We investigate the properties of the optimal solution and the optimal solutions of the continuous relaxation. We develop an optimization algorithm and report its favorable results.

1 - MIP Models and Methods for Interpretable Linear Classification

Berk Ustun, PhD Candidate, Massachusetts Institute of Technology, 5 Cambridge Center, 7-790, Cambridge, MA, 02139, United States of America, ustunb@mit.edu, Cynthia Rudin

We present a comprehensive approach to create accurate and interpretable linear classification models using mixed-integer programming. Our approach can build models that incorporate many interpretability-related qualities, and that strike a user-defined balance between accuracy and interpretability. We use our approach to create scoring systems and M-of-N rule tables for applications in medicine, marketing and crime. In addition, we propose methods to train models on large-scale datasets.

2 - Dynamic Ensemble-based Prediction of Equity Price Direction

Nick Street, Professor and Departmental Executive Officer, The University of Iowa, S210 Pappajohn Business Building, Iowa City, IA, 52242, United States of America, nick-street@uiowa.edu, Mike Rechenthin

We propose a dynamic ensemble classification technique designed specifically to predict short-term (around one minute) directional price movements in stocks. The model automatically adjusts for concept drift and transfers knowledge obtained from other stocks to improve its predictions. We demonstrate the effectiveness of this model and discuss some surprising insights regarding the effectiveness of different predictors.

3 - Interpretation Clustering of RNA Expression Data using Quadratic Programming

Kristin Bennett, Professor, Rensselaer Polytechnic Inst., Math Sciences, Dept AE327, 110 8th Street, Troy, NY, 12180, United States of America, bennek@rpi.edu, Chris Fasano, Elisabeth Brown, Chris Gatti

Typically one clusters data and then interprets the clusters. We take interpretations and then find clusters that fit the interpretations. We use quadratic programs to find all data fitting the profiles within experimental error. The resulting composite interpretations applied to RNA-Seq time series data from an embryonic stem cell model are used to help understand human cerebral cortex formation.

Mission Planning I

Sponsor: Military Applications Society

Sponsored Session

Chair: Chase Murray, Auburn University, 3301 Shelby Center, Auburn, AL, United States of America, CCM0022@auburn.edu

1 - Multi-depot Vessel Routing in a Direction Dependent Wavefield

Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com, Daniel Schroeder, Alvaro Maggiar, Irina Dolinskaya

Considerable research has been done on the vehicle routing problem and its variants; however only limited work deals with possible environmental conditions and their effects on the vehicle routes. This research presents the multiple-depot vehicle routing problem for surface vessels; the vehicles must traverse a time-invariant direction-dependent medium. Our model captures environmental effects and vessel dynamics on the considered paths. Multiple heuristics are developed and tested.

2 - A New Approach to Planning Cooperative Missions

Paul Scerri, Carnegie Mellon University, Robotics Institute, 5000 Forbes Avenue, Pittsburgh, PA 15213, United States of America pscerri@cs.cmu.edu, Bob Jacobs

This talk describes initial work using an iterative planning algorithm called DIMS to plan cooperative manned and unmanned vehicle missions against an adversary. The algorithm iterates between planning, simulating and model shaping to quickly find interesting cooperative plans in a very large solution space. With the addition of techniques from game theory, specifically fictitious play, the convergence of the algorithm is further improved.

3 - Dynamic Programming for Task Assignment in Multi-Human Multi-Robot Interaction Systems

Monali Malvankar, University of Western Ontario, Schulich School of Medicine & Dentistry, London, ON, Canada, mmalvan@uwo.ca, Siddhartha Mehta, Eduardo Pasiliao

Multi-human multi-robot interaction is a complex system in which robots, e.g., Unmanned Aerial Vehicles (UAVs), may share information with a group of human operators to perform geographically-dispersed priority-based tasks within a specified time. A dynamic programming model is developed to optimally allocate tasks to teams of human operators with the objective to maximize the overall system performance while considering human factors.

4 - An Adaptive UAV Routing Model with Uncertainty on Intelligence Values

Mike Moskal, University at Buffalo, 342 Bell Hall, Department of Industrial and Systems Eng, Buffalo, NY, 142620, United States of America, mmoskal@buffalo.edu, Rajan Batta

We consider a UAV routing problem to maximize information fulfillment across an entire mission. An area of operation is discretized into a series of grids, each assigned a value representing the importance of surveying that area at that point in time. These values fluctuate as intelligence needs change, introducing an element of uncertainty. The presented model is capable of maximizing information fulfillments, reducing the impact of uncertainty, and delivering a real-time UAV route.

Outsourcing, Offshoring, and the Changing Nature of Organizational Boundaries and Architectures

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Saikat Chaudhuri, The Wharton School, University of Pennsylvania, 2000 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19104, United States of America, saikatc@wharton.upenn.edu

1 - Risk Sharing Partnerships In Outsourced Offshore Knowledge Process Networks

Ravi Aron, Associate Professor, Johns Hopkins University, 100 International Drive, Room 1331, Baltimore, MD, 21202, United States of America, raviaron@jhu.edu, Praveen Pathak

We look at a panel data of 22 pairs of knowledge intensive processes that have been outsourced to offshored providers. Each pair consists of very similar processes wherein one contract has a risk-sharing clause and the other does not, while other features remain the same. We find that over a period of time risk sharing leads to less physical monitoring, higher customer satisfaction and output quality. Our findings have implications for firms sourcing specific capabilities from specialists.

2 - The Human Cost of Complexity: Linking Product Architecture and Employee Turnover

Alan MacCormack, Harvard University, Soldiers Field, Boston, MA, 02163, United States of America, amaccormack@hbs.edu, Dan Sturtevant

Recent studies of software suggest modular systems are cheaper to maintain (in terms of defects) and easier to adapt (in terms of productivity). But few studies explore the human costs that such systems generate for those working within them. In this study, we explore the impact of complexity on employee turnover. We find developers working on the most complex parts of a system are more likely to leave. Our results further highlight the critical links between technical and social systems.

3 - The Determinants and Evolution of Major Inter firm Transactions in the US Apparel Sector

Xiao Zhao, University of Ottawa, 21 Cotswold Crescent, Toronto, ON, M2P1N1, Canada, mimosazhao@gmail.com, Margaret Dalziel

We investigate the determinants of major inter firm transactions, relying on a longitudinal dataset of over 2,000 of the largest transactional relations between publicly traded firms in the U.S. apparel sector. The results indicate the importance of inter firm complementarity, rather than inter firm similarity, in explaining the sector architecture.

4 - The Impact of Offshore Outsourcing Scale, Scope & Vendor Relationships on Firm Market Value Creation

Saikat Chaudhuri, The Wharton School, University of Pennsylvania, 2000 Steinberg Hall-Dietrich Hall, 3620 Locust Walk, Philadelphia, PA, 19104, United States of America, saikatc@wharton.upenn.edu

As outsourcing expands to higher-end tasks, the outcomes and implications remain unclear. Extant literature poses contradictory predictions on the extent a firm should outsource and engage with vendors. We examine a sample of publicly announced IT/ITES outsourcing deals from 2000-2009, and find that greater sophistication of outsourced tasks lowers market value creation for the client, while increased scale has a positive effect. These effects are amplified by longer client-vendor relationships.

1 - Generative Diffusion of Innovations and Knowledge Networks in Open Source Projects

Zhewei Zhang, Temple University, Philadelphia, PA, 19122, United States of America, zhang@temple.edu, Sunil Wattal, Bin Zhang, Youngjin Yoo

We conceptualize an open source community as a constellation of dynamic, multiple and heterogeneous informal knowledge networks. OSS development is therefore affected by these networks. We identify two knowledge networks, a more professional, developer-project network and a more social, developer-developer network, which a developer can simultaneously belongs to. We argue that the two networks emphasized on different types of knowledge transfer, and have different effects on project development.

2 - Potential of Social Media for Disaster Management

Lucy Yan, Indiana University, Kelley School of Business, Business 570C, Bloomington, IN, 47401, United States of America, yanlucy@indiana.edu, Alfonso Pedraza-Martinez

Social media has been widely used in disseminating information and important messages. It may increase the amount of data available to humanitarian workers in the aftermath of disasters and may also inform the general public. However, little attention has been paid to explore the role of social media on disaster management. We propose a framework to integrate social media in disaster management for real time decision making.

3 - Are Searches on Weekends More Influential on Stock Price?
Qiang Ye, Harbin Institute of Technology, 92 Xidazhi Street, School of Management,, Harbin, 150001, China, yeqiang@hit.edu.cn, Xianwei Liu

This study proposes a new measure using the proportion of the searches done on weekdays in a week. Based on daily search volume data from search engines, we try to explore the search weekend effects and its impact on stock price. We find that searches done on weekends are more influential on future stock price than searches done on weekdays. To validate the empirical findings, we define a week in different orders and got consistent results.

Sponsored Session

Chair: Xuanming Su, University of Pennsylvania, The Wharton School, Philadelphia, PA, 19104, United States of America, xuanming@wharton.upenn.edu

1 - Dynamic Matching in a Sharing Economy
Ming Hu, Assistant Professor, Rotman School of Management, University of Toronto, 105 St George Street, Toronto, ON, Canada, Ming.Hu@rotman.utoronto.ca, Yun Zhou

Sharing economy has significantly changed many marketplaces in recent years. Examples include the ridesharing services such as Uber. These examples share a common structure of a two-sided market that engages three parties: the supply side, the demand side, and an intermediate firm. In this research, we propose a general framework of dynamically matching supply with demand by the intermediary firm and explore the optimal and heuristic matching policies.

2 - Customer Referral Incentives and Social Media
Evan Sadler, NYU, 44 W 4th St, New York, NY, United States of America, esadler@stern.nyu.edu, Ilan Lobel, Lav Varshney

We study the optimal structure of referral incentive programs that are used to attract customers to businesses. We show that the shift from person-to-person referrals to social media referrals leads to nonlinear payment polices being optimal, but that capped linear policies are a good approximation.

3 - On the Optimality of Synchronizing Pricing and Replenishment with Strategic Customers
Leon Zhu, Associate Professor, University of Southern California, Bridge Hall 401, University Park Campus, Los Angeles, CA, 90089, United States of America, leonyzhu@usc.edu, Ying-Ju Chen

We investigate the joint inventory and revenue management problem with strategic customers for the classical economic order quantity setting. We establish the optimality of the cyclic intertemporal price discrimination even for the homogeneous customer setting. The optimal replenishments and price promotions are synchronized and no capacity rationing is needed. For the heterogeneous customer setting, we find that high frequent intertemporal price discounts can arise as a predominant feature.

4 - Holiday Retailing with Gift Cards
Alice Lu, University of Pennsylvania, Philadelphia, PA, United States of AmericaUniversity of Pennsylvania, xingwei@wharton.upenn.edu, Xuanming Su

Gift cards are popular among retailers and consumers during holidays. Most states require retailers to transfer a portion of unredeemed value on gift cards to the state government. This paper studies the profitability of gift cards and the influence of different state laws on retailer strategies and consumer behavior.

Chair: Tong Wang, National University of Singapore, 15 Kent Ridge Drive, Singapore, 119245, Singapore, tong.wang@nus.edu.sg

1 - New Approximations for Bayesian Bandit Problems
Michael Kim, Assistant Professor, University of Toronto, 5 King's College Road, Toronto, ON, M5S 3G8, Canada, kimmi@mie.utoronto.ca, Andrew Lim

In his seminal work, Gittins showed that the optimal policy of a multi-armed bandit problem is of index-type. Computing Gittins indices however, are not always easy. For example, Bayesian bandits have infinite dimensional state spaces, and consequently computing the Gittins index is an intractable problem. In this work, we propose new approximation techniques for the DP equations of Bayesian bandits, and show how they lead to explicit solutions that do not require backwards recursion.

2 - A Parsimonious Non-parametric Method for Recommendations
Jeremy Chen, Department of Decision Sciences, National University of Singapore Business School, 15 Kent Ridge Drive, Singapore, 119245, Singapore, jeremy.chen@nus.edu.sg, Weijia Gu, Michael Kim, Sheryl Kimes, Andrew Lim

Recommender systems feature in the business models of many large internet companies. Most recommender systems are based on parametric models of the characteristics of alternative choices and the preferences of users. However, in most settings, usage data is readily available, while data on users and the characteristics of alternatives are not. We present non-parametric methods making recommendations leveraging only usage data. We believe this work is of strong practical significance.

3 - Data-driven Inventory Management with Demand Substitution in Retailing
Anna-Lena Sachs, University of Cologne, Albertus-Magnus-Platz, Cologne, Germany, anna-lena.sachs@uni-koeln.de, Stefan Minner

We formulate a data-driven model that integrates forecasting and inventory optimization by considering the effects of external factors on demand, unobservable lost sales and substitution behavior. Using data from a large European retail, we investigate the trade-off between learning about substitution behavior from highly censored data versus learning about demand from little censored data. We find that more learning about substitution yields slightly better results in terms of profits.

4 - Estimation and Optimization of Logit Demand Model with Covariates, Missing Data, and Auxiliary Info
Tong Wang, National University of Singapore, 15 Kent Ridge Drive, Singapore, SG, 119245, Singapore, tong.wang@nus.edu.sg, Baiyu Li, Andrew Lim

We consider parameter estimation, parameter uncertainty characterization, and decision optimization for an inventory control problem with a demand model that includes customer choice with stochastically changing covariates, missing observations and auxiliary information. Customer arrivals follow a Poisson process, and the choices follow a Logit model. We estimate the parameters using MCMC algorithm in a Bayesian setting, which provides us with a framework to account for parameter uncertainty.

Operational Issues in Trade-in Programs

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Gil Souza, Associate Professor, Indiana University, Kelley School of Business, Bloomington, IN, 47405, United States of America, gsouza@indiana.edu

1 - Optimal Dynamic Pricing for Trade-in Programs
Mohammad Ghuloum, PhD Student, Indiana University, Kelley School of Business, Bloomington, IN, 47405, United States of America, mghuloum@indiana.edu, Goker Aydin, Gil Souza

Trade-in managers (e.g., college booksellers) start the selling season with zero inventory and have to simultaneously acquire and sell used products. Unlike conventional dynamic pricing models, the inventory is not readily available at the beginning of the horizon. This paper studies the optimal acquisition and selling prices for such firms.

2 - Trade-in Rebates for Price Discrimination and Product Recovery
Mark Ferguson, Professor, University of South Carolina, Columbia, SC, United States of America, mark.ferguson@moore.sc.edu, Gil Souza, Vishal Agrawal

Many OEMs offer trade-in rebates to their existing customers when they purchase newer versions of a product. In business-to-business settings, the amounts of the rebates are often opaque to the firm's other customers, resulting in customized rebate amounts. We investigate how this practice affects the firm's decisions regarding secondary markets and offering remanufactured products.

3 - Consumer Trade-in Program Design and the Quality of Returns
Fei Qin, Postdoctoral Fellow, McGill University, Desautels Faculty of Management, Montreal, QC, H3A1G5, Canada, qinfei99@gmail.com, Michael Fry, Uday Rao

We study the structure of the supply chain facilitating used-product return from, and resale to, end consumers. By modeling a variety of trade-in supply chain structures in practice, we show their impact on the performance of the trade-in firm, the retailer, and the channel.

4 - Lemons, Trade-ins, and Remanufacturing
Ximin (Natalie) Huang, PhD Student, Georgia Institute of Technology, Atlanta, GA, United States of America, ximin.huang@scheller.gatech.edu, Atalay Atasu, Beril Toktay

Trade-in programs have been shown to partially mitigate the lemons problem in secondary markets. In this paper, we show when and how remanufacturing traded-in products can further improve the efficiency in secondary markets.

Service Science: Toward Systematic Service System Innovation

Cluster: Tutorials

Invited Session

Chair: Paul Maglio, University of California, Merced, Merced, CA, United States of America, pmaglio@ucmerced.edu

1 - Service Science: Toward Systematic Service System Innovation
Paul Maglio, University of California, Merced, Merced, CA, United States of America, pmaglio@ucmerced.edu

Service science is the study of complex service systems. It may involve methods and theories from operations, industrial engineering, marketing, computer science, psychology, information systems, design, and more. In fact, understanding innovation in service systems often requires combining multiple methods because of the complex ways in which interactions among people, technology, organizations, and information create value in different contexts and under different conditions. Service Science the journal documents empirical, modeling, and conceptual studies of complex service systems, and is the archival record of service science the field. The journal is also helping to shape the field. This tutorial will review the emergence of service science the field by analyzing papers published in Service Science the journal, and discuss the new field's foundations, prospects, and opportunities.

Optimization and Modeling for Individual Decision-Making

Cluster: Social Media Analytics

Invited Session

Chair: Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43210, United States of America, allen.515@osu.edu

1 - SMERT Modeling of #BringBackOurGirls Tweets
Anthony Afful-Dadzie, Lecturer, University of Ghana Business School, P. O. Box LG 78, Legon, Ac, Ghana, afful-dadzie@ug.edu.gh, Theodore Allen

The twitter campaign has brought global attention to the important cause of abducted girls in Nigeria. Subject Matter Expert Refined Topic (SMERT) models permit the exploration of freestyle text in a way that permits intuitive editing of the topic definitions. The results show the range and level of constructive discourse.

2 - DDAER Policy Optimization for Improved Facebook Experiences
Chen Xie, Consultant, Flexis North America Inc. Corporate Operations Department, 110 Polaris Parkway Suite 305, Westerville, OH, 43082, United States of America, chen.xie@flexis.com

Facebook users have many choices to make about how active to be, what types of posts as well as security settings. There are also many ways to measure their success including the numbers of positive events (contacts from friends) and negative events (unwanted contacts). We gather personal experience data and apply dynamic decision approximate empirical reward processes which are a generalization of Markov decision processes. We show how a personal policy can be formed to improve user experience.

3 - SMERT Modeling of Stephen Colbert Tweets
Theodore Allen, Associate Professor, The Ohio State University, 1971 Neil Avenue, 210 Baker Systems, Columbus, OH, 43210, United States of America, allen.515@osu.edu

Stephen Colbert has generated over 3,000 tweets from @StephenAtHome with over 6 million followers. Using our own Subject Matter Expert Refined Topic (SMERT) model, we identify a list of intuitive topics. Then, we chart the evolution over time of issues addressed to try to understand the Colbert mind. Results include the topics of relative fixation and omission.

4 - Experimentation and Modeling of Facebook Privacy Settings
Shih-Hsien Tseng, Assistant Professor, School of Commerce at Kainan University, 33857 No. 1 Kainan Road, Luzhu Shiang, Ta, Taiwan - ROC, tsengsh@mail.knu.edu.tw, Theodore Allen, Chen Xie, Zhenhuan Sui

Hundreds of millions of people use Facebook for pleasure or work. We use planned experiments to explore the impact of privacy settings and activity level on outcomes including the numbers of spam messages, positive contacts, likes, and undesirable contacts. The methods could be applied by others and possibly inform future software development.

Novel Techniques in Integer Programming

Sponsor: Optimization/Computational Optimization and Software

Sponsored Session

Chair: Imre Polik, SAS Institute, Cary, NC, 27513, United States of America, imre.polik@gmail.com

1 - Valid Inequalities for Mixed Integer Second Order Cone Optimization (MISOCO)
Aykut Bulut, Lehigh University, 200 W Packer Avenue, Bethlehem, PA, 18015, United States of America, aykut@lehigh.edu, Ted Ralphs

We investigate the computational performance of the valid inequalities for MISOCO problem from literature. These valid inequalities include conic MIR cuts introduced by Atamturk and Narayanan, conic Gomory cuts introduced by Cezik and Iyengar, and disjunctive conic cuts introduced by Belotti et al. We solve the MISOCO problem using a branch and bound scheme and measure the reduction in the size of the search tree due to valid inequalities used.

2 - Using and Reusing Dual Information in Branch and Bound
Menal Güzelsoy, SAS, 100 SAS Campus Drive, Cary, NC 27513, United States of America, menal.guzelsoy@sas.com

In this talk we present several techniques to reuse dual information (such as dual feasible solution and dual rays) later in branch and bound. Bound tightening and branching decisions will both benefit for his extra information. The effectiveness of the ideas will be demonstrated with the SAS/OR mixed-integer linear solver.

Dynamic Optimization with Uncertain Demand

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Omar Besbes, Associate Professor, Columbia University, 3022 Broadway, New York, NY, 10027, United States of America, ob2105@columbia.edu

Co-Chair: Ciamac Moallemi, Barbara and Meyer Feldberg Associate Professor of Business, Columbia Business School, 3022 Broadway, Uris 416, New York, NY, 10027, United States of America, ciamac@gsb.columbia.edu

1 - Capacity Constraints across Nests in Assortment Optimization under the Nested Logit Model
Jacob Feldman, Cornell University, Ithaca, NY, 14850, United States of America, jbf232@cornell.edu, Huseyin Topaloglu

We consider assortment optimization problems when customers choose according to the nested logit model and there is a capacity constraint limiting the total capacity consumption of all products offered in all nests. For the cardinality constrained case, we develop an effcient algorithm to compute the optimal assortment. When the capacity consumption of each product is arbitrary, we give an algorithm to obtain a 4-approximate solution.

2 - Dynamic Inventory Management with Limited Observations
Juan Chaneton, PhD Student, Columbia Business School, 3022 Broadway, New York, NY, 10027, United States of America, jchaneton15@gsb.columbia.edu, Omar Besbes, Ciamac Moallemi

We consider a dynamic inventory management problem in which the retailer has only partial access to the stochastic process that drives inventory evolution. In such settings, the retailer's decision should account not only for the current inventory state, but also for the way decisions (current and past) affect information acquisition. We assess the impact of this information limitation in a common retailing optimization problem.

3 - Connections between Least Squares Monte Carlo and Math Programming Based ADP

Selvaprabu Nadarajah, Assistant Professor, University of Illinois at Chicago, Liautaud Graduate School of Business, Chicago, IL, United States of America, selvan@uic.edu, Francois Margot, Nicola Secomandi

Least squares Monte Carlo (LSM) and math programming ADP methods are widespread in financial engineering and operations research. We connect recent LSM and math programming ADP methods using an approximate linear programming (ALP) relaxation approach based on restricting the ALP dual. This work provides a new perspective on LSM and additional insights into existing ALP relaxations. We also present methodological extensions motivated by this analysis.

4 - Centralized and Decentralized Dynamic Price and Lead Time Quotation

Baykal Hafizoglu, ASU, Tempe, AZ, United States of America Arizona State University, baykal@asu.edu, Pinar Keskinocak, Esma Gel

We discuss the dynamic price and lead time quotation problem in a make-to-order system under two decision making settings: (1) centralized setting considers a central agent determining price and lead times, and (2) decentralized setting assumes that price and lead time decisions are taken respectively by marketing and manufacturing departments. We explore the optimal policy structure under both settings and discuss the inefficiencies of decentralized decision making.

Hilton- Continental 8

Topics in Supply Chain Management

Sponsor: Manufacturing & Service Operations Management/Supply Chain

Sponsored Session

Chair: Houyuan Jiang, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, United Kingdom, h.jiang@jbs.cam.ac.uk

1 - Optimal Sourcing Decision and Information Sharing Under Multi-tier Disruption Risk in a Supply Chain

Jiho Yoon, Doctoral Candidate, Michigan State University, N468 North Business Complex, Michigan State University, East Lansing, MI, 48824-1121, United States of America, yoon@bus.msu.edu, Claudia Rosales, Srinivas Talluri

We consider a three-tier supply chain consisting of a manufacturer and two suppliers. Both suppliers may experience disruptions; the effect of disruption risk on manufacturer's sourcing decisions is analyzed. We study the effect of information sharing in the supply chain and identify conditions under which the first-tier supplier is willing to share second-tier supplier information.

2 - New Risk Concepts for Supply Chain Design Models

Stefan Nickel, KIT, Kaiserstrasse 12, Karlsruhe, Ba, 76131, Germany, stefan.nickel@kit.edu, Francisco Saldanha da Gama, Iris Heckmann

Risk concepts have been applied in a broad variety of research fields and methodologies. Most of these approaches, however, consider risk as a static concept and do not address the dynamic nature and potential aggravation of risk. We introduce new risk concepts that consider risk as a dynamic concept, whose impact may aggravate over time and propagate through the network. We present mathematical programming models of these risk concepts for different supply chain design models.

3 - To Supply or Not to Supply to a Competing Buyer

Zhibin (Ben) Yang, Assistant Professor, University of Oregon, Eugene, OR, 97403, United States of America, zyang@uoregon.edu, Haresh Gurnani, Xinxin Hu

We study the supplier's allocation of limited production capacity to a buyer that sells to the same market, using a three-stage model. We characterize the buyer and the supplier's market competition equilibrium in which the buyer may strategically withhold excessive supply, and analyze the supplier's capacity allocation and pricing decisions.

4 - Supply Chain Contracting with Limited Demand Information

Houyuan Jiang, Dr, University of Cambridge, Judge Business School, Trumpington Street, Cambridge, United Kingdom, h.jiang@jbs.cam.ac.uk, Serguei Netessine

The well-known wholesale price and buy-back contracts in supply chains are investigated when only limited demand information is available to the retailer and the supplier. We show that these contracts, in particular the buy-back contract, cannot coordinate the supply chain in general. We study supply chain coordination conditions. We characterize efficiency of these contracts.

Doctoral Work in Sustainable Operations Management

Sponsor: Manufacturing & Service Operations Management/Sustainable Operations

Sponsored Session

Chair: David Drake, Assistant Professor, Harvard Business School, Boston, MA. United States of America, ddrake@hbs.edu

1 - Service-level Elasticity of Demand for Mobile Money Cash Transactions

Karthik Balasubramanian, Doctoral Student, Harvard Business School, Boston, MA, United States of America kbalasubramanian@hbs.edu, David Drake

"Mobile money" can transform the lives of 2 billion people that live on less than $2 a day. However, the mobile money agents (who exchange cash for electronic value and vice versa) that are crucial to the development of mobile money ecosystems face severe inventory problems. We study the service-level elasticity of demand for cash transactions: how does service level affect demand for an agent's services?

2 - Extended Producer Responsibility (EPR), Secondary Markets & Export Restrictions

Isil Alev, Doctoral Student, Georgia Tech School of Industrial and Systems Engineering, Atlanta, GA, United States of America isilalev@gatech.edu, Vishal Agrawal, Atalay Atasu

EPR-based take-back legislation is the prevalent policy for several durable products such as electronics; however, existing analysis ignores the durable nature of the products and presence of secondary markets. In our work, we analyze the effectiveness of EPR in the presence of secondary markets and show that it may result in unintended adverse environmental outcomes. We then extend our work by analyzing the effect of export bans in practice and show that they exacerbate these adverse outcomes.

3 - The State of Scope 3 Carbon Emissions Reporting in Supply Chains

Christian Blanco, PhD Student, UCLA Anderson School of Management, Los Angeles, CA, United States of America christian.blanco.2016@anderson.ucla.edu, Felipe Caro, Charles Corbett

Protocol organizations previously focused on carbon reporting for emissions emitted from company owned equipment (scope 1) and energy purchases (scope 2), but are increasingly including indirect emissions from upstream suppliers (scope 3). We compare scope 3 emissions disclosed to CDP to a benchmark by Huang et al. (2009). We find firms are beginning to account for an increasing portion of their supply chain's carbon emissions, but opportunities still remain for expanding scope 3.

4 - The Impact of Ecolabeling on the Optimal 'Green' Product Line

Karthik Murali, University of Illinois, Urbana, IL, United States of America, kmurali4@illinois.edu, Michael Lim, Nicholas C. Petruzzi

We study the optimal product line problem through a model of vertical differentiation in the context of 'green' attributes which are characterized by unobservability to consumers and consumer confusion in evaluating the utility derived from these attributes. Ecolabels provided by trusted certifying agencies or firms themselves are used to exhibit 'green' attributes. We characterize ensuing implications of ecolabeling for the environment and derive policy implications for government intervention.

DEA Methodology

Cluster: Data Envelopment Analysis

Invited Session

Chair: Ole Bent Olesen, Professor, University of Southern Denmark, Campusvej 55, 5230 Odense, Denmark, ole@sam.sdu.dk

1 - Cone Ratio and Assurance Regions in Slack Based DEA Models – A Challenge

Ole Bent Olesen, Professor, University of Southern Denmark, Campusvej 55, 5230 Odense, Denmarkole@sam.sdu.dk, Niels Christian Petersen

There exists a close link between input or output oriented radial cone ratio DEA and the corresponding DEA model with assurance regions. This link is less straight forward for the case of non-radial slack based measures. In this paper we analyze the relationship between assurance regions and cone ratio formulations of such additive models. Certain problems are identified and their relations to multi-objective programming are discussed.

2 - Pitfalls of the Multi-stage DEA Model with Additive Efficiency Decomposition

Chien-Ming Chen, Nanyang Business School, Nanyang Technological University, 50 Nanyang Ave., Singapore, 639798, Singapore, cmchen@ntu.edu.sg, Sheng Ang

This paper highlights several problems of the multi-stage DEA model with additive efficiency decomposition. We show that the decomposition weights are non-increasing in the sequence of stages and illustrate the problems with a case study.

3 - The Orientation of DEA Models with Dual-role Factors

Wen-Chih Chen, National Chiao Tung University, 1001 Ta Hsueh Rd., Hsinchu, Taiwan - ROC, wenchih@faculty.nctu.edu.tw

In contrast to conventional input/output factors, dual-role factors are those can be both inputs and outputs simultaneously. This study investigates issues on the orientation of DEA models with dual-role factors. We also propose efficiency measures for the cases with dual-role factors.

4 - Stochastic Programming Approach to DEA for Evaluation of Future Efficiency

Yuma Konishi, Osaka University, 2-1 Yamadaoka, Suita, Osaka, Japan, yuma.konishi@ist.osaka-u.ac.jp, Hiroshi Morita

DEA is developed without uncertainty. But there is so much uncertainty that cannot be ignored for future efficiency prediction. Stochastic programming framework of DEA enables us to determine how to take actions before getting observation results, in contrast to after getting one by the deterministic DEA. We show SPDEA approach for evaluating future efficiency to cope with the risk attitudes, and illustrate the difference of evaluation of future efficiency among some risk attitudes.

Dynamic Mechanism Design in Revenue Management

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27705, United States of America, srb43@duke.edu

1 - Dynamic Allocation and Learning with Strategic Arrivals

Philipp Strack, Microsoft Research New England, One Memorial Drive, Cambridge, MA, 02142, United States of America, philipp.strack@gmail.com, Benny Moldovanu, Alex Gershkov

A designer allocates several indivisible object to a stream of randomly arriving agents. The long-lived agents are privately informed about their value for an object, and about their arrival time to the market. The designer learns about future arrivals from past arrivals, while agents strategically choose when to make themselves available for trade. We inquire whether the complete information, efficient policy is implementable and characterize revenue maximizing mechanisms.

2 - Dynamic Mechanism Design with Budget Constrained Buyers

Santiago Balseiro, Assistant Professor, Duke University, 100 Fuqua Drive, Durham, NC, 27705, United States of America, srb43@duke.edu, Gabriel Weintraub, Omar Besbes

In online advertising, ad slots are typically allocated using a second-price auction or some variation of it. We explore, using a dynamic mechanism design approach, whether other auction formats could improve the auctioneer's profit in the presence of budgets constraints.

3 - On the Durable Good Monopoly Problem

Gerardo Berbeglia, Assistant Professor, Melbourne Business School, 200 Leicester Street, Melbourne, 3053, Australia, g.berbeglia@mbs.edu, Peter Sloan, Adrian Vetta

A duropolist is a monopolist in the market of a durable good. We study the equilibria of the associated bargaining game with atomic consumers and finite horizon that satisfy the standard skimming property. We prove that duropoly profits are always at least as large as static monopoly profits, but never exceed double the static monopoly profits. Lastly, we show that the bounds are tight. The bounds hold regardless of the number of periods, number of consumers, and their specific values.

4 - Bandit Networks: Learning Without Experimentation

Ankur Mani, Massachusetts Institute of Tech, 20 Ames Street #385, Cambridge, MA, 02139, United States of America, amani@MIT.EDU, Ilan Lobel, Josh Reed

We consider a firm consisting of a network of retail stores. None of the retail store managers have an incentive to experiment individually to find the value of alternative policies. We show that under certain conditions, learning occurs in this network of stores regardless of the lack of experimentation.

■ TA17

Hilton- Franciscan B

Behavioral Perspectives

Sponsor: Manufacturing & Service Operations Management/Service Operations

Sponsored Session

Chair: Mirko Kremer, Professor, Penn State University, 460 Business Building, University Park, PA, United States of America, muk22@smeal.psu.edu

1 - Capacity Decisions under Information Asymmetry – Experimental Evidence

William Schmidt, Assistant Professor, Johnson Graduate School of Management, 314 Sage Hall, Ithaca, NY, 14853-6201, United States of America, wschmidt@cornell.edu, Ryan Buell

We examine capacity choices under information asymmetry and find that decision makers more often make choices consistent with Pareto optimization logic. This has material implications for both research and practice as it yields dramatically divergent predictions compared to more commonly modeled alternatives.

2 - Working Smarter Not Harder: Queue Discretion, Batching, and Performance in Outsourced Teleradiology

Maria Ibanez, Doctoral Student, Harvard Business School, Morgan Hall 428, Soldiers Field Road, Boston, MA, 02163, United States of America, mibanez@hbs.edu, Jonathan Clark, Robert Huckman, Bradley Staats

We examine how knowledge workers exert discretion on the order in which to execute tasks and the subsequent performance implications of those choices. Using two and a half years of data on more than 2.7 million cases read by outsourced radiologists working at one of the largest teleradiology firms in the US, we explore potential heuristics in ordering decisions, and how this endogenous ordering affects performance.

3 - Impact of Queueing System Design on Human Servers' Behavior

Masha Shunko, Purdue University, 403 W. State Street, West Lafayette, IN, 47906, United States of America, mshunko@purdue.edu, Julie Niederhoff, Yaroslav Rosokha

In queueing systems with human servers, service rate may depend on many factors. Based on series of lab and field experiments, we analyze the impact of queueing system layout and visibility of the queue length on service speed. We show that layout with parallel queues and good visibility of the queue length are important determinants of workers' speed.

4 - The Impact of Congestion on Diagnostic Accuracy

Mirko Kremer, Professor, Penn State University, 460 Business Building, University Park, PA, United States of America, muk22@smeal.psu.edu, Francis de Vericourt

We investigate decision-making and judgment in the context of diagnostic services systems that pose difficult trade-offs for the (human) server. For instance, in triage systems additional testing improves diagnostic accuracy for one patient, but increases congestion in the system (thus delaying service provision to other patients).

Revenue Management in Retail and Service I

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Andrew Vakhutinsky, Principal Scientist, Revionics, 52 Cannon Ball Rd., Sharon, MA, 02067, United States of America, Andrew.Vakhutinsky@revionics.com

Co-Chair: Natalia Viktorovna, Sr. Operations Research Specialist, SAS Institute, 100 SAS Campus Drive, Cary, NC, United States of America, Natalia.Viktorovna@sas.com

1 - A Simulation Study of BAR by Day Heuristics

Jason Chen, SAS Institute, SAS Campus Drive, Cary, NC, 27513, United States of America, Jason.Chen@sas.com

A BAR (Best Available Rates) by Day policy sets a rate for each occupancy day. The rate of a multi-day stay is equal to the sum of each occupancy day's rate. Its simple form makes this type of policy attractive to many hotels. However, the interaction of multi-day stays that share the same occupancy days makes the difficult network problem even harder to solve. We present the simulation study of several BAR by Day heuristics using real hotel data.

2 - The Re-layout Problem in Grocery Stores

Ilknur Uludag, Industrial and Systems Engineering, 3301 Shelby Center Auburn University, Auburn, AL, 36849-5346, United States of America, izt0002@auburn.edu, Alice E. Smith

In this study,the facility re-layout problem in grocery stores is studied. Although the process of the re-layout in a store is time consuming and costly, the re-layout problem has not been investigated in detail in the retail industry. A mathematical model for the solution of the problem is developed and tested using real world data and randomly generated scenarios. The best solutions by the mathematical model are presented. A greedy heuristic for the problem is proposed for large size problems.

3 - Demand Models for Substitutable Grocery Products

Setareh Borjian, MIT Operations Research Center, Cambridge, MA, United States of America, sborjian@mit.edu, Andrew Vakhutinsky

We describe the demand for a product assortment in a grocery retail category using choice modelling approach. We estimate the parameters of models based on the transactions history from a large national grocery chain, and compare the models using different sales periods. We show that among other factors, promotion has significant effect in demand variation and should therefore be considered as an input to the models to get a more accurate estimation of demand.

4 - An Attribute-based Retail Assortment Model

Jeff Moore, Revionics, 2998 Douglas Blvd, Suite 350, Roseville, CA, 95661, United States of America, jmoore@revionics.com, Bryan Ball, Andrew Vakhutinsky

We will present an analysis of several methods of "sight unseen" demand forecasting for retail goods using attribute-based models. We will describe the product attributes used, the method of holdout testing used to gauge prediction accuracy and to compare models, and the various modeling approaches employed (regression models, decision trees, and random-forests). We will describe how these methods performed across a set of test cases using retail demand history.

Dynamic Learning and Pricing

Sponsor: Revenue Management & Pricing

Sponsored Session

Chair: Stefanus Jasin, Stephen M. Ross School of Business, University of Michigan, 701 Tappan St, Ann Arbor, MI United States of America, sjasin@umich.edu

1 - Model Selection in Pricing and Revenue Management

Arnoud V. den Boer, University of Twente, Drienerlolaan 5, Enschede, 7522 NB, Netherlands, a.v.denboer@utwente.nl

In optimization problems, simple mathematical models that discard important factors may sometimes be preferred over more realistic models. This can happen if the parameters of the simpler models are easier to estimate than the parameters of the complex model; there thus is a trade-off between modeling error and statistical error. We propose a data-driven method to decide when misspecified models give better results, and apply it to pricing and revenue management problems.

2 - Dynamic Pricing and Demand Learning with Limited Price Experimentation

He Wang, MIT, 77 Mass Ave, E40-130, Cambridge, MA, 02139, United States of America, wanghe@mit.edu, David Simchi-Levi, Alexander Weinstein

In a dynamic pricing problem where the demand function is unknown a priori, price experimentation can be used for demand learning, but in practice sellers are faced with business constraints that prevent them from conducting extensive experimentation. We consider a dynamic pricing model where the seller can only change price for a limited number of times during the sales window, and show that simple policies can achieve asymptotically optimal regret bounds.

3 - Application of Self-Adjusting Controls for Dynamic Pricing with Unknown Demand

George Chen, Stephen M. Ross School of Business, University of Michigan, 701 Tappan Ave, Ann Arbor, MI, 48109, United States of America, georgeqc@umich.edu, Stefanus Jasin, Izak Duenyas

We study the network-RM pricing problem with unknown demand functions in both parametric and nonparametric cases. Using the self-adjusting heuristic, we get the best attainable revenue loss rate in the parametric setting. Moreover, a much sharper performance can be achieved if parametric demand function family is well-separated. We also show that self-adjusting heuristic almost attains the best achievable revenue loss rate for the nonparametric setting if demand is sufficiently smooth.

4 - Near-optimal Bisection Search for Nonparametric Dynamic Pricing with Inventory Constraints and Unknown

Murray (Yanzhe) Lei, PhD, University of Michigan, 701 Tappan Street, R3410, Ann Arbor, MI, 48109, United States of America, leiyz@umich.edu, Stefanus Jasin, Amitabh Sinha

We consider a general class of revenue management problems with inventory constraints, where the price-dependent demand function is unknown. We develop nonparametric dynamic pricing algorithms and provide upper bounds on the revenue losses comparing to a clairvoyant in asymptotic regime: for single-product problems, our algorithm matches the theoretic lower bound; for multiple-product problems, our algorithm outperform existing literature, especially when there are a lot of different products.

Facility Logistics I

Sponsor: TSL/Facility Logistics

Sponsored Session

Chair: Sadan Kulturel-Konak, Pennsylvania State University-Berks, Tulpehocken Rd. PO Box 7009, Reading, PA, United States of America, sadan@psu.edu

1 - Role of Product Exposure in Retail Design

Corinne Mowrey, PhD Candidate, Wright State University, 207 Russ Center, 3640 Col Glenn Hwy, Dayton, OH, 45435, United States of America, mowrey.4@wright.edu, Pratik Parikh

A key aspect of retail facility design, often alluded to but rarely analyzed, is product exposure to the shopper along their travel path. From a shopper's perspective, a greater amount of product exposure means less time spent searching for items of interest. From a manager's perspective, converting a shopper's time from searching to purchasing would likely result in increased sales. We discuss an approach to quantify product exposure for various retail layouts and share preliminary insights.

2 - Flow Balancing with Uncertain Demand for Automated Package Sorting Centers

Luis Novoa, PhD Candidate, George Washington University, Department of Decision Sciences, School of Business, Washington, DC, 20052, United States of America, ljnovoa@gwmail.gwu.edu, David Morton, Ahmad Jarrah

At package carriers' hubs, primary sorters direct incoming packages to secondary sorters for further segregation to the outbound destinations level. We study the problem of assigning package destinations to secondary sorters to balance the hub's workload while considering the uncertainty in package volumes and adhering to loading capacities. Hybrid stochastic/robust formulations, solution algorithms and computational performance are discussed. Benefits from proposed models are quantified.

3 - Dynamic Facility Layout Problem using a Hybrid Approach

Sadan Kulturel-Konak, Pennsylvania State University-Berks, Tulpehocken Rd. PO Box 7009, Reading, PA, United States of America, sadan@psu.edu

This study presents a hybrid approach to solve the Dynamic Facility Layout Problem (DFLP) on the continuous plane with unequal area departments. In our hybrid approach, once the Genetic Algorithms (GA) sets up relative department positions, actual department locations and shapes are determined by solving a Linear Programming (LP) problem. Results for the problems studied in the literature earlier and for newly defined problems will be presented.

4 - SINGA Port – The Next Generation Container Port Concept

Loo Hay Lee, Associate Professor, National University of Singapore, 10 Kent Ridge Crescent, Singapore, Singapore, iseleelh@nus.edu.sg, Dah-Chuan Gong, Brett Peters, Matthew Petering, Ek Peng Chew

We will discuss a project to design a "Sustainable Integrated Next Generation Advanced Port," which can handle 20 million TEUs per annum. A novel container terminal is proposed with features of a double-story structure, indented storage yard, overhead bridge crane, and automated lifting vehicle. We will argue how we overcome the challenges that we have faced. We will also illustrate what analyses have been done to make the final design and explore the research issues behind the project.

Innovative Solutions for Congestion Mitigation I

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Siriphong (Toi) Lawphongpanich, University of Florida, Industrial and Systems Engineering, Gainesville, FL, 32611, United States of America, Lawphong@ise.ufl.edu

Co-Chair: Yafeng Yin, University of Florida, Gainesville, FL, United States of America, yafeng@ce.ufl.edu

1 - Congestion Pricing for Improving Network Service: A Simulation-Based Optimization Approach

Lei Zhang, Associate Professor, University of Maryland, 1173 Glenn Martin Hall, College Park, MD, 20742, United States of America, lei@umd.edu, Xiqun (Michael) Chen

An innovative surrogate optimization is proposed for congestion pricing with computationally expensive objective functions assessed by simulation-based dynamic traffic assignment. Response surfaces are exploited by DIRECT a modification to Lipschitzian optimization. The framework is applied to optimize mileage based tolls of a freeway sub-network. We investigate invariant macroscopic fundamental diagrams validated by fixed and probe traffic flow data. Various optimal toll scenarios are compared.

2 - Profit Maximization of a Private Toll Road with Cars and Trucks

Xiaolei Guo, Assistant Professor, University of Windsor, 401 Sunset Ave., Odette School of Business, Windsor, ON, N9B 3P4, Canada, guoxl@uwindsor.ca

Profit maximization of a private toll road is not only important to the road operator itself, but also important to the government, because understanding the profit-oriented behaviors is the first step to setting proper regulations. This paper looks into the profit maximization problem of a private toll road competing against a free alternative in presence of cars and trucks, where trucks differ from cars in value of time, congestion externality, and pavement damage.

3 - On the Design of Multi-Period Tradable Credit Schemes for Travel Mobility

Mohammad Miralinaghi, Purdue University, 550 Stadium Mall Drive, West Lafayette, IN, 47906, United States of America, smiralin@purdue.edu, Srinivas Peeta

Credit-based congestion pricing is a strategy to mitigate congestion by creating artificial markets for mobility credits. This study develops a multi-period equilibrium modeling framework to capture the evolution of credit price when credit demand and supply vary with time. To enable the central authority to manage the credit supply, transfer fee and reservation credit price are applied to stored credits for consumption in future periods.

4 - Dual-Toll Pricing Problem for Regulating Hazmat Transportation under Nonlinear Delay

Changhyun Kwon, University at Buffalo (SUNY), 318 Bell Hall, Buffalo, NY, 14221, United States of America, chkwon@buffalo.edu, Tolou Esfandeh, Rajan Batta

We investigate a dual-toll setting policy to mitigate the risk of hazmat shipment in transportation networks. We formulate the problem as a bi-level program wherein the first level aims at minimizing the risk via dual toll, and the second level explores the user equilibrium flow pattern of the regular vehicles and hazmat carries. We suggest an inverse optimization procedure and approximate methods based on piecewise linearization.

Selective and Time Dependent Routing Problems

Sponsor: Transportation Science & Logistics

Sponsored Session

Chair: Mehmet Basdere, Northwestern University, The Technological Institute, 2145 Sheridan Road Room C210, Evanston, IL, 60208, United States of America, mehmetbasdere2016@u.northwestern.edu

1 - The Traveling Salesman Problem with Time-dependent Service Times

Duygu Tas, Postdoctoral Fellow, CIRRELT and Canada Research Chair in Distribution Management, HEC Montreal, Bureau 3520, Pavillon Andre-Aisenstadt, Campus de l'Université de Montreal, Montreal, QC, H3C 3J7, Canada, duygu.tas@cirrelt.ca, Gilbert Laporte, Ola Jabali, Michel Gendreau

The Traveling Salesman Problem (TSP) with time-dependent service times is a generalization of the classical TSP where the duration required to serve any customer is defined as a function of the moment to begin service at that location. This talk will describe the analytical insights derived from the properties of service time and fundamental routing assumptions (e.g., first-in-first-out), and present experimental results obtained by using different service time functions.

2 - Race Course Configuration Problem

Mehmet Basdere, Northwestern University, The Technological Institute, 2145 Sheridan Road Room C210, Evanston, IL, 60208, United States of America, mehmetbasdere2016@u.northwestern.edu, Karen Smilowitz, Sanjay Mehrotra

In this talk, we present a new type of tour finding problem in the marathon course design setting. The aim is to find a valid marathon course that minimizes the average distance to the medical facilities within the region of interest without preventing the public access to those facilities while visiting a predetermined subset of landmark streets. The underlying problem becomes a variant of selective travelling salesman problem.

3 - Solution Methods for the Rural Postman Problem with Time Windows

Ingrid Marcela Monroy Licht, PhD Student, École Polytechnique de Montréal, 2500, Chemin de Polytechnique, Montreal, Canada, ingrid-marcela.monroy-licht@polymtl.ca, Ciro Alberto Amaya, André Langevin

The rural postman problem consists in finding an optimal tour visiting a subset of required arcs. We present a MIP formulation for the case with time windows and we solve the problem using a cutting plane algorithm. A competitive Adaptive Large Neighborhood Search metaheuristic is proposed for solving larger instances. Computational experiments are done on a large set of instances with up to 104 required edges.

Network Design and Repositioning for Bike-sharing Systems

Sponsor: TSL/Freight Transportation & Logistics

Sponsored Session

Chair: Sin C. Ho, Aarhus University, 8210 Aarhus, Denmark, sinch@asb.dk

Co-Chair: W. Y. Szeto, The University of Hong Kong, Shatin, N.T., Hong Kong- PRC, ceszeto@hku.hk

1 - Bicycle Network Design with Genetic Algorithm

C. S. Shui, The University of Hong Kong, Hong Kong, China, samshui@hku.hk, W. Y. Szeto

This study introduces a bicycle network design problem that maximizes coverage and demand satisfaction simultaneously within a limited budget. Genetic Algorithm is adopted with two repairing operators introduced to improve the solution search. A case study in Tuen Mun, Hong Kong shows that the GA can solve single and bi-objective design scenarios with various budget levels. The tradeoff between two objectives is also investigated through varying the weighting factor.

2 - An Artificial Bee Colony Algorithm for the Public Bike Repositioning Problem

W. Y. Szeto, Shatin, N.T., Hong Kong- PRC
The University of Hong Kong, ceszeto@hku.hk, C. S. Shui

This paper introduces an artificial bee colony algorithm to solve the shared bikes repositioning problem. A modified version is proposed to improve the solution quality of the original version. Two objectives, minimizing total duration and minimizing maximum duration, are examined to show their relationships with the number of operating vehicles.. The trade-off between the service duration and the tolerance of demand dissatisfaction is also illustrated.

3 - Iterated Tabu Search for the Bike Repositioning Problem

Sin C. Ho, Aarhus University, 8210 Aarhus, Denmark, sinch@asb.dk, W. Y. Szeto

We study the static bike repositioning problem where the problem consists of selecting a subset of stations to visit, sequencing them, and determining their pick-up/drop-off quantities under various operational constraints. The objective is to minimize the total penalties incurred at all the stations. We present an iterated tabu search heuristic to solve the described problem. Experimental results show that this heuristic can generate high quality solutions using small computing times.

Sponsored Session

Chair: Stephen Boyles, Assistant Professor, University of Texas at Austin, 301 E Dean Keeton St Stop C1761, Austin, TX, 78712, United States of America, sboyles@mail.utexas.edu

1 - Autonomous Vehicle Intersection Modeling in Dynamic Traffic Assignment

Michael Levin, The University of Texas at Austin, ECJ 6.2, Austin, TX, 78712, United States of America, michaellevin@utexas.edu, Stephen Boyles

Autonomous vehicle intersection policies offer opportunities for capacity increase, which to date have been studied in custom micro-simulations. We propose an algorithm for modeling such policies in dynamic traffic assignment that simplifies tile-based reservation models to ensuring separation at a reduced number of conflict points. The model is compared with published micro-simulation results and used to analyze intersection-auction congestion-pricing under user equilibrium behavior.

2 - Network Contraction Methods for Dynamic Pricing at Charging Stations

Ehsan Jafari, PhD Candidate, The University of Texas at Austin, Austin, TX, United States of America, ejafari@utexas.edu, Stephen Boyles

Dynamic pricing strategies can potentially mitigate load issues on the power grid due to electric vehicle charging. This talk presents network contraction-based methodologies for rapid assessment of pricing strategies.

3 - A Game-theoretical Framework for Traffic Signal Control Systems with Connected Vehicles

Lin Xiao, University of Minnesota, Minneapolis, MN, United States of America, lxiao@umn.edu, Henry X. Liu

In this paper, a game-theoretical framework for traffic signal control with connected vehicles is proposed. The game is designed in the way that connected vehicles and signal controller will determine the signal timing plan via negotiating. This framework utilizes the connected vehicles' two-way communication capability, which didn't attract much attention in previous studies. Numerical study shows that the proposed framework outperforms traditional traffic signal control method with connected vehicles.

4 - Online Auction Designs for Traffic Intersection Operations

R. Jayakrishnan, University of California, Irvine, CA, United States of America, rjayakri@uci.edu, Roger Lloret-Batlle

The purpose of this paper is to analyze the general case of online auctions in the traffic intersection problem. Insights are developed based on a general framework and mechanisms for efficiently utilizing available time budgets, with signal formulations that are not necessarily constrained to traditional cycle designs.

Hilton- Union Sq 5

Public Transportation

Contributed Session

Chair: Ramesh Bollapragada, Professor, San Francisco State University, 1600 Holloway Avenue, San Francisco, CA, 94132, United States of America, rameshb@sfsu.edu

1 - Identifying Communication Needs for Disabled and Elderly during Transportation

Lavanya Marella, Graduate Research Student, University of Tennessee, 511 John D. Tickle Building, 851 Neyland Drive, Knoxville, TN, 37996, United States of America, lmarella@vols.utk.edu, Yuting Li, Eric Arendt, Rapinder Sawhney, Dhanush Agara Mallesh

One of the top barriers preventing the disabled from using public transportation was their ability to ask bus drivers basic questions concerning destination, safety and general comments. The research objective of identifying these communication needs is executed by partnering with three major transit agencies covering five counties in Tennessee and surveying the participants (passengers and drivers). Survey results are data-mined to identify future technological solutions.

2 - Reducing Traffic Congestion on all San Francisco Bay Area Highways

Ramesh Bollapragada, Professor, San Francisco State University, 1600 Holloway Avenue, San Francisco, CA, 94132, United States of America, rameshb@sfsu.edu, Uyen Tran

In this paper, we study the traffic trends of Interstate 80 and US 101 across the nine counties of the San Francisco Bay Area over the time period between 1992 and 2013, discovering the bottlenecks, and presenting several managerial insights, through sensitivity analysis, on how to allocate limited resources that provide the infrastructure to support the locations with the highest potential for traffic growth and, therefore, relieve congestion and reduce traffic time on the studied locations.

3 - Critical Systems Management Issues of Implementing the Positive Train Control Technology in a Region

Yalda Khashe, PhD Candidate, University of Southern California, 3715 McClintock Ave, GER 240, Los Angeles, CA, 90089, United States of America, khashe@usc.edu

Positive Train Control (PTC) is a generic term referring to a range of fully integrated technologies that overlay existing safety systems to prevent train-to-train collision and improve worker safety. One of the challenges that railroad industry is facing for implementing PTC is the complications of introducing this new technology to an already existing system and its effect on the Technological, organizational and human subsystems and their interactions.

1 - On the Continuous Fermat-Weber Problem for a Convex Polygon Using Euclidean Distance

Thomas Zhang, Wayzata High School, 4955 Peony Lane, Plymouth, MN, 55446, United States of America, thomaszh3@gmail.com, John Carlsson

We consider the continuous Fermat-Weber problem, where the customers are continuously distributed on a convex polygon. We derive a closed-form expression for finding the average distance from a given point to continuously distributed customers along the boundary, minimize the expression using a Weiszfeld-type procedure, and derive a closed-form formula to find the average distance for a given point to the entire convex polygon, assuming uniform distribution.

2 - A SOCP Formulation for Continuous Location Problems under Refraction

Victor Blanco, Universidad de Granada, Fac. Ciencias Economicas y Empresariales, Granada, Spain, vblanco@ugr.es, Diego Ponce, Justo Puerto

Refraction phenomenon describes the process that occurs when the light changes of medium and the phase velocity is changed but its frequency remains constant. This phenomenon is applicable to model different region-dependent transport systems where each region is allowed to be traversed with a given speed. We extend the Snell's law to any dimension and any lp norms and address the problem of locating a new facility under this effect. Computational experiments run in Gurobi are reported.

3 - Robust Facility Location Optimization with Location-dependent Demands

Juan Carlos Espinoza Garcia, ESSEC Business School, Avenue Bernard Hirsch, CS 50105, Cergy, 95021, France, juancarlos.espinoza@essec.edu, Laurent Alfandari

We present a robust optimization approach to location problems where the allocation of demand is dependent on the final choice of locations. We consider allocation rules from a global perspective (Master planning) and from a demand/supply dependent point of view. We develop the model in the context of differentiated goods, utilizing a hedonic price model for the estimation of demand allocation. Finally, we present an application to New Housing Developments planning.

4 - Integrating Uncertain Data in Disaster Relief Facility Location

Bin Li, University of Arkansas, Bell Engineering Building 4110, Fayetteville, AR, 72703, United States of America, binli@email.uark.edu, Ashlea Milburn

A multi-objective formulation of the minimax regret for the facility location problem that allows decision makers to open an efficient number of facilities when there is demand uncertainty. The problem is motivated by the recent need of integrating social data from multiple sources in order to make optimal decisions. CPLEX is used for solving three different optimization problems based on three different facility location strategies.

Demand-Responsive Rail Service Design

Sponsor: Railway Applications

Sponsored Session

Chair: Kuilin Zhang, Assistant Professor, Michigan Technological University, 1400 Townsend Drive, 870 Dow Environmental Sciences, Houghton, MI, 49931, United States of America, klzhang@mtu.edu

Co-Chair: Dengfeng Yang, Sr. R&D Engineer, Infor US Inc., 8777 N. Stemmons Freeway, Dallas, TX, United States of America, dengfeng.yang@infor.com

1 - Demand-oriented Trains Timetables for a Single Railway Line

Eva Barrena, HEC and Interuniversity Research Center, CIRRELT, 3000 Chemin de la Côte-Sainte-Catherine, Montréal, Canada, eva.barrena@cirrelt.ca, Leandro C. Coelho, Gilbert Laporte, David Canca

We study the design and optimization of train timetables for a rail rapid transit line adapted to a dynamic demand environment. The objective is to minimize the average passenger waiting time at the stations. We first propose two mathematical programming formulations. We then analyze the properties of the problem before introducing a metaheuristic in order to solve large instances of the problem within short computation times.

2 - Comprehensive Operational Dynamic Real-time Train Re-routing for a Freight Train Network

Alborz Parcham-Kashani, Georgia Institute of Technology, 755 Ferst Drive NW, Atlanta, GA, 30332, United States of America, akashani@gatech.edu, Alan Erera

We present a comprehensive model for the operational problem of dynamically re-routing freight trains in real-time in the event of a network disruption. The model considers the direct and indirect impact of re-routing decisions on the arrival time of rail cars at their final destinations. Compared to past solutions implemented by our sponsor, our model takes into account the potential benefit of avoiding re-routing options that create unnecessary congestion at terminals.

3 - Capacity Evaluation along Baltimore-DC Based on Directional vs. Bidirectional Scenarios of Operation

Hamed Pouryousef, Michigan Tech. University, 824 Dow, CEE Dept. Michigan Tech. Uni, 1400 Townsend Dr, Houghton, MI, 49931, United States of America, hpouryou@mtu.edu, Pasi Lautala

This research takes advantage of the strengths of multiple simulation packages developed in the U.S. and Europe, namely Rail Traffic Controller (RTC), OpenTrack and RailSys, on Baltimore-DC corridor. The main objective was to use their features and capabilities to compare a directional operation approach with current bidirectional approach and estimate the potential speed improvements and eventually better capacity utilization obtained along the segment with directional approach.

4 - Quadratic Programming Model for Optimizing Demand-responsive Transit Timetables

Huimin Niu, Professor and Dean, School of Traffic and Transportation,, Lanzhou Jiaotong University, Lanzhou, China, hmniu@mail.lzjtu.cn, Xuesong Zhou

This talk focuses on optimizing real-time passenger train timetables under time-dependent, geographically distributed demand matrices. A quadratic programming model with linear constraints is developed to dynamically adjust train departure and dwell times at each station to accommodate existing and predicted passenger demands in the near future. We present a few numerical examples to demonstrate the effectiveness of the proposed model.

1 - A Decision Theoretic Approach to Aircraft Collision Avoidance

Mykel Kochenderfer, Assistant Professor, Stanford University, 496 Lomita Mall, Durand Building, Room 250, Stanford, CA, 94305, United States of America, mykel@stanford.edu

The Traffic Alert and Collision Avoidance System (TCAS) is currently mandated worldwide on all large transport aircraft to reduce the risk of collision. TCAS uses deterministic models and heuristic rules, which limit the robustness of the system. This talk presents a decision theoretic approach for designing collision avoidance systems. This approach has been used to produce an optimized system that is poised to become the next international standard for collision avoidance.

2 - Using Analytics to Predict and Reduce Delays in Airport Terminals

John-Paul Clarke, Associate Professor, Georgia Institute of Technology, 270 Ferst Drive, Atlanta, GA, 30332, United States of America, johnpaul@gatech.edu, Harold Nikoue

In this talk, we present a decision support tool that predicts excessive passenger wait times inside the airport based on flight information, smart-phone-derived passenger movement data, and planned staffing levels. As part of this work, we developed a stochastic simulation to model the demand at the airport, and determine how changes in staffing levels can mitigate congestion.

3 - Data-Driven Methods for Detection of Anomalous Trajectories

Nikunj Oza, NASA, nikunj.c.oza@nasa.gov

Currently, problems in the National Airspace are found using exceedances, which are pre-defined, known anomalies. They cannot identify unknown anomalies. Data-driven methods for anomaly detection and identify data points that do not fit statistically with most of the data. These methods have been used to identify previously unknown but safety-relevant anomalies. This talk will describe our recent work on data-driven anomaly detection on radar track data over LAX, DEN, and the New York metroplex.

4 - A Comprehensive Flight Risk Model

Suresh Rangan, Technical Fellow, FedEx, 3131 Democrat Rd, Memphis, TN, 38118, United States of America, Suresh.Rangan@fedex.com, Mingzhou Jin, Ying Zhang

Various risks are involved in flight operations, including crew proficiency, equipment, environment, performance, and external pressures. Based on investigation on the practice and interactions with pilots, a comprehensive risk model is proposed to incorporate the logic relationship between dozens of factors and overall risk. Factor weights are verified with historical data. The model is used to minimize the overall risk and enhance flight safety in the most effective way through optimization.

Contributed Session

Chair: Laleh Ghalami, Wayne State University, 4500 Cass Ave., #427, Detroit, MI, 48201, United States of America, laleh.ghalami@wayne.edu

1 - Project and Portfolio Management: Combination of Data Envelopment Analysis and Structural Equation

Roseane Silveira, UFRN, Av Salgado Filho, 3000, Campus Universiterio, Lagoa Nova, Natal, 59072970, Brazil, roseane_rodrigues1@hotmail.com, Mariana Almeida, Jesus Aramayo

In this study, we present a model of combined use of data envelopment analysis and structural equations to construct an evaluation model of project management and portfolio selection applicable to brazilian petroleum industry. This model is possible to evaluate the influences from: project teams; quality and scope, and planning and control for successful management and establish benchmarks in project portfolio. The results can help to make decision for future improvement.

2 - Influence of Contractual Incentive and Trust on Contractor's Cooperative Behavior

Yongcheng Fu, Tianjin University, 92 Weijin Road, Nankai District, Tianjin, 300072, China, fuyongcheng@tju.edu.cn, Lihan Zhang, Yongqiang Chen

This paper distinguished two kinds of contractor's cooperative behavior, task-based behavior and relationship-based behavior, and studied the following research questions: 1) how the combination of contractual incentive and trust influence contractor's cooperative behavior; 2) how to determine the optimal incentive coefficient; 3) what are the boundary conditions for the complementation of contractual incentive and trust.

3 - Knowledge Sharing in the Inter-organizational Teams: The Influence Mechanisms of Relationships and Task Conflicts

Zhi Chen, University of Science and Technology of China, School of Management, Hefei, 230026, China, zhichen@mail.ustc.edu.cn

Knowledge sharing within inter-organizational teams is critical to team creativity. We proposed a model relating team conflict to knowledge sharing, and knowledge sharing to team creativity. The moderating effect of shared leadership on the relationship between team conflict and knowledge sharing were examined.

4 - Constrained Project Allocation Problem

Abdulaziz Alkabaa, PhD Student, University of Tennessee, 851 Neyland Drive, Knoxville, TN, 37996, United States of America, aalkabaa@utk.edu, Alberto Garcia-Diaz

A combined project selection-for-investment and allocation-for-development model is formulated for a transportation agency to maximize the value of benefits derived by users of a highway system subject to budget constraints, using Mahalanobis distances. Projects are developed by in-house engineers or private contractors. An overview of the solution procedure is given.

5 - Refining Engagement: A Team Process Model

Amy Sommer, Assistant Professor, HEC Paris, 1 Rue de la Liberation, Jouy-en-Josas, 78351, France, Sommera@hec.fr, Lisa Stickney, Deanna Kennedy

Team engagement is herein considered through task and relational engagement dimensions. We discuss the link of antecedents to task and relational engagement, team processes, and outcomes. This framework can enhance the way engagement is used for team selection, training, outcomes, and employee retention.

Vacation and Online Scheduling

Cluster: Scheduling and Project Management

Invited Session

Chair: Marc Posner, Professor, Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, posner.1@osu.edu

1 - Makespan Minimization Subject to Machine Unavailability and Total Completion Time Constraintsi

Yumei Huo, Associate Professor, CUNY at Staten Island, Staten Island, NY, United States of America, yumei.huo@csi.cuny.edu

In this research, we study the preemptive bi-criteria scheduling problems on m parallel machines with machine unavailable intervals. The goal is to minimize the makespan subject to the constraint that the total completion time is minimized. We study the model where each machine can have multiple unavailable intervals, but at any time, there is at most one machine unavailable. We show that there is an optimal polynomial time algorithm for this model.

2 - Minimizing Total Completion Time in Flowshop with an Unavailable Interval on the First Machine

Hairong Zhao, Associate Professor, Purdue University at Calumet, Hammond, IN, 46323, United States of America, hairong@purduecal.edu

We study the problem of minimizing total completion time in 2-stage flowshop with an unavailable interval on the first machine. The problem is NP-hard in the strong sense even if both machines are always available. With availability constraint, many papers have studied the makespan minimization problem, but no research is done on total completion time minimization. Our paper is the first attempt to investigate the problem and our goal is to develop an efficient branch-and-bound algorithm.

3 - Online Production Planning and Information Purchase to Maximize Market Share

Marc Posner, Professor, Ohio State University, Integrated Systems Engineering, 1971 Neil Avenue, Columbus, OH, 43210, United States of America, posner.1@osu.edu, Chris Potts, Nicholas G. Hall

We consider a production planning problem with complete information about current orders. Additional orders become available at a known time. Prior to this time, costly information about these orders may become available. We maximize the proportion of orders completed by their due dates, minus information cost, if purchased. We describe an asymptotically best possible algorithm that maximizes the value of information. Further, we study the sensitivity of performance to decisions.

Analytics in Cloud

Sponsor: Service Science

Sponsored Session

Chair: Rahul Ghosh, IBM, 3039 Cornwallis Road, Durham, NC, 27709, United States of America, rghosh@us.ibm.com

1 - Statistics @ Scale

Chiranjit Mukherjee, Statistician, Google, 1600 Amphitheatre Pkwy, Mountain View, CA, 94043, United States of America, chiranjitmukherjee@gmail.com

This presentation focuses on available statistical tools and techniques available on/for popular cloud computing environments.

2 - On Outlier Detection and Workload Forecasting for Contact Centers

Rahul Ghosh, IBM, 3039 Cornwallis Road, Durham, NC, 27709, United States of America, rghosh@us.ibm.com, Gyana Parija, Sudhanshu Singh, Santosh Srivastava

Long term forecasting for contact centers with high accuracy is an issue of great importance since it triggers capacity planning, scheduling, hiring and training activities for the contact center. Forecasting for businesses with outliers is more difficult because outliers add an extra layer of randomness to the historical data. We propose a method for forecasting that identifies various kinds of outliers and allows users to assess their impact for analysis and forecasting.

3 - Resource Allocation in Cloud Storage

Ioannis Papapanagiotou, Assistant Professor, Purdue University, 401 N Grant Street, West Lafayette, IN, 47907, United States of America, ipapapan@purdue.edu, Zhihao Yao

Cloud storage solutions have gained immense popularity as a paradigm for the dynamic provisioning of storage services deployed on Backend systems. In this work, we present our vision and discuss the research challenges in the volume request allocation in Cloud storage systems with multiple backend systems. We will present efficient policies that can provide efficient and fast allocation of the volume requests, and can also provide a guaranteed Quality of Service.

4 - Gaining Deeper Insights from Text: Unsupervised Learning Methods Perform Better

Abhinav Shashank, Co-Founder & CEO, InnovAccer, D-66 First Floor, Sector 63, Noida, UP, 201301, India, abhinav@innovaccer.com, Kanav Hasija

Machine Learning techniques with training corpus are useful in extracting entities, objects, emotions, personalities, and other characteristics from text, although are highly context-biased. We, in this paper, present techniques to perform such exercises which are context independent. Good data corpus and re-iteratively tested algorithms are building blocks for these techniques.

Team Performance

Cluster: Workforce Management and Engineering

Invited Session

Chair: Gretchen A. Macht, Pennsylvania State Unviersity, State College, PA, United States of America, gretchen.macht@gmail.com

1 - Interpersonal Skills, Communication, and Team Performance

Gretchen A. Macht, Pennsylvania State University, State College, PA, United States of America, gretchen.macht@gmail.com, David A. Nembhard, Robert M. Leicht

We consider the degree to which mixed Emotional Intelligence (EI) characteristics of interpersonal skills predict team performance. When specifically examining intellectual tasks the literature demonstrates that interpersonal skills, how individual understand others' emotions, were not significant with engineering project team's performance. This study utilized structural equation models to examine the direct and indirect effects of interpersonal skills on team performance. The current results contribute to the literature by adding further understanding of the mediating variable, such as communication, that exist within the emotional intelligence-performance team dynamic.

2 - The Effect of Task Complexity on Deadline Rush in Individual and Team Performance

Ji-Eun Kim, Pennsylvania State University, State College, PA United States of America, blessedpond@gmail.com

"Deadline rush" occurs when work rate increases as a deadline approaches. Using an Anti-Air Warfare Coordinator (AAWC) task, we show that task complexity is associated with higher deadline reactivity of for both individual and team work. The current result highlights the importance of task complexity in managing and forecasting human behaviors in the presence of deadlines.

3 - Some Effects of Deadline Proximity on Work Performance

David A. Nembhard, Pennsylvania State University, State College, PA, United States of America, dan12@psu.edu, Kenneth Doerr

Deadlines have been known for some time to influence human behavior. However, the management of people and associated deadlines poses unanswered questions. How do deadlines affect individual work rate variability? What role does communication play in team performance in the presence of deadlines? These questions are important to aid managers in making operational and policy decisions regarding deadlines. Results indicate evidence that communication has an effect on performance in the presence of deadlines, and also has some impact on the variability of performance.

Product Design and Manufacturing

Cluster: New Product Development

Invited Session

Chair: Gulru Ozkan, Clemson University, Department of Management, 120B Sirrrine Hall, Clemson, SC, 29634, United States of America, gulruo@clemson.edu

1 - Product Design in a Decentralized Supply Chain: Value of Information Asymmetry

Narendra Singh, Georgia Tech, Atlanta, GA, United States of America, Narendra.Singh@scheller.gatech.edu, Stelios Kavadias, Ravi Subramanian

We study an OEM's optimal product design and sourcing strategies in a supply chain consisting of an OEM, who has a less-efficient alternative sourcing option, and a more-efficient supplier with the power to dictate contract terms. We show that if the competitiveness of the OEM's alternative source is sufficiently low, the first-best quality is chosen. Further, we show that asymmetric information about the OEM's cost structure may lead to higher profits for both the OEM and the supplier.

2 - Problem-Solving Effort and Success in Innovation Contests: The Role of National Wealth and Culture

Cheryl Druehl, George Mason University, 4400 University Drive, Fairfax, VA, United States of America, cdruehl@gmu.edu, Jesse Bockstedt, Anant Mishra

Innovation contests allow firms to harness specialized skills from diverse participants. We examine the implications of diversity,in terms of national wealth and culture, in such contests on problem-solving effort and success. Also, we examine whether "home bias" effects exist. Using a large dataset from an online logo-design contest and country-level archival data, we find that diversity in wealth and culture do impact problem-solving effort and find evidence of "home bias" effects.

3 - A Behavioral Analysis on the Use of an Intermediary in Manufacturing Outsourcing

Qiong Chen, Clemson University, 100 Sirrine Hall, Clemson University, Clemson, SC, 29631, United States of America, qiongc@g.clemson.edu, Aleda Roth, Gulru Ozkan, Fred Switzer

In this paper, we examine how the perceived capability of the intermediary, perceived costs, time pressure and the type of manufacturing outsourcing decision act to systematically influence manager's decision to outsource production either directly or indirectly through an intermediary. We present a behavioral operations model, constructs and empirically validated measures.

Risk Analysis Models for Critical Infrastructure and Service Systems

Sponsor: Public Programs, Service and Needs

Sponsored Session

Chair: Joost Santos, Assistant Professor, George Washington University, 1776 G St NW, Suite 101, Washington, DC, 20052, United States of America, joost@gwu.edu

1 - The Strive for Financial Accountability and its Impact on the Utility Created by an NGO

Christian Burkart, WU Vienna University of Economics and Business, Welthandelsplatz 1, D1.4106, Vienna, 1020, Austria, christian.burkart@wu.ac.at, Tina Wakolbinger, Fuminori Toyasaki, Michael Fearon

Financial accountability measures including administrative cost ratios are increasingly employed by donors to quantify aid agencies' performance. Typically lower administrative costs are seen as preferable ignoring possible positive effects. In this paper, we develop an optimization model that analyzes the influence of the consideration of administrative costs on the decision-making behavior and utilities of NGOs, beneficiaries and donors.

2 - Risk Mitigation in a Supply Chain Infrastructure Using Fault-Tree Optimization

Mike Sherwin, Mississippi State University, Mississippi State, MS 39732, United States of America, mds539@msstate.edu, Hugh Medal, Steven Lapp

This paper presents a quantitative approach to improve decisions related to risk mitigation within a supply chain infrastructure using a combination of fault-tree analysis and mathematical optimization. A fault-tree is analyzed to determine the optimum mitigation and resource allocation plan that reduces the probability of an event given budgetary constraints.

3 - Analysis of Drought Mitigation Strategies using Dynamic Input-Output Modeling and Event Trees

Joost Santos, Assistant Professor, George Washington University, 1776 G St NW, Suite 101, Washington, DC, 20052, United States of America, joost@gwu.edu

Climate change is expected to increase the frequency and intensity of droughts in many parts of the world. The adverse effects of droughts can propagate through regional sectors as a result of their inherent interdependencies. In this work, we evaluate three drought management strategies by combining economic input-output modeling with event tree analysis: (i) reducing the initial level of water supply disruption, (ii) managing water consumption, and (iii) prioritizing water-use dependencies.

4 - Estimating the Effects of Utility Disruption on Household Well-being During Hurricane Sandy

Pallab Mozumder, International Hurricane Research Center, Florida International University, Miami, FL, 33199, United States of America, mozumder@fiu.edu, Sisi Meng

Intense winds and flooding brought widespread interruptions to public utility services along Hurricane Sandy's path in the Northeastern US. Using household survey data, we provide an initial estimate of the household damages due to disruption in utility services (electricity, water, gas, telecommunication and public transportation). Understanding major determinants of damages caused by utility disruptions and its impact on household well-being can provide key inputs for disaster management.

Telecommunications Network Flows and Design

Sponsor: Telecommunications

Sponsored Session

Chair: Stanko Dimitrov, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca

1 - Assessing Vulnerability of Wireless Telecommunications Networks

Ozgur Kabadurmus, Assistant Professor, Yasar University, Bornova, Izmir, Turkey, ozk0001@tigermail.auburn.edu

In telecommunications network design problems, survivability and reliability are well known QoS metrics to mitigate service disruptions. In this study, wireless telecommunications network designs obtained by optimization for capacitated resilience and well known network reliability/survivability metrics (k-terminal reliability and traffic efficiency) are compared in terms of their performance (and vulnerability) in network attacks and random failure scenarios.

2 - Compact Formulation of the Network Design Problem: An Empirical Study

Eli Olinick, Associate Professor, Southern Methodist University, Dallas, TX, 75205, United States of America, olinick@lyle.smu.edu, Adam Colley

We present a new formulation for network flows in undirected graphs yielding significantly smaller LP's than those derived from the node-edge or edge-path formulations. This characterization of network flow yields a more compact formulation allowing more efficient solutions including instances either too large or too time consuming to solve by the standard edge-path and node-edge formulations, and is applied to the network design problem in an empirical study.

3 - Generating OSPF Weights from Computed Routing Polices that Account for Active Queue Management

Stanko Dimitrov, University of Waterloo, 200 University Avenue West, Waterloo, Canada, sdimitro@uwaterloo.ca, Jiaxin Liu, Laura Sanita

We present work on generating OSPF weights from routing policies computed for backbone networks that account for active queue management (AQM). We show that for a given all-pairs routing policy, finding bounded integer edge weights such that the given routing policy can be derived using shortest paths is NP-Hard. We test the realizability of OSPF policies accounting for AQM on a set of backbone networks and compare the performance of our generated policies with the policies currently used.

Public-Private Partnership and Performance Based Logistics Contract Design

Sponsor: Artificial Intelligence

Sponsored Session

Chair: Amir Reza KashaniPour, University of Maryland, College Park, College Park, United States of America, akashani@umd.edu

1 - Bilateral Contract Design for Wind Energy Projects under Uncertainty

Xinyuan Zhu, Graduate Research Assistant, University of Maryland, College Park, University of Maryland, College Park, MD, 20742, United States of America, zxyemily@umd.edu, Qingbin Cui

This paper proposes a stochastic program to design the long-term Power Purchase Agreement (PPA) for wind energy projects. The long-term risks and cash flow volatility are considered through the metric of Conditional Value at Risk (CVaR), and a chance constraint is proposed to depict the electricity buyer's non-regret attitude. The model is applied to the Cape Wind offshore project in US as the case study, and the optimized PPA of the project is discussed through an out-of-sample analysis.

2 - Maintenance Enterprise Resource Planning (MERP): A Budget Simulation for PBL

Rogers Ascef, Lt Col - PhD Candidate, 905 Spruance Rd, Monterey, CA, 93940, United States of America, rascef@nps.edu

One of way to manage Maintenance Supply Chain (MSC) is to use Performance Basic Logistic. One of more arduous tasks of PBL management is to know how much I have to pay to match an operational availability. The research proposes to build a simulation using a proposed model called Maintenance Enterprise Resource Planning (MERP) to predict the budget based in the service level and the quantity of usage of equipment. Also, this simulation can be used to negotiate contracts using PBL.

3 - A Non-cooperative Lease Contract

Maryam Hamidi, Session Chair, University of Arizona, 1127 E. James E. Rogers Way, Room 111, P.O. Box 210020, Tucson, AZ, 85721, United States of America, mhamidi@email.arizona.edu, Ferenc Szidarovszky, Haitao Liao

Here a game-theoretic model is developed to study the process by which the owner (lessor) leases certain equipment to a user (lessee) under a lease contract. The lessor and lessee need to jointly decide on optimal lease period, usage rate and preventive maintenance policy of the leased equipment. The non-cooperative Nash equilibrium is studied to solve this problem and the structural properties of the optimal strategies are investigated and an algorithm is provided to search for the equilibria.

4 - Stockout Compensation: Joint Inventory and Price Optimization in Electronic Retailing

Hement Bhargave, UC Davis, Graduate School of Management, One Shield Avenue, Davis, CA, 95616, United States of America, hemantb@ucdavis.edu, Daewon Sun, Susan Xu

We analyze the effect of offering a lower price during stockout to compensate for a customer's waiting time, using an EOQ-type inventory-modeling framework but solving simultaneously for both the optimal prices and the lengths of the in-stock and stockout periods. The optimal stockout-compensation policy is to choose period lengths and prices such that the two periods have equal effective prices. Compared with a backorder policy without compensation, the stockout compensation policy improves profits and social welfare but at the expense of consumer surplus.

Health Care Modeling Optimization I

Contributed Session

Chair: Guven Kaya, PhD Student, Industrial Engineering-University of Houston, E222 Engineering Building 2, Houston, TX, 77204, United States of America, gkaya@central.uh.edu

1 - Modeling and Analysis of Primary Care Delivery System

Xiang Zhong, Research Assistant, University of Wisconsin Madison, 1513 University Avenue, Madison, WI, 53705, United States of America, oliver040525@gmail.com, Molly Williams, Jingshan Li, Sally Kraft

In this work, we introduce an analytical model to characterize the general primary care delivery system. A Markov chain model is built to study the in-room services. The in-room processes are aggregated to a single server and the variation of such process is evaluated. A G/G/1 queuing model with general patient arrival and general service distribution is developed to evaluate the patient length of stay and resource utilization.

2 - Outpatient Appointment Scheduling: Challenges and Opportunities in Korea

KwonGi Mun, Rutgers Business School, 1 Washington Park, Newark, NJ, 07102, United States of America, kwongmun@pegasus.rutgers.edu, Yao Zhao, Endre Boros

The rate of growth in health spending in Korea was more than twice the average across OECD countries. We first review the Korean insurance system, and also start to review previous papers that explain mathematical approaches for reducing the waiting time of patients' queue. A main contribution is that a newly designed mathematical method will help hospitals optimize both profit and patients' satisfaction.

3 - Add-on Surgical Case Scheduling with Multiple Objectives and Stochastic Case Durations

Ashkan Hassani, PhD Student, Wayne State University, 4815 Fourth Street, Detroit, MI, United States of America, ashkan.hassani@wayne.edu, Hakimuddin Neemuchwala, Alper Murat

We study the problem of scheduling add-on cases in a multi-OR facility. Perfect information of all add-on cases is available before the start of day. We formulate a multi-criteria stochastic mixed-integer program and develop an efficient algorithm. Objective is to minimize deviations from planned schedule considering resource constraints. Model and results are verified using data from the Detroit VAMC.

4 - A Benders Decomposition Approach for Beam Angle Optimization (BAO) Problem

Guven Kaya, PhD Student, Industrial Engineering-University of Houston, E222 Engineering Building 2, Houston, TX, 77204, United States of America, gkaya@central.uh.edu, Gino Lim, Wenhua Cao

In radiation therapy treatment planning problems, computational effort grows significantly with data and model size. Benders decomposition technique is useful to overcome memory problem. It divides the problem into many smaller problems, so solving small problems can be more effective than solving a single large problem. We apply Benders method to beam angle optimization (BAO) problem. We use fluence map optimization (FMO) model as subproblem. Prostate cancer case is used to show results.

5 - Optimal Time Planning for Hospital Operating Rooms and Surgery Blocks Allocation under Uncertainty

Qiqi Zhang, University of Windsor, 401 Sunset Avenue, Windsor, ON, N9B 3P4, Canada, zhang1be@uwindsor.ca, Yifei Zhang, Guoqing Zhang

To improve hospital operating room (OR) efficiency, we propose both deterministic and stochastic optimization models for hospital surgery allocation and ORs time planning. The objective of the models is to minimize the sum of fixed OR cost, normal operating cost, and overtime operating cost. Different from existing models, we integrate time allocation for each surgery with OR time planning in the stochastic model. Numerical experiments are conducted to test the results for the two models.

Optimization in Radiation Therapy and Epidemic Control

Sponsor: Health Applications

Sponsored Session

Chair: Hamed Yarmand, Massachusetts General Hospital and Harvard Medical School, Proton Therapy Center, MGH, 30 Fruit Street, Boston, MA, 02114, United States of America, hamedyarmand@gmail.com

1 - A Clinical Approach to Beam Angle Optimization in Radiation Therapy

Hamed Yarmand, Massachusetts General Hospital and Harvard Medical School, Proton Therapy Center, MGH, 30 Fruit Street, Boston, MA, 02114, United States of America, hamedyarmand@gmail.com, David Craft

In current clinical systems for radiation therapy treatment planning optimization the beams are selected manually and the intensities are then optimized. We investigate the potential benefits of incorporating automated beam selection into such clinical systems using our in-house developed algorithm to generated quality-guaranteed treatment plans which use the minimum number of beams.

2 - Interfacing GAMS and MATLAB for Large-scale Optimization

Jagdish Ramakrishnan, Post-doctoral scholar, University of Wisconsin-Madison, Wisconsin Institute for Discovery, Madison, WI, 53715, United States of America, jramakrishn2@wisc.edu, Steven Dirkse, Michael Ferris

For many applications, modeling languages (e.g. GAMS) provide easy prototyping and linking to optimization solvers while statistical software (e.g. MATLAB) provide much better data analysis ability. We developed a faster data transfer tool for large indexed data between GAMS and MATLAB, now part of the latest GAMS distribution. We illustrate its usefulness by solving a large-scale radiotherapy problem and visualizing the results in CERR, a MATLAB based radiotherapy visualization tool.

3 - Cost-effectiveness Assessment of Influenza Control Strategies using an Agent-based Model

Seyed Hossein Moosavi, Concordia University, 1455 Boulevard de Maisonneuve Ouest, Montreal, QC, H3G2B7, Canada, moosavi.hossein@gmail.com, Elnaz Karimi, Ali Akgunduz, Ketra Schmitt

We assess costs associated with a university influenza control policy and compare these to the costs of illness. Probability assessments are derived from an agent-based model which simulates individual behavior in an university population using a variety of intervention strategies. We then conduct a cost-effectiveness analysis to find the best combination of interventions to control the spread of influenza in the target population.

Sponsored Session

Chair: Bryan A. Norman, Associate Professor, University of Pittsburgh, 1033 Benedum Hall, Pittsburgh, PA, 15261, United States of America, banorman@pitt.edu

1 - Integrated Storage and Shelf-space Allocation via Integer Programming

Nazanin Esmaili, PhD Student, University of Pittsburgh, 1048 Benedum Hall, Pittsburgh, PA, 15261, United States of America, nae22@pitt.edu, Jayant Rajgopal, Bryan A. Norman

We address the joint allocation of storage and shelf-space, motivated by the management of inventory items that are dispensed at outpatient clinics. We present an integer programming formulation for selecting the items to be stocked, along with their shelf space allocations, in order to maximize the total value which is based on the desirability of stocking items. We propose several valid inequalities in order to improve computational performance and also present a heuristic algorithm.

2 - Using Optimization-Based Techniques to Reduce the Supply of Surgical Instruments

Amy Cohn, University of Michigan, 1205 Beal Avenue, Ann Arbor, MI, United States of America, amycohn@med.umich.edu, Daniel Hazlett

We consider the case of building "trays" or "sets" of surgical instruments — all of the instruments needed by a specific surgeon to perform a specific surgery. We investigate ways to reduce the overall need for excessive/redundant levels of instrument inventory by finding a reduced set of tray definitions that still meet each surgeon's needs.

3 - Peri-operative Healthcare Inventory Management in the Real World

James Benneyan, Director, Healthcare Systems Engineering Institute, 360 Huntington Ave, Boston, MA, 02115, United States of America, j.benneyan@neu.edu, Dayna Martinez, Adam Perruzzi

Typical inventory policies can be difficult to implement in many healthcare settings for a variety of reasons, including culture, physician autonomy, and unavailable or inaccurate data. We summarize several recent projects to improve perioperative inventory management practices and reduce associated costs, including establishing PAR levels, replenishment policies, and processed for updating and maintaining accurate preference cards.

4 - Day-of-Discharge Planning at Acute Care Hospitals

Nicholas Ballester, Wright University, Department of Biomedical, Industrial and Human Factors Engineering, Dayton, OH, 45435, United States of America, Ballester.2@wright.edu, Pratik Parikh, Kylie Bertsch, Nan Kong

We explore the tradeoffs within inpatient discharge processes, which affect the steadiness of intra-departmental inpatient flow, through a simulation study. Our focus is specifically on the sequence of events on the day-of-discharge and its effects on discharge time distribution and upstream boarding. Data collected from a local hospital are used to develop and validate our model. We evaluate a variety of discharge strategies and conduct statistical comparisons on process-related metrics.

Workload, Quality, and Staffing

Sponsor: Health Applications

Sponsored Session

Chair: Wen-Ya Wang, San Jose State University, One Washington Square, San Jose, CA, United States of America, wenya.wang@sjsu.edu

1 - Improving Emergency Medical Services (EMS) with Time-Region-Specific Cruising Ambulances

Jiun-Yu Yu, Assistant Professor, National Tawain University, No. 1, Section 4, Roosevelt Road, Da-An, Taipei, Taiwan - ROC, jyyu@ntu.edu.tw

EMS refers to both patient transport and medical support solution for people with illness or injuries. Recent clinical evidence shows that time spent by the ambulance to arrive at the scene is critical. To reduce the response time, a time-region-specific ambulance cruising policy is proposed. Analytics and GIS are applied to generate the joint time-region distributions to identify high frequency grids. Simulation models are built to examine various ambulance cruising policies.

2 - Behavior-Aware Nurse Staffing

David Cho, Indiana University, Operations & Decision Technologies Dept, Kelley School of Business, Bloomington, IN, 47405, United States of America, ddcho@indiana.edu, Kyle Cattani, Alex Mills, Kurt Bretthauer

This paper presents nurse staffing models that incorporate quality of patient care and workforce behavior, issues often ignored in current research. For example, we consider behavioral issues such as temporary nurse speedup and its impact on patient length-of-stay. We study the question of whether hospitals can simultaneously reduce costs while achieving better patient outcomes.

3 - Physician Panel Design
Wen-Ya Wang, San Jose State University, One Washington Square, San Jose, CA, United States of America, wenya.wang@sjsu.edu, Diwakar Gupta

This study focuses on the physician panel design problem of determining the patient composition (i.e. panel size and types of patient) for physician panels. We investigate how clinics would allocate a heterogeneous pool of patients who have different propensity for requesting urgent appointments to physicians to balance physician workload and cost of serving patients in a timely manner.

4 - Cross-sector Collaboration in a Population Health Framework
Sandra Potthoff, Associate Professor, University of Minnesota, 420 Delaware Street SE, Mayo Mail Code 510, Minneapolis, MN, 55455, United States of America, potth001@umn.edu

The former mayor of Kansas City was surprised when its county health rankings were dead last in the state in spite of the presence of a premier health system. Population health entails more than a highly functioning healthcare system. It requires collaboration across institutional sectors. As healthcare moves to a population health focus, a cross-sector systems approach is needed with new performance metrics of quality and outcomes. This talk describes early efforts to move in this direction.

Inventory Management in Healthcare

Sponsor: Health Applications

Sponsored Session

Chair: Hossein Abouee Mehrizi, University of Waterloo, 200 University Avenue West, Waterloo, ON, N2L 3G1, Canada, haboueemehrizi@uwaterloo.ca

1 - Blood Platelet Inventory Management with Protection Levels
Alan Scheller-Wolf, Professor, Carnegie Mellon University, Tepper School of Business, Carnegie Mellon University, Pittsburgh, PA, 15213, United States of America, awolf@andrew.cmu.edu, Itir Karaesmen, Ismail Civelek

We consider ordering and allocation of a perishable product with demand for different ages, such as blood platelets. If demand is satisfied with inventory of a different age, a cost is incurred. We propose a simple replenishment and inventory allocation heuristic to minimize the expected total cost that has superior performance compared to existing heuristics in the literature, particularly if supplies are limited.

2 - Optimal Inventory Policy for Perishable Products with Regular and Optional Expedited Replenishmt
William Pierskalla, Professor, UCLA Anderson School, Los Angeles, CA, United States of America, william.pierskalla@anderson.ucla.edu, Lawrence Leung, Deming Zhou

Platelets have a mere three-day life span in U.S. A periodic review inventory system for such a perishable product under two replenishment modes is analyzed. Regular orders are placed at the beginning of a cycle. Within the cycle, the manager has an option of placing an expedited order. For this platelet inventory problem, we prove the existence and uniqueness of an optimal policy that minimizes the expected cost and develop an algorithm to obtain the optimal inventory levels.

3 - Optimal Multi-specialty Surgery Scheduling under Operating Resource and Hospital Bed Constraints
Shrutivandana Sharma, Singapore University of Technology and Design, 20 Dover Drive, Singapore, 138682, Singapore, shrutivandana@sutd.edu.sg, Hossein Abouee Mehrizi

We consider a bed scheduling problem, where the decision is to schedule surgeries of two different types over a finite horizon. The number of surgeries of each type that can be performed in any period is bounded by the availability of operating resources for that type, as well as the total availability of beds. We formulate the problem as a multi-period capacitated inventory problem, and characterize the optimal solution.

4 - Better Intermediation in Two-Sided Markets
Mustafa Akan, Tepper School of Business; Carnegie Mellon University, 5000 Forbes Ave, Pittsburgh, PA, 15213, United States of America, akan@andrew.cmu.edu

This paper proposes a mechanism to maximize the total number of successful matchings by improving the recommendation scheme the intermediaries follow. These recommendations play a crucial role because they shape the beliefs of the agents on the receiving end of the market about the other side.

Issues Related to Large-scale Data Mining

Sponsor: Computing Society

Sponsored Session

Chair: Philipp Baumann, University of Bern, Department of Business Administration, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, philipp.baumann@pqm.unibe.ch

1 - Sparse Computation for Large-scale Data Mining with Pairwise Affinities
Dorit Hochbaum, Professor, University of California, Berkeley, IEOR Department, Etcheverry Hall, Berkeley, CA, 94720, United States of America, hochbaum@ieor.berkeley.edu, Philipp Baumann

Supervised normalized cut and k-nearest neighbors are two effective classification techniques that employ pairwise affinities. This takes quadratic time and space to generate. Unlike existing sparsification techniques that process the full matrix and round down some of the entries to zero, sparse-computation computes only the high similarity pairs and requires at most linear time. It is demonstrated that sparse-computing delivers dramatic reductions in run times while maintaining high accuracy.

2 - Construction of Index-tracking Portfolios using Data Mining and Linear Programming
Oliver Strub, University of Bern, Department of Business Administration, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, oliver.strub@pqm.unibe.ch, Norbert Trautmann, Philipp Baumann

Index tracking is a popular investment strategy because of the low management and transaction costs. The construction of a tracking portfolio includes selecting an appropriate subset of index constituents, which is computationally expensive. We apply data mining techniques to determine a promising subset in short running time, and linear programming to determine the portfolio weights. This novel approach compares favorably to existing ones in terms of out-of-sample performance and running time.

3 - A Computational Comparison of Machine Learning Methods and the Supervised Normalized Cut
Philipp Baumann, University of Bern, Department of Business Administration, Schuetzenmattstrasse 14, Bern, 3012, Switzerland, philipp.baumann@pqm.unibe.ch, Yan Yang, Dorit Hochbaum

We present a computational study evaluating the binary classification performance of ten machine learning methods. The study includes, for the first time, variants of the recently proposed method of supervised normalized cut. The performance is evaluated in terms of prediction accuracy and run time on various datasets from the UCI Machine Learning Repository. The results demonstrate that k-nearest neighbors, support vector machine and supervised normalized cut perform best in terms of accuracy.

4 - Clustering Categories in Support Vector Machines
Dolores Romero-Morales, Professor in Operations Research, Copenhagen Business School, Denmark, drm.eco@cbs.dk, Emilio Carrizosa, Amaya Nogales Gomez

We propose the Cluster Support Vector Machines (CLSVM) methodology to reduce the complexity of the SVM classifier in the presence of categorical features. Four strategies for building the CLSVM classifier are presented based on solving: the original SVM formulation, a QCQP formulation, and an MIQP formulation as well as its continuous relaxation. We illustrate that our methodology achieves comparable accuracy to that of the SVM with original data but with a dramatic decrease in complexity.

Sponsored Session

Chair: Wolf Ketter, Professor, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062 PA, Netherlands, wketter@rsm.nl

1 - Managing Smart Home Energy Consumption through Intelligent Decision Support

Konstantina Valogianni, PhD Candidate, Rotterdam School of Management, Burgemeester Oudlaan 50, Rotterdam, 3062PA, Netherlands, KValogianni@rsm.nl, Wolf Ketter, John Collins, Dmitry Zhdanov

We present a decision support algorithm for smart homes equipped with household appliances and electric vehicles. The presented algorithm is implemented through an intelligent agent, representing the household. We use reinforcement learning and dynamic programming to provide personalized consumption recommendations to household prosumers and evaluate the results under competitive energy markets conditions. By using the algorithm we observe benefits both for the prosumers and the smart grid.

2 - Facilitating Appropriate Compensation of Electric Energy and Reserve through Standardized Contracts

Deung-Yong Heo, PhD Student, Department of Economics, Iowa State University, 260 Heady Hall, Ames, IA, 50011, United States of America, dyheo@iastate.edu, Leigh Tesfatsion

The current design of wholesale power markets makes it difficult to ensure appropriate compensation for many important load-balancing services, such as flexibility in power attributes. This study examines the possibility of facilitating appropriate compensation through the introduction of standardized contracts (SCs) with swing (flexibility) and demonstrates how SCs can be supported by two settlement system permitting efficient load balancing under system constraints and reserve requirements.

3 - Impact of Information Transparency and Social Value Orientation on Smart Grid Balancing

Laurens Rook, TU Delft, Jaffalaan 5, Delft, 2628BX, Netherlands, L.Rook@tudelft.nl, Sudip Bhattacharjee, Xu Han, Wolf Ketter

We tested and found that smart grid balancing under information transparency (where consumers are aware of collective actions for the whole population in different periods) has a better outcome than under no information. We further posited that this effect would be moderated by social value orientation (SVO; the weight people attach to their own benefits relative to those of others).

4 - AgentUDE: The Success Story of the Power TAC 2014's Champion

Serkan Ozdemir, PhD Candidate, University of Duisburg-Essen, DAWIS, Universitat Duisburg-Essen, Schützenbahn 70, Essen, 45127, Germany, serkan.oezdemir@icb.uni-due.de, Rainer Unland

Future smart grid will bring new actors and features such as local producers, storage units and interruptible consumers to the current electricity grid. Power Trading Agent Competition (Power TAC) provides a comprehensive simulation platform to enable various smart grid studies as well as an annual competition in which autonomous brokers trade in the power markets and gain profits. AgentUDE won the 2014 games as the newest participant of the competition utilizing an adaptive and reactive agent.

Behavior in Supply Chains and Procurement

Sponsor: Behavioral Operations Management

Sponsored Session

Chair: Ruth Beer, PhD Candidate in Technology and Operations, Ross School of Business, University of Michigan, 701 Tappan Street, R4421, Ann Arbor, MI, 48109, ruthbeer@umich.edu

1 - Does the Retailer Lie about Sales Under a Revenue Sharing Contract? An Experimental Investigation

Yinghao Zhang, Assistant Professor, Salisbury University, Perdue Hall 333, 1101 Camden Avenue, Salisbury, MD, 21804, United States of America, YXZHANG@salisbury.edu, Tianjun (TJ) Feng

We investigate whether the retailer will truthfully report the sales data to the supplier under a revenue sharing contract, and how the retailer's truth-telling (or lying) behavior may influence the supplier's contract decisions. Our theory shows that a profit maximizing retailer will always report "zero" sales, leading the supplier in favor of a wholesale price contract. The lab experiment, however, suggests otherwise.

2 - Sourcing Decisions Leading Up To and Following High Impact, Low Probability Disruptions

Kyle Goldschmidt, Pennsylvania State University, 426A Business Building, University Park, PA, 16802, United States of America, khg116@psu.edu, Doug Thomas, Chris Craighead, Mirko Kremer

We examine decision-making regarding supply base diversification when threatened by high impact, low probability (HILP) supply chain disruptions.

3 - Decision Making and Cognition in Multi-Echelon Supply Chains: An Experimental Study

Brent Moritz, Assistant Professor, Penn State University, 469 Business Building, University Park, PA, 16802, United States of America, bmoritz@psu.edu, Arunachalam Narayanan

Individual decision making contributes to the bullwhip effect. Using a large experiment, the cognitive profile of decision-makers results in substantial differences in cost and order quantity variance. We report subject-level decision heuristics: The degree of the underweighting the supply line is linked to an individual's level of cognitive reflection.

4 - The Impact of Decision Rights and Long Term Relationships on Innovation Sharing

Ruth Beer, PhD Candidate in Technology and Operations, Ross School of Business, University of Michigan, 701 Tappan Street, R4421, Ann Arbor, MI, 48109, ruthbeer@umich.edu, Hyun-Soo Ahn, Stephen Leider

We study a supplier's incentives to share an innovation with a buyer when sharing the innovation increases efficiency but makes the supplier vulnerable to the buyer sharing it with other suppliers. We show, both theoretically and experimentally, that the supplier's optimal decision depends on the length of the relationship and in particular, on how the buyer allocates decision rights among its employees.

Chair: Siqian Shen, Assistant Professor, University of Michigan, 2793 IOE Building, 1205 Beal Avenue, Ann Arbor, MI, 48109, United States of America, siqian@umich.edu

1 - Isomorphism Pruning on General Integers

Jim Ostrowski, Assistant Professor, University of Tennessee, 525K John D. Tickle Building, 851 Neyland Drive, Knoxville, TN, 37996, United States of America, jostrows@utk.edu, Jeff Linderoth, Francois Margot

Isomorphism pruning helps solve highly symmetric integer programming problems by using symmetry to fix variables and prune branch-and-bound nodes. Implementing isomorphism pruning on general integers has been difficult. In past work, branching on a variable with k many possible values required k-many children. We show how to drop this restriction and allow for a traditional 2-child branching strategy.

2 - Fast Column Generation for Submodular Minimization

Andrew Orso, University of Michigan, 1102 Maiden Lane Ct, Apt 112, Ann Arbor, MI, 48105, United States of America, orso@umich.edu, Siqian Shen, Jon Lee

We present a practical column generation algorithm for the general submodular minimization problem together with computational results demonstrating that our algorithm performs well on a diverse set of instances.

3 - Strengthened Sparse Approximations for Polytopes

Andres Iroume, Georgia Tech, Atlanta, GA, United States of America, airoume3@gatech.edu, Santanu Dey, Marco Molinaro

When MIP-solver use cuts to separate fractional solutions, the preferred option is sparse cuts (those with only a small number of non-zero coefficients). A natural question, recently addressed by Dey, Molinaro and Wang, is; how well can we approximate a polytope P only using sparse cuts. In this talk we address the problem of allowing a limited number on dense cuts (on top of the sparse ones) to strengthen approximate P.

4 - Approximating Sparse Covering Integer Programs Online

Viswanath Nagarajan, University of Michigan, Ann Arbor, MI, United States of America, viswa@umich.edu, Anupam Gupta

We study covering integer programs (CIPs) in an online setting, where the constraints arrive over time. We give an O(log k log L)-competitive randomized online algorithm for solving CIPs. Here k and L denote the row and column sparsity of the constraint matrix. Our algorithm is based on the online primal-dual paradigm, where a novel ingredient is to allow dual variables to increase and decrease throughout the course of the algorithm.

Robust and Prior-free Optimization – Theory and Applications

Sponsor: Optimization/Optimization Under Uncertainty

Sponsored Session

Chair: Chaithanya Bandi, Kellogg School of Management, Northwestern University, Evanston, IL, United State of America, c-bandi@kellogg.northwestern.edu

1 - Data-driven Learning in Dynamic Pricing using Adaptive Optimization

Phebe Vayanos, MIT Sloan School of Management, 50 Memorial Dr., Cambridge, MA 02142, United States of America, pvayanos@mit.edu, Dimitris Bertsimas

We consider the pricing problem faced by a retailer endowed with a finite inventory of a product offered to price-sensitive customers. The parameters of the demand curve are unknown to the seller who has at his disposal a history of sales data. We show that the seller's problem can be formulated as an adaptive optimization problem with decision-dependent uncertainty set. We obtain a conservative approximation in the form of mixed-binary conic optimization problem that is practically tractable.

2 - A Tractable Analysis of the Transient Behavior of Queues

Nataly Youssef, MIT, 20 Palermo St., Cambridge, MA 02141, United States of America, youssefn@mit.edu, Dimitris Bertsimas, Chaithanya Bandi

We propose a tractable approach for studying the transient behavior of multi-server queues. We model the queueing primitives via polyhedral uncertainty sets inspired by the limit laws of probability. Our approach provides qualitative insights via closed form expressions and produces accurate numerical predictions of transient waiting times for heavy traffic queues with various interarrival and service time distributions, heavy tail coefficients and number of servers.

3 - Resourceful Contextual Bandits

Ashwinkumar Badanidiyuru, Google Research Scientist, Google, 707 Continental Circle, Apt 927, Mountain View, CA, 94040, United States of America, ashwinkumarbv@gmail.com

We study contextual bandits with constraints on resources, which are common in applications such as choosing ads or dynamic pricing of items. We design the first algorithm for solving these problems that improves over a trivial reduction to the non-contextual case. We consider very general settings for both contextual bandits (arbitrary policy sets, Dudik et al. (UAI'11)) and bandits with resource constraints (Badanidiyuru et al. (FOCS'13)), and prove a regret guarantee which is near-optimal.

4 - Algorithmic Linear Regression via Modern Optimization Methods

Angela King, MIT, 77 Massachusetts Ave, E40-129, Cambridge, MA, 02139, United States of America, aking10@mit.edu, Dimitris Bertsimas

Linear regression is one of the most widely applied statistical methods. Some properties of a good model include a parsimonious fit, statistically significant variables, robustness to uncertainty in data, and interpretability. Obtaining a model with all these properties is typically done by trial and error. We algorithmize the process of fitting linear regression models using tools from integer, continuous, and robust optimization and provide evidence that this outperforms standard techniques.

Network and Graphs 3

Contributed Session

Chair: Patrick O'Reilly, PhD Candidate, Mineral and Energy Economics, Colorado School of Mines, P.O. Box 11, Golden, CO, 80402, United States of America, poreilly@mines.edu

1 - Fast Community Detection Method for Social Network

Cheng-Bang Chen, Penn State University, 445 Waupelani Dr. Apt.K18, State College, PA, 16801, United States of America, czc184@psu.edu

Analyzing the network structure is a powerful tool in studying entity relationships. There are lots of community detection methods, but most of them function just through the network structure. We develop a community detection algorithm with both structure and extra node information which is useful in social network.

2 - Evolution of Market Process in Reverse Supply Chains as Rapidly-Exploring Random Trees

Patrick O'Reilly, PhD Candidate, Mineral and Energy Economics, Colorado School of Mines, P.O. Box 11, Golden, CO, 80402, United States of America, poreilly@mines.edu

Seeing markets as networks is neither new, nor standard. Capturing market emergence has been elusive, yet something that can be characterized with network models, minimally as supply chains, and more extensively as rapidly-exploring random trees (a random graph). Where markets are thought to be missing, they may be emergent, if not already in a less visible, but mature speculative existence. The case of reverse supply chains in durable goods is offered as a timely example.

3 - A New Method to Evaluate the Deterioration-Effect Multi-state Flow Network Reliability

Wei-Chang Yeh, National Tsing Hua University, No.101, Sec. 2, Guangfu Rd., East Dist., Hsinchu City, Taiwan - ROC, weichang.yeh@gmail.com, Yi-Yun Chang

The arcs and nodes of multistate flow network (MFN) are obey the flow conservation law but sometimes arcs would had deterioration-effect. For example, signal transform will decrease if the transmission distance is too great. The deterioration-effect of arcs MFN model called MFNde. An example presented to illustrate how the proposed algorithm that use MP to calculate the deterioration-effect d-minimal path and evaluate the reliability of an MFNde model.

4 - Social Network Formation Modelling

Song Chew, Associate Professor, Southern Illinois University Edwardsville, IL, 62026, United States of America, schew@siue.edu

We present a model for social network formation. In this model, a new born node attaches to a random number of randomly chosen existing nodes. We study the node degree distribution for this model.

5 - A Biased Random-key Genetic Algorithm to Maximize the Accepted Lightpaths in WDM Optical Networks

Celso Ribeiro, Universidade Federal Fluminense, Departamento de CIÍncia da Computaçao, Niteroi, 24210-240, Brazil, celso@ic.uff.br, Julliany Brand„o, Thiago Noronha

Routing and wavelength assignment in optical networks consists in routing a set of lightpath requests, such that lightpaths with common links are assigned to different wavelengths. The goal is to maximize the number of requests that may be accepted, given a set of available wavelengths. We propose a biased random-key genetic algorithm for solving this problem. Computational results show that the average optimality gaps obtained with this heuristic are smaller than 4% for literature instances.

Network Interdiction Applications

Sponsor: Optimization/Network Optimization

Sponsored Session

Chair: Hugh Medal, Assistant Professor, Mississippi State University, 260F McCain Hall, Mississippi State, MS, 39762, United States of America, hugh.medal@msstate.edu

1 - Experimental Evaluation of Network Robustness against Multi-Strategy Greedy Attacks

Mario Ventresca, Assistant Professor, School of Industrial Engineering, Purdue University, 315 N Grant St, West Lafayette, IN, 47907, United States of America, mventresca@purdue.edu, Dionne Aleman

The robustness of networks versus an attacker who sequentially selects from a number of different strategies, each of which removes one node from the network is investigated. We analyze four robustness measures and six network centrality measures form the set of strategies at the disposal of the attacker. A comparison to single-strategy attack is also performed. Betweenness attacks often outperform random and greedy multi-strategy selection, the latter often becoming trapped in local optima.

2 - Optimal Deployment of Security Resources: Analyzing the Damage and Intervention Cost Tradeoff

Apurba Nandi, Mississippi State University, 1120 East Lee Blvd, Apt 160, Starkville, MS, 39759, United States of America, akn77@msstate.edu, Hugh Medal

The high degree of dependency of today's firms on information systems means that they are highly vulnerable to information theft and sabotage through different forms of security breaches. In this paper, we find the optimal intervention strategies, which minimize the objectives: 1) the loss due to security breaches and 3) the cost of intervention. We formulate the problem as a mixed-integer linear program and develop exact and heuristic solution algorithms.

3 - A Bi-Level Programming Model for the Wireless Network Jamming Placement Problem

Venkata Surya Vadlamani, Mississippi State University, 205 Lynn Ln, Apt# 5F, Starkville, MS, 39759, United States of America, vv66@msstate.edu, Hugh Medal, Burak Eksioglu

We study a network interdiction problem on a multi-hop multi-channel wireless network in which an attacker places jamming devices to minimize the expected throughput of the network. We model the problem as a bi-level attacker-defender mixed integer program. The attacker locates a limited number of jamming devices, and the defender determines an optimal channel hopping strategy. The defender seeks to maximize the equilibrium network throughput, and the attacker seeks to minimize it.

Optimization, Network 2

Contributed Session

Chair: Fatih Mutlu, Qatar University, MIE Department, Doha, 2713, Qatar, fatihmutlu@qu.edu.qa

1 - An Optimization Model for A Multi-Tier Ring Based Design of a Greenfield Transport Optical Network

Fatih Mutlu, Qatar University, MIE Department, Doha, 2713, Qatar, fatihmutlu@qu.edu.qa, Karam Al-Shorbassi

We develop a multi-tier ring based design for a greenfield transport optical network. Each demand node is assigned to one of the potential nodes and nodes will form a 3-tier ring network structure. The network consists of one tier-1 ring, and multiple tier-2 rings, each of which is connected to two tier-1 nodes, and multiple tier-3 rings, each of which is connected to two different tier-2 nodes. We develop an MIP formulation for the design problem and a construction heuristic.

2 - Age-based Preventive Maintenance in Multi-component Systems: An Integer Programming Approach

Khatereh Ahadi, University of Arkansas, 1601 North Leverett, Apt 20, Fayetteville, AR, 72701, United States of America, khatereh.ahadi@gmail.com, Kelly Sullivan

In this study, we consider a multi-component system in which components become less reliable over time. For this system, we seek to schedule component replacements over a finite time horizon in order to minimize the cost due to component and system failures and replacement of the components. We present a new class of integer programming models derived from a network-based linear programming formulation that represents the system reliability.

3 - Finding Optimal Mean-Risk Routes in Dynamic Stochastic Networks: a Stochastic Dominance Approach

Xing Wu, Assistant Professor, Lamar University, 4400 MLK Parkway, Cherry Engineering RM 2032, Beaumont, TX, 77706, United States of America, xing.wu@lamar.edu

The mean-risk model is widely used in the stochastic routing problems in networks for its compact and easy-to-understand form. The risk is usually defined as the standard deviation of the route travel time. Previous studies solve this model by assuming link travel times following normal distributions and employing the central limit theorem. This study relaxes this constraint and aims to find a general approach to solve this model in dynamic networks based on the stochastic dominance theory.

4 - Stochastic Random Projection Algorithm for Stochastic Network Design Problem

Umit Tursun, Postdoctoral Research Associate, University of Illinois at Urbana-Champaign, 104 S. Mathews Ave. B-14, Urbana, IL, 61801, United States of America, utursu2@illinois.edu, Rakesh Nagi

We consider a comprehensive random projection algorithm for stochastic network design problems under uncertain demand, where the objective and constraints are defined by convex functions and integrality restrictions are imposed on a subset of the decision variables. A stochastic convex random projection optimality algorithm for lower bound and a stochastic random projection feasibility algorithm for upper bound are used in succession converging to the solution set almost surely.

1 - Transportation Network Flow Problems on Manifolds

Emre Tokgoz, Quinnipiac University, 275 Mount Carmel Ave., Hamden, CT, 06518, United States of America, emre.tokgoz-1@ou.edu

Research problems in the network flow theory are mainly in the Euclidean space setting. In this talk, transportation problems will be considered on manifold settings with applications.

2 - Using Neural Networks to Optimize Blood Transfers among US Regions in a Simulated Natural Disaster

Hussein Ezzeldin, ORISE Fellow, OBE, CBER, FDA, 10903 New Hampshire Ave, WO71 room 1009C, Silver Spring, MD, 20993, United States of America, hussein.ezzeldin@fda.hhs.gov, Richard Forshee, Arianna Simonetti

We present a model of the US blood supply network, where the daily blood transfers among regions are optimized by using a Dynamic Neural Networks Heuristic (DNNH). The DNNH is capable of modeling a complex non-linear function of quotidian and forecasted regional factors to optimize the holistic performance of the network. In support of planning for emergency preparedness, blood transfers during normal operational conditions are compared with those simulated for a natural disaster.

3 - A Study on Cascading Failure Phenomenon of Interdependent Supply Chain Networks

Liang Tang, Southeast University, No.2, Sipailou Campus, Nanjing, Nanjing, China, tangericliang@gmail.com, Jie He, Ke Jing

To analyze the robustness of complex interdependent supply chain networks composed of a cyber-layer network and a physical-layer network while the supply chain system suffers from disruption events, a cascading failure model is presented. Through a giant component function and one-to-one directed interdependence relation, time-varied functional equations are constructed to reveal the robustness of supply chain networks. A numerical simulation shows the fragility of such interdependent networks.

Chair: John Mitchell, Professor, Rensselaer Polytechnic Institute, 325 Amos Eaton, Math Sciences, 110 Eighth St, Troy, NY, 12180, United States of America, mitchj@rpi.edu

1 - Strengthening a Second Order Cone Relaxation for Binary Quadratic Polynomial Problems

Julio César Göez, Postdoctoral Fellow, GERAD, Montreal, QC, Canada, jgoez1@gmail.com, Miguel Anjos

This work builds on the second order cone relaxation for binary quadratic problems proposed by Ghaddar, Vera and Anjos (2011) who used a polynomial optimization approach. We explore how this relaxation can be strengthened using additional constraints. In particular, we explore the combination of disjunctive conic cuts with this relaxation. We present computational results on a test set containing various types of binary quadratic polynomial problems.

2 - Using Disjunctive Conic and Cylindrical Cuts in Solving Quantitative Asset Allocation Problems

Sertalp B. Cay, PhD Candidate, Lehigh University, 200 W Packer Ave, Bethlehem, PA, 18015, United States of America, sec312@lehigh.edu, Julio Göez, Tamas Terlaky

The novel methodology of disjunctive conic and cylindrical cuts (DCC) was developed recently to solve mixed integer second order cone optimization (MISOCO) problems. First steps are made in implementing this powerful methodology in a Branch-and-Conic-Cut software package. In this study, we explore the use of this novel methodology in solving asset allocation problems. Preliminary numerical results show that DCC have significant positive impact when solving a set of realistic problem instances.

3 - Relaxing Nonconvex Quadratic Functions by Multiple Adaptive Diagonal Perturbations

Hongbo Dong, Assistant Professor, Washington State University, Neill 103, Pullman, WA, 99164, United States of America, hongbo.dong@wsu.edu

We propose a novel cutting surface procedure to derive strong convex quadratic relaxations for a set defined by a nonconvex quadratic function and some separable constraints. Our relaxations do not use a large number of lifted variables. We design a specialized coordinate minimization algorithm to solve the separation. Computational results show that our approach has potential to be successful in a branch-and-bound approach to solve general mixed-integer quadratically constrained programs.

4 - Completely Positive Reformulations for Optimization Problems

with Complementarity Constraints

John Mitchell, Professor, Rensselaer Polytechnic Institute, 325 Amos Eaton, Math Sciences, 110 Eighth St, Troy, NY, 12180, United States of America, mitchj@rpi.edu, Lijie Bai, Jong-Shi Pang

We derive equivalent convex completely positive reformulations for several classes of nonconvex optimization problems defined over convex cones, including rank-constrained semidefinite programs and quadratically constrained quadratic programs (QCQPs). The first part of the reformulation is to cast the problem as a conic QCQP with just one nonconvex constraint with a special structure. Our results do not make any boundedness assumptions on the feasible regions of the problems considered.

Invited Session

Chair: Dan Iancu, Stanford Graduate School of Business, 655 Knight Way, Stanford, CA, United States of America, daniancu@stanford.edu

1 - How Fast Should You Grow? Balancing Growth and Survival in a Cash Constrained Firm

Vishal Gaur, Cornell University, Johnson School, Ithaca, NY, United States of America, vg77@cornell.edu, Yasin Alan

We analyze the optimal investment policy of a cash constrained firm and compare it to different heuristics commonly used in practice. Through this, we develop practical insights into the relationship between firm growth and probability of survival.

2 - Supply Function Equilibrium in Electricity Markets

John Birge, Jerry W. and Carol Lee Levin Professor of Operations Management, University of Chicago Booth School of Business, 5807 S Woodlawn Ave, Chicago, IL, 60637, United States of America, john.birge@chicagobooth.edu, Nur Sunar

Many financial markets, such as those for electricity, include supply and demand offers that result in the equilibrium prices and quantities. In commodity markets, the actual supply can be uncertain, implying changes in the nature of the equilibrium. This talk will present models for these functions and implications for electricity markets.

3 - Operationalizing Financial Covenants

Gerry Tsoukalas, Wharton, Walnut Street, Philadelphia, PA United States of America, gtsouk@wharton.upenn.edu, Dan Iancu, Nikos Trichakis

We study the interplay between the design of financial covenants and the operational decisions of a retailer that obtains financing through secured (asset-based) lending contracts. While it is widely held that covenants serve to protect lenders, the ways in which a retailer can adapt his operations in response have not been studied. Endogenizing this effect, we show that the retailer can use operational levers (such as "fire sales") to diminish or even circumvent covenant effectiveness.

4 - Impact of Input Price Variability in Stochastic Inventory Systems

David Chen, University of Minnesota, 111 Church Street, Minneapolis, MN, 55455, United States of America, chen2213@umn.edu, Saif Benjaafar, William Cooper

We examine the impact of input price variability and correlation in the context of inventory system with stochastic demand and stochastic input prices. For a general class of such systems, and for a wide range of assumptions regarding price evolution, we show that that higher input price variability leads to lower expected cost.

1 - Sticky Reflecting Ornstein-Uhlenbeck Processes and Interest Rate Modeling with Zero Lower Bound

Yutian Nie, Northwestern University, 2145 Sheridan Rd, Evanston, IL, 60208, United States of America, YutianNie2016@u.northwestern.edu, Vadim Linetsky

We study sticky reflecting Ornstein-Uhlenbeck processes which are solutions to SDEs with sticky boundary conditions. We construct sample paths of the solution by means of time change and represent the transition semigroups in terms of spectral expansion. As an application, we propose a Markovian short rate model with zero lower bound based on sticky OU processes under which zero coupon bond and interest rate derivative prices have analytical solutions though eigenfunction expansion.

2 - Long Term Risk and Ross Recovery: A Martingale Approach

Likuan Qin, PhD Candidate, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60208, United States of America, LikuanQin2012@u.northwestern.edu, Vadim Linetsky

We start with a pricing kernel in the semimartingale asset pricing framework and study existence of the long-term forward measure. We show that in the ergodic Markovian environment the Hansen-Scheinkman factorization of the pricing kernel into the permanent and transitory components naturally emerges, and Ross recovery emerges as the special case. The strength of our semimartingale approach is that we naturally extend these concepts to non-Markovian models and, in particular, treat HJM models.

3 - Additive Subordination and its Applications in Finance

Rafael Mendoza-Arriaga, McCombs School of Business, University of Texas at Austin, 1 University Station, Austin, TX, 78712, United States of America, rafael.mendoza-arriaga@mccombs.utexas.edu, Lingfei Li

Applications in finance often require the use of time-inhomogeneous Markov processes. This paper studies additive subordination, which we show is a useful technique for constructing time-inhomogeneous Markov processes with analytical tractability. Additive subordination is the natural time-dependent generalization of the classical Bochner's subordination. We develop an analytical tractable formula for pricing crack spread options, as an application example.

4 - Modeling Electricity Prices: A Time Change Approach

Zhiyu Mo, The Chinese University of Hong Kong, Hong Kong - PRC, zymo@se.cuhk.edu.hk, Rafael Mendoza-Arriaga, Lingfei Li, Daniel Mitchell

We develop a new framework for modeling electricity spot prices by time changing the basic affine jump diffusion, which successfully captures seasonal spikes. Our model is easy to estimate from data and it is tractable for pricing electricity derivatives.

Improved Methods for Solving Special Classes of MINLP

Sponsor: Optimization/Global Optimization & MINLP

Sponsored Session

Chair: Francisco Trespalacios, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, ftrespal@andrew.cmu.edu

1 - A New Non-convex Quadratic Programming Approach for Mixed Integer Programming

Jaehwan Jeong, York College of Pennsylvania, 211 Willman Business Center, York, PA, 17402, United States of America, jjeong@ycp.edu, Chanaka Edirisinghe

We present an efficient approach for mixed integer quadratic optimization models based on the iterative use of our previously developed solution method for nonconvex quadratic programming. The method is tested with large-scale investment portfolio selection problems and compared with the MIQP solver in CPLEX.

2 - Logic-based Outer-approximation for the Global Optimization of Generalized Disjunctive Programs

Francisco Trespalacios, Carnegie Mellon University, 5000 Forbes Avenue, Pittsburgh, PA, 15213, United States of America, ftrespal@andrew.cmu.edu, Ignacio E. Grossmann

An alternative way to represent MINLP problems is Generalized Disjunctive Programming (GDP) that involves algebraic equations, disjunctions and logic propositions. In this work we present a logic-based outer-approximation algorithm to find the global solution of non-convex GDPs. The algorithm solves a master MILP and an NLP subproblem. The basic algorithm is improved with three main features: a novel derivation of a new type of cuts, a two-stage partition, and a parallelization of subproblems.

3 - A New Class of Minimum Triangle Inequalities (MINTI) for 0-1 QCQPs

Jitamitra Desai, Professor, Nanyang Technological University, 50 Nanyang Avenue, Singapore, Singapore, jdesai@ntu.edu.sg

We present a new class of minimum triangle inequalities (MINTI) for 0-1 QCQPs. We prove that these inequalities are superior to the traditionally used triangle inequalities, and offer several variations of these new cutting planes. We also present an improved branch-and-bound algorithm that incorporates certain properties from the MINTI cuts, and prove the efficacy of these cuts via our computational results.

4 - The Extended Supporting Hyperplane Algorithm for Convex MINLP Problems

Andreas Lundell, Abo Akademi University, Biskopsgatan 8, Turku, 20500, Finland, andreas.lundell@abo.fi, Jan Kronqvist, Tapio Westerlund

The extended supporting hyperplane (ESH) algorithm can be used to solve convex mixed-integer nonlinear programming (MINLP) problems as sequences of linear and mixed-integer linear programming problems. It is based on the extended cutting plane (ECP) algorithm, however instead of cutting planes, supporting hyperplanes are utilized. In addition, it includes a preprocessing step based on solving linear problems to efficiently obtain a tight linear relaxation of the nonlinear feasible region.

1 - A Behavioral Perspective on Workload Control Concepts: Setting the Workload Norm for Order Release

Anita Klotz, Research Assistant, University of Innsbruck, Universitaetsstrasse 15, Innsbruck, 6020, Austria, anita.klotz@uibk.ac.at, Hubert Missbauer

Most of the research on production planning and control (PPC) is linked to control structures, mathematical models and algorithms without explicitly considering human behavior. For the implementation of a behavioral perspective on a PPC concept including workload control, we investigate the effect of changing the workload norms on human behavior in a laboratory experiment. Our contribution is to stress the importance of considering behavioral aspects in the specification of workload norms.

2 - Transient Analysis of Bernoulli Serial Production Line with Perishable Products

Feng Ju, University of Wisconsin Madison, 1513 University Avenue, Room 3235, Madison, WI, 53706, United States of America, fju2@wisc.edu, Jingshan Li

In this presentation, a serial production line with Bernoulli reliability model machines, finite buffers and perishable products will be presented. Analytical formulas are derived to evaluate transient performance in two-machine case. In addition, a computationally efficient aggregation-based procedure is introduced to estimate the performance in longer production lines.

3 - Optimal Control of Kanban Systems: Impact of Production and Consumption Rates

Gregory DeYong, Assistant Professor, Southern Illinois University, Rehn Hall 207C, Mail Code 4627, 1025 Lincoln Drive, Carbondale, Il, 62901, United States of America, gdeyong@siu.edu

The traditional kanban control equations ignore the effect of production and consumption rates. Instead, for purposes of cost calculation, production and consumption are considered to be instantaneous events. By modifying the traditional kanban control equations, we are able to evaluate kanban policies more effectively by improving the representation of production and consumption.

4 - A Decomposition Algorithm for the Multi-level Capacity Constrained Lot Sizing Problem

Xue Lu, London Business School, Sussex Pl, London, NW1 4PT, United Kingdom, xlu@london.edu, Zeger Degraeve

Multi-level capacity constrained lot sizing problem (MLSLCP) has high application value, but solving the problem to optimality remains daunting. We decompose the MLCLSP on the time horizon and the multi-level product structure. Computational results show that our algorithm provides a tighter lower bound than all the existing models. We also demonstrate the generality of the decomposition algorithm by extending it to the production routing problem (PRP).

1 - Cost-effective Acceptance Sampling Plans for U.S. Live Plant Imports Inspection

Robert Haight, USDA Forest Service Northern Research Station, 1992 Folwell Ave, St. Paul, MN, 55108, United States of America, rhaight@fs.fed.us, Cuicui Chen, Rebecca Epanchin-Niell

We address the design of plant import inspections to prevent the introduction of quarantine organisms that threaten U.S. crops and forests. We derive an expression for expected number of accepted infested units (slippage) based on shipment size, infestation rate, sample size, and inspection efficacy. Then, we determine sample sizes for sets of shipments of unknown quality to minimize total expected slippage cost subject to inspection capacity. Optimal plans are compared with current practice.

2 - Optimal Eradication of Invasives: Complications from Structure and Species Interactions

Alan Hastings, Distinguished Professor, Department of Environmental Science & Policy, University of California, One Shields Avenue, Davis, Davis, CA, United States of America, amhastings@ucdavis.edu

I will describe the problem of eradicating an invasive species in an optimal way (minimizing budget or time). Using approaches based on linear programming to look at solutions in a deterministic setting, I will focus on the importance of stage or spatial structure in determining the optimal approach. I will then focus on problems where interactions with other species lead to constraints that change the optimal solution.

3 - An Age-, Density-, and Frequency-Structured Bio-Economic Model for Controlling Invasive Species

Esra Buyuktahtakin, Assistant Professor, Wichita State University, Wichita, KS, United States of America, esra.b@wichita.edu, Eyyüb Kibis, Greg Houseman, Tanner Lampe, Halil Cobuloglu

We present an optimization model to control a biological invasion over time with an objective of minimizing the cost of damage. The age-structured population model includes the seed bank and predicts multi (bi)-logistic rather than simple logistic growth, which may contribute to the lag response in population spread. Additionally, given budget constraints, utilizing control measures every 2-3 years is found to be more effective than yearly control because of the time to reproductive maturity.

INFORMS Undergraduate Operations Research Prize

Cluster: INFORMS Undergraduate Operations Research Prize

Invited Session

Chair: Tuncay Alparslan, tuncay.alparslan@american.edu

1 - INFORMS Undergraduate Operations Research Prize

Tuncay Alparslan, tuncay.alparslan@american.edu

The Undergraduate Operations Research Prize Competition is held each year to honor a student or group of students who conducted a significant applied project in operations research or management science, and/or original and important theoretical or applied research in operations research or management science, while enrolled as an undergraduate student. The prize is given each year at the Annual Meeting.

2 - Robust Demand Response Portfolio Management under Operational Uncertainty

Hongfan Chen, Georgia Institute of Technology, Industrial and Systems Engineering, Atlanta, GA, United States of America, Andy Sun, Shijie Deng

In this paper, we consider the demand response (DR) portfolio management problem in an electricity market environment. We particularly study the optimal management of a large number of commercial and industrial resources. We first construct a new mixed-integer optimization model to describe the dynamics of such DR resources. Then, we propose a robust optimization formulation with a new type of uncertainty sets that model the uncertainty in the demand reduction realized by DR resources. An efficient algorithm is proposed to solve the resulting nonlinear mixed integer problem. Computational experiments show the behavior and advantages of the robust optimization model.

3 - Dynamic Resource Allocation Problems with Nonstationary Customer Arrivals: Two-class Case

Chao Qin, University of Michigan, Industrial and Operations Engineering, Ann Arbor, MI, United States of America, umsjtuqc@umich.edu, Cong Shi, Cheng Hua, Huanan Zhang

We study a two-class dynamic resource allocation problem under uncertainty, with the objective of maximizing the expected revenue. The demand for each class of customers is modeled as a nonhomogeneous Poisson process, in which the instantaneous arrival rates can be nonstationary (time-dependent) and correlated, which captures realistic features such as demand seasonality and forecast updating mechanism. We devise an efficient admission control policy, called regret-balancing policy, to solve this class of problems. The key idea is to balance the regret (defined as the difference between the current cost and the hindsight optimal cost) associated with each acceptance or rejection decision. We show that our policy admits a constant worst-case performance guarantee of 2 in terms of regret. We also demonstrate through a comprehensive numerical study that our proposed policy perform consistently near-optimal, with a maximum performance error below 3%. We believe that the key ideas developed in this paper can be broadly applied to other core resource allocation or revenue management problems.

4 - Cash Management System Design for a Major Bank in Turkey

Muberra Ozmen, Middle East Technical University, Industrial Engineering Department, Ankara, Turkey, Engin Yildiz, Gamze Yagiz, Sidika Tunc, Selen Yildirim

An applied project made for a bank is discussed. There is a tradeoff between operational costs and the cost of keeping idle cash at the facilities. To minimize the overall costs while keeping the customer satisfaction at a high level, first the location decisions of the central cash offices (CCOs) and related assignment decisions are considered. Then the cash management system of ATMs is considered. The developed approaches are implemented for a geographical region. The results lead to important savings. A user interface is also developed that allows an easy updating of decisions when there are changes in the system.

5 - Impact of Sensor Measurement Errors in Sensor Positioning in Water Quality Monitoring Networks

Jisu Park, Georgia Institute of Technology, 765 Ferst Drive, Atlanta, GA, United States of America, jpark361@gatech.edu, Chuljin Park, Yongsoon Eun, Mustafa Aral, Seong-Hee Kim

We study the impact of sensor measurement errors in the problem of determining sensor locations in water quality monitoring networks. We develop a probabilistic model for sensor measurement errors and find sensor locations that minimize the expected time until spill detection subject to the reliability of detecting a spill is greater than a pre-specified threshold. Randomness in a contaminant spill and rain events is considered with various levels of bias and variability in sensor measurements.

MAS Tutorial Session. Management Innovation to Transform The Department of Defense Logistics Enterprise: An Update

Sponsor: Military Applications Society

Sponsored Session

Chair: Greg Parlier, Past President, MAS of INFORMS, 255 Avian Lane, Madison, AL, 35758, United States of America, gparlier@knology.net

1 - Management Innovation as a Strategic Technology

Greg Parlier, Past President, MAS of INFORMS, 255 Avian Lane, Madison, AL, 35758, United States of America, gparlier@knology.net

Using descriptive, prescriptive, and predictive analytics, the concept of "management innovation as a strategic technology" (MIST) is introduced and applied to DoD's materiel enterprise. Cutting-edge supply chain theory, powerful analytical methods, and innovative planning concepts are applied to this national security resource challenge. The complementary power of OR, advanced analytics, and management innovation for dramatic performance improvement and cost savings is demonstrated.

Optimal Policies - Supply Chain Applications

Sponsor: Applied Probability Society

Sponsored Session

Chair: Ananth Krishnamurthy, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, ananth@engr.wisc.edu

1 - A Stochastic Control Approach to Operationalizing Offshore Production Decisions

Taimaz Soltani, Doctoral Student, Eindhoven University of Technology, Den Dolech 2, Eindhoven, Netherlands, T.Soltani@tue.nl, Arun Chockalingam, Jan C. Fransoo

We consider a firm that can offshore a portion of its production. The firm can change the proportion of offshored production at any point in time. This change incurs both fixed and proportional costs, and the firm faces a time lag between the decision time and the time the change actually occurs. We formulate this problem as a stochastic impulse control problem, and derive optimal control policies that dictate what proportion of production should be offshored at any point in time.

2 - Exploiting Structural Properties to Analyze High Dimensional Multi-Product Manufacturing Systems

Sanket Bhat, University of Wisconsin-Madison, 1513 University Avenue, Madison, WI, 53706, United States of America, sbhat2@wisc.edu, Ananth Krishnamurthy

We analyze a resource allocation problem for multi-product manufacturing systems by formulating a dynamic program. We solve the large dimensional Markov decision process through approximate linear programming approach. By exploiting the structure of the transition probability matrix, we reduce the constraints from exponential to polynomial in number of products. Through numerical studies, we demonstrate the value of divisibility in resources under seasonal demands.

3 - Dynamic Pricing and Inventory Management under Fluctuating Procurement Costs

Renyu Zhang, Olin Business School, Washington University in St. Louis, Campus Box 1156, 1 Brookings Drive, St. Louis, MO, United States of America, renyu.zhang@wustl.edu, Guang Xiao, Nan Yang

We study a periodic review joint pricing and inventory control model under procurement cost fluctuation. The firm adopts the dynamic pricing and dual-sourcing strategy to mitigate the cost fluctuation risk. We characterize the optimal policy and the impact of cost fluctuation upon the optimal decisions. Finally, we conduct extensive numerical experiments that quantify the significant value of dynamic pricing and dual-sourcing in the presence of fluctuating procurement costs and uncertain demand.

4 - Competition Risk in Sourcing Strategies for Assembled Products

Ashesh Kumar Sinha, University of Wisconsin - Madison, 2130 University Ave Apt 77, Madison, WI, 53726, United States of America, asinha4@wisc.edu, Ananth Krishnamurthy

We analyze a system where a product is assembled from multiple components sourced from vendors. The components are classified as core, intermediate, and standard in terms of their design. Using stochastic models we analyze tradeoffs and determine sourcing strategies to mitigate risks of divulging product knowledge while meeting costs and service level objectives.

Stochastic Analysis in Games

Sponsor: Applied Probability Society

Sponsored Session

Chair: Ramesh Johari, Stanford University, Huang 311, Stanford, United States of America, ramesh.johari@stanford.edu

Co-Chair: Gabriel Weintraub, Columbia Business School, gyw2105@columbia.edu

1 - Network Security and Contagion

Asuman Ozdaglar, MIT, 77 Massachusetts Avenue, Cambridge, MA, 02139, United States of America, asuman@mit.edu, Daron Acemoglu, Azarakhsh Malekian

We present a model of investments in security in a network of interconnected agents. The network connections introduce the possibility of cascading failures depending on exogenous or endogenous attacks and the profile of security investments by the agents. We provide a characterization of equilibrium and optimal investments as a function of the network structure and position, which is captured in terms of new network centrality measures defined through bottleneck nodes of the network.

2 - Approximations for Repeated Auctions with Budgets

Gabriel Weintraub, Columbia Business School, Columbia University, New York, NY 10027, United States of America, gyw2105@columbia.edu, Santiago Balseiro, Omar Besbes

In this talk we provide novel approximation results for the notion of Fluid Mean Field Equilibrium (FMFE) introduced to study the dynamic bidding strategies of budget-constrained agents in repeated auctions. This setting arises in online advertising markets. First, using a natural scaling, we prove that FMFE provides a good approximation to the rational behavior of agents as markets become large. Second, we show that FMFE provides a good approximation even in small markets with few players.

3 - Unbalanced Random Matching Markets: The Stark Effect of Competition

Itai Ashlagi, MIT, 100 Main st., Cambridge, MA, United States of America, iashlagi@mit.edu, Jacob Leshno, Yash Kanoria

We characterize the core in random matching markets with unequal numbers of men and women. We find that even the slightest imbalance leads to harsh competition on the long side. With high probability the core is small, in the sense that a vanishing fraction of agents have multiple stable partners. Further, under any stable matching, approximately, the short side "chooses" and the long side is "chosen". Simulations show that these features are observed even in small markets.

4 - A Mean Field Approach to Dynamic Matching Markets

Ramesh Johari, Stanford University, Huang 311, Stanford, United States of America, ramesh.johari@stanford.edu, Nick Arnosti, Yash Kanoria

We present a mean field limit theorem for a certain class of dynamic random matching markets. In our model buyers and sellers dynamically arrive over time, and live for unit lifetime. Upon arrival, sellers apply to a subset of buyers present; upon exit, buyers can screen and/or make offers to applicants. Using a contraction argument, we provide a mean field approximation for this system when the number of buyers and sellers becomes large.

Chair: Shuai Huang, Assistant Professor, University of Washington, Industrial and Systems Engineering, Seattle, WA, United States of America

Co-Chair: Kaibo Liu, Assistant Professor, UW-Madison, 1513 University Avenue, Madison, WI, United States of America, kliu8@wisc.edu

1 - Monitoring Wind Turbine Vibration Based on SCADA Data

Zijun Zhang, Assistant Professor, City University of Hong Kong, SEEM Department, P6600, 6/F, Academic 1, Kowloon Tong, Hong Kong - PRC, zijzhang@cityu.edu.hk

Three data-driven models for detecting abnormalities of wind turbine vibrations reflected in time domain are discussed. The k-means clustering algorithm was applied to develop the first monitoring model. The other two monitoring models for detecting abnormal wind turbine vibration were developed by using the concept of a control chart. The performance of the monitoring models for detecting abnormalities of wind turbines reflected in vibration data was validated with the SCADA industrial data.

2 - Multi-dimensional Dynamic Network Modeling and Change Detection

Jing Li, Associate Professor, Arizona State University, jing.li.8@asu.edu, Na Zou

In many areas involving network data, such as social network analysis and communication network modeling, network entities interact through a variety of channels or the interaction is measured by multiple dimensions. The interaction is also dynamic in nature, i.e., the baseline is changing. In this study, we propose a method based on Kalman filter and Gaussian process models to model multi-dimensional network evolution and detect changes.

3 - Dirichlet Process Gaussian State Machine for Change Detection in Nonlinear Nonstationary Processes

Zimo Wang, Texas A&M University, 1301 Barthelow Dr. 21C, College Station, TX, 77840, United States of America, zimowang@neo.tamu.edu, Satish Bukkapatnam, Wayne Hung

We present a nonparametric Dirichlet Process Gaussian State Machine (DPGSM) model and a hypothesis test to discern incipient changes in dynamic intermittency, which is one of the most common types of nonlinear nonstationary behaviors. Extensive experimental investigations suggest that DPGSM can detect incipient surface damage in sensor-integrated ultraprecision manufacturing processes almost two magnitudes of time earlier compared to any other method tested.

4 - Statistical Microstructure Modeling and Reconstruction of Dual Phase Steels

Nailong Zhang, Wayne State University, 5200 Anthony Wayne Dr, Apt 413, Detroit, Mi, 48202, United States of America, eo9364@wayne.edu, Qingyu Yang

Microstructure modeling and reconstruction of dual phase steels has attracted increasing attention in recent years. However, most of the existing methods only consider a single microstructure sample/image so that the randomness of different samples is ignored. In this study, we propose a new modeling and reconstruction method that captures the variation across different microstructure samples. A case study is conducted by applying the proposed method to the dual phase steel DP 980.

Statistical Approaches to Personalized Healthcare II

Sponsor: Quality, Statistics and Reliability

Sponsored Session

Chair: Abe Zeid, Northeastern University, 360 Huntington Ave, Boston, MA, United States of America, zeid@coe.neu.edu

1 - Healthcare Analytics – Predicting Patient Stay through ED Admissions

Yi-Shan Sung, Research Asistant, Penn State, 425 Waupelani Dr., Apt. 509, State College, PA, 16801, United States of America, yqs5097@psu.edu, Paul Griffin, Soundar Kumara, Priyantha Devapriya, Cheng-Bang Chen

With the introduction of 2-mid night rule it is increasingly becoming important to predict patient stay through Emergency Department Admissions. Using admission attributes, clinical parameters and past encounters we develop statistical and graph analytics based techniques to estimate individual patient's expected stay. Results from these in turn will help in developing models for better resource utilization.

2 - Provider Strategic Responses to the Affordable Care Act

Zhongyuan Yu, Stevens Institute of Technology, 1 Castle Point Terrace, Hoboken, NJ, 07030, United States of America, annie.yzy@gmail.com, William Rouse

Healthcare providers are uncertain about how they should best respond to the Affordable Care Act. We present a list of investment strategies and develop a "rich" agent-based approach. By "rich", we mean much richer rule sets and information sources including agents' financial statements and operational performance to address a variety of what-if scenarios. The model, as well a large-scale interactive visualization, facilitates gaining insights important to decision making processes.

3 - Bed Allocation to Reduce Overflow

Jingui Xie, Associate Professor, University of Science and Technology of China, Jinzhai Road 96, Hefei, 230026, China, xiej@ustc.edu.cn, Mabel Chou, Marcus Ang, David Yao

Patients who wait close to six hours are assigned to any available beds in the internal wards. As a consequence, patients are overflowed everywhere, and physicians have to walk all day long to see their patients. To address this issue, we build up an analytical model, and propose different implementable polices. We use the real data from a Singapore hospital and a simulation model to test the proposed polices.

Data Analytics in Simulation

Sponsor: Simulation

Sponsored Session

Chair: Canan Gunes Corlu, Boston University, 808 Commonwealth Avenue, Boston, MA, United States of America, canan@bu.edu

1 - On the Price of Correlation Parameter Uncertainty in Simulation Optimization

Alp Akcay, Assistant Professor, Bilkent University, Ankara, 06800, Turkey, alp.akcay@bilkent.edu.tr, Bahar Biller, Canan Gunes Corlu

We consider a simulation with correlated inputs. We use a multivariate input model for representing the inputs but the correlation parameters of this model are estimated from finite data. In certain cases, the high variability around the correlation parameter estimates increases the value of the expected cost function of the simulation optimization. We discuss the minimization of the expected cost of correlation parameter uncertainty with examples from data-driven inventory management.

2 - Statistical Uncertainty Analysis for Stochastic Simulation with Dependent Input Models

Wei Xie, Rensselaer Polytechnic Institute, 110 8th Street, Center for Industrial Innovation 5207, Troy, NY, 12180-3590, United States of America, xiew3@rpi.edu, Barry Nelson, Russell Barton

When we use simulation to estimate the performance of a stochastic system, the simulation often contains input models with dependent components that were estimated from real-world data. We generalize a metamodel-assisted bootstrapping approach to quantify the impact of dependent input model and simulation estimation error on system performance estimates. Our approach is supported with both theoretical analysis and an empirical study.

3 - Comparing Simulated System Designs under Input Parameter Uncertainty

Bahar Biller, Carnegie Mellon University, Tepper School of Business, 5000 Forbes Avenue, Pittsburgh, PA, United States of America, billerb@andrew.cmu.edu, Canan Gunes Corlu

We study the problem of comparing simulated systems designs under input parameter uncertainty while aiming for a probability of correct selection that exceeds some user-specified value. Using asymptotic normality approximation and Bayesian simulation replication algorithm for capturing parameter uncertainty in the simulation output data, we demonstrate the effectiveness of our comparison procedures as a function of data length, number of replications and number of alternative system designs.

4 - Simulation of Non-Stationary Queueing Systems

Mohammad Mousavi, Stanford University, Stanford, CA, United States of America, mousavi@stanford.edu, Peter Glynn

We discuss the challenges that arise in the planning simulations of systems with time dependent arrival and service rates. Estimating how far back in time a simulation must be initialized is an essential problem in planning simulations. We propound using reflected Brownian motion (RBM) with time-dependent drift and volatility as a guide for estimating this initialization time. We develop the first exact simulation method for RBM with time-dependent drift and volatility.

Biofuel Supply Chain and Market

Sponsor: Energy Natural Resources and the Environment/ Sustainability and Environment

Sponsored Session

Chair: Guiping Hu, Assistant Professor, ISU, 3014 Black Engineering, Ames, IA, 50011, United States of America, gphu@iastate.edu

1 - Bi-level Programming Model and Algorithm for Decentralized Biofuel Supply Chains

Fengqi You, Assistant Professor, Northwestern University, 2145 Sheridan Road, Evanston, IL, 60201, United States of America, you.fengqi@gmail.com, Dajun Yue

We develop a Stackelberg game modeling and optimization framework for biofuel supply chains with multiple players. The supply chain design problem with leader-follower relationship is formulated as a bi-level programming model, which is reformulated into a single level mixed-integer nonlinear program (MINLP) based on the KKT conditions of the followers' problems. We also develop a tailored branch-and-refine algorithm for the efficient global optimization of the resulting non-convex MINLP.

2 - A Bottom-up Equilibrium Model for Emerging Advanced Biofuel Market

Leilei Zhang, Iowa State University, 3004 Black Engineering, Ames, IA, 50011, United States of America, leileizh@iastate.edu, Yihsu Chen, Guiping Hu

We develop a bottom-up equilibrium model to study the interactions among the stakeholders along the supply chain of the emerging biofuel market considering different levels of substitution among a variety of advanced biofuels. We analyze the effects of substitution of biofuels on famers' land allocation, biofuel production, biofuel blending, and market prices under a variety of market structures. Policies impacts are analyzed on biofuel markets and social welfares.

3 - A Capacitated Lot-Sizing Model for Biofuel Production with Environmental Consideration

Esra Büyüktahtakin, Wichita State University, Wichita, KS, United States of America, Esra.Buyuktahtakin@wichita.edu, Halil Cobuloglu, Alperen Burak Kantas

In this paper, we present a multi-objective mixed-integer programming model for capacitated ethanol production from switchgrass, sugarcane, corn, and wheat. The model minimizes the production cost while considering tax credits and penalties for excessive carbon emission and water consumption. Sensitivity analysis is conducted on its application to a real biorefinery project in Kansas.

1 - A Heuristic Approach using Multi-phase Decomposition to Solve IRP Occurring in Bulk Gas Distribution

Tejinder Singh, AIR LIQUIDE, 12800 W. Little York Rd, Houston, TX, 77041, United States of America, tejinder.singh@airliquide.com, Jeffrey Arbogast

This paper solves the inventory routing problem (IRP) occurring in industrial gas distribution where liquefied industrial gases in bulk are distributed to customers with cryogenic tanks for storage. It considers a multi-period IRP with multiple products assuming constant demand rates. The paper details a multi-phase approach based on decomposing the original problem into different sub-problems. Each sub-problem is then solved with a heuristic method applying neighborhood search strategy.

2 - Cooperative Game Theory for Collaborative Logistics in Forestry and Petroleum Industries

Mario Guajardo, Assistant Professor, NHH Norwegian School of Economics, Helleveien 30, Bergen, N-5045, Norway, Mario.Guajardo@nhh.no, Mikael Rönnqvist

We formulate Operations Research models for collaborative logistics arising in forestry and petroleum industries. In the forestry case, the opportunities for collaboration relate to better transportation planning, timber exchange and volume assignments. In the petroleum case, they relate to pooling inventory of spare parts for off-shore platforms. We address coalition structure and cost allocation problems in these cases, using cooperative game theory concepts.

3 - The Effect of Combining RAM Modelling and Stochastic Simulation Modelling on Production Efficiency

Jacques Van Der Westhuizen, RAM Specialist, Sasol, 1 Klasie Havenga Road, Sasolburg, 1947, South Africa, jacques.vanderwesthuizen1@sasol.com

Reliability Availability and Maintainability (RAM) uses Monte-Carlo simulation models to assess key units in the production process and reduce downtime. Sasol has developed an innovative technique that combines RAM with stochastic discrete-event simulation models to assess production risk to its complex gas to liquids value chain. The value of these models has been repeatedly shown through improvements to the bottom line for existing and new plants.

Bidding and Behavior in Procurement Markets

Cluster: Auctions

Invited Session

Chair: Michael N. Katehakis, Rutgers University, Newark, NJ, United States of America, mnk@rutgers.edu

1 - An Empirical Study of Electronic Reverse Auction (ERA) Project Outcomes and Satisfaction

Willem Standaert, Willem.Standaert@UGent.be, Steve Muylle

We develop and empirically test a structural model, which hypothesizes positive relationships between organizational and project antecedents, financial, operational, and strategic ERA project outcomes, and buyer satisfaction. Based on a global field study with 180 purchasing professionals, we found that operational and strategic outcomes were positively related with ERA project satisfaction, while price savings were not.

2 - A Behavioral Model for Overbidding in Sealed-Bid Multi-Attribute Procurement Auctions

Bernardo Quiroga, Pennsylvania State University, State College, PA, United States of America, bernie@psu.edu, Brent Moritz, Daniel Guide, Jr.

In sealed bid auctions, the empirical presence of over-aggressive bidding has been widely documented. Using a laboratory experiment under the independent private values paradigm, we provide a behavioral explanation of this phenomenon. We use a structural estimation of implicit latent private types and their corresponding probability density. We provide results in different contexts, including price-only, quasi-linear-scores, and 'beauty-contest' auctions including dimensions other than price.

3 - Adaptive Bidding in Repeated Auctions

Michael N. Katehakis, Rutgers University, Newark, NJ, United States of America, mnk@rutgers.edu, S. Karti Puranam

We consider the problem of a firm that procures items by bidding in repeated simultaneous auctions. We study adaptive dynamic bidding strategies for the firm that optimize measures of short and long term valuation.

Contributed Session

Chair: Mengqi Hu, Mississippi State University, PO Box 9542, Mississippi State, MS, United States of America, mhu@ise.msstate.edu

1 - How Long Do People Keep Reducing Electricity Consumption after Public Pressures?

Shigeharu Okajima, Waseda University, 1-6-1 nishi waseda Shinjyuku ku, Tokyo, Japan, shigeharu.okajima@gmail.com

Japanese media campaigns have begun to support for limiting electricity consumption after the Fukushima nuclear accident. We investigate whether Japanese media campaigns affect Japanese electricity consumption. We found that the commercial sector has reduced electricity consumption, while the residential sector has not changed electricity consumption.

2 - Financial Risk Management of a Lignocellulosic Biorefinery: A Stochastic Programming Approach

Lingfeng Cheng, PhD Student, Cornell University, 111 Wing Dr., Ithaca, NY, 14850, United States of America, lc674@cornell.edu, C. Lindsay Anderson

Bioethanol is a promising fuel alternative. However, given carbon tax constraints and ethanol price uncertainty, how much to produce and how to schedule production is a problem largely neglected. To solve this, we formulate a two-stage stochastic program. In the first stage, a process model is built with carbon tax constraints to determine the optimal production. In the second stage, a scheduling problem is formulated integrating forward contract and CVaR constraints to decrease financial risk.

3 - Collaborative Operation Strategies for Multiple Buildings with CCHP Systems

Mengqi Hu, Mississippi State University, PO Box 9542, Mississippi State, MS, United States of America, mhu@ise.msstate.edu, Rui Dai

To the best of our knowledge, most of the existing research about combined cooling, heating, and power (CCHP) systems focuses on a single building. In this study, we investigate the collaborative operation decisions for multiple buildings with CCHP systems which are allowed to freely share energy and exchange information. A collaborative decision model is presented to determine the optimal strategies that aim to minimize operational cost, primary energy consumption and carbon dioxide emission.

4 - NGL-NA: A New Model of the NGL Market of North America

Robert Brooks, President, RBAC, Inc., 14930 Ventura Blvd, Suite 210, Sherman Oaks, CA, 91403, United States of America, rebrooks@rbac.com

The last decade's "shale gas revolution" has not just recreated the US natural gas industry. It has also revitalized the markets for natural gas liquids and petrochemicals. NGL-NA is a multi-commodity model of the North American market for natural gas liquids. NGL-NA uses optimization techniques to compute flows and prices for each of the various NGL commodities through existing and prospective infrastructure. The presentation will describe the model and results from recently run scenarios.

5 - Equilibrium Investment Strategies in Renewable Portfolio Standards under Uncertainty

Yuta Kamobayashi, Tokyo University of Science, 2641 Yamazaki, Noda-shi, Chiba, Japan, 7414609@ed.tus.ac.jp, Ryuta Takashima

Recently renewable portfolio standard (RPS) has been introduced due to further penetration of renewable energies. In this paper, we propose a two-period competition model in an oligopolistic electricity industry with uncertain demand in order to consider investment behaviors for firms in a framework of the PRS. We analyze an effect of the RPS on investments in renewables and non-renewables. Additionally, we show how a percentage of production from renewables affects the market equilibrium.

Sponsored Session

Chair: Feng Qiu, Argonne National Laboratory, 9700 S. Cass Av., Argonne, IL, 60439, United States of America, fqiu@anl.gov

1 - Large-scale Stochastic Power Grid Islanding Operations by Line Switching and Load Shedding

Mehdi Golari, Graduate Research Assistant, University of Arizona, Systems and Industrial Engineering Department, Tucson, AZ, 85719, United States of America, golari@email.arizona.edu, Jianhui Wang, Neng Fan

Under certain contingency states with some failed components or in the process of restoration of a failed power grid, islanding is an efficient method to isolate the failed part to prevent cascading blackout and supply the electricity to the other parts of the power system. We present a large scale stochastic MIP model as well as efficient algorithms to solve the islanding problem.

2 - Assessing and Improving Resilience of Infrastructures to both "Worst Case" and "Most Likely" Events

Dave Alderson, Associate Professor, Naval Postgraduate School, United States of America, dlalders@nps.edu, Jason Ross, Matt Carlyle

Recent events have shown our critical infrastructure systems to be vulnerable to both non-deliberate hazards (e.g., extreme weather, technological failure) and deliberate threats (e.g., terrorist attacks). These events often point to different parts of an infrastructure system as critical, leaving policy makers in a quandary about how to invest a limited budget to increase system resilience. Using a historical example, we contrast and reconcile these views under a common risk-based perspective.

3 - Power System Restoration with Integrated Sectionlization and Generator Start-up Sequencing

Feng Qiu, Argonne National Laboratory, 9700 S. Cass Av., Argonne, IL, 60439, United States of America, fqiu@anl.gov

The restoration process of the bulk power system after a partial or complete blackout relies on generating units with black-start capabilities. In the normal build-up restoration process, the system is sectionalized first into a set of subsystems (islands) in which the generators are started afterwards. In this work, we integrate the two problems into a single model that minimizes the restoration duration for the overall system.

4 - Modeling Disruption Impacts to National Critical Infrastructure

Julia Phillips, Argonne National Laboratory, phillipsj@anl.gov, Stephen Folga

Understanding impacts of disruptions to systems of nation critical infrastructure is a crucial component of national security. The IAC has created a series of linear models for select infrastructure systems that simulate immediate impacts of disruptions to these systems. Outputs include GIS representation of the impacts, as well as information to inform decision makers on critical areas to focus protection or resilience activities towards. Creating links between the models is currently underway

Renewable Energy Integration and Trading in Electricity Markets

Sponsor: Energy, Natural Res & the Environment/Energy

Sponsored Session

Chair: Nur Sunar, University of North Carolina at Chapel Hill, Chapel Hill, NC, United States of America, Nur_Sunar@kenan-flagler.unc.edu

1 - Supply Function Bidding with Uncertain Supply and Demand: Electricity Markets with Renewables

Nur Sunar, University of North Carolina at Chapel Hill, Chapel Hill, NC, United States of America Nur_Sunar@kenan-flagler.unc.edu, John Birge

Despite the high penetration of renewable energy in the electricity generation mix, surprisingly, the implications of supply uncertainty for equilibrium market outcomes and generators' production schedules have not yet been fully analyzed.Using the differential equation theory, our paper shows that if renewable generators strategically bid in electricity markets, the supply uncertainty may have unexpected consequences for equilibrium day-ahead market prices and generators' production schedules.

2 - New Models for Risk Trading

Eddie Anderson, Professor, University of Sydney Business School, University of Sydney, Sydney, Australia, edward.anderson@sydney.edu.au

We introduce a new model for pricing derivatives in a wholesale electricity market, where players trade both to hedge risks and to make profit. The usual analysis derives the forward price from a stochastic model of the underlying dynamics (allowing for risk preferences). We consider a model in which prices arise from market clearing where each player has private information about the underlying price, different degrees of confidence in that information, and different risk preferences.

3 - Competition and Coalition Formation of Renewable Power Producers

Baosen Zhang, Postdoc, Stanford University, 473 Via Ortega, Y2E2 Building, Room 242, Stanford, CA, 94305, United States of America, zhangbao@stanford.edu, Ramesh Johari, Ram Rajagopal

We investigate group formation and strategic behavior of renewable power producers in electricity markets. It has been suggested that renewable producers should form large groups to take advantage of spatial diversity to reduce the uncertainty in their output. We characterize the trade-off between market power and generation uncertainty as a function of group size: there is a sweetspot where groups are large enough to achieve uncertainty reduction, but small enough to have any market power.

4 - SMART-ISO – A Stochastic Model of PJM for Renewables with Robust Cost Function Approximations

Warren Powell, Professor, Princeton University, Sherrerd Hall, Charlton St, Princeton, NJ, 08544, United States of America, powell@princeton.edu, Hugo Simao

SMART-ISO is a carefully calibrated stochastic model of the PJM energy markets and grid which closely matches the PJM decision process with day-ahead unit commitment, intermediate (30 minutes) unit commitment and real-time economic dispatch. We then introduce the idea of a robust cost function approximation policy for unit commitment, which formalizes the approach used by ISOs today. We show that a robust CFA can be tuned to handle relatively high penetrations of off-shore wind.

Parc- Mission III

Simulation and Optimization III

Contributed Session

Chair: Jelmer Van der Gaast, Erasmus University Rotterdam, Burgemeester Oudlaan 50, Rotterdam, Netherlands, jgaast@rsm.nl

1 - Analysis of a Polling System for Dynamic Order Picking

Jelmer Van der Gaast, Erasmus University Rotterdam, Burgemeester Oudlaan 50, Rotterdam, Netherlands, jgaast@rsm.nl

In a dynamic order picking system (DPS), an order picker picks orders in batches that arrive in real-time during its picking cycle, which subsequently changes the order picker's current picking route. We model a DPS as a polling system with batch arrivals and determine the waiting time distribution of an individual order line, as well as, the expected order throughput time. Results show that dynamic order picking lead to short order throughput times compared to traditional batch picking systems.

2 - Simulation-based Robust Revenue Maximization of Complex Truck-Shovel Systems in Surface Coal Mines

Saisrinivas Nageshwaraniyer, University of Arizona, 1502 E 10th St 134, Tucson, AZ, 85719, United States of America, ngsaisrinivas@gmail.com, Young-Jun Son

A robust simulation-based optimization approach is proposed for surface coal mines to maximize revenue. A highly detailed simulation model of a real mine is constructed for case study. Response Surface Methodology is then applied to obtain variance of revenue under the influence of uncontrollable factors such as truck haul times, which are later applied as constraints in optimization. The proposed approach results in higher and robust revenues compared to non-robust optimization formulation.

3 - Labor Capacity Assignment Model for Remanufacturing Environments

Osman Aydas, PhD Student / Research Assistant, University of Wisconsin - Milwaukee, 3202 N. Maryland Ave., Milwaukee, WI, 53211, United States of America, otaydas@uwm.edu, Anthony Ross, Wilkistar Otieno

Study evaluates the performance of labor capacity assignment models of remanufacturing environments characterized by stochastic order arrivals and dynamic labor assignment policies. We consider multiple tiers of repair lead time, seasonality in product flows and different employee skill set requirements for a multistage remanufacturing process. A simulation model is developed to investigate alternatives to achieving the performance targets.

4 - A Comparative Study of TOPSIS, GRA and VICOR Based Taguchi Methods for Optimization of FMS

Berna Dengiz, Professor, Baskent University, Eskisehir Road 20th. km, Ankara, 06510, Turkey, bdengiz@baskent.edu.tr, Yusuf Tansel Ic, Orhan Dengiz, Gozde Cizmeci

This study presents a case study of an FMS considering a multi-response simulation optimization using TOPSIS, GRA and VICOR based Taguchi methods. While reducing simulation experiments with Taguchi design, TOPSIS, GRA and VICOR procedures are used to combine multiple FMS responses into a single response. Optimal configuration is obtained for the FMS with improved performance. Results show that TOPSIS and GRA-based Taguchi methods are better than VIKOR-based Taguchi methods.

Succeeding with Revenue Management

Sponsor: The Practice Track

Sponsored Session

Chair: Warren Lieberman, President, Veritec Solutions, 824 Miramar Terrace, Belmont, CA, 94002, United States of America, Warren@veritecsolutions.com

1 - Revenue Management in the Big Data Era

Alex Dietz, Principal Industry Consultant, SAS Institute, SAS Campus Drive, Cary, NC, 27513, United States of America, alex.dietz@sas.com

In the era of Big Data, an impressive array of data has become available to support RM decisions, including competitive prices, customer reviews, and even web logging information. This piece will delve into the practical applications, value, and limitations of this data, based on both research and real-world experience.

2 - Models and Methods

Warren Lieberman, President, Veritec Solutions, 824 Miramar Terrace, Belmont, CA, 94002, United States of America, Warren@veritecsolutions.com

Based on our work in several dozen industries, we have found that certain modeling characteristics can increase the effectiveness of Revenue Management decision support tools. In addition, we have found that organizational structures can significantly affect the quality of Revenue Management/Dynamic Pricing decisions. In this session, we explore the impacts of models and methods on the success of revenue management implementations.

3 - Revenue Management at Disney Cruise Line

Erin Clark, Director, Revenue Management, Disney Cruise Line, 210 Celebration Place, Kissimmee, FL, 34747, United States of America, Erin.Clark@Disney.com

Although relatively small in comparison to many other cruise lines, Disney Cruise Line (DCL) has been a leader in the industry with respect to implementing critical Revenue Management strategies and tactics. While Revenue Management models have certainly been important, so too have DCL's organizational and business process decisions. Our presentation will highlight a variety of aspects of our Revenue Management approach.

Parc- Market Street

Joint Session Analytics/HAS: Topics of Healthcare Analytics II

Sponsor: Analytics & Healthcare

Sponsored Session

Chair: Issac Shams, University of Michigan-Ann Arbor, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, issacsh@umich.edu

1 - An Analytics Approach to Designing Patient Centered Medical Homes

Saeede Ajorlou, University of Michigan-Ann Arbor, 1205 Beal Ave, Ann Arbor, MI, 48109, United States of America, saeede@umich.edu

This talk presents an analytics approach to design a Patient Centered Medical Home from an operations management point of view. Aggregating multiple data tables for patient attributes, provider characteristics, and station and division variables, we first developed statistical models with variable selection routines to predict annual portfolio healthcare demands. Then, using these models we proposed stochastic optimization models that assign patients to a set of PCMH teams.

2 - A Simulation-based Approach to Estimate the Proportion of Tuberculosis Recent Transmission

Parastu Kasaie, Postdoctoral Fellow, The Johns Hopkins Bloomberg School of Public Health, 3231 Bishop St, Cincinnati, OH, 45220, United States of America, kasaiept@mail.uc.edu, David W. Dowdy, W. David Kelton

Accurate estimation of the proportion of TB from recent vs. remote transmission is critical to disease-control policy. Existing cluster-analysis approaches of TB strains in studies of molecular epidemiology are crude and prone to bias. We study, via simulation, the accuracy of such estimates in relation to disease incidence, underlying reactivation rate, sampling coverage and duration, and develop a more accurate estimator for the true proportion of incidence due to recent transmission.

3 - Predicting Daily Negative Moods of Young Adults using an Elastic-Net Regularized Model

Fan Wang, University of Arkansas, 4207 Bell Engineering, Fayetteville, AR, 72701, United States of America, fxw005@uark.edu, Shengfan Zhang

Depression and stress are two common negative moods in young adults. This study establishes a logistic regression model to predict daily depression and stress for university students. The explanatory variables involve a variety of personal attributes, such as flu symptoms, daily cellphone use and life style. The elastic-net regularization is used to handle the collinearity problems and estimate the best prediction model. Multiple resampling techniques are used to tune the elastic-net parameters.

The Past, Present and Future of Teaching Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu

1 - Teaching Decision Making with Social Networks

Ali Abbas, Professor, University of Southern California, Industrial and Systems Engineering, Price School of Public Policy, Los Angeles, CA, United States of America, aliabbas@illinois.edu

Teaching decision making with social networks is a new and fun reverse-classroom setting that provides hands-on training and enables students to see immediate benefits of the decision tools they learn in class. This talk summarizes the learning of teaching decision making with Ahoona, a free decision making social network.

2 - DQ 101: An introduction to Decision Quality

Carl Spetzler, Chairman and CEO, SDG, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, cspetzler@sdg.com

This session will review the content of the free MOOC that provides a basic understanding of the elements of DQ. The course requires about 15 hours of effort over five weeks and uses short (3-15 minutes) lectures in a team based online platform. We will also share our experience after having given the course four times.

3 - Innovative Methods and Tools to Teach DA/DQ and Provide On-Demand Decision Support

Mazen Skaf, Managing Director, Strategic Decisions Group, 745 Emerson St, Palo Alto, CA, 94301, United States of America, mskaf@sdg.com

We present innovative tools aimed at teaching the basic principles and methods of DA/DQ, promoting the use of DA, and providing decision support for organizational as well as personal decisions.

4 - Teaching While Doing – Will Universities Join or Get Out of the Game?

Jim Matheson, Chairman, SmartOrg, Inc., 855 Oak Grove Ave Ste 202, Menlo Park, CA, 94025, United States of America, jmatheson@smartorg.com

I began DA in 66-7, and teaching at SU from 68. By mentoring PhD Students, an internship requirement by Bill Linvill, fostered their interest and practical skills. IDs were invented! This year I taught Frontiers in DA by one-day flights and web meetings. Now, SmartOrg is embedding Decision Systems in real organizations, and for the summer has taken on four interns, who will learn much. The future may flip back to internships with mentors and web classes to share experience and learn theory.

5 - Teaching with Ron
Brad Powley, Consultant, SDG, 745 Emerson Street, Palo Alto, CA, 94301, United States of America, bpowley@sdg.com

For many graduate students, being a teaching assistant is a means of funding. Those who served as teaching assistants for Ron Howard's classes will attest that the job itself was one of the most important learning experiences of their university education. This talk will explore Ron's approach to teaching through the unique perspective of his teaching assistants.

6 - What's Past is Prologue: Lessons from Howard Raiffa's Pioneering Multimedia Courses
Patrick Noonan, Professor & Assoc. Dean, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30322, United States of America, patrick.noonan@emory.edu

The terms "decision analysis" and "multimedia" are both celebrating 50th anniversaries. Early in the history of both, Howard Raiffa started experimenting with unorthodox blends of print, audio and eventually early PC tools to teach DA. Some of these works shine today, not only as important artifacts of DA history and wonderful, still-relevant examples of his gift for explanation, but as guides for how DA education can thrive in an era of ubiquitous Internet, apps, flipped classes and MOOCs.

Medical Applications in Decision Analysis

Sponsor: Decision Analysis

Sponsored Session

Chair: Jeff Stonebraker, Assistant Professor, North Carolina State University, Campus Box 7229, Raleigh, NC, 27695, United States of America, jsstoneb@ncsu.edu

1 - Medical Technology Applications
Phil Beccue, White Deer Partners, 2228 Knollcrest Pl, Westlake Village, CA, 91361, United States of America, Phil@WhiteDeerPartners.com

Medical products are often perceived as the orphan sister to the glamorous drug industry, yet they include essential elements of modern medical care, from CT scanners to robots used by surgeons. With their unique regulatory and financial pressures, product managers have relied on Decision Analysis methods to help navigate the path to success. We discuss the enhanced value that DA is bringing to this business in a number of recent applications.

2 - Implementation of Decision Analysis for Claims Management at Stanford Medical Center
John Celona, Principal, Decision Analysis Associates, 505 Vista Ave, San Carlos, CA, 94070, United States of America, jcelona@sbcglobal.net

Stanford University Medical Center self-insures and manages claims and lawsuits. Beginning five years ago, we developed and implemented a process to enable routine decision analysis of all lawsuits and claims to drive case management strategy and to set reserves for the captive insurance companies. We present the methods and the results, which to date are far superior to the results from previously used actuarial methods.

3 - Implementing Decision Analysis in a Healthcare Information Technology Company
Elayne Ko, Director, Portfolio and Decision Analysis, Pfizer, Inc., Collegeville, PA, United States of America, Elayne.ko@pfizer.com, Tom Stone

The presentation explores the journey and learning of implementing decision analysis in a healthcare information technology (HIT) company. In HIT, the relationship between specific product investment and return is much less direct compared to the typical industries where decision analysis is more prevalent, e.g., pharmaceutical, oil & gas, mining. This poses challenges in evaluating HIT product investments and decision-making, requiring unique approaches to valuation and risk assessment.

4 - Modeling Latent Therapeutic Demand
Jeff Stonebraker, Assistant Professor, North Carolina State University, Campus Box 7229, Raleigh, NC, 27695, United States of America, jsstoneb@ncsu.edu

This presentation discusses a new medical application area of decision analysis. Decision analysis has been applied extensively in medical decision making for the prevention of, diagnosis of, and the treatment of diseases. There are, however, diseases that can't be prevented. These diseases are often under-supplied where treatment is scarce and uncertain and, consequently, suboptimal for patients. We use decision analysis to model the number of people with the disease and how they are treated.

Real Options in Business Strategy

Sponsor: Decision Analysis

Sponsored Session

Chair: Dharma Kwon, Assistant Professor, University of Illinois at Urbana-Champaign, 1206 South Sixth Street, Champaign, United States of America, dhkwon@illinois.edu

1 - Technological Change: A Burden or a Chance
Verena Hagspiel, Norwegian University of Science and Technology, Industrial Economics and Technology Mgt., Trondheim, Norway, verena.hagspiel@iot.ntnu.no, Peter Kort, Claudia Nunes, Pedro Jesus

This paper considers a firm that faces a declining profit stream for its established product. The firm has the option to invest in a new technology with which it can produce an innovative product while having the option to exit as well as suspend operations at any point in time. Besides timing the firm also has to decide about the size of investment.

2 - The Value of Reducing Lead Time under Non-Stationary Demand
Isik Bicer, Mr., University of Lausanne, Quartier UNIL-Dorigny, B,timent Anthropole, Lausanne, 1015, Switzerland, isik.bicer@unil.ch, Suzanne De Treville, Verena Hagspiel

We build newsvendor model on real-options theory and investigate the value of lead-time reduction under the risk of sudden and abnormal changes in demand forecasts. We use a "jump-diffusion" model and apply an Edgeworth series expansion to explore the impact of sudden changes in demand forecasts on the value of lead-time reduction. We show that the value of lead-time reduction increases substantially in the intensity and/or the magnitude of jumps.

3 - Multi-item Search with Holding Costs
Steven Lippman, slippman@anderson.ucla.edu, Sheldon Ross

We consider a multi-item search problem with a holding cost that is linear in the number of unsold items wherein the seller optimally sells n items. Suppose instead that there are n sellers each with one unit to sell. We show that the return to the n sellers in the decentralized problem is the same as the return to the single seller with n units to sell.

4 - Stochastic Dynamic Game of Principal-Agent under Asymmetric Information with Unobservable Action
Youngsoo Kim, University of Illinois, Chicago, IL, United States of America, ykim180@illinois.edu, Dharma Kwon

We study a dynamic game between an employer and an employee. The employer cannot observe the employee's type and effort, but the employer can observe the employee's performance, which is a Brownian motion with drift governed by the employee's type and effort. The employer learns about the employee's type to either dismiss or promote the employee, and the employee reacts by putting an effort. We find Markov Perfect Bayesian equilibria and compare equilibrium strategies for each type of employees.

Joint Session Data/AI/HAS: Big Data Analytics and Smart Health III

Sponsor: Data Mining, Artificial Intelligence, & Healthcare

Sponsored Session

Chair: Sung Won Han, New York University, 650 First Avenue, New York, NY, United States of America, sungwonhan2@gmail.com

1 - Strategic Lean Implementation in Healthcare
Yong Taek Min, Boston University, Boston, MA, United States of America, ytmin@bu.edu, Jay Kim, Joseph Restuccia, Michael Shwartz

We assess if there are different lean implementation strategies in hospitals and how effective they are in improving quality and efficiency performance. Lean implementation patterns are identified based on hospitals' differing degree of emphasis on lean principles. Quality and efficiency performance of each hospital is analyzed by using CMS database.

2 - Infectious Disease Facility Location and Outbreak Response Strategies for Africa

Neil Desnoyers, Assistant Clinical Professor, Drexel University, 3141 Chestnut Street, Philadelphia, PA, 19104, United States of America, ndesnoyers@drexel.edu

The 2013-2014 outbreak of Zaire ebolavirus demonstrates, "Örapid, reliable diagnostic procedures must be implemented Ö closer to endemic [areas] so that local public health officials Ö need [not] rely on distant reference laboratories."(NEJM doi:10.1056/NEJMp1405314) For Ebola and Lassa viruses, diagnostic procedures must be carried out in a BSL-4 laboratory: Two such exist in Africa. We explore facility location and outbreak response strategies using decision modeling techniques.

3 - Data Fusion of 9-axis Inertial Measurement Unit (IMU) From Modern Pedometer for Health Application

Liang Zhou, LiangZhou@savvysherpa.com

Pedometers use built-in accelerometer to count steps. Along with the additional gyroscope and magnetometer sensors, a modern pedometer is able to capture 9-axis data in real-time. In our study, a data fusion method is developed to integrate the outputs from 3 sensors, and a model based activity classification framework is introduced to identify certain types of ADLs (Activities of Daily Living). Some potential health applications will be discussed.

4 - Modeling and Analysis of Multiple Patient Rapid Response Process

Xiaolei Xie, Tsinghua University, Shunde Building, Beijing, 100084, China, xiexiaolei0209@gmail.com, Jingshan Li, Colleen Swartz, Paul DePriest

Improving efficacy of hospital rapid response operations is crucial, which are designed and implemented to treat deteriorating patients. We present an analytical model with a multi-patient network to characterize such a process and evaluate the mean decision time, which is strongly correlated with care quality. Medical resource sharing issue is addressed using a two-level iteration method. Finally, the impact of other factors, such as time variability of patient in normal status, is studied.

Behavioral Issues in Adversarial Preference Modeling

Sponsor: Multiple Criteria Decision Making

Sponsored Session

Chair: Gilberto Montibeller, London School of Economics, Houghton Street, London, United Kingdom, G.Montibeller@lse.ac.uk

1 - A Multiple-Target Defensive Resource Allocation Game with Quantal-Response Attacking Strategies

Jun Zhuang, University at Buffalo, 317 Bell Hall, Buffalo, NY, 14260, United States of America, jzhuang@buffalo.edu, Yan Wang

This research studies a new attacker-defender game over multiple targets, where the attacker is bounded rational and assumed to use quantal-response strategies. We validate the model using real data from both terrorism and counterterrorism databases.

2 - Adaptive Security Resource Allocation for Protecting Wildlife and Fisheries

Milind Tambe, USC, 3737 Watt Way, PHE 410, Los Angeles, CA United States of America, tambe@usc.edu

While previous works have deployed applications with a game-theoretic approach for counter-terrorism, protecting wildlife and fisheries are important domains presenting new research challenges related to learning behavioral models from collected poaching data. We address this challenge and develop a new algorithm that adaptively improves the security resource allocation strategy against the learned behavioral model.

3 - Framing Value-driven Decision Models for Different Classes of Cyber Adversaries

Richard John, Associate Professor, University of Southern California, RTH 310, University Park, Los Angeles, CA, 90089, United States of America, richardj@usc.edu, Heather Rosoff, Detlof von Winterfeldt

Cyber attackers generally have multiple and conflicting objectives that underlie their motivations. Attackers have evolved from single individuals to organized groups, some state-sponsored, with advanced capabilities to attack U.S. cyber systems. For different classes of cyber adversaries, we demonstrate diversity in values and objectives, attitudes toward risk, trade-offs among conflicting objectives, and uncertainty about the outcomes for alternative attack strategies.

4 - On the Behavioral Validity of Adversaries' Judgments in Count-terrorism Models

Sumitra Sri Bhashyam, Houghton Street, wc2 2ae, London, United Kingdom, S.Sribhashyam@lse.ac.uk, Gilberto Montibeller

In adversarial models, terrorist are seen as rational agents that maximize expected utility, as consequentialist decision makers who have clear objectives and stable preferences, and as being capable of appraising dispassionately the decision context. Here we will scrutinize these assumptions, with evidence available from the terrorism and behavioral decision research literatures, and suggest ways that judgments in counter-terrorism models can be modelled to improve their behavioral validity.

Quality and Statistical Decision Making in Health Care Applications

Sponsor: Data Mining

Sponsored Session

Chair: Shuai Huang, Assistant Professor, University of Washington, Industrial and Systems Engineering, United States of America, shuaihuang@usf.edu

1 - Outcome and State Transition Modeling for Adaptive Interdisciplinary Pain Management

Aera Leboulluec, Adjunct Professor, University of Texas at Arlington, 500 West First Street, 420 Woolf Hall, P.O. Box 19017, Arlington, TX, 76006, United States of America, aerakim77@yahoo.com, Victoria Chen, Li Zeng

This research develops a process based on the inverse probability of treatment weighted method to address the endogeneity while estimating state transition and outcome models. First, a method is developed for independent treatments then a general method is developed for correlated treatments.

2 - Development of Clinical Nutrition Staffing Models Based on Patients Electronic Health Records

Kai Yang, Director, Healthcare Systems Engineering Group, Wayne State University, 4815 4th street, Detroit, MI, 48201, United States of America, kai.yang@wayne.edu, Saeede Ajorlou

The objective of this study is to develop clinical workload models for nutritionists based on patients' electronic health records. A comprehensive multilevel database for inpatient admissions and outpatient visits is first assembled that involves patient, clinical, and case-mix risk factors. Then a hierarchical additive model with a feature selection algorithm that determines a subset of the most relevant factors is used to predict nutritional staffing requirements.

3 - Recursive Reconstruction Method for Time Varying Sparse Signal from Noisy Undersampled Measurements

Kaveh Bastani, Virginia Tech, kaveh@vt.edu, Zhenyu Kong

We study the recursive reconstruction of time varying sparse signal from noisy undersampled measurements. This type of problem has been seen in many signal processing applications, like real-time dynamic MRI. We propose a reconstruction method by estimating the global support set of the signal from the covariance matrix of time series measurements. Then, the recursive reconstruction method is proposed based on sparsity analysis of the truncated signal from spike-and-slab prior model.

4 - A Joint Spectral Decomposition Method for Time-dependent Network Data

Shuai Huang, Assistant Professor, University of Washington, Industrial and Systems Engineering, United States of America, shuaihuang@usf.edu, jing li

The network spectral decomposition method has been widely adopted as a critical enabler in many exiting network analysis methods. Considering that existing spectral decomposition method was built for static network, we develop a general methodology for conducting spectral decomposition on time-dependent network data. The proposed methodology is thoroughly evaluated on two important applications that involve time-dependent network data, e.g., the network prediction and network monitoring.

Mission Planning II

Sponsor: Military Applications Society

Sponsored Session

Chair: Michael Hirsch, President, ISEA TEK, 620 N. Wymore Road, Suite 260, Maitland, FL, 32751, United States of America, mhirsch@iseatek.com

1 - UAV Route Planning using Stochastic Dynamic Programming
Aaron Williams, PhD Student, University of Illinois at Champaign-Urbana, 1014 W. Church St., Apt2, Champaign, IL, 61821, United States of America, amwilli2@illinois.edu

We consider the problem of route planning with multiple UAVs with varying degrees of communication on a single map. We present multiple stochastic dynamic programming algorithms to deal with these varying degrees of communication. The stochastic dynamic programming approach has advantages in computational complexity, essential for onboard route planning. We measure the amount of information lost at each communication level.

2 - Sensor Tasking for Unmanned Aerial Vehicles with Limited Communications Bandwidth
Chase Murray, Auburn University, 3301 Shelby Center, Auburn, AL, United States of America, CCM0022@auburn.edu

This talk will explore a sensor tasking problem, where directional sensors operating in multiple modalities must be allocated to time sensitive targets. The system operates in a communications bandwidth-limited environment, such that part of the problem involves deciding the resolution of the data captured as well as the delay between the capture and the broadcast of data. A novel solution approach, making use of the underlying mixed integer linear programming formulation, is presented.

3 - An Exact Method for the Peace-Time Convoy Movement Problem to Minimize Civilian Traffic Disruption
Azar Sadeghnejad Barkousa, University At Buffalo, Industrial & Systems Engineering, Buffalo, NY, 14260, United States of America, azarsade@buffalo.edu, Moises Sudit, Rajan Batta

We seek optimal routing for convoys, with specific time windows and blocking/overtaking constraints, in order to minimize civilian traffic disruption. We offer an exact algorithm based on k shortest path and maximum clique problems. Numerical testing on random networks is performed. CPLEX fails to solve even 6 convoy problems on a 24 node network in 4 hrs. Our method finds an optimal solution for such problems in less than 1 second. A realistic case study from Colombia is our next step.

4 - Measuring the Price of Anarchy for UAV teams
Hector Ortiz-Pena, CUBRC, CUBRC, Buffalo, United States of America, Hector.Ortiz-Pena@cubrc.org, Michael Hirsch, Moises Sudit, Mark Karwan

We develop a formulation to maximize the information gain from a team of autonomous unmanned vehicles (UxVs) to support Intelligence, Surveillance and Reconnaissance (ISR) mission objectives. The formulation is used to evaluate the Price of Anarchy.

Business Ecosystem, Networks and Innovation

Sponsor: Technology, Innovation Management and Entrepreneurship

Sponsored Session

Chair: Jianxi Luo, Assistant Professor, Singapore University of Technology & Design, 20 Dover Drive, Singapore, SG, Singapore, luo@sutd.edu.sg

1 - Modeling the Evolution of Generativity and the Emergence of Digital Ecosystems
Jason Woodard, Assistant Professor, Singapore Management University, School of Information Systems, 80 Stamford Road, Singapore, 178902, Singapore, jwoodard@smu.edu.sg, Eric Clemons

Agent-based computational modeling offers a powerful tool for studying decentralized innovation and the emergence of digital business ecosystems. We have created a series of models that show how key features of these ecosystems can evolve, including core components and reusable parts. We find that boundedly rational designers without coordination or foresight can generate ecosystems that satisfy diverse consumer preferences and exhibit robustness to changes in these preferences over time.

2 - Using Transaction Networks to Describe the Structure of Sectors
Margaret Dalziel, University of Waterloo, 200 University Avenue West, Waterloo, Canada, mdalziel@uwaterloo.ca, Xiangyang Yang

Today's products are created by the combined efforts of numerous firms linked together by transactions into vast networks known as sectors. Using a novel dataset of the major transactions in the US economy, we analyze the structure of sectors.

3 - Knowledge Discovery for Business Ecosystem Intelligence
Hyunwoo Park, Georgia Institute of Technology, 85 5th St NW, Atlanta, GA, 30308, United States of America, hwpark@gatech.edu, Rahul Basole, Brandon Barnett

We develop and apply a computational knowledge discovery approach for understanding and visualizing innovation, coopetition, and convergence in business ecosystems.

4 - Transaction Cycle Participation, Vertical Integration, and Innovation: An Empirical Network Analysis
Jianxi Luo, Assistant Professor, Singapore University of Technology & Design, 20 Dover Drive, Singapore, SG, Singapore, luo@sutd.edu.sg

A firm's architecture of participation in the business ecosystem may affect its innovation performance. We analyze the transaction network positions and performances of 227 Japanese electronics firms. The results show that, a firm's participation in inter-firm transaction cycles, instead of sequential transactional relationships, has a positive impact on its innovation performance for vertically-integrated firms, but a negative impact for vertically-specialized firms.

IS Research with Policy Implications

Sponsor: eBusiness

Sponsored Session

Chair: Min-Seok Pang, Assistant Professor, Temple University, Philadelphia, PA, United States of America, mins.pang@gmail.com

1 - An Economic Analysis of Shared IT Services in Public Sector
Min Chen, George Mason University, 4400 University Drive, Fairfax, VA, 22030, United States of America, mchen15@gmu.edu, Min-Seok Pang

In this study, we build a simple, stylized economic model to analyze the decisions for developing and pricing of a shared IT service, which is a unique phenomenon in the public sector. Governments collectively share enterprise IT services for public services in order to save costs and to improve their bargaining power vis-a-vis IT vendors. We derive implications for the private-sector IT industries.

2 - Gamification Doesn't Work: The Effect of Virtual Rewards and Reputation on User Contributions
Wei Chen, University of California, San Diego, 9500 Gilman Drive, La Jolla, CA, 92093, United States of America, Wei.Chen@rady.ucsd.edu, Xiahua (Anny) Wei, Kevin Zhu

This study examines the effect of two gamification mechanisms, virtual rewards and reputation, on voluntary user contributions in online communities. We analyze panel data from a knowledge sharing platform, and find that surprisingly, neither virtual rewards nor reputation induce user contributions. It is the relative reputation (ranking) that plays a role. These findings highlight the importance of social comparison in the incentive design of online communities.

3 - An International Investigation of the Market Value Impacts of Energy and Carbon Management Systems
Daniel Rush, University of Michigan, R4431 Ross School of Business, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, danrush@umich.edu, Nigel Melville

Energy and Carbon Management Systems (ECMS) are a new type of information system that enable organizations to measure and manage their energy, carbon dioxide, and other greenhouse gases. Companies world-wide are adopting ECMS to comply with regulations, further organizational goals, and respond to their stakeholders. Despite this increased adoption, the financial impacts of these systems are not well understood. This international event study thus investigates the market value impacts of ECMS.

4 - The Internet and Hate Crime: Offline Spillovers from Online Access
Jason Chan, NYU, Stern School, New York, NY, United States of America, jchan@stern.nyu.edu, Anindya Ghose, Robert Seamans

In this paper, we empirically investigate the effect of the Internet on racially-driven hate crimes. To understand the link, we study the extent to which broadband availability affects racial hate crimes in the US from 2000-2008. We deploy a set of econometric techniques to account for estimation biases. We find strong evidence that broadband availability increases racial hate crimes and its effects are stronger in areas with higher levels of racism, income inequality, and education attainment.

Empirical Supply Chain Studies

Sponsor: Manufacturing & Service Operations Management

Sponsored Session

Chair: Jun Li, Assistant Professor, Ross Business School, University of Michigan, 701 Tappan Street, Ann Arbor, MI, 48109, United States of America, junwli@umich.edu

1 - Supply Chain Disruptions and the Role of Information Asymmetry

William Schmidt, Assistant Professor, Johnson Graduate School of Management, 314 Sage Hall, Ithaca, NY, 14853-6201, United States of America, wschmidt@cornell.edu, Ananth Raman

Disruptions have been found to damage firm value. This may induce (1) managers to behave strategically in revealing operational disruptions and (2) the market to respond differently to disruptions when managers can behave strategically. Both factors distort the true economic impact of disruptions on firm value. Our research sheds light on these tangled relationships.

2 - Risk Propagation in Supply Network

Yixin (Iris) Wang, Ross School of Business, 701 Tappan Street, Ann Arbor, MI, United States of America, iriswang@umich.edu, Jun Li, Ravi Anupindi

The goal of this research is to assess interdependency of risks in supply network and to understand the process of risk propagation using firm-level supplier relationship data and risk event data. We focus on high-tech industry and concentrate on impacts of disruptions on interrelated firms through supplier-buyer relationship or more broadly, through sharing common suppliers/customers. We aim to help firms manage risks more efficiently and acknowledge sub-tier importance.

3 - Systematic Risk in Supply Chain Networks

Nikolay Osadchiy, Assistant Professor, Emory University, 1300 Clifton Rd NE, Atlanta, GA, 30309, United States of America, nikolay.osadchiy@emory.edu, Vishal Gaur, Sridhar Seshadri

The demand uncertainty faced by a firm can be caused by idiosyncratic factors or systematic economic factors. We investigate how systematic risk propagates through supply chain networks using industry-level data for the manufacturing, wholesale trade, and retail trade sectors of the U.S. economy. We find that the systematic risk increases from retailers to wholesalers and manufacturers, and the increase in systematic risk is driven by the aggregation of orders over customers and time.

4 - Supply Chain Network Structure and Firm Returns

Jing Wu, PhD Student, University of Chicago Booth School of Business, 5050 S Lake Shore Dr 3417S, Chicago, IL, 60615, United States of America, wujing@chicagobooth.edu, John Birge

This paper investigates the effects of supply chain connections on firm performance, as reflected in stock returns, at two interaction levels, first-order from directions and second-order from systemic exposures through the network.

1 - Generalization and Exploration via Randomized Value Functions

Zheng Wen, Stanford University, 555 W Middlefield Rd, Apt. A304, Mountain View, CA, United States of America, wenzheng.ee@gmail.com, Benjamin Van Roy

We consider reinforcement learning problems in which an agent must generalize from past experience and explore to reduce uncertainty. We propose an approach to explore based on randomized value functions and an algorithm — randomized least-squares value iteration (RLSVI) — that embodies this approach. We explain why algorithms using Boltzmann or epsilon-greedy exploration can be highly inefficient and present computational results that demonstrate dramatic efficiency gains enjoyed by RLSVI.

2 - Weakly Coupled Dynamic Program: Information and Lagrangian Relaxations

Fan Ye, Georgia Institute of Technology, 755 Ferst Drive, NW, Atlanta, GA, 30332, United States of America, fye8@gatech.edu, Enlu Zhou, Helin Zhu

"Weakly coupled dynamic program" consists of multiple controlled stochastic processes that evolve independently but subject to a set of linking constraints on the controls. It decouples into lower-dimensional dynamic programs via Lagrangian relaxation on the linking constraint, which also yields a bound on the optimal value. Based on the Lagrangian relaxation, we utilize the information relaxation approach and propose a computationally tractable method to obtain a tighter dual bound.

3 - Learning to Optimize Via Information-Directed Sampling

Daniel Russo, Stanford University, 218 Ayrshire Farm Lane, Apt. 102, Stanford, CA, 94305, United States of America, dan.joseph.russo@gmail.com, Benjamin Van Roy

We offer a fresh, information-theoretic, perspective on the exploration/exploitation tradeoff and propose a new algorithm—information-directed sampling—for a broad class of online optimization problems. We establish a general expected regret bound and demonstrate strong simulation performance for the widely studied Bernoulli, Gaussian, and linear bandit problems. Simple analytic examples show information-directed sampling can dramatically outperform Thompson sampling and UCB algorithms.

4 - Exact Solution to a Dynamic Learning and Decision Making Problem

Hao Zhang, University of British Columbia, 2053 Main Mall, Vancouver, BC, V6T1Z2, Canada, hao.zhang@sauder.ubc.ca

Dynamic decision making is about choosing the best sequence of actions under sequential observations. It is especially challenging when the underlying state (of the machine, patient, customer, etc.) is unobservable. For a large class of problems, e.g. Bayesian learning and sequential hypothesis testing, the underlying state does not change over time. We discuss a general approach for solving such problems, and present an exact solution in the two-state case with interesting structural results.
